Disclaimer

This report has been produced for the sole benefit of Cube Highways Pte. Ltd. This Report (the "Report") is confidential and disclosed only for information purposes, and it may not be relied upon by any party other than the Client or a Party to a Reliance Letter, and Steer: a) makes no warranty, expressed or implied, with respect to the use of any information or methods disclosed in this Report; and b) assumes no liability with respect to the use of any information or methods disclosed in this document. Any such party by its acceptance or use of this Report releases Steer from any liability for direct, indirect, consequential, or special loss or damage whether arising in contract, warranty, express or implied, tort or otherwise.

The Report is based on standard professional efforts, and information available to us at the time the review took place and is subject to time and budget constraints of the Report's scope of work. This Report, information and statements contained herein, are all based on third party data provided to us, or sourced by us, and Steer has not sought to establish the reliability of the data, except as specifically stated in the Report. Steer bears no responsibility for the results of any actions taken on the basis of third-party data.

Certain forward-looking statements in the Report are estimates based on interpretations or assessments of information available at the time of writing. The Report is thus to be viewed as an assessment that is time-relevant, specifically referring to conditions at the time of the review. Steer undertakes no obligation to update the Report for any reason.

While the estimates contained in the Report are not precise forecasts, they do represent, in our view a reasonable expectation of the future, based on information we have been provided with or sourced. However, the estimates necessarily rely on numerous assumptions and judgements, and circumstances may occur over the timeframe of the project that go counter to these assumptions and judgements and that affect the project's realized revenues. Actual events may differ from those assumed, and events are subject to change. Therefore, Steer makes or provides no warranty, whether implied or otherwise, as to the accuracy of forward-looking information presented. Further, it is important to note that forecasts presented represent long term growth profiles; the results for individual time periods may vary from forecasted values.

Traffic Consultant developed the relationships in the models used to produce the forecasts for the projects based on data available through September 2025. This report does not consider variations in traffic performance due to changing macro and force majeure events such (but not limited to) as global wars, economic uncertainty (high inflation, global recession), and changes in the regulatory environment. The situation remains dynamic and is subject to significant change in the short and medium term. In this challenging context, Traffic Consultant has produced base forecasts with a view on a possible scenario for the traffic forecasts. However, it is important to note that this is only one view, and there continues to remain uncertainty as to the short-term, intermediate or prolonged effects of and responses to such macro-economic/force majeure events. As a result, no assurance can be provided by Traffic Consultant that the scenarios and assumptions Traffic Consultant has identified will prove to be accurate. Given the uncertainty inherent in this scenario, Traffic Consultant advises that all readers of the Report consider the Report in the context of their own assessment of the impact of such events.

TO THE FULLEST EXTENT PERMITTED BY APPLICABLE LAW, THE LIABILITY OF THE TRAFFIC CONSULTANT FOR ANY LOSS, DAMAGE, COST OR EXPENSE SUFFERED OR INCURRED BY ALL PERSONS OR ENTITIES AND FOR ALL CLAIMS RESPECTING ITS WORK PERFORMED IN CONNECTION WITH THE ISSUE OR THE REPORTS IS HEREBY LIMITED IN THE AGGREGATE TO THE AMOUNT OF FEES ACTUALLY PAID BY THE CLIENT TO THE TRAFFIC CONSULTANT IN RESPECT OF THE REPORTS AND CONNECTED SERVICES.

SH	State Highway
T&R	Traffic and Revenue
TMS	Traffic Management System
TVC	Traffic Volume Count
WADT	Weekly average daily traffic
YTD	Year to Date

1 Introduction

The assignment

1.1 The Cube Highways Fund Advisors Private Limited (the "Client") has commissioned Steer Davies Gleave India Private Limited ("Steer") for a traffic due diligence to be carried out on the Delhi Agra Tollways Limited (hereafter called "Asset"). This report forms part of the annual fair market valuation (FMV) undertaken as part of the "Transit 10 project". It presents an update of the Asset's traffic and revenue forecasts over its remaining concession period based on actual traffic data available through September 2025 and latest macroeconomic, and network-related assumptions.

1.2 Our scope of work for the traffic and revenue forecasting process is presented in Table 1.1 below:

Table 1.1: Scope of work and sources of data

Scope of work	Data source
• Review of historical Traffic Management System (TMS) data, Origin-Destination (OD) data, Vendor reports and documents	• Provided by Client for the period between Dec'13 and Sept '25
• Historical analysis and forecasts for baseline growth, including – Background growth, – Seasonality	• Historical toll plaza data provided by Client and benchmarks from Assets in the vicinity wherever long time series historical data was not available
• Validation of revenue reported in FY26YTD	• TMS data provided by Client • Revenue reconciliation using toll plaza traffic and ticket type data to calculate revenue and reconciling it with toll plaza reported revenue.
• OD analysis to understand growth drivers: – Zonal influence and Top OD pairs – Commodity distribution – Trip length distribution	• Origin Destination (OD) surveys undertaken by Steer in 2025
• Analysis of upcoming network improvements and other developments, that may have future impacts on traffic	• Secondary research and our in-house experience of working in the vicinity of the Asset. Impact analysis based on Generalised Journey Cost spreadsheet-based analysis

Scope of work	Data source
• Historical revenue analysis and forecasts for revenue estimation, including – Toll segmentation and trip factors, – Overloading shares,	• Calculated from historical data provided by Client
• Final traffic growth forecasts including baseline growth rates and potential future impacts	• Elasticity based base growth and potential impacts from secondary research, Asset historical traffic performance and Steer's in-house experience of working on toll roads on the corridor • Gross Domestic Product (GDP) forecast assumptions provided by Client
• Toll revenue estimation for the entire concession including toll evolution	• Toll evolution based on latest toll notification published by National Highway Authority of India (NHAI) and latest actual Wholesale Price Index (WPI) trends as shared by the Client. • Assumptions of WPI forecasts and future tolling length changes provided by Client • Revenues estimated as a product of traffic forecasts and toll evolution

Our approach

1.3 The approach employed by Steer in the preparation of these forecasts was developed to take advantage of existing knowledge of the Asset and available data from various sources made available by the Client as well as publicly sourced. It follows well-established practices for forecasting ongoing traffic growth on an existing/brownfield Asset. The analysis focused on two sets of issues, namely:

- Understanding the traffic that is currently using the Asset; and
- Identifying how and why that traffic is likely to change in the future.

1.4 To understand the current traffic on the Asset, we have analysed traffic data from multiple independent sources:

- Client-provided secondary data, including:
  - TMS data for KM46 and KM94 available from Jul'22 to Sept'25.
  - TMS data for KM164 from FY13 to Sept '25
  - Concession agreement and toll notifications for FY25 and FY26
  - Previous T&R studies and reports.
  - Bid and Lender studies.
  - Steer-commissioned OD survey at two plazas on the Asset: TP1 Gadpuri (KM46) and TP3 Mahuvan (KM164) to validate any change in growth drivers and travel patterns. Surveys were conducted at TP1 and TP3 on 6th and 7th February 2025 respectively.
  - Steer-commissioned TVC surveys from 6th to 8th February 2025 on both TP1 and TP3.

- We undertook revenue reconciliation for FY26YTD, by building up revenue from the traffic reported by each of the toll plaza and subsequently matching it to the reported revenue for FY26YTD using the prevailing toll rates and reported segmentation/toll-frequencies for FY26YTD. This is a key part of our analysis to validate the segmentation/toll-frequency assumptions and the Annual Average Daily Traffic (AADT) reported for each of the toll plazas.

1.5 The estimation of future traffic demand on the Asset was undertaken through:

- Estimating FY26 base year position. The FY25 AADT was calculated using the monthly traffic data for FY25. The annual FY25 AADT was then grown with elasticity linked GDP/GSDP growth to arrive at the FY26 expected traffic. To determine the adopted FY26, the expected FY26 traffic was validated against six months of actual traffic (Apr-Sept) and necessary adjustments were made where required.
- Secondary research to understand plans for new developments and progress of ongoing developments on the Asset.
- Steer independent primary surveys and site visits to validate our network and contextual understanding.
- Developing a bespoke growth model for each Asset/plaza/toll class to forecast year-on-year traffic growth from FY26 to the end of concession period.
- Investigating the elasticity of historical traffic growth compared to state (GSDP) and national (GDP) growth. Where historical data is limited, we have benchmarked the Asset against our Steer knowledge base (e.g., similar Asset types in the same state or on the same corridor), to derive appropriate elasticities.
- Applying our elasticities to independent GDP forecasts as provided by Client.
- Identifying and analysing the potential impacts of any relevant changes to the competitive position of each Asset – these include impacts of changes to road network including expressways and opening of competitive modes of travel.
- Identifying and analysing any other potential impacts to traffic and revenue on each Asset – these include axle load norms, axle shift for heavy goods, FASTag implementation.
- Considering changes in trends of segmentation over time and making suggestions for changes in exemptions in the future
- Preparing traffic and revenue forecast for the Asset for the remaining concession period. The analysis here includes the specific impacts of network-related developments, or other exogenous factors specific to the Asset. We have developed a set of forecasting assumptions for three scenarios: a base case, and upside and downside scenarios.

Contents of this report

1.6 The report has been divided into the following chapters:

- Chapter 1 introduces the methodology and approach to undertake the traffic and revenue due diligence.
- Chapter 2 describes the key characteristics of the Asset and its surrounding road network, primarily based on site visits.
- Chapter 3 summarises the current and historical traffic on the Asset, including results from the TMS, TVC, and OD analysis.

- Chapter 4 presents the socio-economic context of India, the corridor and region/state containing the Asset, along with our approach and results on estimating background growth, and our key forecasting assumptions.
- Chapter 5 presents our baseline year forecast and summarises our results on estimating background traffic demand growth.
- Chapter 6 summarises our assessment of network-related impacts and presents concession traffic and revenue forecasts for the Asset along with the assumptions for the upside and downside scenarios.

2 The Asset

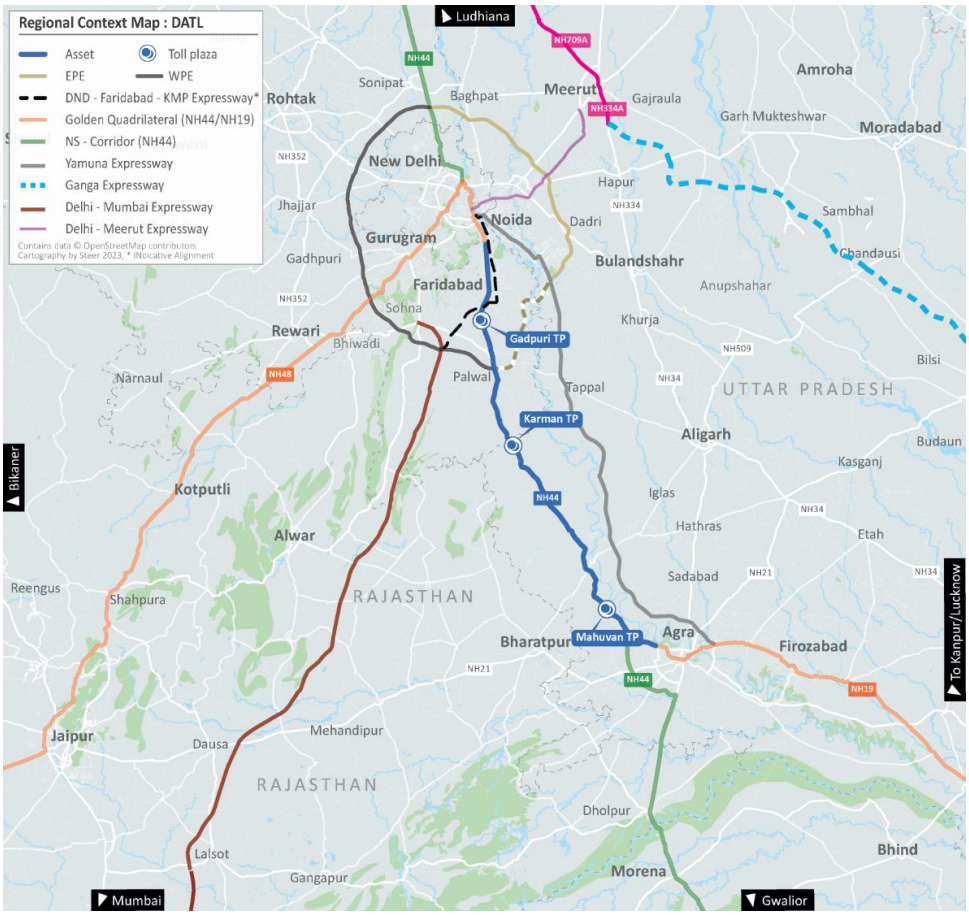
Introduction

2.1 This chapter provides a description of the Asset, based on both primary data (from site visits), and our understanding of the region and network surrounding the Asset. We cover the Asset's strategic network context, followed by key economic activities and network-related developments around the Asset.

Strategic Network Context

2.2 The Asset is situated in the states of Haryana (HR) and Uttar Pradesh (UP), connecting the Central National Capital Region (NCR; comprising Delhi state) to Agra in the south, via Palwal (HR) and Mathura (UP). Figure 2-1 below presents the regional road network within which the Asset is located.

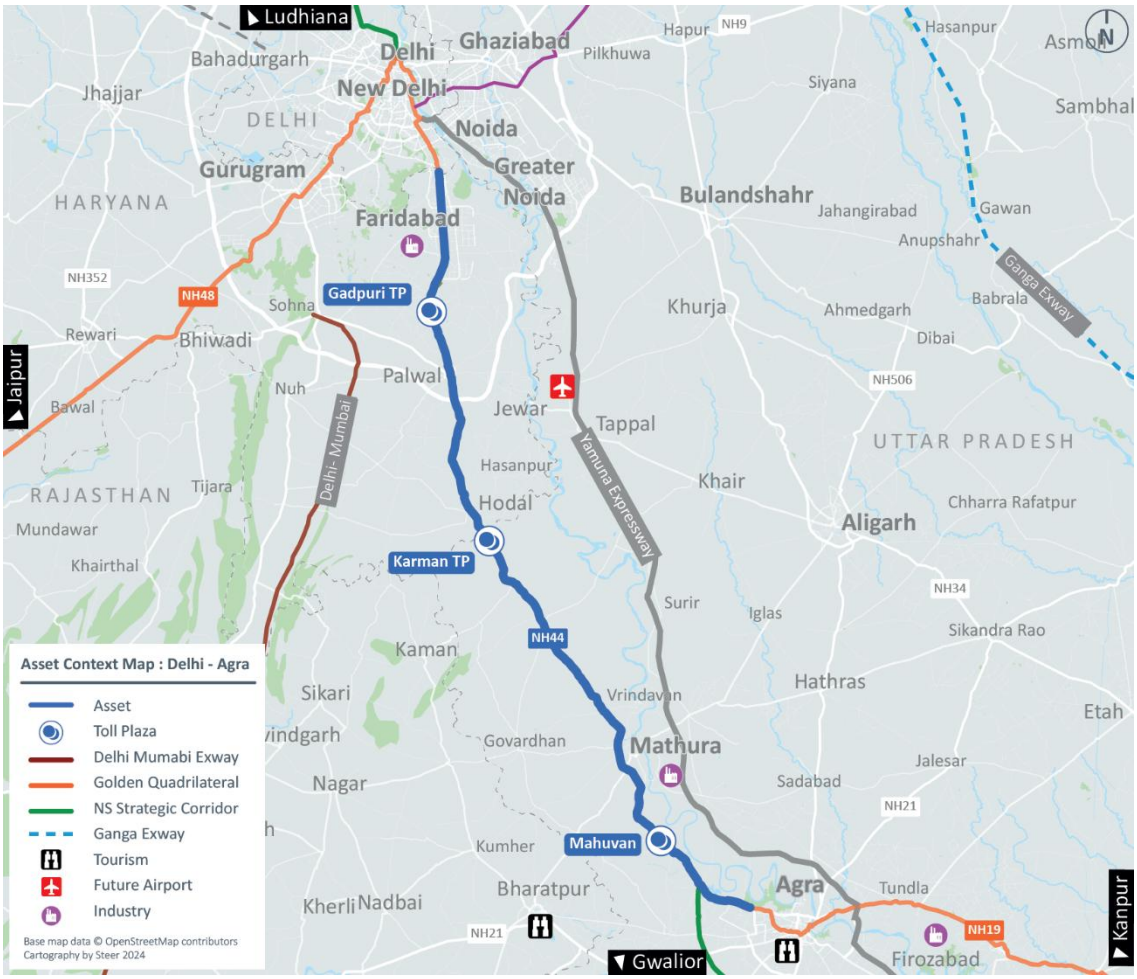
Figure 2-1: Regional Context



Source: Steer cartography using OpenStreetMap data

2.3 The Asset is a 179.5 km toll road between Delhi and Agra which forms part of the north-south NH44 corridor (Old NH2 in Haryana, and Uttar Pradesh). Previously, up to June 2022, the Asset operated two toll plazas i.e., Srinagar (KM74) and Mahuvan (KM164). On commencing full commercial operations (COD) from July 2022 onwards, the Asset began operating three toll plazas; Srinagar toll plaza (KM74) was split into two different toll plazas - Gadpuri (KM46), and Karman (KM94), which are now operational along with the existing plaza Mahuvan (KM164).

Figure 2-2: Asset context



Source: Steer cartography

2.4 The Asset forms part of the Grand Trunk Road – which is a part of the Asian Highway 1 (AH1). By virtue of its strategic location, it primarily caters to the following types of movements:

- **East-west long-distance movement** from Kashmir in North India to the India-Bangladesh border. This route originally connected Kabul in Afghanistan to Chittagong in Bangladesh. This movement caters traffic between northern parts of country and eastern states.
- **North-south long-distance movement** connecting Srinagar in Kashmir (northernmost state) to Kanyakumari in Tamil Nadu (southernmost state in mainland India). This movement caters traffic between northern parts of country (Delhi, Punjab) to the southern states of Karnataka, Telangana, etc.

- **Medium-distance movement** as a key corridor in this region, connecting Delhi with Lucknow, Kanpur, Indore etc. via Agra and Mathura.
- **Short-distance inter-urban movement** between towns and cities in and around Delhi, Palwal, Mathura and Agra.

Concession and tolling

2.5 The toll plazas on the Asset have been operational since December 2012, and the Client started the operations in FY20. There are still 13 years left in the concession period with FY39 being the last year of the concession. Table 2.1 below presents a summary of the concession.

Table 2.1: Summary of concession

Particulars	Details
State	Delhi, Haryana, Uttar Pradesh
Highway and lane configuration	• NH 19/NH 44 • Six-lane divided
Toll plazas	**Previously:** • KM74, Srinagar (till June 2022) • KM164, Mahuvan **Existing/Operational (July 2022 onwards):** • KM46, Gadpuri • KM94, Karman • KM196, Mahuvan
Length (KM) as per concession agreement, applicable	**Previously:** • KM74: 89.75 KM • KM164: 89.75 KM **Existing/Operational:** • KM46: 47.28 KM • KM94: 63.22 KM • KM164: 69.00 KM
Commencement of operations*	• KM46: July 2022 • KM94: July 2022 • KM164: December 2012
Operation by Client	FY20
Concession period	19 years
Last year of concession	FY39

Source: Concession agreement

2.6 Tolls are collected for toll categories including Single, Return, Local Commercial and Monthly Passes. Rates for Single Journey tickets on all three toll plazas are shown in the Table 2.2 below.

2.7 All three toll plazas have dedicated ETC/FASTag lanes for electronic tolling. FY26 toll rates were revised in the start of FY26 fiscal year i.e., April 1, 2025.

Table 2.2: Vehicle-wise single toll rates on the Asset – applicable April 2025 to March 2026

Type of Vehicle	Single Journey Fee (INR)		
	KM46 – **Gadpuri**	KM94 - **Karman**	KM164 - **Mahuvan**
CJV	125	95	105
LCV	195	155	170
Bus/Truck	400	325	355
3A/MAV	615	510	555
HCM/EME/OSV	780	620	675

2.8 Figure 2-3 below illustrates a typical cross-section of the Asset and its associated toll plazas. Specifically, Pictures 1 and 2 depict the Gadpuri and Mahuvan toll plazas, while Pictures 3 and 4 showcase a cross-section and the quality of the Asset's road infrastructure.

Figure 2-3 (clockwise): Typical cross-section of the Asset, toll plaza and alternate road

Source: Steer site visit

Key economic activities

2.9 The Asset connects the National Capital Territory (NCT) of Delhi at its northern end with the world-renowned tourist city of Agra at its southern end. Besides linking Agra to the national capital region, it also forms the initial section of a longer corridor that connects

Delhi and other parts of North India to Central, East and South India. As a result, the Asset observes significant volumes of all types of traffic, including, but not limited to:

- In terms of passenger movement, daily commuters travelling between Delhi and other smaller municipalities along the corridor (e.g., Palwal, Hodal, Mathura, Agra), and leisure travellers/tourists travelling to/from Agra and Delhi.
- In terms of commercial/goods movements, industry supplies and manufactured goods, as well as agricultural products, with a considerable share of consumption-based commodities.

Tourism

2.10 The Asset is surrounded by several major tourist attractions, with Delhi and Agra forming two of the three vertices of the Golden Triangle - one of India's most popular travel circuits for international tourists.[1] Delhi, Agra, Fatehpur Sikri and other towns in the region are home to several historical monuments and heritage sites, including the famed Taj Mahal (Agra). Religious tourism and pilgrimage sites include Surajkund, Badkhal Lake, Shivling at Hodal, ISKCON temple (all in and around Central NCR), and Banke Bihari and other major temples of Mathura and Vrindavan.

Industry

2.11 Major industrial and commercial centres are located at the northern end of the Asset, between Okhla, Badarpur, Faridabad[2], Ballabhgarh and Palwal[3], which are connected via the DND – KMP Expressway and the Asset. This includes North India's largest inland port and container transhipment terminal at Badarpur called ICD Tughlakabad[4]

2.12 Extending further south and east beyond the Asset, the Agra-Lucknow highway has historically been (and continues to be) an industrial corridor with leather and textile industries located in Agra[5] and Kanpur[6], and glassmaking industries located in Firozabad.

2.13 Mathura has an Indian Oil Corporation (IOCL) refinery with a capacity of 8.0 mmtpa[7]. Consequently, the Asset has a distinct industrial character, with a large share of traffic movements being good vehicles serving many of these industries.

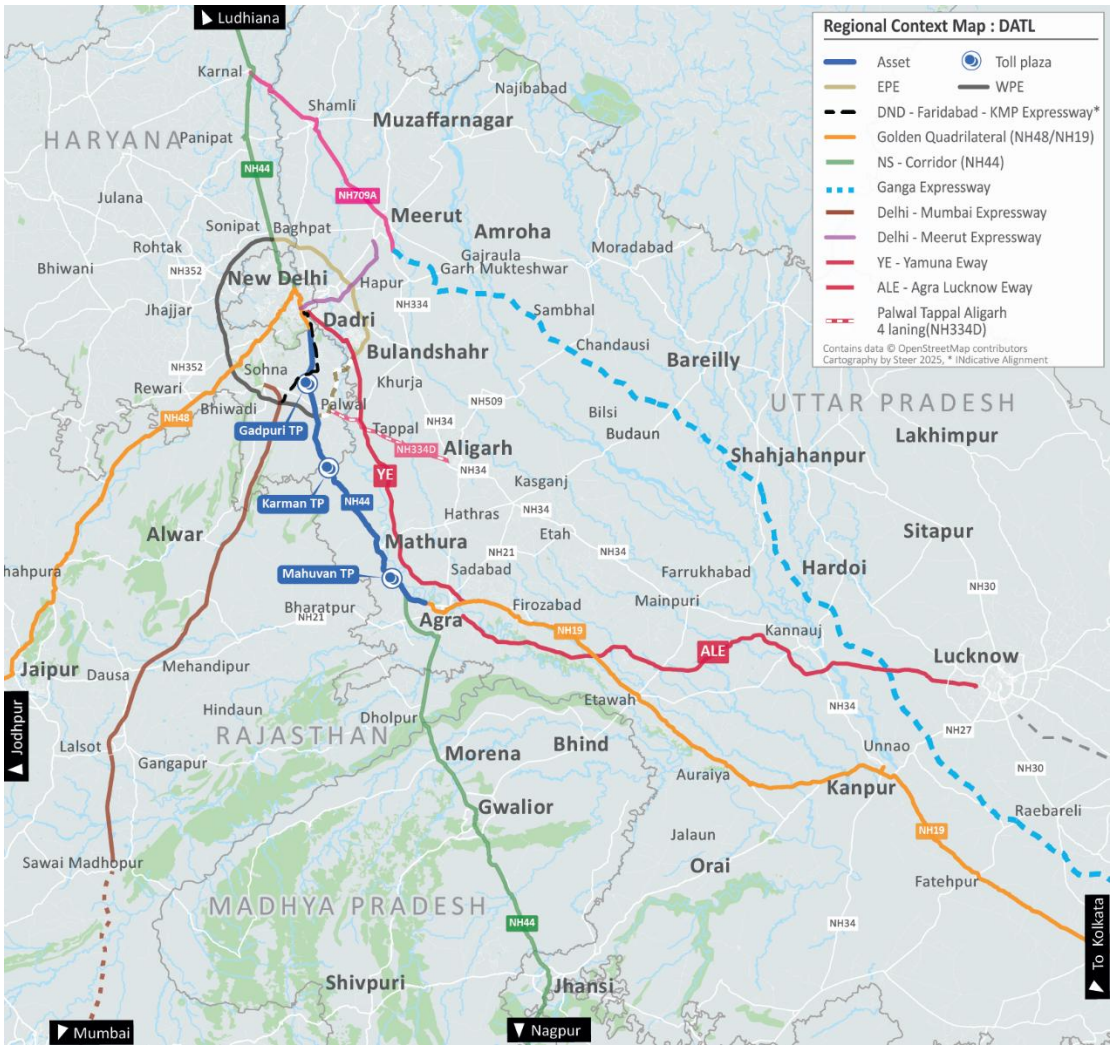
Alternate routes

Figure 2-4: Alternate routes to the Asset



Source: Steer Cartography

2.14 This Asset caters to the strategically important east-west movement - between Delhi and north-western India at one end, and Uttar Pradesh and eastern India at the other end – by virtue of its location and the linkage it provides between activity centres in the region. Figure 2-4 above illustrates other alternate routes available to users while travelling between Delhi and Lucknow. As shown in the map, the alternate routes are:

- **Asset route**: Delhi – Faridabad - Agra (via NH 44 – Kanpur - Lucknow
- **Alternate 1 route**: Delhi - Ghaziabad (via NH 34) – Aligarh – Kannauj - Lucknow
- **Alternate 2 route**: Palwal – Tappal – Aligarh – Kannauj - Lucknow (via NH334D)
- **Alternate 3 route**: Delhi - Yamuna Expressway (YE) - Agra Lucknow Expressway (ALE)- Lucknow

2.15 The Asset is also located on the strategically key north-south corridor, with NH44 traversing through Punjab, Haryana, Delhi, Rajasthan, Uttar Pradesh, Madhya Pradesh, Maharashtra, Telangana, Karnataka and Tamil Nadu. Currently there is one major alternative National Highway route for traffic with one trip end in northern India and other

in Maharashtra via NH48 corridor. Additionally, the upcoming the Delhi-Mumbai expressway will be another alternate for the traffic between Delhi NCR and Maharashtra.

Delhi-Mumbai Expressway

2.16 As aforementioned, the Asset currently connects traffic travelling between North Indian regions of Delhi, Agra, Punjab, Haryana, and beyond to regions located further south including Mumbai, and Indore, other parts of Maharashtra and beyond. In this context, a key alternative route that has materialized in recent years (since FY19) is the Delhi-Mumbai Expressway, upon expected completion by FY27, it will connect the Sohna Elevated Corridor to the Jawaharlal Nehru Port in Maharashtra, eventually becoming a key competing route to the Asset for north-west traffic movement.

2.17 The Delhi-Mumbai Expressway (DME) is a 1290-KM long greenfield expressway that has been developed to provide an improved 8-lane route to long-distance traffic between North/Western India to Mumbai[8]. Movements for which the DME serves as a directly competing alternative to the Asset route include the following:

- **Trips originating in Delhi/Punjab/Haryana/Agra destined to Indore**: For traffic to get to Indore, there is an alternate route through the expressway via Ratlam/Garoth-Ujjain.
- **Trips originating in Delhi/Punjab/Haryana/Agra destined to Mumbai**: This traffic currently uses either the NH8 corridor or NH44 and NH52 corridor. After the commencement of operations on the DME, users and commercial operators travelling this route will be presented with a cheaper, and faster alternative.
- **Trips originating in Punjab/north destined to Faridabad**: For traffic to access Faridabad from regions around Punjab, historically the preferred route passed through Palwal – Gadpuri – Faridabad. However, this movement has now shifted to the Western Peripheral in conjunction with the DME and the Faridabad spur. This shift only affects the Gadpuri (KM46) plaza.

2.18 A few sections of the greenfield expressway have been made operational with Sohna-Dausa-Lalsot section (Feb'23), Madhya Pradesh section (Sep'23), Vadodara-Bharuch section (Feb'24), Lalsot-Sawai-Madhopur section (Feb'24) and the Kota-Bundi Section (Dec'24) already being operationalised. The project is currently experiencing construction delays, mainly on the Gujarat stretch[9]. Once the remaining sections are made operational, the long-distance movement between Delhi/north and Mumbai/south currently appearing on the Asset could be at the risk of shifting to the alternate DME.

2.19 In addition to the DME, the 50 km stretch of the DND-KMP Flyway that will connect DND Flyway to KMP Expressway by FY27 is expected to impact traffic growth on the Asset as part of the same broad network development. The DND-KMP Flyway was conceived as a 3-package 50 km stretch aimed to reduce congestion within Delhi NCR and Faridabad by connecting Kalindi Kunj to the DME directly for commercial vehicles travelling through Delhi and originating from the industrial clusters of Faridabad and other parts of NCT to the DME via Nuh in Haryana[10]. Package 3 of this development was completed in February

[8] **Delhi - Mumbai Expressway (Times Now, April 2025)**

[9] **Delhi-Mumbai Expressway Update: Surat-Maharashtra stretch delayed,** (March 2025)

[10] **DND - KMP Flyway Package Details**

2023[11] and Package 2 was opened to traffic in November 2024[12]. Both these developments continue to impact Gadpuri plaza which has lost traffic over the past couple of years due to the increased access to the DME provided by these developments.

2.20 Package 1 of the DND-KMP Flyway i.e., 9km elevated corridor connecting Mithapur to DND Flyway is expected to be completed and operational by FY27. Once this is completed, a further loss of traffic is expected across the NH44 corridor for the share of long-distance through traffic that continues to use the Asset between Faridabad and other locations further south, and also along the DME alignment.

3 Traffic Description

Introduction

3.1 This chapter presents historical and current traffic and revenue trends on the Asset, as well as analysis of origin-destination (OD) survey data and traffic count data. This covers data which was collected as a part of this study and in previous studies, as well as data provided by the Client.

3.2 Traffic demand data is generally collected and analysed to understand the volume and vehicle composition of demand currently using the Asset, while OD data is used to obtain a better understanding of travel patterns, trip lengths, trip purposes and areas of influence in the vicinity of the Asset, as well as the commodities being moved by goods vehicles. This analysis, combined with our understanding of the Asset (based on our site visits), enables us to identify the key drivers of demand on the Asset.

3.3 Actual toll plaza data is used as the basis from which the current/base year annual average daily traffic (AADT) is established. This data was provided by the Client and was independently analysed and validated using traffic volume count (TVC) information.

PCU factors considered for reporting.

3.4 The PCU factors considered in Table 3.1 below are as per IRC64 1990[13]. Based on discussions with the Client, for reporting purposes, Rigid and Trailer truck splits in the TVC counts have been used for calculating the effective PCU for MAV trucks. For Rigid trailer trucks a PCU factor of 3 has been assumed, whereas for Trailer trucks a PCU factor of 4.5 as defined in IRC64 1990 [14] has been adopted.

Table 3.1: PCU factors

Vehicle category	PCU Factor
CJV	1.0
Mini LCV	1.5
LCV	1.5
Bus	3.0
2A	3.0
3A/MAV	3.60*
OSV	4.5

Source: Steer analysis and IRC64,1990; this PCU factor is taken as the average of the PCU factors calculated for each of the three plazas on the Asset.

[13] **IRC 064: Guidelines for Capacity of Roads in Rural Areas**

[14] On this Asset, we have 3A/MAV combined volumes. However, for PCU calculations, to maintain consistency, we have used the shares derived from the latest TVC on the Asset (conducted in February 2025)

Historical trends

3.5 By virtue of its location, the Asset caters to both passenger traffic and goods vehicles as it connects two major cities in north India, i.e., the NCT of Delhi, and Agra, and also connects the northern regions of Delhi, Punjab, Haryana (and beyond) to the rest of the country, including states across central, east, and south India, and all their constituent cities, industrial hubs, and trade centres. As a result, the Asset carries a healthy mix of both passenger and commercial traffic.

3.6 CJVs account for the highest volume of total traffic on the Asset as major religious sites and tourist destinations in Mathura, Vrindavan and Agra witness high volume of both domestic and international tourist traffic every year. In addition to this, the large presence of leather and textile industries [5 6] , and the IOCL refinery in Mathura also contribute to the growth of commercial traffic on the Asset.

3.7 Table 3.2 through Table 3.7 below present historical variation in tollable and total (tollable + exemptions/violations) traffic volume at all three toll plazas on the Asset, both in terms of vehicle-wise AADT as well as total PCUs. Post June 2022, the earlier toll plaza (Srinagar; KM74) was split into two toll plazas i.e., Gadpuri (KM46) and Karman (KM94) that currently continue to operate on the Asset. Therefore, the data presented in the tables below for these two plazas are for the period July 2022 to the latest available period (i.e., September 2025). For Mahuvan (KM164) the data has been presented from FY19.

Table 3.2: Historical evolution in AADT by vehicle class at KM46 (Gadpuri)

Vehicle Category	FY23*	FY24	FY25	FY26YTD	FY25 vs FY24 (%)
CJV	31,943	32,776	34,852	34,981	6.3%
LCV	1,750	1,803	1,636	1,641	(9.2%)
Bus	876	949	1,074	1,149	13.1%
2A	2,122	1,774	1,740	1,629	(1.9%)
3A/MAV	3,204	2,646	2,335	2,213	(11.8%)
OSV	10	2	1	1	-
AADT	**39,906**	**39,951**	**41,638**	**41,614**	**4.2%**
PCU[1]	**54,518**	**52,609**	**53,702**	**53,316**	**2.1%**

Source: Steer analysis of the Client data; FY23* consists of data from Jul'22 to Mar'23; FY26YTD consists of data from Apr'25 to Sep'25; 1 PCU totals above consider PCU factor of ~3.60 for 3A/MAV combined traffic.

3.8 From FY25 to FY26YTD, KM46 has observed 3.8% growth at an AADT level, driven by a 5% increase in CJVs. This growth in passenger traffic is likely due to increased movement between, and within, urban centres of Faridabad, Palwal, and other parts of Delhi NCR. At a PCU level KM46 has grown at 2.1% over FY25 levels (as of FY26YTD).

Table 3.3: Historical evolution in Tollable AADT by vehicle class at KM46 (Gadpuri)

Vehicle Category	FY23*	FY24	FY25	FY26YTD	FY25 vs FY24 (%)
CJV	27,219	29,242	31,066	30,877	6.2%
LCV	1,670	1,776	1,613	1,627	(9.2%)
Bus	839	939	1,064	1,145	13.3%
2A	2,010	1,746	1,719	1,612	(1.6%)
3A/MAV	3,160	2,617	2,320	2,205	(11.4%)
OSV	10	2	1	1	-
Tollable AADT	**34,908**	**36,322**	**37,782**	**37,465**	**4.0%**
Tollable PCU[1]	**49,075**	**48,882**	**49,736**	**49,097**	**1.7%**

Source: Steer analysis of the Client data; FY23* consists of data from Jul'22 to Mar'23; FY26YTD consists of data from Apr'25 to Sep'25; Tollable traffic excludes exemptions and violations; 1 PCU totals above consider PCU factor of ~3.60 for 3A/MAV combined traffic.

3.9 Commercial traffic (2A, 3A, and MAVs) volumes crossing KM46 experienced a year-on-year decline in both FY25 and the current FY26 YTD. This downturn can be attributed to the opening of the Delhi-Mumbai Expressway's Faridabad spur (DME) in February 2023[11] , which took away short- and medium-distance traffic previously observed at KM46 Gadpuri. Further decline in FY25 and FY26YTD can be attributed to the completion of Package 2 of the Flyway [12], which provides direct access from Jaitpur in Delhi to Faridabad. This spur connects with the Western Peripheral Expressway at Khalilpur plaza, offering a faster and more efficient route to Rohtak and locations further north/northwest.

Table 3.4: Historical evolution in AADT by vehicle class at KM94 (Karman)

Vehicle Category	FY23*	FY24	FY25	FY26YTD	FY25 vs FY24 (%)
CJV	18,232	20,026	22,117	22,576	10.4%

Tollable PCU[1]	**32,613**	**34,819**	**34,920**	**42,019**	**47,457**	**50,242**	**52,725**	**52,455**	**8.3%**

Source: Steer analysis of the Client data (MAV includes 3A across all the years; 2A includes Bus from FY19-21; FY26YTD consists of data from Apr'25 to Sep'25.; tollable traffic excludes exemptions and violations; 1 PCU totals above consider PCU factor of ~3.60 for 3A/MAV combined traffic.

3.12 Since FY19, KM164 has observed strong PCU growth, posting an average annual growth rate of 9.1% per year over the period FY19-FY25. Much of this growth can be attributed to

the rapid pace of development in and around Delhi NCR over the past several years where the Asset has benefitted from its strategic location, connecting Delhi NCR to other locations across the country. KM94 and KM164 have grown at rates of 5.2% and 4.9% respectively in FY26YTD at a PCU level, stemming majorly from steady growth observed in CJVs, LCVs, and 2As. 3A/MAV traffic on the Asset has declined at all three toll plazas on the Asset in FY26YTD compared to FY25. Several factors have contributed to this, including:

- The secular decline of 3A traffic volumes – consistent with most national highway corridors in the country – due to updated axle load regulations, and a growing preference for 2As and MAVs. This contraction in 3A volumes is dampening the year-on-year growth rates for the combined total of 3A and MAV traffic volumes.
- The Delhi-Mumbai Expressway (DME) now observes a proportion of long-distance traffic which earlier used to appear on the Asset. Additionally (as detailed above in 2.19) the DND – KMP Flyway development has impacted long-distance movement appearing on the Asset by providing better access to the DME if passing through the inner areas of the National Capital.
- Upgrades to the Palwal – Tappal and Ghaziabad – Aligarh corridors have enhanced the Level of Service (LoS), leading to medium-distance traffic bound for Kanpur to favour the Ghaziabad – Aligarh – Kanpur route as an alternate to the asset.

3.13 The reduction in 3A volume observed on the Asset is a result of the declining demand for 3A vehicles, which are being replaced by 2As and MAVs. MAVs offer higher tonnage capacity making them more cost-effective for transporters, while the increase in 2A volume reflects the growing preference for these vehicles due to favourable changes in the legal permissible loads for 2As and their suitability for e-commerce-related freight, particularly high-value, low-volume goods over medium to long distances. This is consistent with our discussion with various transporters and OEMs across the country who are favouring 2A and 5A vehicles for commodity movement due to better unit economics.

Historical Revenue

3.14 Table 3.8, Table 3.9 and Table 3.10 below present the historical evolution in total and average daily revenue collection at Gadpuri (KM46), Karman (KM94), and Mahuvan (KM164). As of FY26YTD, AADC at all three toll plazas on the Asset grew over FY25 levels. The AADC growth at KM46, KM94, and KM164 has been 3%, 0.5% and 0.3% respectively.

3.15 This growth has been driven primarily by the increase in CJVs, LCVs, and 2As, as consumption demand from the urban consumption hubs of Faridabad, Delhi, Mathura and Agra continues to grow. Delhi and Agra also continue to grow as major tourism destinations for both domestic and international travellers.

Table 3.8: Historical total revenue (INR Cr) and AADC (INR Lakhs): TP Gadpuri (KM46)

Toll Plaza	CJV	LCV	Bus	2A	3A/MAV	Total	AADC	AADC Growth (%)
FY23	46.7	6.6	6.4	17.0	42.4	119.2	43.5

Toll Frequencies

3.16 Toll frequency or segmentation is typically the share of each ticket category recorded for a particular vehicle type. Each vehicle category has a different segmentation. As a part of historical analysis, we calculate the toll frequency for each vehicle category from the monthly data shared by the Client. The most common ticket categories observed on a typical National Highway concession are: Single, Return, Monthly, Local and Exempt. Given the local nature of traffic, some Assets offer custom made local passes to attract the local commuters to opt for these category passes instead of evading tolls. Brief descriptions of the different ticket types are provided in Table 3.11 below.

Table 3.11: Typical ticket types sold at NHAI plazas

Category	Description
Single	Allows the vehicle to cross the toll plaza once
Return	Daily pass for crossing the toll plaza multiple times within 24 hours. Charged 1.5 times the single toll
Monthly	Discounted entry ticket for users who undertake multiple trips within a month can buy the monthly pass.

Category	Description
Local Personal	Discounted monthly pass only for private cars of residents within 20KM radius of toll plaza
Local Commercial	50% discount on single trips for commercial vehicles registered in the local district
Exemptions	Officially exempted vehicles like ambulance, police cars, key political personnel etc.

3.17 Understanding the toll frequency gives insights into the nature of traffic plying on the Asset. CJVs generally have higher shares of return tickets or monthly passes as passenger vehicles typically travel shorter distances and are more regular/routine than commercial movements; heavy trucks mostly have single tickets as these trips are longer distance and vehicles may not be appearing on the same plazas as frequently given the nature of commercial transportation. Nonetheless, the exact shape and form of these ticket type distributions across different vehicle categories vary from Asset to Asset or even toll plaza to toll plaza. The Asset catering to short distance local traffic generally observes high share of return or other local, and monthly passes while an Asset catering to strategic long-distance traffic generally observes a high share of single ticket traffic.

Introduction of Annual pass for CJVs

3.18 The National Highway Authority of India launched the “The FASTag Annual Pass” on August 15, 2025, a prepaid facility that allows private CJVs to travel across designated National Highway and National Expressway toll plazas. The annual pass is worth INR 3,000. The pass is valid for one year or 200 trips, whichever occurs first and is applicable only to private, non-commercial vehicles (Car/Jeep/Vans).

Since this pass has been introduced by NHAI, it is not valid on

- state governed toll plazas on highways
- state governed toll plazas expressways
- Parking areas or other non-NHAI tolling locations

3.19 The pass can be activated via the RajmargYatra app or the NHAI website, and links directly to an existing FASTag.

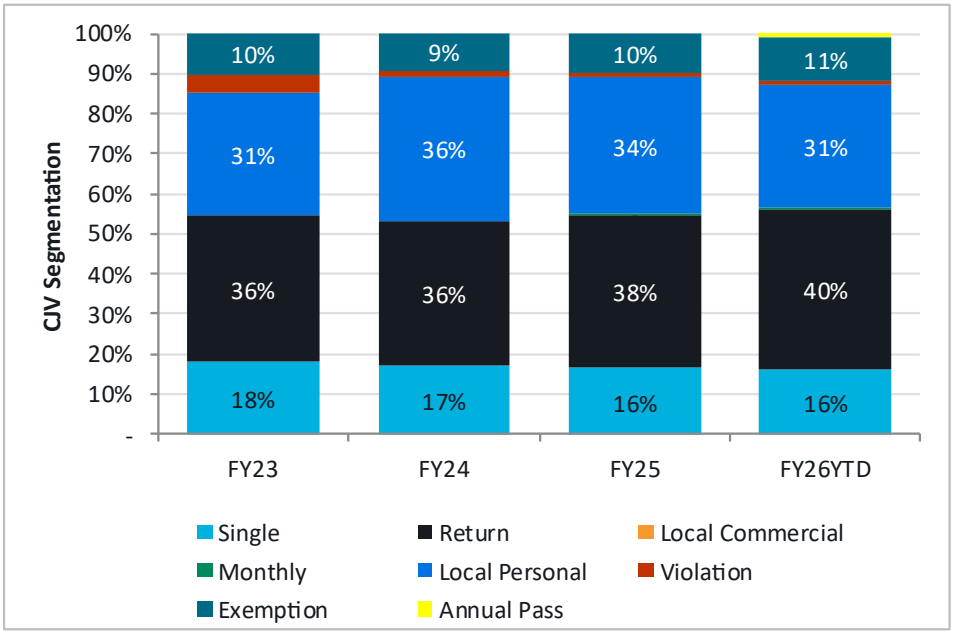
The Annual Pass aims to:

- Promote cashless and seamless travel on national highways.
- Reduce congestion and improve traffic flow at tolls
- Provide cost-effective travel for frequent users of NH/NE toll road

Share of traffic by payment type

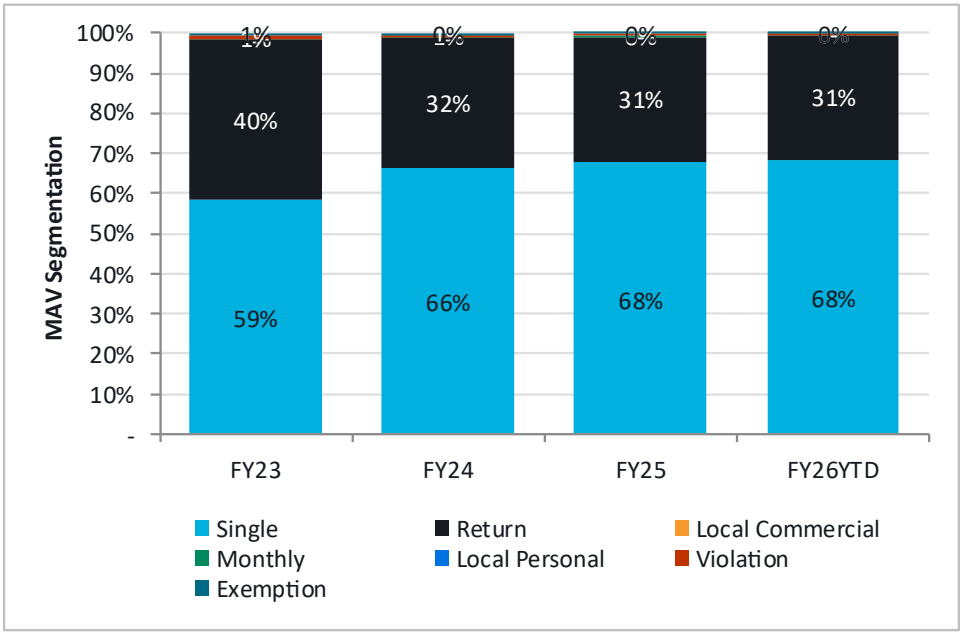
3.20 Figure 3-1 through Figure 3-4 below illustrate CJV and MAV ticket segmentations observed at KM46 (Gadpuri) and KM94 (Karman) toll plazas for the period FY23 (partial, July 2022-March 2023) through FY26YTD (April 2025- August 2025).

Figure 3-1: CJV Ticket-segmentation at KM46 (Gadpuri)



Source: Steer analysis of Client data; FY23 consists of data from Jul'22 to Mar'23; FY26YTD contains data thru Aug'25

Figure 3-2: MAV Ticket-segmentation at KM46 (Gadpuri)



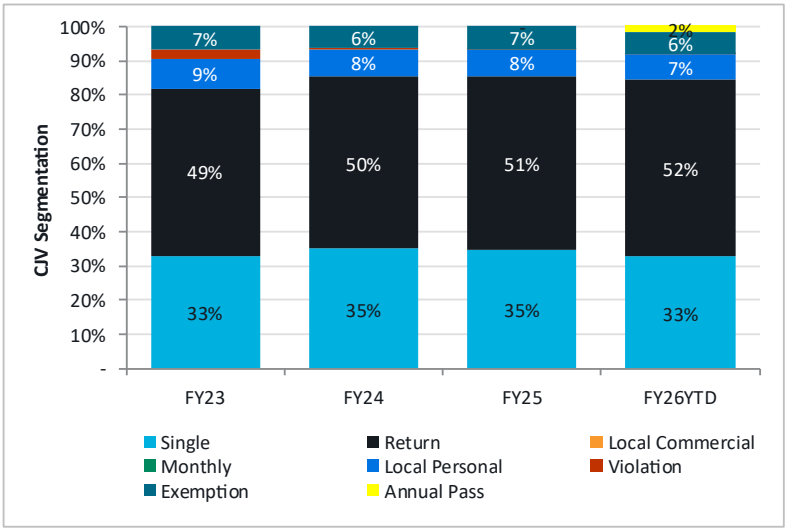
Source: Steer analysis of Client data; FY23 consists of data from Jul'22 to Mar'23; FY26YTD contains data thru Aug'25

3.21 As discussed earlier, two of the Asset toll plazas i.e., KM46 (Gadpuri), and KM94 (Karman), became operational after the original Srinagar toll plaza (prior KM74) was split into two different plazas in July 2022 (FY23). From graphs above, we see that ticket segmentation trends at both the plazas follow from their geographic locations along the Asset; KM46 (Gadpuri), the plaza located nearest to Delhi NCR and between the urban settlements of Delhi/Faridabad and Palwal, observes a high share of local traffic, or traffic

volumes captive to the area. At KM46, commercial trucks (MAVs) also make short-distance trips within Delhi-NCR, as evidenced from the high share of MAV return tickets on this plaza (as compared to KM94 and KM164). As of FY26YTD, 31% of MAVs were return trips at KM46.

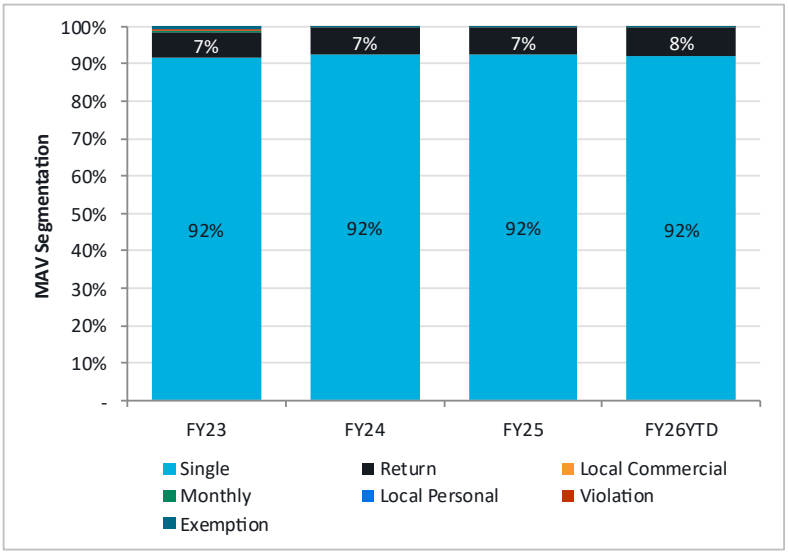
3.22 KM94 (Karman) observes more long-distance traffic than observed at KM46, largely because it is located farther away from urban centres on either end of the Asset, meaning most traveller crossing KM94 are likely longer-distance in nature. As shown in Figure 3-3 and Figure 3-4 below, this is supported by the significantly lower share of return tickets (and correspondingly higher share of single tickets) observed at KM94 relative to KM46. This observation is further validated by 2A/3A categories reporting a smaller share of return tickets in their segmentations at KM94.

Figure 3-3: CJV Ticket-segmentation at KM94 (Karman)



Source: Steer analysis of Client data; FY23 consists of data from Jul'22 to Mar'23; FY26YTD contains data thru Aug'25

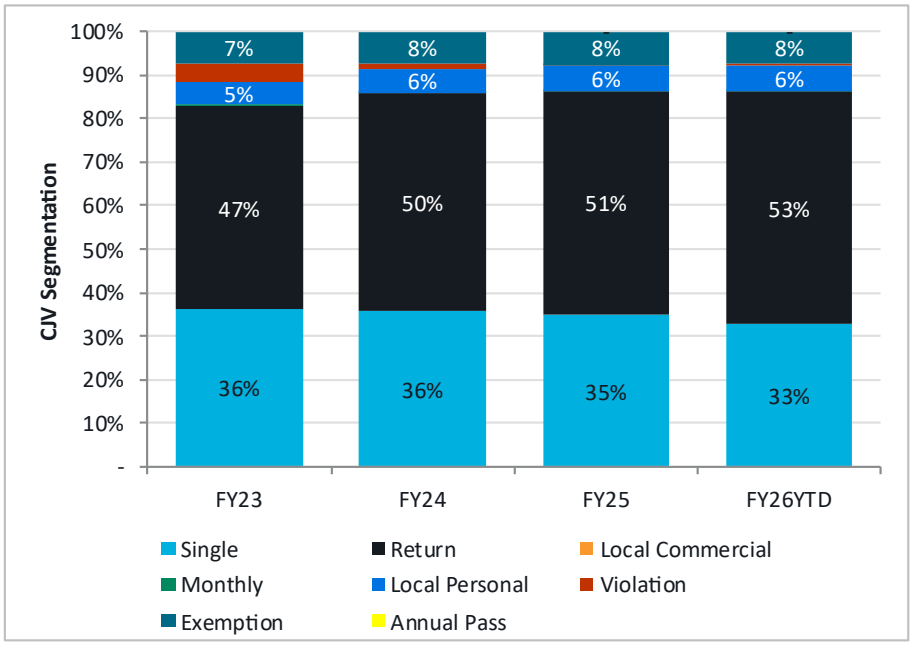
Figure 3-4: MAV Ticket-segmentation at KM94 (Karman)



Source: Steer analysis of Client data; FY23 consists of data from Jul'22 to Mar'23; FY26YTD contains data thru Aug'25

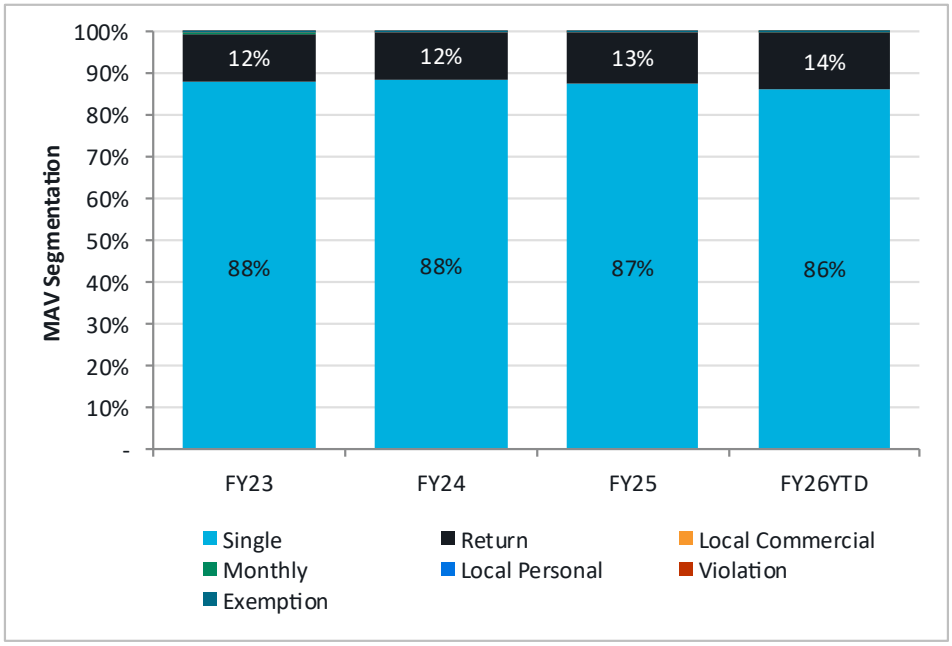
3.23 Figure 3-5 and Figure 3-6 below present ticket segmentation for CJVs and MAVs at KM164 (Mahuvan). Since the adoption of FASTag in FY21, the share of single tickets purchased by CJVs at KM164 (Mahuvan) has stabilized, and as of FY26YTD is 33%. The proximity of KM164 to Agra and nearby urban centres further explains the high share of return tickets for CJVs – which has been roughly 49-52% across the past four years.

Figure 3-5: Ticket-segmentation for CJV at KM164 (Mahuvan)



Source: Steer analysis of Client data; FY26YTD contains data thru Aug'25

Figure 3-6: Ticket-segmentation for MAV at KM164



Source: Steer analysis of Client data; FY26YTD contains data thru Aug'25

3.24 The share of single tickets at KM164 Mahuvan is high (86%, as of FY26YTD) implying MAVs observed on the asset are long-distance – significantly more than KM46 (68%).

Additionally, the share of return tickets for MAVs are still higher than that observed at KM94 meaning that KM164's proximity to Agra and nearby urban centres also influence the nature of MAV trips observed at KM164 - where some proportion of commercial trucks are also short-distance - lower than KM46, but higher than KM94.

Data Collection exercise

3.25 As mentioned previously, to validate and inform various inputs used in our forecasting, we undertook primary data collection on the Asset, comprising the surveys listed in Table 3.12 below. OD survey data was collected on behalf of the Client, and TVC surveys were commissioned by Steer with a third party. OD data collection typically involves manual data entry by enumerators based on oral surveys with road users crossing toll plazas. TVC data collection involves video-graphic capture of traffic crossing the toll plazas, followed by manual counting.

Table 3.12: Data collection schedule

TP	3-day videography-based TVC			1-day OD survey	
	Start date	End date	Time (hrs)	Start date	Start time
KM46 Gadpuri	06 Feb 2025	08 Feb 2025	0000-2359	06 Feb 2025	0900 hours
KM164 Mahuvan	06 Feb 2025	08 Feb 2025	0000-2359	07 Feb 2025	0900 hours

Source: Steer

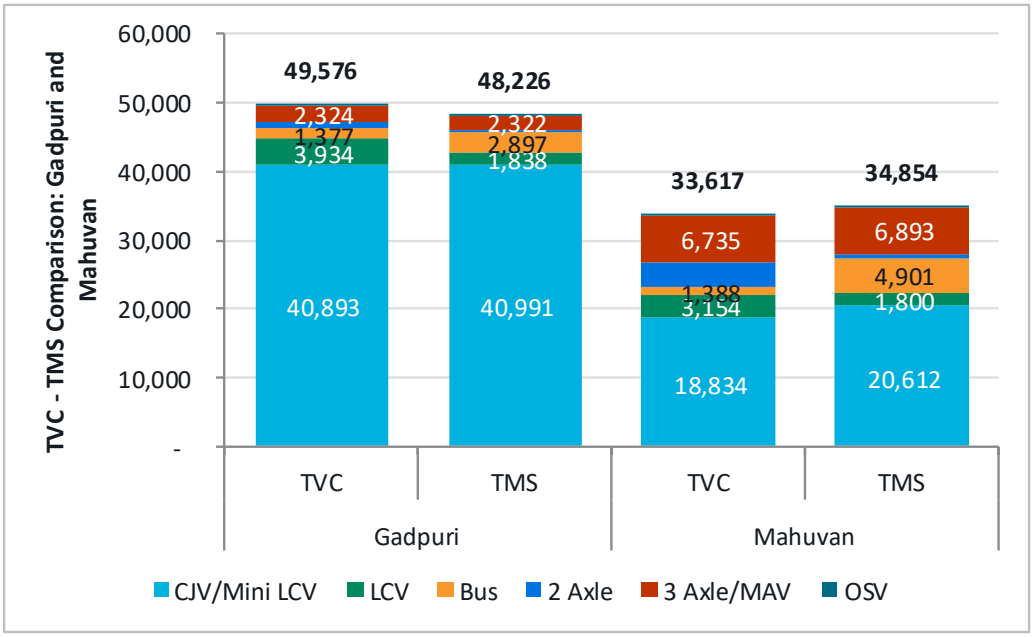
3.26 It should be noted that, in our experience, traffic on national highways shows variation across the week due to the economic activities surrounding each road. To derive a representative TVC count considering daily variation, three-day to seven-day traffic counts are generally recommended. Hence, in order to fully understand the impact of this weekly fluctuation on the Asset, we collected three-day counts at each toll plaza.

Key findings of the TVC data analysis

3.27 The results of the TVC study carried out by Steer in February 2025 are presented in this section. TVC surveys were conducted to help validate TMS data provided by the Client, and to inform various inputs used in our forecasting analysis.

3.28 Since we use the TMS data to estimate the base year AADT, we have used our overlapping TVC data to validate the TMS data on those days, as provided by the Client. In Figure 3-7 below, we observe that over the period (or days) for which the TVC data was collected, there existed little difference between the reported TMS traffic count data and the independently recorded TVC data. Based on this output, we independently validated the TMS count data provided by the Client, and no additional adjustment (in this respect) was made to estimate our Base year AADT from the TMS data provided by the Client.

Figure 3-7: TVC-TMS Comparison: KM46 Gadpuri & KM164 Mahuvan



Source: Steer analysis

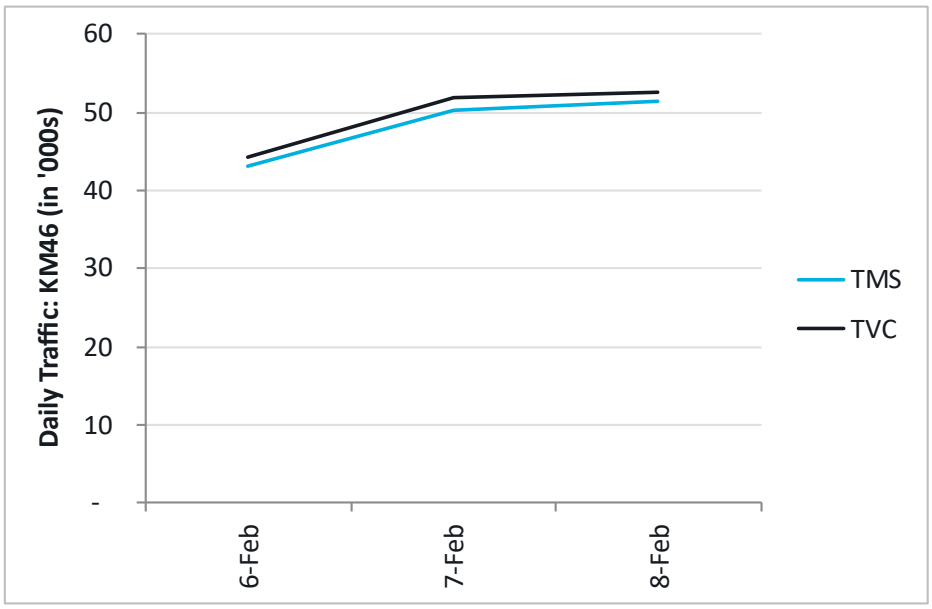
3.29 Additionally, the difference between the TMS and TVC data at a total traffic level, as well as for commercial traffic volumes alone was well within our accepted levels of variation. We have thus relied on the TMS data for additional study without any adjustments.

TVC-TMS analysis

3.30 Figure 3-8 and Figure 3-9 below present our analysis of the TVC data sourced via independent primary surveys and the TMS data provided by the Client over the same data collection period/days i.e., 6th February 2025 to 8th February 2025. We used our TVC data to validate the toll plaza data for the same days as supplied by the Client via their toll management system (TMS). This TMS data was then used as the base data, for our forecasting model.

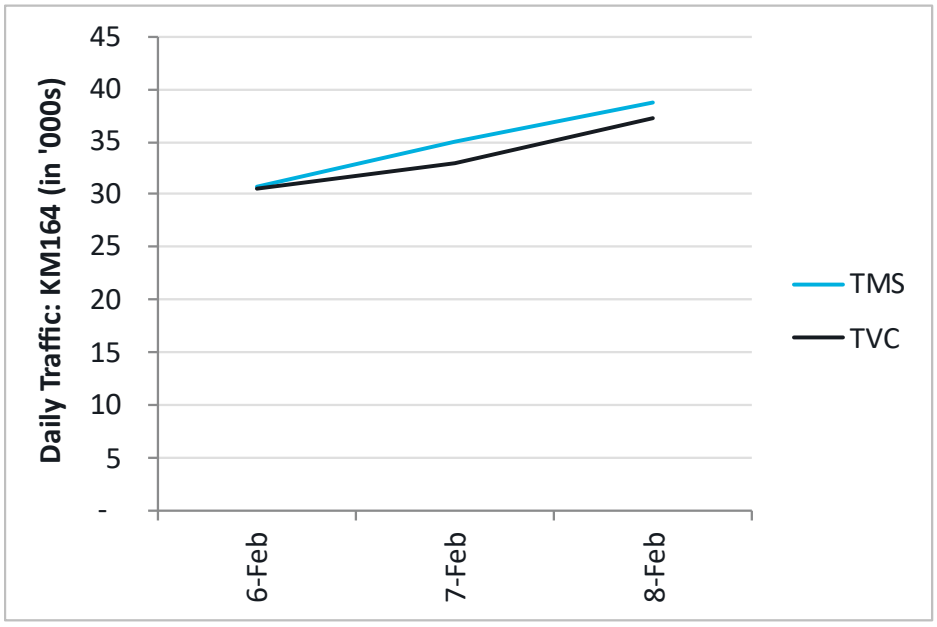
3.31 The graphs show the comparison of TMS and TVC calculated Average Daily Traffic (ADT) levels at two of the plazas on which the surveys were conducted i.e., KM46 (Gadpuri) and KM164 (Mahuvan). The TMS data from the Client's operational systems at both plazas closely aligns with our third-party TVC data for the same days, showing a difference of 2.8% at Gadpuri and (3.6%) at Mahuvan toll plaza. This comparison provides confidence in the TMS data for forecasting purposes and ensures that the data being used to estimate the Base year AADT (and subsequent forecasts of traffic and revenue from that Base) is accurate and reflective of actual plaza volumes.

Figure 3-8: Daily TVC and TMS traffic comparison on KM46



Source: Steer analysis

Figure 3-9: Daily TVC and TMS traffic comparison on K164



Source: Steer analysis

WADT estimates

3.32 Taking a simple average of the three-day TVC count data, we obtained the weekly average daily traffic (WADT) for each of the two toll plazas (KM46 and KM164). This WADT excludes non-tollable vehicles such as tractors, two-wheelers, bullock-carts, etc., but includes officially exempt vehicles such as police cars, ambulances, emergency response vehicles, and government vehicles.

3.33 As presented in Table 3.13 below, CJVs and Mini LCVs constitute the highest WADT at the Gadpuri toll plaza (KM46) with a combined value of 40,893. LCVs and MAVs follow with

3,934 and 1,577 WADT, respectively. The Mahuvan toll plaza (KM164) exhibits a comparable trend, where CJVs have the highest WADT (16,962), succeeded by MAVs (4,519 WADT) and Mini LCVs (1,872 WADT).

Table 3.13: WADT at KM46 (Gadpuri) and KM164 (Mahuvan)

Toll Plaza	CJV	Mini LCV	LCV	Bus	2 Axle	3 Axle	MAV	OSV	Total WADT	Total PCU
KM46 (Gadpuri)	37,374	3,519	3,934	1,377	1,034	747	1,577	14	**49,576**	**61,663**
KM164 (Mahuvan)	16,962	1,872	3,154	1,388	3,502	2,216	4,519	3	**33,617**	**60,177**

Source: Steer analysis of TVC data

3.34 Figure 3-10 below compares the outputs of the TMS and TVC data analysis in terms of traffic volume shares by vehicle type. As evidenced from the plot below, as well as the analysis outputs presented above, we believe our estimation of the base year traffic from the TMS data is reasonably accurate and reflective of true volumes observed on the Asset. The overall good fit of the data at a WADT level and minimal variation between the TVC and TMS data for the largest revenue generator (3A and MAV) suggests that the Client TMS data is robust and reflect actual operational volumes currently appearing on the Asset.

Figure 3-10: Comparison between vehicle shares from TVC and TMS WADTs

Key findings of origin-destination analysis

Overview

3.35 Origin-destination (OD) analysis enables us to understand the nature of traffic movement on the Asset. The OD analysis presented here is based on data collected on behalf of the Client in February 2025. OD surveys were conducted at two of the toll plazas on the Asset i.e., at KM46 (Gadpuri), and at KM164 (Mahuvan) owing to the difference in traffic trends and movements observed at both these plazas. Given the similarity in traffic profiles observed at KM94 and KM164, no additional OD survey was commissioned for KM94. The

OD data collected as part of this study was analysed to derive the following key insights regarding the nature and profile of traffic plying the Asset:

- Zonal influence
- Commodity distribution
- Top OD pairs
- Trip length distribution

3.36 While zonal analysis and the list of top OD pairs help us to understand 'where' people and goods travel, commodity distribution sheds light on 'what' goods get transported. Trip length distribution show 'how far' vehicles and people travel, and goods get transported. This set of analyses is generally used to estimate the key drivers of traffic and to inform our key forecasting assumptions around traffic demand elasticities, growth drivers, and other exogenous factors that may impact future traffic growth on the Asset.

Sample rates

3.37 Sample rates help understand the reliability of OD data. They are calculated by dividing OD sample counts from the OD surveys by traffic counts (based on the TVC data) over the survey period. Table 3.14 below presents the sample rates for key vehicle categories at both the Asset toll plazas.

3.38 Sample rates at toll plazas are typically low for passenger vehicles due to shorter stoppage durations and reduced response times following the implementation of FASTag in FY22. On the contrary, sample rates for commercial vehicles are higher. Our acceptable thresholds for passenger vehicles are typically a minimum of 20-25%, while for commercial vehicles, the threshold is 60%.

3.39 Table 3.14 below presents the sample rates recorded at KM46 Gadpuri and KM194 Mahuvan for both passenger and commercial vehicles.

Table 3.14: Sample rates for OD data

Vehicle type	KM46 Gadpuri	KM164 Mahuvan
Passenger	24.5%	17.4%
Goods (2A+3A+MAV)	73.8%	43.1%

Source: Steer analysis of OD data

Zone categories

3.40 To facilitate better interpretation of key regional drivers of traffic as determined by their OD zones, and influenced by various towns, cities, states and regions in the vicinity of the Asset, we have aggregated zonal data as described in Table 3.15 below. The methodology applied to aggregate zones vary based on the characteristics of different Assets.

Table 3.15: Zone aggregations for zonal influence analysis

Aggregate Zone	Description
Local	Local zones are those that fall on or very close to the Asset.
Immediate area of influence (IAOI)	IAOI zones are the locations which generate traffic and lie within approximately 75-150 KM distance from the Asset.
Rest of State	Rest of the cities/Districts in the state that Asset lies in (other than Local/IAOI)

Aggregate Zone	Description
Central NCR	Delhi, Gurgaon, Noida.
Rest of Haryana	Haryana
North India	Uttarakhand, Jammu & Kashmir, Himachal Pradesh
Madhya Pradesh	Madhya Pradesh
Rajasthan	Rajasthan
Punjab	Punjab
Uttarakhand	Uttarakhand
Gujarat	Gujarat
East and Northeast India	West Bengal, Orissa and Northeast Indian states
South India	Andhra Pradesh, Tamil Nadu, Karnataka, Kerala, Maharashtra, Goa

Source: Steer analysis

Zonal influence

3.41 Zonal influence measures the contribution of a zone or zonal aggregation/region to traffic volumes plying on the Asset, by vehicle type[15]. This section presents the zonal influence[16] of different zones (as described in Table 3.15 above) at both the toll plazas where OD surveys were conducted in February 2025 i.e., KM46 (Gadpuri) and KM164 (Mahuvan). Figure 3-11 and Figure 3-12 below present the zonal influence of different zones on traffic volumes of each vehicle category that cross both the toll plazas.

3.42 At Gadpuri, regions in 'North India' hold the highest share across all vehicle categories, with local and IAOI zones also holding high shares (34% for 3A/MAVs). On the other hand, at Mahuvan, IOAI and Local influence decreases with an increase in vehicle size (66% for CJVs and 22% for MAVs)

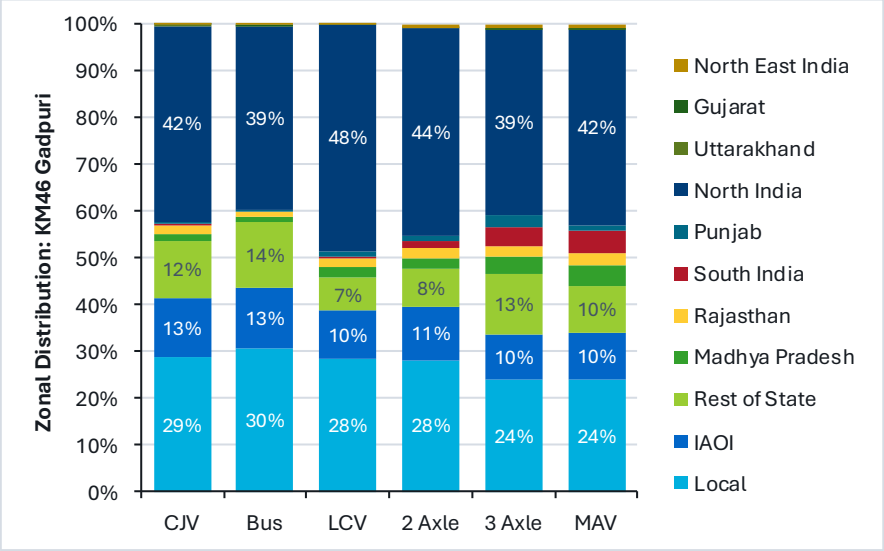
3.43 For inter-urban corridors, only smaller vehicles (CJVs and LCVs) see a higher share of local trips compared to trucks. However, since we see industrial zones located on the Asset itself, the influence of zones located in immediate regions (inclusive of parts of all three regions) is high even for heavy trucks like MAVs, which range from 38% at KM164 to 44% at KM46.

3.44 'Local' trips on the Asset are mainly destined towards or originating from areas within a 20 km radius of the Asset, including locations such as Runakta, Sikandra, Mathura (all in Uttar Pradesh and Ballabhgarh (in Haryana). Apart from regions within the state, share of commercial vehicle trips to and from North India have a major influence on traffic plying on the Asset – the share for 3A/MAVs being 39-44% at Gadpuri and 27-30% at Mahuvan.

[15] Zonal influence is analysed on trip ends and not trips.

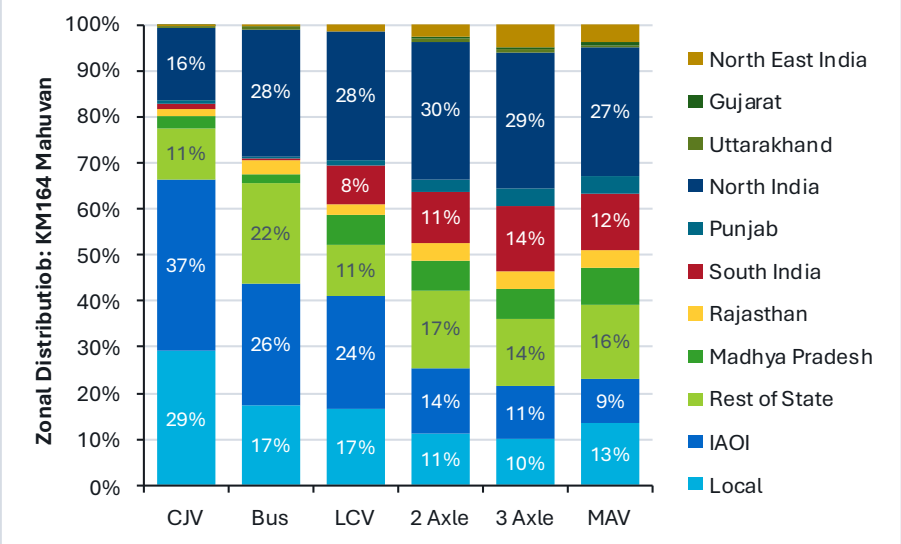
[16] For example, if out of 100 trips at a toll plaza on an Asset, 10 trips are between Hyderabad and Delhi and 90 trips are between Hyderabad and Chennai, then zonal influence of Hyderabad is 50% since one trip end of all trips are at Hyderabad. Likewise, zonal influence of Delhi and Chennai would be 5% and 45%, respectively.

Figure 3-11: Zonal influence, KM46 Gadpuri



Source: Steer analysis of OD data

Figure 3-12: Zonal influence, KM164 Mahuvan



Source: Steer analysis of OD data

Internal External analysis

3.45 Internal-External analysis helps in identifying the trips which either have both the origin and destination within the regions close to the Asset, or any only one end in the region, or if it is through-traffic (i.e., with both trip ends outside the immediate region of the Asset), that travel medium to long distances across the country.

3.46 Figure 3-13 and Figure 3-14 below present the outputs of the Internal-External analysis conducted on the latest OD survey data at both the Asset toll plazas i.e., KM46 (Gadpuri) and KM164 (Mahuvan). The plots help provide additional insight into the trip patterns of different vehicle types observed on the Asset.

Figure 3-13: Internal-external distribution, KM46 Gadpuri

	Internal	Rest of State	External
External	10%	6%	1%
Rest of State	12%	6%	3%
Internal	40%	14%	7%

Source: Steer analysis of OD data

Figure 3-14: Internal-external distribution, KM164 Mahuvan

	Internal	Rest of State	External
External	13%	14%	8%
Rest of State	9%	8%	15%
Internal	9%	13%	11%

Source: Steer analysis of OD data

3.47 Figure 3-14 and Figure 3-15 above show that the influence of local and IAOI zones for MAVs reduces on the Asset, from the northern to the southern toll plazas. The external-external influence is lower at KM46 (1%), while it has the higher (40%) share of I-I trips.

3.48 This difference in trip patterns of MAVs crossing either of the toll plazas is due to their relative locations along the Asset alignment. The KM46 plaza lies at the southern end of the NCR which is a major industrial and manufacturing region (with hubs such as Ballabhgarh, Okhla and Manesar), as well as being a large consumption centre. Thus, a large proportion of "Internal- Internal" MAV trips at this plaza are those between different

industrial units across NCR as well as the traffic between industries and consumption centres in the region.

3.49 In contrast to Gadpuri, the E-E and I-I shares at KM164 (Mahuvan) are 8% and 9% respectively. KM164 lies closer to Agra and further away from Delhi resulting in a lower share of local trips for MAVs, as there are less industrial clusters in this region, and most traffic observed in this area will be medium-long distance traffic originating and destined for locations far away from where the plaza is located

Commodity distribution

3.50 For the commodity distribution analysis, we grouped various commodities into aggregate categories for ease of interpretation, as shown in Table 3.16 below. The charts in the following sub-section present information in terms of aggregate commodity categories.

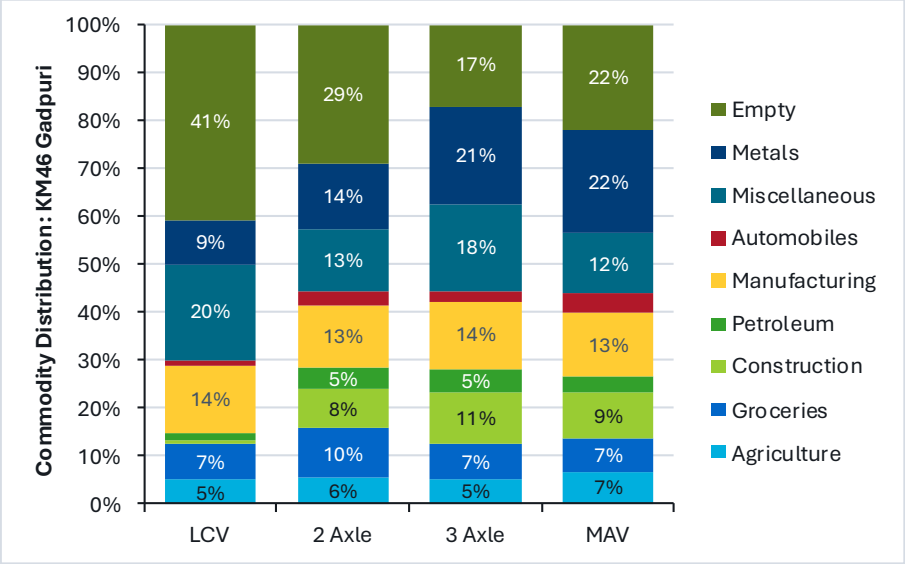
Table 3.16: Aggregate commodity categories

Commodity Description	Code	Combined codes used for charts
Agriculture Products / Cash crops (Wheat, Rice, Sugar cane, Maize etc.)	AGR	AGR
Cattle Food / Live Stock (sheep, goat, cow, cattle food etc)	LIV	
Perishable Items (Fruits, vegetables)	PER	GRO
Animal Products/Dairy/Eggs/Fish/Meat/Animals	DFM	
Groceries / Food items (Soap, Salt, Sugar, Pulses, Spices, Biscuits, bread, cold drinks, beer etc.)	GRO	
Building Material / Construction (Cement, Lime, Brick, fly ash, etc)	CNS	CNS
Sand/Clay	SND	
Stone (kota stone, marble, Granite, Aggregate stone etc.)	STN	
Mining Minerals (Coal, Gypsum, Cobalt etc.)	MIN	
Ceramic	CRM	
Petroleum Products (Oil, LPG, CNG, etc.)	PET	PET
Chemicals / Fertilizers (Acids, Fertilizers etc.)	CHM	
Electrical/Manufacturing items (Electronic items, Medicine, Leather, Wine, Rubber/ Tyre, Plastics, Cloth, Paper etc.)	MAN	MAN
Raw Wood, Cork & Wood Products, Furn	WUD	
Automobiles (Finished products, auto parts, Car/bike manufacturing, New Chassis)	AUT	AUT
Basic / Fabricated Metals (Iron, Steel / Metal)	MET	MET
Machinery / Spare parts	MAC	
Empty	EMT	EMT
Container	CTR	MSC
Miscellaneous (Parcel, Courier, House hold items etc.)	MSC	
Passengers	PAS	
Scrap	SCR	

Source: Steer analysis

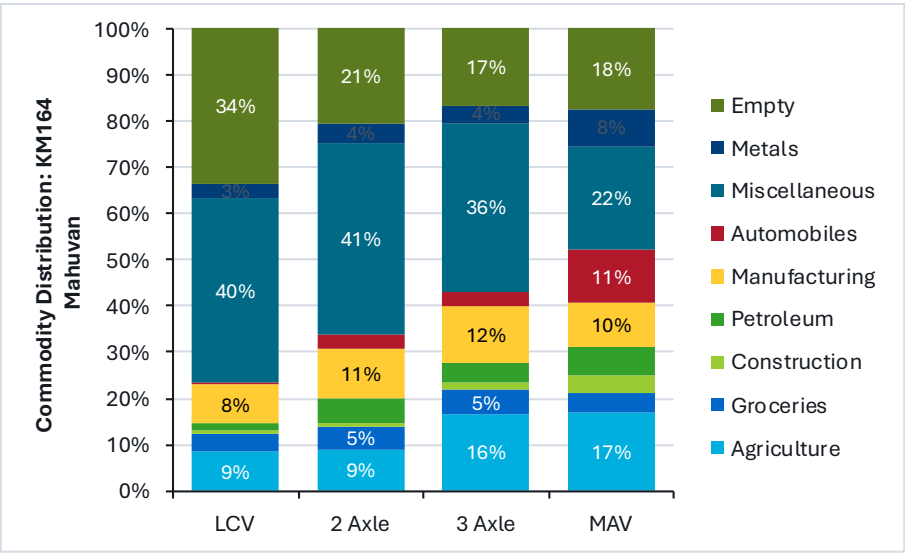
3.51 Figure 3-15 and Figure 3-16 below present the commodity distribution for goods vehicles at both the toll plazas where the OD surveys were conducted. Analysis of the commodity distribution at both toll plazas reveals that agricultural items, groceries, manufactured products, miscellaneous goods (including parcels), and metals represent the predominant categories. These commodity groups collectively account for approximately 62% and 61% of the traffic volume for 3-Axle vehicles (3A) and Multi-Axle Vehicles (MAV) at the Gadpuri toll plaza, and approximately 74.5% and 61.1% for 3As and MAVs at the Mahuvan toll plaza, respectively.

Figure 3-15: Commodity distribution, KM46 Gadpuri



Source: Steer analysis of OD data

Figure 3-16: Commodity distribution, KM164 Mahuvan



Source: Steer analysis of OD data

3.52 Agricultural commodities (such as onions, potatoes and rice), manufactured items (such as plastic, electronics and medicines), metals (iron and steel) and groceries have the highest share in terms of commodity distribution at both toll plazas. At KM46 Gadpuri, these categories have a combined share of 47% for 3A and 49% for MAVs, while at KM164 Mahuvan, these shares are found to be 39% for both 3A/MAVs.

3.53 The share of empty vehicles is higher for LCVs and lower for 2A/3A/MAVs. Amongst 2A/3A/MAVs, the range of empty vehicle share is 22-29% at KM46 (Gadpuri), while at KM164 (Mahuvan) this range is observed to be 18-21%. This is expected as more local truck movements at KM46 results in them making more trips for loading and unloading at warehouses.

3.54 Miscellaneous commodities (which include couriers and parcels) are observed to have a share of 12-20% across all goods vehicle categories at KM46 (Gadpuri). This share is much higher at KM164 (Mahuvan), where 35-40% of LCV/2A/3As are observed to carry miscellaneous goods.

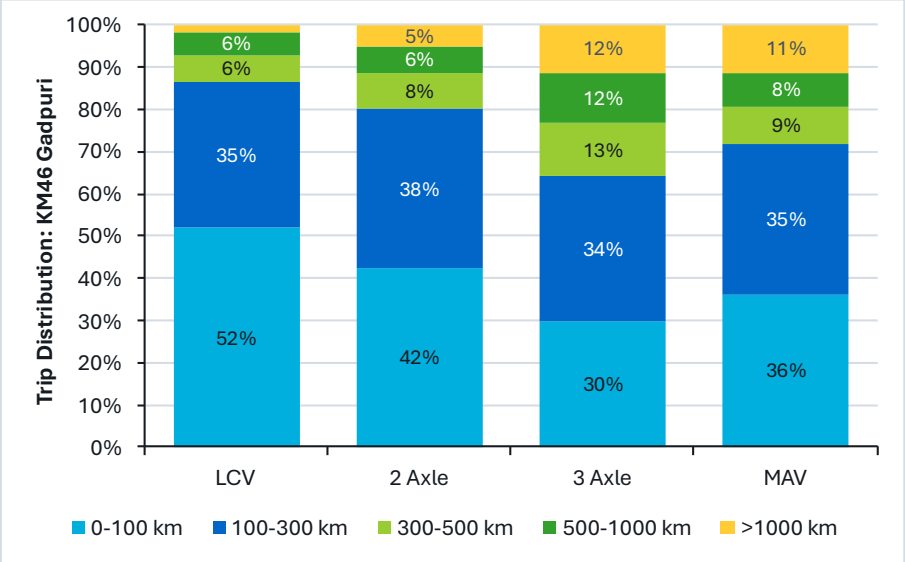
Trip length analysis

3.55 Trip-length distribution provides distance-based profiles of each vehicle category crossing either of the toll plazas. This insight, in addition to explaining trip patterns of traffic plying the Asset, also helps to validate our assumed macroeconomic drivers of traffic, outputs from the zonal influence analysis, and each plaza's toll segmentation trends.

3.56 Figure 3-17 and Figure 3-18 below present the outputs of the trip length analysis performed on the OD survey data from both the plazas. Each plot shows the distribution of total trips (by each vehicle category) across different trip distances. For ease of interpretation, we have categorised distances into five groups – local (0-100KM), short-distance (100-300 KM), medium-distance (300-500 KM), long-distance (500-1000 KM) and very-long-distance (+1,000 KM). The trip distances were derived as driving distances from Google Distance Matrix Tool and is based on the zonal coordinates of each OD pair recorded during the OD surveys[17].

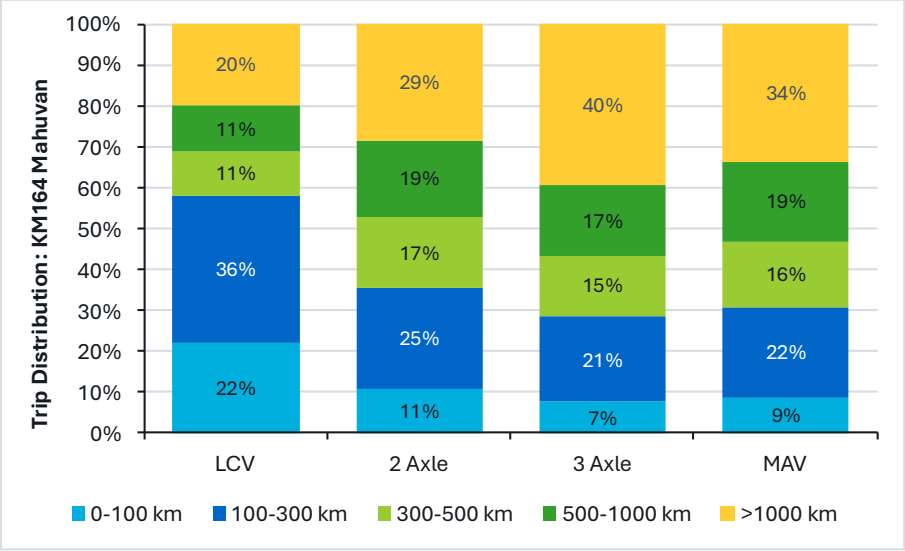
[17] Google Distance API is a tool that is available on a chargeable basis from Google Maps Platform. Link: **https://developers.google.com/maps/documentation/distance-matrix/start**. Travel distance and time information for driving/transit under various congestion scenarios can be extracted through this tool by using macro-enabled Excel, R, etc.

Figure 3-17: Trip length distribution, KM46 Gadpuri



Source: Steer analysis of OD data

Figure 3-18: Trip length distribution, KM164 Mahuvan



Source: Steer analysis of OD data

3.57 As discussed in the previous sections, KM46 (Gadpuri) and KM164 (Mahuvan) have distinct distributions of trip lengths by each vehicle category. As shown in Figure 3-17 above, KM46 (Gadpuri) observes a high share (64-77%) of trips below 300km in distance, across all goods vehicle categories. This is due to its proximity to the densely-populated NCR area, facilitating more local and IAOI movement.

3.58 In contrast, the trip distribution analysis at KM164 (Mahuvan) reflects more of its long-distance nature of traffic as observed at the toll plaza; 40% of 3As and 34% of MAVs crossing the plaza make trips more than 1000km in length, validating our observations from the zonal distribution and internal-external analyses. As we move from north to south along the Asset, the influence of states such as Madhya Pradesh, Rajasthan and regions in South India (Bengaluru, Hyderabad, Chennai) increases.

Conclusions

3.59 The Asset is a 179.5 km toll road between Delhi and Agra which has historically been a part of NH44, which is a major National Highway facilitating north-south movement. It is also the longest national highway in the country.

3.60 The Asset consists of three toll plazas – KM46 (Gadpuri), KM94 (Karman) and KM164 (Mahuvan). KM46 and KM94 started operations in July 2022, while KM164 has been operational since FY13. In terms of total AADT, the growth rates at the plazas in FY26YTD compared to FY25 is 3.8%, 8.1% and 9.0% respectively. When considering the total PCUs, the plazas have grown at 1.9%, 5.2% and 4.9% respectively over the same period in FY25.

3.61 KM46 has observed muted growth overall and in PCU terms largely due to the impact of the DME as well as the DND KMP Flyway packages 2 and 3 that become operational in February 2023 and November 2024 resulting in decline in commercial vehicles originating from the industrial clusters of Faridabad and other parts of the NCT of Delhi, that previously crossed KM46. In contrast KM94 and KM164 have exhibited strong growth over FY25 levels despite the loss of long-distance traffic volumes due to partial commissioning of Delhi-Mumbai expressway, upgrade of Aligarh Kanpur (NH34) and through traffic previously coming from KM46 as these two plazas have always observed more long-distance traffic and also observe traffic that never crosses KM46 i.e., traffic that originates further north of Delhi, bypasses it using the EPE or WPE/KMP (including KM46) but then connects with the Asset at Palwal to continue on their journey's southbound or eastbound from Delhi.

3.62 The TVCs conducted by Steer in February 2025, at KM46 (Gadpuri) and KM164 (Mahuvan) toll plazas found that at the total level, TMS counts were 2.8% lower than TVC counts at KM46, and 3.6% higher than TVC counts at KM164. Although the difference between the TMS and TVC counts is slightly higher at KM164 than evaluated at KM46, the magnitude of variation may arise due to etc reconciliation as volume of traffic is quite high, allowing us to validate the TMS data with the independent TVC data collected as part of this study.

3.63 The OD analysis conducted by Steer in February 2025 found that KM46 (Gadpuri) exhibits a higher share of local trips compared to KM164 (Mahuvan) – expected given KM46's closer proximity to Delhi NCR and other nearby urban and commercial clusters relative to KM164, which is farther away and though closer to Agra, does not observe similar volumes of locally originating traffic. At both the plazas, a high share of local and IAOI trips were observed for both passenger and commercial vehicles due to the presence of urban clusters such as Agra, Mathura, Palwal, Ballabhgarh, Faridabad

3.64 An analysis of commodity distribution at Gadpuri and Mahuvan reveals that in terms of 3A/MAVs, the key commodities transported on the Asset include leather & textiles, manufactured items, fabricated metal sheets (as discussed above in 2.11), - which combined make up around 40-50% of the commodity share at both plazas, for 3A/MAVs .

3.65 When considering the internal-external analyses for MAVs at both the plazas, KM164 (Mahuvan) was found to have a greater share of External-External trips (8%) compared to KM46 Gadpuri (1%). KM46, due to its proximity to Delhi, also observes 40% of MAV trips with both ends within an internal region. The trip length analysis supports these findings, with MAVs at KM46 having a large share (71%) of trips below 300km in length, while 53% of MAV trips at KM164 are more than 500km in length.

4 Socioeconomic context and traffic growth

Introduction

4.1 The growth of traffic on existing (brownfield) roads depends on, firstly, how fast the background travel demand grows (background growth); and secondly, how successful the Asset is in attracting that traffic (traffic capture). Background travel demand is driven by the socio-economic conditions in the regions where the Asset is located and the country as a whole. These include:

1. Changes in factors such as population, economic growth (regional and national) and industrial production; and
2. Other local factors such as strategic port growth, and growth in local industries near the Assets.

4.2 In turn, the change in the competitive position of the Asset (and thus of the traffic capture it will achieve) derives from how the service offered and the prices charged on the Asset change in comparison to competing roads; and whether any new competing road facilities are available. In this chapter, we assess the socio-economic indicators relevant to traffic growth on the Asset.

Population growth

National Level

4.3 Table 4.1 below shows that the total population in India has grown at a Compound Annual Growth Rate (CAGR) of 1.5% since 2000, decreasing over the years, as shown in Table 4.1 below. The World Bank forecasts this growth to decrease to 0.6% CAGR by the 2030-45 period.

Table 4.1: CAGR of population in India

Years	CAGR		
	Total Population (m)	Rural Population (m)	Urban Population (m)
1970 - 1985	2.3%	1.9%	3.8%
1985 - 2000	2.0%	1.7%	2.9%
2000 - 2015	1.5%	1.0%	2.6%
2015 – 2030*	1.0%	0.3%	2.3%
2030 – 2045*	0.6%	-0.3%	1.9%

Source: World Bank Data on Health Nutrition and Population Statistics, *forecast population growth

State Level

4.4 Table 4.2 below shows the evolution of population in the states of Uttar Pradesh and Delhi (containing the Asset), compared to that of the country.

4.5 As Table 4.2 shows, the populations of both Uttar Pradesh and Delhi have grown at a faster pace compared to that of India, between FY12 and FY24. As of FY24, Uttar Pradesh holds an 8.1% share in India's population, while Delhi has a 1.5% share.

Table 4.2: Population Growth in Uttar Pradesh, Delhi and India (2012-2024)

State	2012 Population (m)	2024 Population (m)	CAGR (2012 – 2024)
Uttar Pradesh	201.5	237.0	1.4%
Delhi	17.0	21.6	2.0%
India	1,210	1,395	1.2%

Source: Ministry of Statistics and Program Implementation estimates

4.6 Due to the complexities of patterns of urbanisation, and the very dynamic nature of local population migration (which are very difficult to forecast with accuracy), we do not use population growth as a proxy for understanding future travel demand growth on the Asset. It has been included in this section simply to provide the underlying socio-economic context of the state/trends in the regions in which the Asset is located.

Economic Indicators

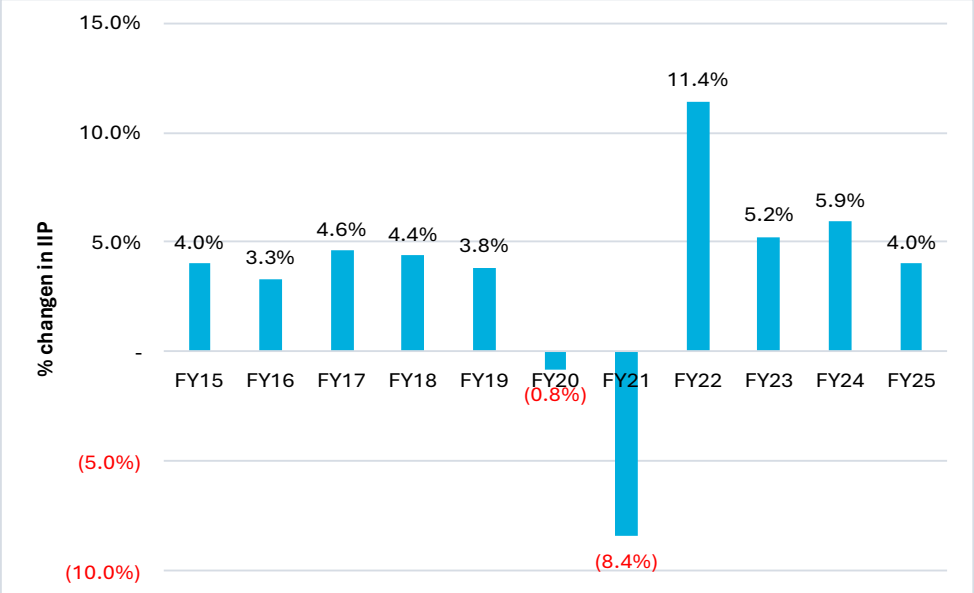
Industrial Production

4.7 The Index of Industrial Production (IIP) is a composite indicator that measures the short-term changes in the volume of production for a basket of industrial products. The IIP data tracks the manufacturing activity in different sectors of an economy, with mining, manufacturing, and electricity being the three broad sectors constituting the IIP.

4.8 Figure 4-1 shows that at an annual level, national IIP was growing at an average of 4% per year over the period FY15-19, before the country underwent a liquidity crisis and experienced an overall economic slowdown in FY20. In the aftermath, IIP shrank by over 8% in FY21 due to a decline in economic activity in the wake of global lockdowns introduced to curb the Covid-19 pandemic. Post the immediate recovery in FY22, IIP growth has since stabilised, with FY25 recording 4% growth over FY24.

4.9 Since state-level IIP data is not as readily available as national level IIP, we have presented national IIP here to indicate nationwide activity in key industrial sectors like power, manufacturing, and mining, all of which influence long-distance commercial movements across the nation, and not unique to this asset. However, we do not use it to forecast future travel demand growth since long-term forecast for IIP is not available through official sources such as MOSPI, RBI or through multilateral organisations like WB, or the IMF.

Figure 4-1: Annual growth – Index of Industrial Production



Source: Steer Analysis of MoSPI data

Vehicle ownership

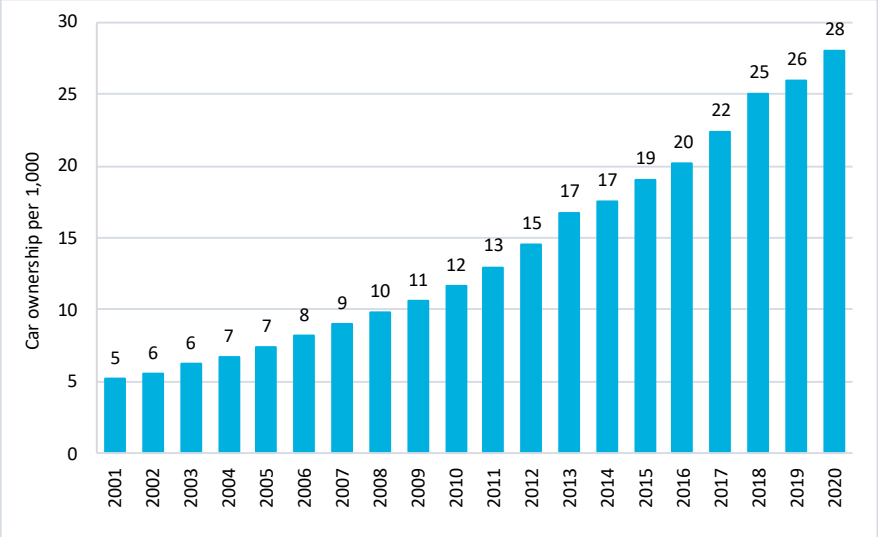
4.10 The gap in car ownership between India and developed nations remains substantial according to recent data. As of 2018, India had approximately 22 cars per 1,000 individuals, a fraction of the 980 cars per 1,000 individuals in the United States[18]. However, this pattern is changing with the increasing per capita income levels. As can be seen in Figure 4-2 below, between 2007-17, number of cars per 1,000 people has more than doubled (from 7 in 2007 to 22 in 2017) and increased at a CAGR of about 11%.

4.11 Overall, India still stands at a very nascent stage in the vehicle saturation curve, offering huge potential for growth going forward. As the income per capita of India and the region itself grow further, we expect car ownership levels to increase. As per the India Energy Outlook (2015), car ownership is projected to grow steeply to 175 cars per 1,000 population by 2040 in India.[19]

[18] **India has 22 cars per 1,000 individuals: Amitabh Kant, Auto News, ET Auto**

[19] **https://www.gita.org.in/Attachments/Reports/IndiaEnergyOutlook_WEO2015.pdf**

Figure 4-2: Car Ownership in India per 1,000 population



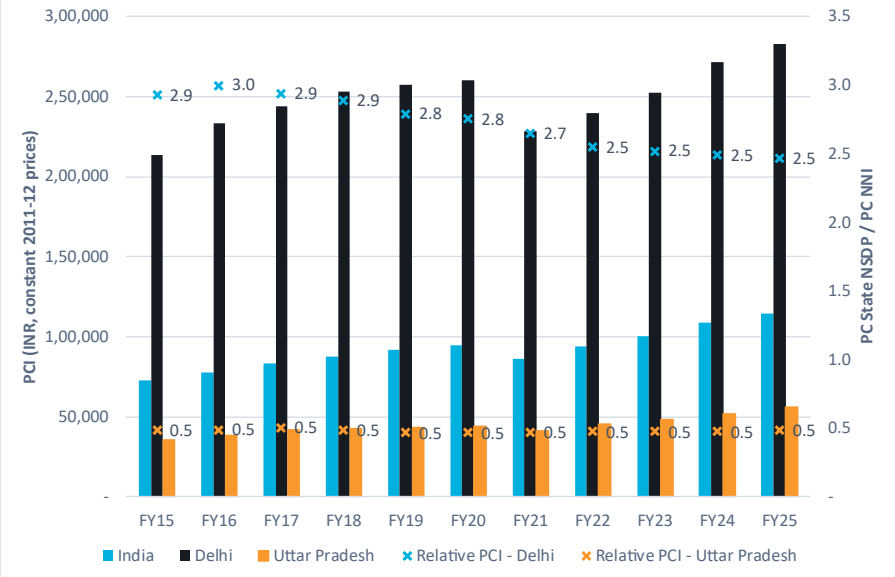
Source: International Energy Agency (IEA)

Per Capita Income (PCI)

4.12 The Asset lies in Uttar Pradesh and Delhi. As shown in Figure 4-3 below, the per capita income of Uttar Pradesh is lower as compared to that of India - it has historically been at roughly 40-50% of the national average since FY15 through present day. On the other hand, the per capita income of Delhi has consistently been higher than that of India – it was 2.5 times higher than the national average, as of FY25.

4.13 Traffic on the Asset is influenced by both Delhi and Uttar Pradesh – specifically, the western region of UP, which has grown at a faster rate than the rest of the state in recent years and is expected to continue this trajectory. The higher per capita income of Delhi and the higher growth in western UP indicates sustained economic growth in the region, driving traffic growth on the Asset over time.

Figure 4-3: Relative Per Capita Income (FY15-FY25)



Source: Steer Analysis of MoSPI data

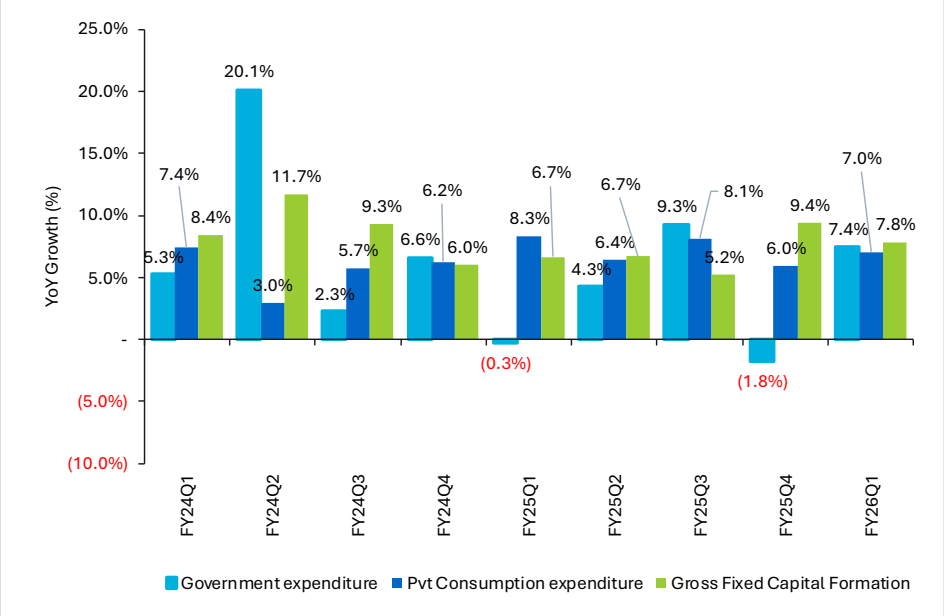
Economic Growth

India's Performance

4.14 Despite a slowdown in the economy during H1FY25, the Indian economy has observed strong growth each quarter since FY25Q2, with the latest published estimates for FY26Q1 GDP at 7.8% over FY25Q1. This performance has been driven by strong growth in investment and consumption expenditures and higher consumer optimism for the year ahead[20].

4.15 In Figure 4-4 below, we present quarterly Y-o-Y growth in three major components of GDP – government expenditures, consumption expenditures, and business investment (gross fixed capital expenditure) over the past two years (FY24-FY26Q1).

Figure 4-4: YoY Growth in Government, Consumption and Business Expenditures



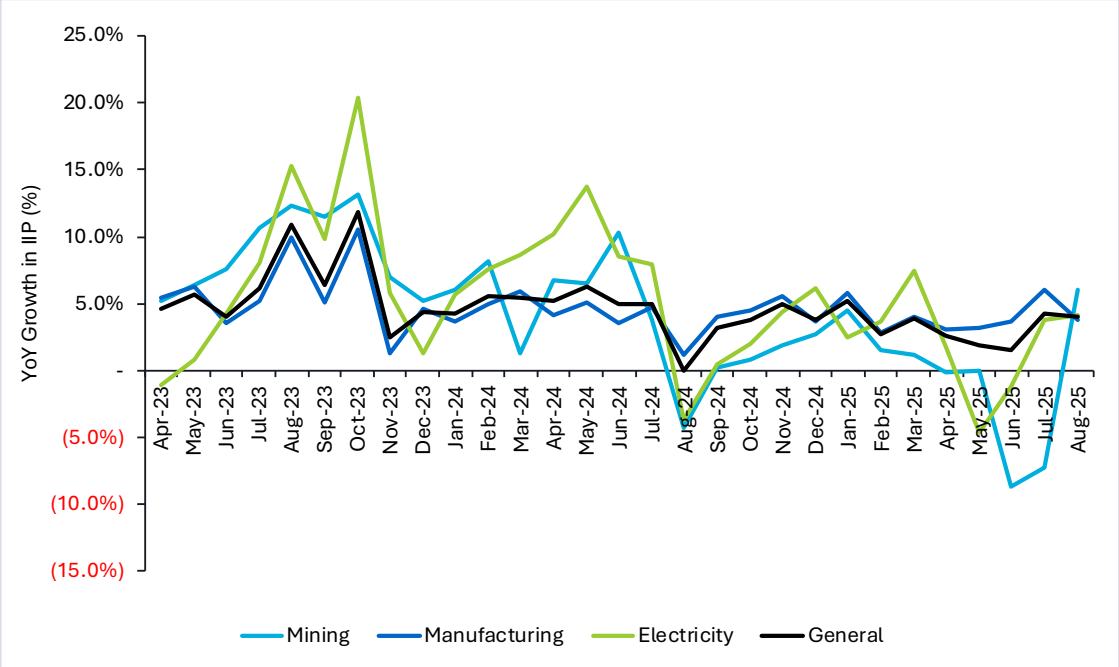
Source: Steer Analysis of MOSPI Data

4.16 While consumption and investment expenditures have continued to show consistent growth over the past two quarters, government expenditures observed a marginal decline in FY25Q4. In FY26Q1, government expenditures rebounded, recording 7.4% growth over FY25Q1 levels.

4.17 Performance across different types of industrial activities (such as Mining, Manufacturing, and Power Generation) directly impact freight movement and commercial traffic volume growth across the country, including on the Asset. In Figure 4-5 below, we present growth trends in IIP – a measure that tracks the performance of the economy across these activities. As of FY26YTD (Apr-Aug '25), the Manufacturing sector continues to perform strongly, recording positive y-o-y growth since FY25Q3. While industrial activity across the two other sectors (i.e., Power Generation and Mining) dropped between May and Jun/Jul '25, they have since rebounded and show signs of continued growth going forward.

[20] Government of India, PIB Release Oct 1 '25

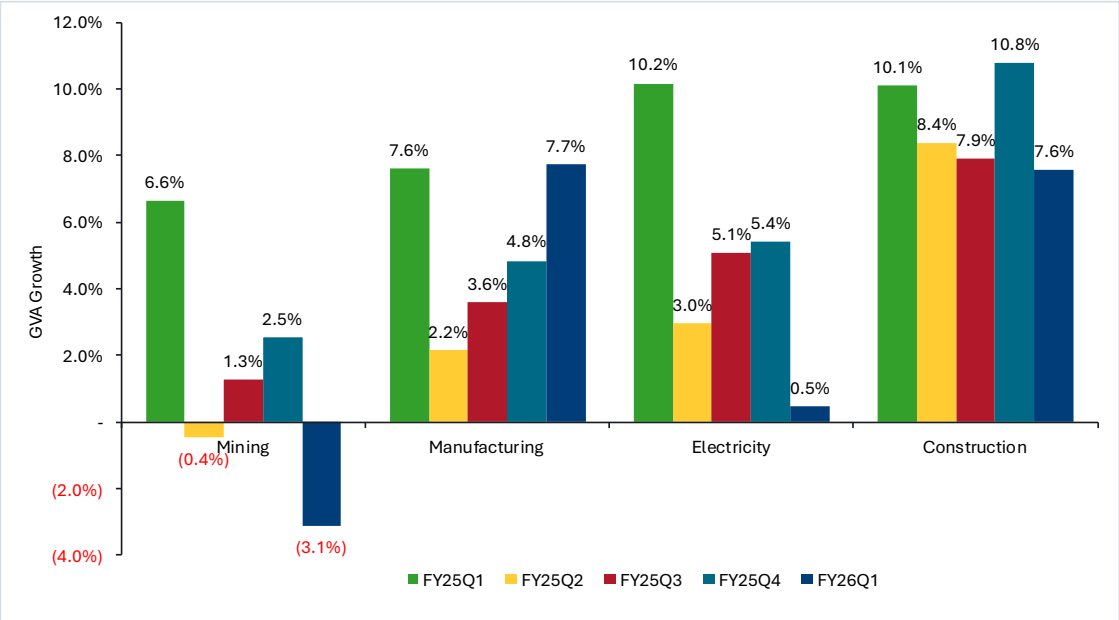
Figure 4-5: Month on Month IIP performance



Source: Steer Analysis of MOSPI Data

4.18 In addition to monthly trends in IIP, Figure 4-6 below presents y-o-y growth of quarterly GVA in four industrial sectors - Mining (& Quarrying), Manufacturing, Electricity (and other Utilities), and Construction. While the Mining and Power sectors observed decline and muted growth in FY26Q1, the Manufacturing and Construction sectors experienced strong growth. Generally, economic growth has remained resilient as of FY26YTD, but performance across industries have varied, impacting economic growth across different regions and on the Asset as well.

Figure 4-6: Industrial components of GVA



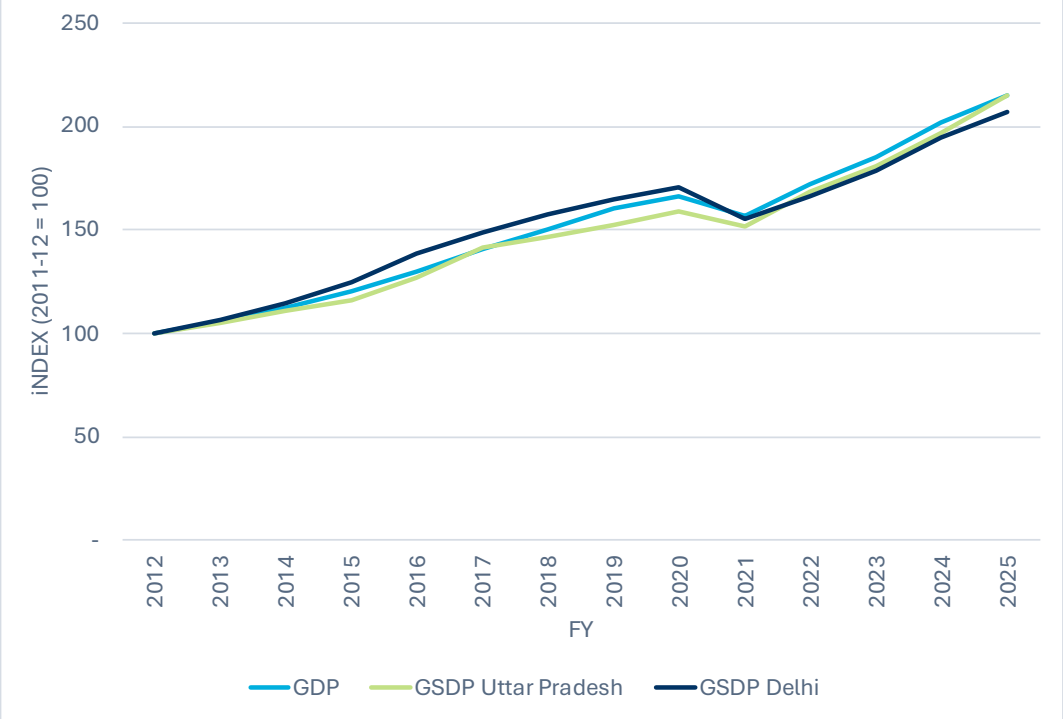
Source: Steer Analysis of MOSPI Data

GDP and GSDP Growth

4.19 Figure 4-7 below presents historical growth in Delhi and Uttar Pradesh GSDP, and the GDP of India. Between the period of FY12 and FY25, the Indian economy grew at a CAGR of 6.1% per year – aided by strong growth in the services/tertiary sector, which grew at a CAGR of 6.9%per year over the same period. UP GSDP and Delhi GSDP grew at 6.1% and 5.8% per year (respectively) between FY12 and FY25 – in step with the national economy.

4.20 As shown in Table 4.2 above, Delhi and UP respectively accounted for 1.5% and 17% of national population in FY24. In terms of national economic contribution, Delhi and Uttar Pradesh contributed approximately 4% and 8% respectively to India's GDP in FY24. Therefore, Delhi's per capita GDP contribution in FY24 far exceeded the same for UP statewide, highlighting the importance of the region in driving consumption demand and regional traffic growth near the Asset.

Figure 4-7: Evolution of Delhi's and Uttar Pradesh's state GDP and national GDP



Source: Steer Analysis of MoSPI data

Economic activity in the state

Uttar Pradesh

4.21 Uttar Pradesh is the most populous state in India with a population of ~237 million people (as of FY24). The state has a large pool of skilled, semi-skilled and unskilled labour. A shown in Figure 4-8 below, the tertiary sector has the highest sectoral contribution (49%) to the state GSVA followed by the secondary (28%) and primary (23%) sectors, as of FY25.

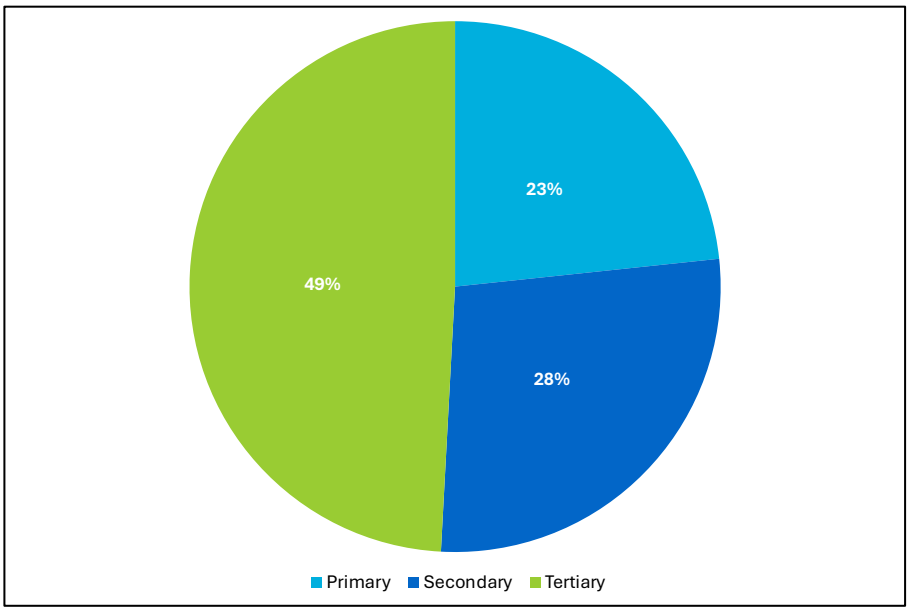
4.22 Uttar Pradesh is considered one of the primary tourist destinations in India, with key tourist attractions being Agra, Varanasi, Mathura and Prayagraj. The state recorded a

tourist footfall of 64.9 crore in 2024, a significant increase of over 17 crore compared to 2023, as per Union Ministry of Tourism[21]

4.23 In terms of secondary sector, the state has key industrial areas in Khurja (Ceramic); Moradabad (Metals); Meerut, Bareilly, Mirzapur and Lucknow (Handloom & Handicrafts); and Kanpur and Noida (Leather and tannery). The state also has an oil refinery in Mathura, operated by the Indian Oil Corporation (IOCL).

4.24 Uttar Pradesh has very fertile Gangetic land with a large share of population dependent upon agriculture for the livelihood. The state is mainly known for production of wheat, sugarcane, potato and mango. As of FY25, the state contributes approximately 13% to India's GVA in terms of the 'Agriculture, forestry and fishing' sub-sector

Figure 4-8: Sectoral contribution to Uttar Pradesh's GSDP as of FY25



Source: Steer Analysis of MoSPI data

Western UP vs UP GSDP Growth

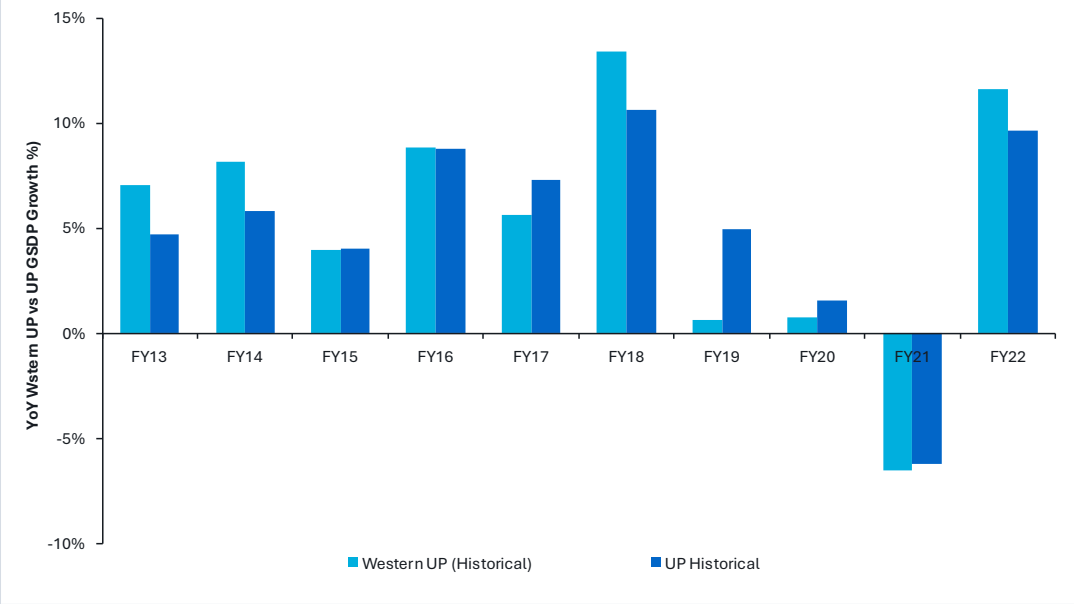
4.25 Since FY13, growth of Western UP GSDP[22] has remained relatively stable, and in line with UP statewide GSDP growth. In Figure 4-9 below, we see that between FY13 and FY22, GSDP growth in Western UP exceeded that of UP overall in 5 of the 10 years (FY13, FY14, FY18, FY21 and FY22), was consistent with UP in 2 of the 10 years (FY15 and FY16), and was below UP GSDP growth in 3 of the 10 years (FY17, FY19 and FY20). While UP statewide growth is largely influenced by Western UP, in recent years (FY21-22), Western UP GSDP has exhibited growth more sensitive than statewide trends.[23]

[21] **up-sees-65-crore-tourists-in-2024-over-17-crore-more-from-2023**

[22] The Western UP region consists of 30 districts, prominent among which are Ghaziabad, Gautam Budh Nagar, Agra, Meerut, Mathura and Bareilly. Historically, this collective region has been the more economically developed part of Uttar Pradesh, and as of FY22 accounted for half of the statewide total GSDP.

[23] Steer analysis of data sourced from the Directorate of Economics and Statistics, Uttar Pradesh (**UPDES website**)

Figure 4-9: Western UP vs UP GSDP Growth



Source: Directorate of Economics and Statistics, Uttar Pradesh

4.26 This can be explained due to a combination of policy- and market-driven factors which have contributed to higher growth in the Western region of the state in recent years. Some of these major developments pertaining to large-scale infrastructure investments in the region include:

- Delhi – Meerut Expressway[24]
- Ganga Expressway [25]
- Noida International Airport (Jewar Airport) [26]
- Logistics hub in Agra, by the Agra Development Authority [27]
- 'New Noida' initiative by the Uttar Pradesh government [28]

4.27 Between FY12–FY25, the GSDP of Uttar Pradesh grew at a CAGR of 6.1% per year. Over the same period, national GDP grew at 6.1%[29] per year, implying that the long-term elasticity factor of UP GSDP growth to national GDP growth is roughly 1. In this context, since Western UP has exhibited more elastic growth relative to UP state overall in recent years, and expectations of strong near-term growth in the Western UP region remain, we have assumed the near-term growth forecast for Western UP to be similarly elastic to

[24] https://timesofindia.indiatimes.com/city/meerut/gadkari-lays-foundation-of-highway-projects-worth-rs-11595-crore-in-west-up/articleshow/68086587.cms

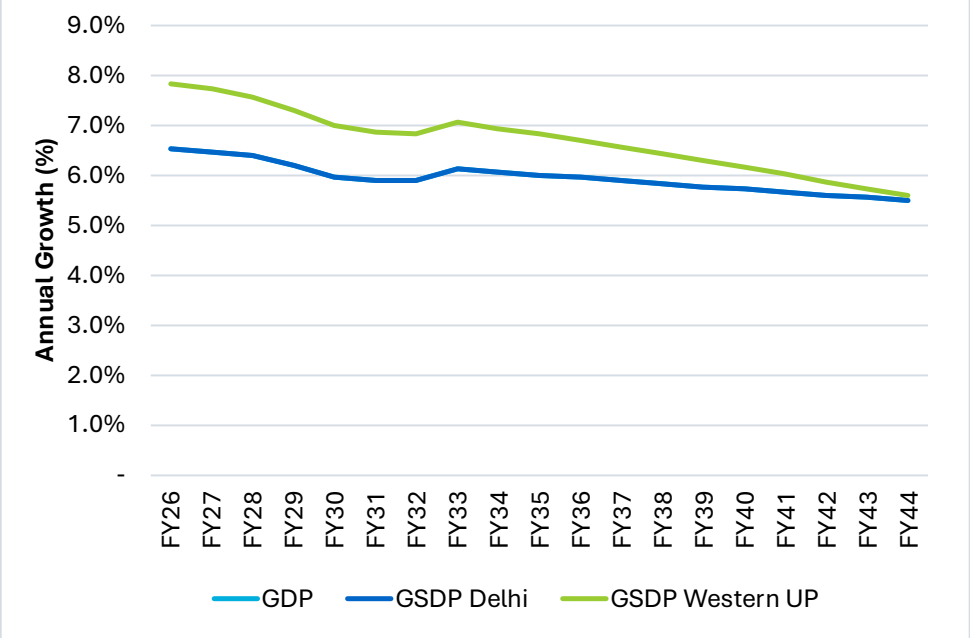
India's GDP growth forecast (as it has been with respect to UP statewide GSDP growth in recent years).

4.28 Figure 4-10 below presents the Client-provided forecasts of national (India) GDP growth from FY26 to FY44, and our assumed GSDP forecast for Western Uttar Pradesh over the same period. In the short term, we have assumed GSDP of Western UP to grow at 1.2 times that of national GDP growth forecast, eventually tapering down to a factor of 1.00 over time as it converges to the national growth rate forecast by FY44.

Figure 4-10: GSDP Western UP vs GDP India Forecast



Source: Steer Analysis

Delhi

4.29 Delhi, the capital city of India, is one of the largest metropolises in the country. In terms of the GSVA composition of Delhi, as shown in Figure 4-11, the tertiary sector has the highest share (86%) followed by the secondary sector (13%) as of FY25.

4.30 The biggest contributors to the tertiary sector in Delhi are tourism, trade, financial services and real estate. Owing to its location, connectivity and rich cultural history, Delhi has always been a prime tourist attraction of the country with key tourist places being India Gate, Lotus Temple, Humayun's Tomb and Akshardham. The Indira Gandhi International Airport of Delhi serves both domestic and international passengers and as of 2024, it was the tenth-busiest airport in the world[30], catering to approximately 72.2 million passengers.

4.31 In terms of secondary sector, the region has key industrial clusters at Narela, Naraina, Okhla and Mayapuri. The primary/agricultural sector accounts for a small share of Delhi's GSVA.

Forecasts for growth drivers

4.32 Following the discussion in Chapter 4 on the nature of economic activity in the state of Western Uttar Pradesh and in Delhi, in this section, we describe the assumptions in relation to forecasts of the key macro-economic drivers of traffic growth on the Asset.

4.33 We have based our forecasts of the GSDPs for Western Uttar Pradesh and Delhi based on the forecasts of the GDP of India as provided by the client.

National GDP

4.34 After the last period of economic slowdown in FY11-12, the country experienced an economic downturn again in late FY19 with FY20 having reported a GDP growth of 4% (relative to an average growth rate of 7% per year between FY13 and FY19). India's GDP growth declined as domestic investment and consumption demand were already under stress because of the liquidity crunch before Covid-19. Other factors that contributed to the economic slowdown included reduced growth rates in automobile sales and production, liquidity crunch in credit markets and rising number of Non-Performing Assets (NPAs) within the banking sector, as well as lower manufacturing production and lower rural consumption[31].

4.35 The Covid-19 outbreak had a significant impact on the Indian economy during the first two quarters of FY21 as government mandated lockdowns across the country effectively stalled economic activity and growth. The growth momentum eventually picked up in Q3 of FY21, with a sharp rebound in the economy in FY22 (GDP recorded 9.7% growth over FY21) and has since observed a consistent growth of 7.6% in FY23 and 9.2% in FY24, before showing signs of slowdown again in FY25 due to several domestic and external

[31] **Data | India's GDP was on a downward slope even before COVID-19 wreaked havoc - The Hindu** (September 2020)

factors. Since H2FY25, the economy has shown strong growth, driven by improved consumer optimism, and growing consumption and investment demand.

4.36 Figure 4-12 below shows the Client-provided GDP projections for India. The forecast projects the GDP of India to grow at an average of 6.3% between FY26-FY30 and 5.8% between FY31-FY44, gradually tapering down to 5.2% by FY50. The GDP growth forecast is broadly in line with other independent forecasts available from reliable sources such as IMF, World Bank and RBI[32] in the medium term.

4.37 We assume the GSDP growth of Delhi to be in line with India's GDP growth throughout the concession period. For our forecast of the GSDP growth of Uttar Pradesh, we have considered the growth expectations for the western region of UP – as opposed to UP state-wide, due to the location of the Asset in the western region of UP. Additionally, we have assumed the GSDP growth of western UP to higher than that of the GDP of India going forward, across the concession period.

4.38 In particular, we expect it to grow at 1.2 times the GDP of India in the short-term, tapering down to be in line with national GDP growth by FY44. This assumption is based on the recent performance of the GSDP of western UP relative to statewide GSDP growth (as discussed in detail in 4.25 above), as well as expectations of continued investment and economic growth in the region owing to a variety of factors

4.39 There are significant investments expected to take place as part of the Delhi and Uttar Pradesh state/regional government plans over the near to medium term (as described in 4.26 above). Given its leading position in industrial investments, western UP is expected to benefit significantly from these future investment plans. In this context, we believe it is reasonable to assume that Western UP will observe more robust economic growth over the near and medium term relative to UP state overall, and by extension, relative to national GDP growth as well.

4.40 Figure 4-12 below shows the assumed growth forecasts for Western UP and Delhi GSDP, and the GDP of India.

[32] **Survey of Professional Forecasters on Macroeconomic Indicators – Results of the 96th Round (Oct 2025)**

Figure 4-12: GDP-GSDP forecast

5 FY26 Base year AADT and Traffic growth analysis

Introduction

5.1 In this chapter, we present our approach, assumptions, and results for baseline (or background) traffic growth for each vehicle category on the Asset. Traffic growth is commonly related to a variety of macro-economic and industry- or commodity-specific factors (hereafter referred to as 'traffic growth drivers'). These growth drivers are typically identified from the results of the OD data analysis and the site visits that help us appreciate the nature of traffic movement – 'what' travels 'where' and 'why'.

5.2 In the absence of long-term historical data on KM46 (Gadpuri) and KM94 (Karman) toll plazas, the option of running statistical models to estimate background growth relationships was not possible for these two plazas, and therefore we have undertaken a detailed benchmarking exercise, coupled with trip length and OD analysis to estimate the traffic growth elasticities for these two plazas. While regression analysis was conducted for KM164 (Mahuvan), the final growth elasticities used to forecast traffic growth at the plazas were also based on benchmarking analysis from other comparable assets and studies conducted by Steer. The estimated elasticities helped inform our final assumptions for use in the forecasting models. These are discussed in detail below.

5.3 Typically, passenger and light commercial vehicle traffic like cars, buses, LCVs and 2-axle trucks grow in line with the GSDP of the state in which the toll road is located. Heavy vehicle traffic like 3-axle trucks and MAVs grow in line with the national GDP. This is because the majority of light vehicles tend to travel shorter distances within the state, whereas a significant proportion of heavy vehicles carry commodities for long-distances across the country. These commodities also tend to be part of industry ecosystems whose demand-supply relationships are scattered across the country and therefore relate more with GDP growth.

FY26 Base year AADT estimates

5.4 The base year is the year on which long-term background forecast growth rates are applied to derive year-wise average annual daily traffic (AADT) estimates for the forecast years. This is therefore an important aspect of our forecasting approach as traffic and ultimately revenue forecasts for future years are built on top of the base year traffic estimate. We have used FY26 as the base year for AADT estimates for the forecast years.

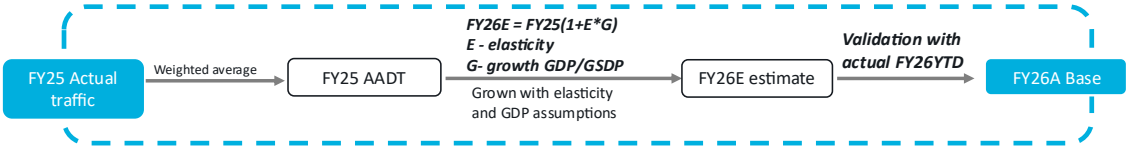
5.5 As described previously in Chapter 3, to establish the base year (FY26) traffic position, we utilised information from various sources – including from the Client and our contextual knowledge, to assess demand on the corridor.

Methodology

5.6 In the absence of long term reliable historical data and relatively short operational history of two of the three toll plazas on the Asset, the base traffic positions for FY26 (across all three plazas) have been estimated utilizing 12 months of actual FY25 traffic data. The weighted average of the actual FY25 traffic (April to March) was taken to arrive at annual FY25 AADT. Using elasticity-based growth assumptions of GSDP or GDP we arrived at our 'estimated' FY26 (FY26E) AADT.

5.7 The monthly profile of the FY26E AADT was then compared to the actual traffic observed in the 6 months (April - September) of FY26 (FY26YTD). The 'adopted' FY26 AADT (FY26A) was then derived by making necessary adjustments to FY26E to reflect the outturn traffic in FY26YTD (adjusted for seasonality). The methodology is presented in Figure 5-1 below:

Figure 5-1: FY26 Base Estimation methodology



Source: Steer Analysis

Seasonality Correction factors

5.8 Traffic on any Asset varies on a month-on-month level. Such variations maybe due to monsoons (typically Jul to Sept) or due to festivals in the region. For e.g. It is observed that typically the truck traffic during the first half of the financial year (April-September) is generally lower than the annual average, mainly because of peak summer season followed by monsoons affecting the freight movement patterns in large parts of the country in the July-September period. In addition to these there may be other seasonal variations specific to the Asset.

5.9 In order to normalise for these variations across the year to provide an AADT estimate, Seasonality Correction Factors (SCF) are used. SCFs are estimated to convert the monthly traffic numbers to an AADT level while accounting for seasonal variation due to local/national festivals, weather changes and/or temporary external impacts. These are typically estimated using historical data for each plaza and vehicle category over multiple years. An SCF >1 means that the traffic for the month is lower than the annual average and vice-versa.

5.10 Therefore, we studied the monthly seasonality of traffic on the Asset by analysing the seasonality trends between monthly average daily traffic (MADT) and AADT for data during the historical years of tolling (excluding years impacted by non-normal events e.g. FY21 COVID). The averaged seasonality trend is then applied to the monthly traffic to obtain our FY26 Base AADT.

5.11 Table 5.1 through Table 5.3 below present the SCFs used for the estimation of the FY26 base year AADT at KM46 (Gadpuri), KM94 (Karman) and KM164 (Mahuvan) toll plazas.

Source: Steer analysis. FY26YTD includes 6 months of FY26 (Apr-Sept '25), FY26A is adopted base for FY26; FY26YTD vs. FY25 growth above reflects growth over the same assessment period in FY25 i.e., Apr-Sept '25 vs. Apr-Sept '24; 1 PCU totals above consider PCU factor of ~3.60 for 3A/MAV combined traffic.

Table 5.6: Adopted base estimates: KM164 Mahuvan

Vehicle Type	FY25	FY26YTD	FY26A	FY26A vs FY25
CJV	15,281	15,704	16,324	6.8%
LCV	1,485	1,514	1,595	7.5%
Bus	1,032	1,050	1,065	3.2%
2A	3,807	3,910	4,074	7.0%
3A/MAV	6,483	6,156	6,512	0.4%
OSV	3	3	3	-
Total	**28,091**	**28,337**	**29,573**	**5.3%**
PCU[1]	**54,001**	**53,722**	**56,207**	**4.1%**

Source: Steer analysis. FY26YTD includes 6 months of FY26 (Apr-Sept '25);; FY26YTD vs. FY25 growth above reflects growth over the same assessment period in FY25 i.e., Apr-Sept '25 vs. Apr-Sept '24; 1 PCU totals above consider PCU factor of ~3.60 for 3A/MAV combined traffic.

5.13 Except for 3A/MAV, all other vehicle categories have exhibited strong growth as of FY26YTD. 3A/MAV volumes across the NH44 corridor continue to be impacted by the access provided by the DME (primarily) in addition to other network changes that have and continue to divert traffic away from the Asset -most significantly at km46 (Gadpuri). Our base estimates for FY26 reflect the assumption that traffic performance for the remainder of the year (Oct '25 – Mar '26) will broadly continue the trend observed through

H1FY26 i.e., Apr-Sept '25. At a PCU level, KM46 is estimated to grow at 3.5%, while KM94 and KM164 are estimated to grow at 4.2% and 4.0% (respectively) over FY25.

5.14 The lower growth at KM46 Gadpuri stems from the shift of short-distance traffic (between Faridabad/Delhi and Rohtak/Punjab) to the DME which earlier used to appear at KM46. The Faridabad bypass connecting to DME and KMP has continued to impact commercial traffic growth on the Asset with both 2A and 3A/MAV volumes observing declines on KM46. Given the more long-distance nature of commercial volumes on KM94 and KM164, 2A trucks on both the plazas recorded strong growth as of FY26YTD. 3A/MAV volumes however showed some decline across both the plazas. Our FY26A Base AADT estimates incorporate these differences in growth trends across the three plazas.

5.15 Passenger traffic (CJV/LCV/Buses) is projected to grow at ~6.1% from FY25 to FY26 at an Asset level which can be attributed to growth observed in urban clusters such as Delhi NCR, Agra, Mathura, and Faridabad. These regions are expected to increase in urban density and experience sustained economic growth going forward, with travel demand related to employment, education and medical purposes expected to positively influence traffic growth on the Asset.

5.16 A common trend observed across the Asset is the flatlining of 3A/MAV growth in FY26A:

- **Preference shift from 3As to MAVs**: As discussed in detail in Section 3.12, the 3A performance over the last three years has been muted. While this Asset does not report 3A trucks separately, evidence from other Assets in the region (based on Steer studies) suggest that 3As have either declined or shown little y-o-y growth since FY22.
- **Shift of medium distance movements to Delhi Mumbai Expressway**: While the full impact of the DME has not yet materialised on KM164 and KM94, a share of short/medium distance movement till Jaipur, Indore have seen a diversion towards the expressway.
- **Shift of Kanpur bound movement to Ghaziabad/Palwal – Aligarh – Kanpur**: Recent upgradation of the Palwal-Tappal and the Ghazibad-Aligarh sections have improved the overall LoS of the alternate route for traffic bound to/originating in Kanpur. This share of traffic earlier used to appear on the Asset but has now started to prefer the alternate route.

Estimation of background elasticities

5.17 Traffic growth elasticities measure the relationship between traffic growth on the Asset and growth in the underlying macroeconomic and regional economic drivers that influence traffic growth on the Asset. Multiplied with forecasts of growth drivers like GDP or GSDP, they provide forecasts of background traffic growth rates.

5.18 The Asset observes CJVs making shorter trips across all the three toll plazas, whereas the commercial traffic trends vis a vis the trip lengths differ from plaza to plaza. These differences can be attributed to the changing proximity of each of the toll plazas to urban centres in the region. These observations have been validated by the results of the OD analysis as well, which show a greater percentage of I-I trips for passenger vehicles, and a growing share of E-E trips for commercial vehicles as we move from KM46 (nearest to Delhi NCR) down to KM164 (nearest to Agra).

5.19 As a result, growth drivers for each vehicle category were selected based on these traffic profiles and trip patterns observed across all three toll plazas (from the OD survey

analysis of the two toll plazas from February 2025 and from prior OD surveys conducted on KM94 in prior studies). Table 5.7 below presents the growth drivers identified to model the forecast background traffic growth rates for each vehicle category at all three plazas.

Table 5.7: Identified growth drivers to model traffic growth

Vehicle type	GDP India	GSDP Western Uttar Pradesh	GSDP Delhi
Car		25% - KM46 Gadpuri 50% - KM74 Karman and KM164 Mahuvan	75% - KM46 Gadpuri 50% - KM74 Karman and KM164 Mahuvan
LCV		50%	50%
Bus		50%	50%
2A	100%		
3A	100%		
MAV	100%		

Source: Steer analysis of Client data

5.20 The recent historical period of tolling is chequered with variations in traffic growth between years for certain vehicle types. As discussed in detail in Chapter 2 and 3, the Asset has seen several network and regulatory related impacts affecting traffic growth over the years, such as:

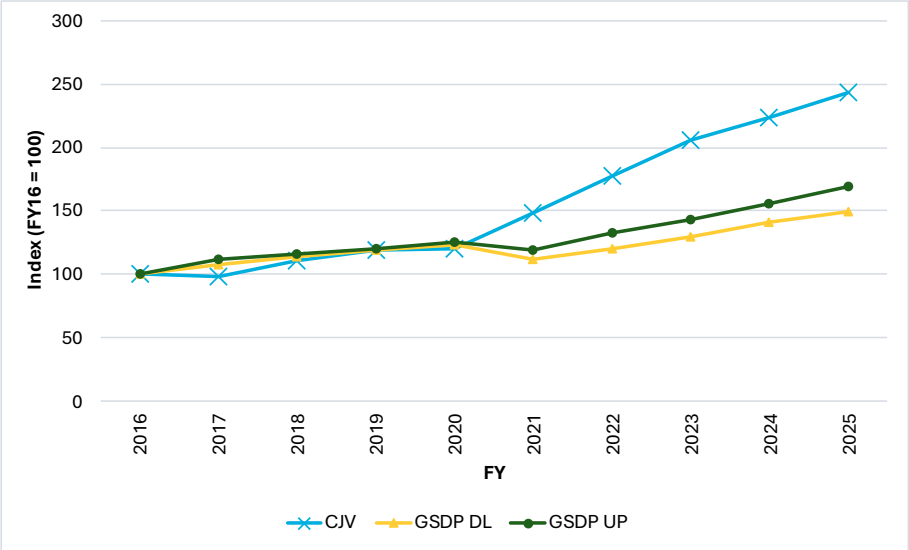
- The splitting of the KM74 toll plaza in FY23 resulted in a change in traffic profiles observed at the two new plazas (relative to the prior plaza). Traffic profiles and trip patterns observed at KM164 have remained more stable since it was not affected by the splitting KM74 in FY23.
- Due to the partial commissioning of Delhi-Mumbai Expressway (DME), we have seen further variations in traffic as different sections of it have gotten operational.

5.21 In our regression analysis for KM164, we have used combined traffic for specific toll/vehicle categories as data for historical years were available only in combined form for those categories (e.g., 3A/MAV), or to estimate more stable models as mandatory FASTag implementation since FY22 resulted in large variations in certain vehicle categories (traffic volumes were redistributed into different vehicle types e.g. Bus/2A).

CJV

5.22 We see from the OD data that the CJVs primarily cater to regional movements between NCR, Faridabad, Mathura/Vrindavan, Agra and other towns lying on the Asset. Apart from the local and IAOI influence seen from towns and cities in Uttar Pradesh, we also observed a considerable influence from Central NCR and Faridabad. We have therefore taken a 50:50 combined GSDP growth of Western UP and Delhi to be the growth driver to model the growth of CJV traffic. Historically, the CJV traffic at Mahuvan toll plaza observed a healthy CAGR of 10% per year between FY16 and FY25, while the GSDP of Delhi and Uttar Pradesh grew by 5% and 6% (respectively) over the same period. Figure 5-2 below shows the relationship between indexed values of CJV traffic at KM164 (Mahuvan) and Western UP/Delhi GSDP.

Figure 5-2: Relationship between CJV traffic and Uttar Pradesh/Delhi GSDP (KM164 Mahuvan)



Source: Steer analysis of Client TMS data and publicly available GSDP data

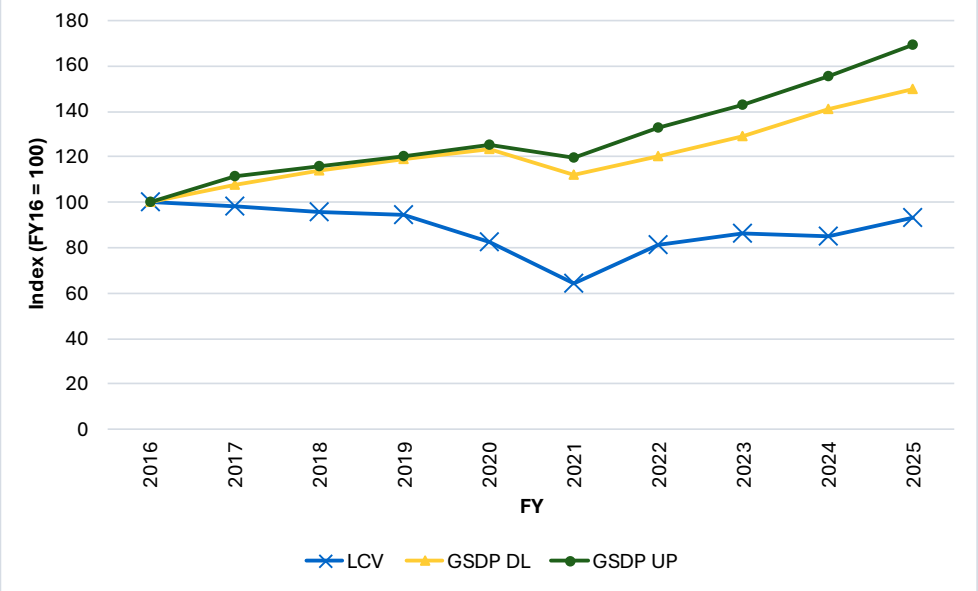
5.23 Considering the robust growth in CJV traffic observed over the operational historical period with trips largely seen between urban areas in and around the Asset, we have assumed a forecast background elasticity of 1.20 at KM94 (Karman) and KM164 (Mahuvan), with respect to the GSDPs of Delhi and Western Uttar Pradesh. This elasticity is tapered down to 1.10 by FY35 at both KM94 and KM164. At KM46 (Gadpuri), we have assigned an elasticity of 1.10 which dampens to 1.0 by FY35. This is in line with benchmarks we have observed at other toll roads across the country, which have a considerable concentration of inter-urban areas along their alignment.

LCV, Bus and 2A

LCV

5.24 As noted in the OD analysis above, LCVs have more regional movements within the state - UP and Delhi in the case of the Asset- than heavier vehicles like 3As and MAVs. As a result, we used Western UP/Delhi GSDP growth as the growth driver to predict LCV traffic growth going forward. However, after FY20, the axle load regulations switched in favour of 2A to carry higher tonnage which has influenced the LCV volumes observed on the Asset. As a result, we see a downward trend in LCV relative to GSDP. Figure 5-3 below depicts the link between indexed values of LCV traffic observed at KM164 (Mahuvan) and Western UP/Delhi GSDP.

Figure 5-3: Relationship between LCV traffic and Uttar Pradesh/Delhi GSDP (KM164 Mahuvan)



Source: Steer analysis of Client TMS data and publicly available GSDP data

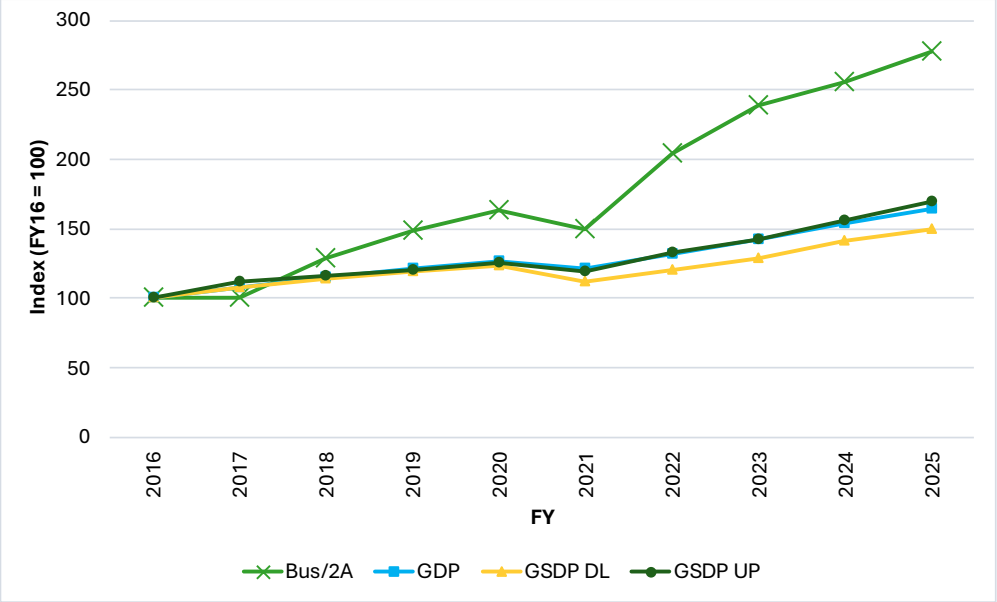
5.25 Based on the above observations and our experience across other toll roads in the country, we conclude that LCV will continue to grow at a modest elasticity of 0.30 to Western UP/Delhi GSDP growth. This is consistent across all three toll plazas on the Asset.

Bus & 2A

5.26 Bus growth tends to be largely supply-driven in many parts of the country, with new buses being bought and deployed by the government at different intervals of time. Based on our experience across the country, buses on inter-urban corridors show moderate elasticities of 0.4 to 0.6 with respect to the regional/state GSDP in which the asset is located.

5.27 Bus/2A category at KM164 (Mahuvan) has observed steady growth from FY18 onwards. The combined Bus/2A volumes grew at a CAGR of 12% between FY18 and FY25. Considering the period post-COVID, Bus+2A volumes have grown at a CAGR of 8% per year between FY23 and FY25, at KM164. However, based on historical data as well as benchmark assets with similar characteristics as DATL, this growth is driven largely off the growth of 2As, and Buses have witnessed a relatively muted growth profile over this period. Thus, we have assumed an elasticity of 0.50 for Buses (with respect to Western UP/Delhi GSDP), and a more positive elasticity of 0.90 for 2As across all toll plazas on the Asset.

Figure 5-4: Relationship between Bus/2A traffic with GSDP Delhi, GSDP UP and GDP (KM164 Mahuvan)



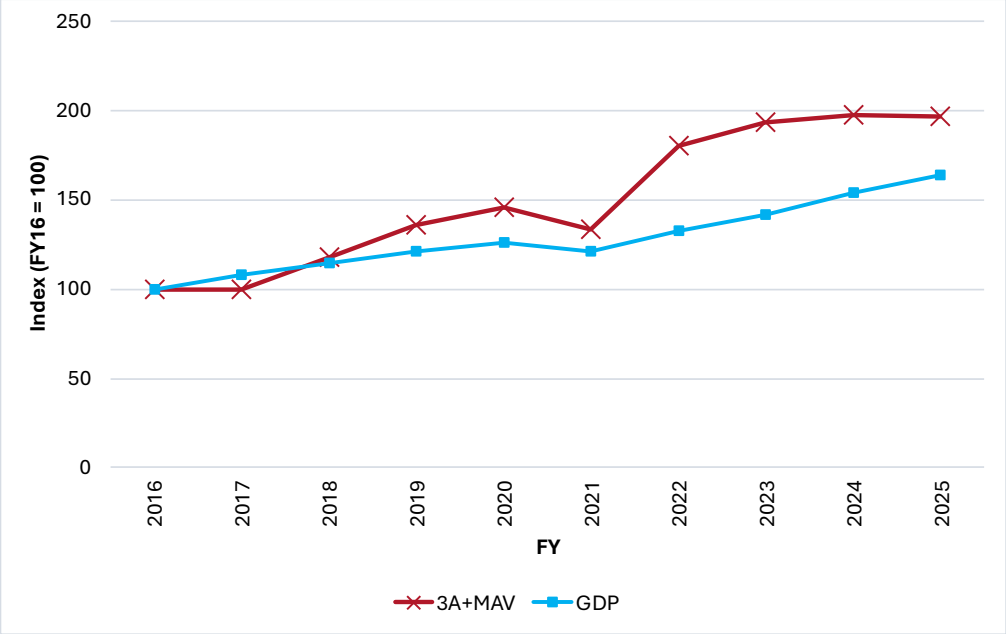
Source: Steer analysis of Client TMS data and publicly available GSDP data

3A/MAV Trucks

5.28 Compared to lighter trucks like LCVs and 2As, 3As and MAVs have more national or long-distance movements covering several states. Given that manufacturing-related commodities tend to take prominence in their commodity distribution, growth in 3A and MAV traffic is dependent on industry demand-supply ecosystems spread across the country. Thus, we have taken GDP as the growth driver to model the traffic growth in 3A and MAVs on the Asset. Figure 5-5 below shows the relationship between indexed values of 3A+MAV traffic at KM164 (Mahuvan) and national GDP over the period FY16-25.

5.29 Historically, 3A+MAV combined traffic has observed robust growth from FY18 onwards. From FY18 to FY25, the combined traffic grew at a 8% CAGR. This growth has been observed due to network-related improvements and continued economic growth in the region within the vicinity of the Asset e.g., Delhi NCR. Over the same period, national GDP grew at a CAGR of 5% per year while UP GSDP grew at a CAGR of 6% per year. Thus 3A/MAV growth at KM164 appears to have shown stronger growth relative to the growth observed in both the state GSDP and India GDP, highlighting the importance of this corridor in facilitating long-distance commercial movements across the country.

Figure 5-5: Relationship between 3A+MAV combined traffic and India's GDP (KM164 Mahuvan)



Source: Steer analysis of Client TMS data and publicly available GDP

5.30 Based on our results from the regression analysis of KM164 (Mahuvan), our observations from the OD analyses presented in Chapter 3, particularly the analysis of trip lengths and commodity distributions, as well as the historical growth observed on the Asset relative to other similar corridors, we have assumed an elasticity of 0.30 (to national GDP) for 3As across all three plazas on the Asset. For MAVs, we have assumed an elasticity of 1.00 at KM46 (Gadpuri), and 1.10 at KM94 (Karman) and KM164 (Mahuvan).

Forecasts for background elasticities

5.31 Table 5.8 below presents a summary of the results of the regression analysis carried out on the historical toll plaza data for KM164 (Mahuvan) and the various macroeconomic (GDP/GDSP) drivers assumed to influence traffic growth on the Asset, along with the assumed forecast elasticities we used to forecast background traffic growth on the Asset.

5.32 The forecast elasticities are projected to remain constant over the majority of the concession period, with gradual tapering down over the long-term for specific plaza-vehicle category combinations. This assumption is grounded in historical trends and a long-term perspective on regional and national growth, suggesting market maturity is still several years away.

5.33 The 6-lane configuration on NH corridors is designed to handle up to 120,000 PCUs. Once the Asset exceeds its 6-lane designed capacity, we anticipate that the year-over-year growth of the Asset will be constrained due to growing congestion and declining Level of Service (LoS).

From our projections, the Asset is expected to reach its design capacity of 120,000 daily PCUs in FY44 (average across all three plazas). As the traffic levels on the Asset get closer to this level, the increasing congestion and deterioration in the level of service (LoS) results in a slowdown of growth as the prospective users look for alternative routes and a proportion of them shift towards the alternatives. To factor in this kind of shift, we have

dampened the elasticities for CJVs and 2As in our forecast model starting from FY35. The same is presented in Table 5.8 below.

Table 5.8: Derived elasticities from regression analysis and assumed forecast elasticities

Vehicle Type	Growth Driver	History		Forecast	
		Derived elasticity	Period considered	Assumed forecast elasticity	Evolution of elasticity
KM164 Mahuvan					
Car	GSDP Western Uttar Pradesh/Delhi	1.27	FY16-FY24	1.20	Decreasing to 1.1 by FY35
LCV	GSDP Western Uttar Pradesh/Delhi	N/A	FY16-FY24	0.30	No change
(Bus + 2A)*	GSDP Western Uttar Pradesh/Delhi	2.13	FY16-FY24	0.50	No Change
2A	GDP			1.00	Decreasing to 0.90 by FY35
(3A + MAV)*	GDP	1.13	FY16-FY25	0.30	No change
				1.10	No Change
KM46 Gadpuri					
Car	GSDP Western Uttar Pradesh/Delhi	-	-	1.10	Decreasing to 1.0 by FY35
LCV*	GSDP Western Uttar Pradesh/Delhi	-	-	0.30	No change
Bus	GSDP Western Uttar Pradesh/Delhi	-	-	0.50	No Change
2A*	GDP	-	-	0.80	No change

MAV	GDP	-	-	1.0	No Change
KM94 Karman					
Car	GSDP Western Uttar Pradesh/Delhi	-	-	1.20	Decreasing to 1.1 by FY35
LCV*	GSDP Western Uttar Pradesh/Delhi	-	-	0.30	No change
Bus	GSDP Western Uttar Pradesh/Delhi	-	-	0.50	No Change
2A*	GDP	-	-	1.00	Decreasing to 0.90 by FY35

Vehicle Type	Growth Driver	History		Forecast	
		Derived elasticity	Period considered	Assumed forecast elasticity	Evolution of elasticity
3A	GDP	-	-	0.30	No change
MAV	GDP	-	-	1.10	No change

Source: Steer analysis; *regressions were run on Bus+2A and 3A+MAV aggregated volumes and elasticities estimated reflect the relationship of growth in the aggregated volumes w.r.t the underlying driver. However, our forecast models assume separate elasticities for each of the vehicle categories w.r.t to the underlying driver variables; Bus + 2A model was run on Western UP/Delhi GSDP variable rather than India GDP, but forecasts assume that 2A traffic is driven by GDP growth

6 Forecast: Network overlays and forecasts

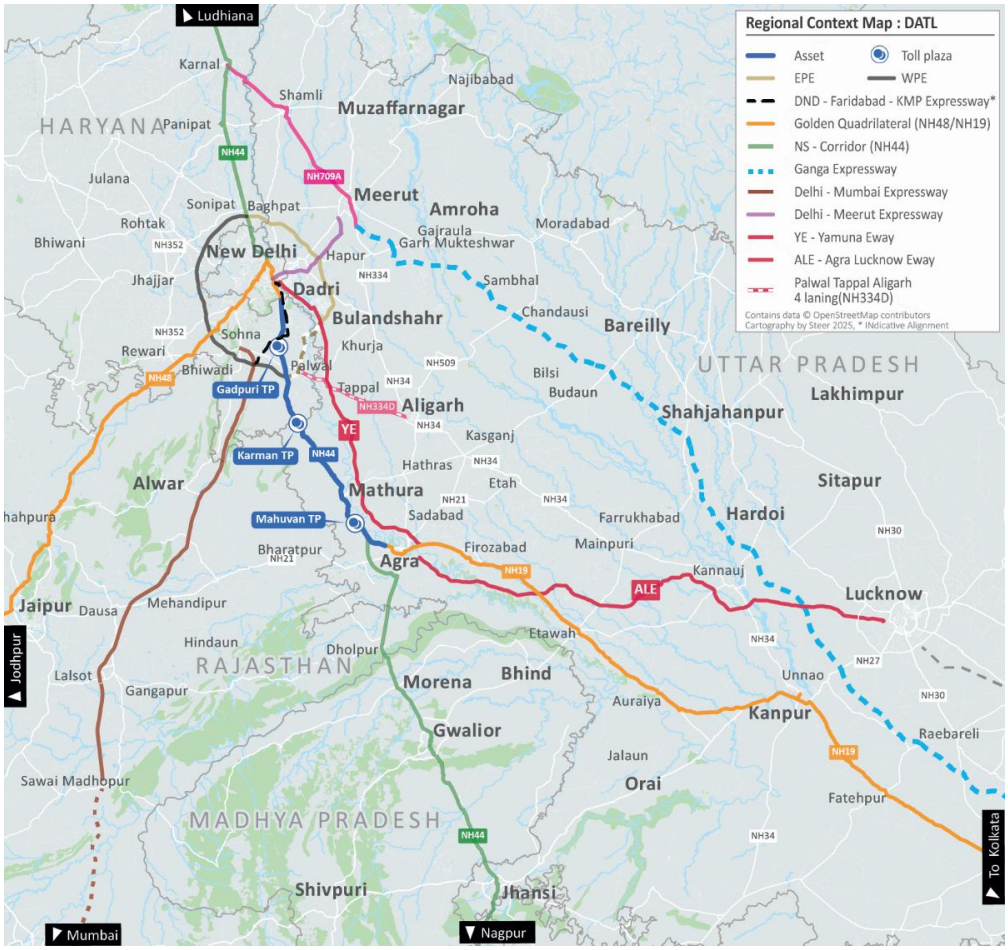
Introduction

6.1 Following the discussion on estimated and assumed forecast background growth rates in the previous chapter, this chapter first deals with the forecasting assumptions around base year AADT and potential impacts on traffic growth on the Asset. Later, it also presents the assumed toll segmentation, trip factors and evolution of toll rates for the forecast period which are used to estimate the forecasted revenue based on the forecasted traffic. In the final section, the chapter summarises the traffic growth rates for the forecast years.

Analysis of potential impacts

6.2 Figure 6-1 below shows a map of the regional transportation road network surrounding the Asset, along with various key feeder and competing routes in the region.

Figure 6-1: Alternate routes and Asset route shown against the regional network context



Source: Steer analysis and cartography

Alternate routes and improvements

6.3 Table 6.1 below presents the upcoming network/other developments, corresponding alternate/feeder routes, year of completion and indicative direction of impact on the Asset. To assess these types of future impacts on the Asset, whether they be positive or negative, we have studied developments (alternate roads, feeder roads and regulatory changes) that are relevant to the Asset within the context of its surrounding road network.

6.4 Apart from the Delhi-Mumbai Expressway becoming fully operational by FY27[33], other major network developments that could potentially have an impact on future traffic growth on the Asset include four-laning of Aligarh-Kannauj and Palwal-Tappal-Aligarh Road sections, the Ganga Expressway, as well as the completion of the Yamuna Expressway (YE) – Eastern Peripheral Expressway (EPE) connector.

6.5 The commissioning of the proposed Ganga Expressway will directly compete with a considerably sized long-distance traffic plying on the Asset. Also, the Yamuna Expressway connection to EPE is expected to provide a positive impact on two plazas of the Asset (KM94 and KM164) as it will provide long-distance traffic travelling to and from regions farther north of Delhi improved access to the Asset as they can bypass Delhi NCR before joining (or after exiting) the Asset.

Table 6.1: List of network/other developments

S. No.	Development	Route affected	Year of impact	Impact (+/-)
1.	Palwal-Tappal-Aligarh 4-laning	Asset route: East-west NH 2 corridor connecting Delhi and Lucknow via Agra Alternate route: Palwal region connected to Aligarh-Lucknow via Palwal-Tappal-Aligarh Road section	FY28 onwards: 100%	-ve
2.	Delhi-Mumbai Expressway	Asset route: North-south NH19 – NH52 corridor Alternate route: Market 1: Delhi-Ratlam-Indore Market 2: Delhi-Mumbai via Delhi-Mumbai Expressway	FY26: 25% FY27 onwards: 100%	-ve
3.	Ganga Expressway	Asset route: Delhi-Agra-Lucknow through NH2/NH19 Alternate route: East-west expressway between Meerut and Prayagraj	FY26: 25% FY28 onwards: 100%	-ve
4.	Yamuna Expway- EPE Connector – Northern Ring	Traffic between Greater Noida industrial area and Agra/beyond currently using the Yamuna expressway	FY28: 20% FY30 onwards: 100%	+ve

Impact assessment for network/other developments

6.6 The section below includes a narrative for each of the network improvements or developments, as listed in Table 6.1 above, that are expected to have a material impact on future traffic growth on the Asset. Please note that all traffic volumes for impacts were estimated as impact rates applied on FY26 base AADT.

Delhi-Mumbai Expressway

6.7 The Delhi-Mumbai Expressway is a 1290-KM long greenfield expressway being developed to provide improved level of service to long-distance traffic between North and Western India compared to the existing national highways that are already operating at high-capacity utilisation. Competing with the traditional north-south NH corridors - NH 2 corridor containing the Asset and the NH 8 corridor part of the Golden Quadrilateral, the upcoming Delhi-Mumbai Expressway could provide faster and unhindered connectivity, as illustrated in Figure 6-1 above.

6.8 As discussed earlier, we have considered two types of north-south movements for this impact, as these have distinct cost comparisons between the Asset corridor and the upcoming expressway:

- **Indore region**: The route through the expressway via Ratlam/Garoth-Ujjain provides an alternate route for long-distance traffic to reach Indore.
- **Mumbai region and South India**: This traffic currently use either NH 8 or NH 2 to ply between Mumbai region, Kerela, and western parts of Karnataka in the south, and Delhi and regions in north. While Central and Eastern parts of Karnataka, Andhra Pradesh traffic already is part of the NH 44 route and therefore out of scope, we have not included Tamil Nadu in the in-scope traffic as we have observed recent shifts from other corridors to the NH 44 route. Overall, the route through expressway provides cost savings through unhindered, seamless, and quicker travel with potentially competitive toll costs.

6.9 A few sections of the greenfield expressway have been made operational with Sohna-Dausa-Lalsot section (Feb'23), Madhya Pradesh section (Sep'23), Vadodara-Bharuch section (Feb'24), Lalsot-Sawai-Madhopur section (Feb'24) and the Kota-Bundi Section (Dec'24) already being operationalised. The project is currently suffering from construction delays, mainly on the Gujarat stretch. The timeline for completion of the expressway has been revised several times and is now expected to be completed by end of FY26 as per reports[33]. The plaza closer to Delhi-NCR (KM46 Gadpuri) has already started observing the negative variance on account of the DME, as discussed in the earlier sections of the report. However, since KM94 and KM164 observe a higher share of long-distance traffic, the impact of the DME has been factored into our forecasts from FY26Q4.

6.10 We have estimated impacts as shown in tables below, using a GJC-based logit model. We have staged the impact over two years to account for a phased completion of various sections and gradual unfolding of the impacts.

Palwal-Tappal-Aligarh

6.11 The Palwal-Tappal-Aligarh Road is a two-laned section that is a key connection between the region south of Central NCR and Aligarh-Lucknow corridor. The road is currently under expansion to 4-lane tolled road[34]. For long-distance traffic between Central NCR, west and northwest, and Lucknow and east, this upgrade would improve the level of service of the alternate corridor connecting the regions west and northwest of Central NCR with the region east of Lucknow.

6.12 There are two bypasses, Khair and Jattari, that are not progressing as per the schedule and are experiencing delays. Considering all the information, it is anticipated that the construction will take an additional year, resulting in an assumed impact from FY28[34].

6.13 Table 6.4 and Table 6.5 below presents the estimated impact due to the upgrade at KM94 (Karman) and KM164 (Mahuvan), derived using a GJC-based logit model.

Ganga Expressway

6.14 The Ganga Expressway is a 596-KM long greenfield expressway being developed to provide improved level of service to long-distance traffic between western and eastern India. Competing with the traditional east-west NH corridors - NH 2 corridor containing the Asset and the Delhi-Agra-Lucknow and Purvanchal Expressways, the upcoming Ganga Expressway could provide faster and unhindered connectivity for long-distance east-west movement across the country, as illustrated in Figure 6-1 above.

6.15 We have considered two types of east-west movements for this impact, as these have distinct cost comparisons between the Asset corridor and the upcoming expressway:

- **Delhi region**: The route through the expressway provides a competitive route for long-distance traffic from Delhi and west to reach Lucknow and east. While toll costs are favourable for the Asset route, distance and time costs are lower on the expressway.
- **Northwest of Delhi**: The trips which are originating from Northwest of Delhi, including Karnal, Punjab, etc. and destined to Lucknow could also potentially prefer this route.

6.16 Assuming successful implementation of all the sections of the expressway, we have estimated impacts as shown Table 6.6 through Table 6.8 below, using a GJC-based logit model. We have staged the impact over three years to account for a phased completion of various sections and gradual unfolding of the impacts. The staging is to account for the gradual network shift expected to start in FY26[35]and materialise into the full impact as the network stabilises with completion of all sections of the Ganga Expressway by FY28.

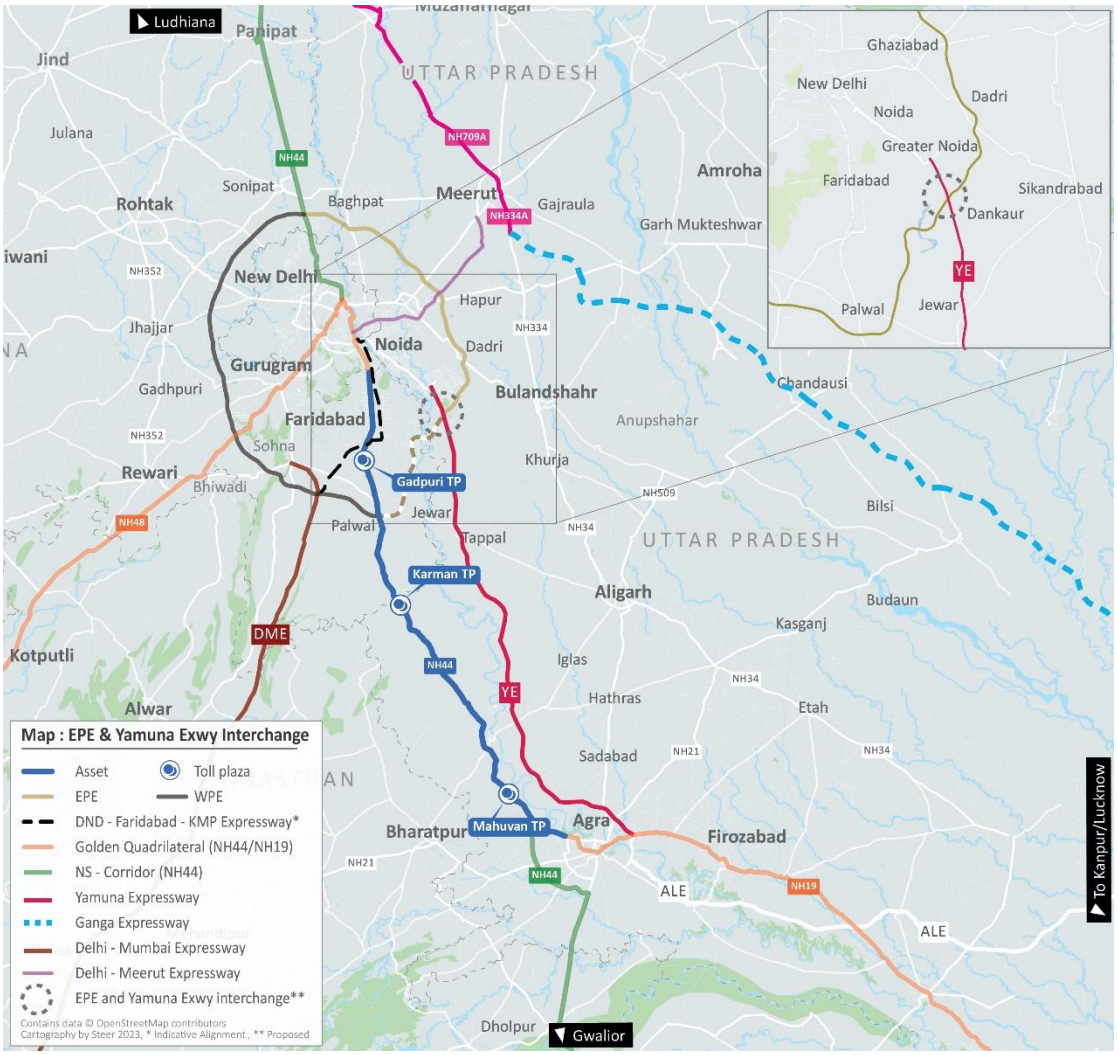
Yamuna Expressway- EPE connector – Northern ring

6.17 The existing alignment of the Eastern Peripheral Expressway runs from Sonipat to Palwal and does not intersect with the Yamuna Expressway. However, recently it has been agreed between UPEIDA and NHAI that the construction of a cloverleaf loop connecting EPE to Yamuna Expressway near Jewar will be commenced[36]. The connection will result in improving connectivity between parts of Noida, Greater Noida, Delhi NCR and Agra. As a result, the traffic which currently originates in the industrial corridor near Greater Noida

[36] **Delhi: Yamuna Expressway To Finally Get Direct Link With Eastern Peripheral Expressway - News18** (April 2025)

and is destined to Agra/beyond will have an alternative via the EPE-Asset route who would have otherwise been using the Yamuna expressway currently.

Figure 6-2: Yamuna - EPE connector – Northern ring



Source: Steer analysis and cartography

6.18 As per the latest data available for Yamuna Expressway approximately 900-1300 trucks currently use the Yamuna Expressway during peak hours[37]. Since the Yamuna Expressway operates at toll rates of more than 14 Rs/Km (compared to the 10 Rs/km on the Asset for Multi Axle vehicles [38], once the connector between Yamuna Expressway and EPE becomes operational this volume of traffic will be able to access Agra via the Asset which will be characterized by toll saving, and a marginal time saving. Therefore, it is expected that a small proportion of the trucks will divert towards the Asset from Yamuna expressway. The positive impact of this development is expected to appear on the Asset starting FY28 in our forecasts. The estimated impact of this development on KM94 and KM164 toll plazas are presented below.

[37] Traffic Density Impact Assessment

Capacity Constraints

6.19 As per the concession agreement, the Asset's design capacity is set at 120,000 PCU's (an average of all three plazas). As congestion increases on the road, the level of service offered by the Asset reduces resulting in traffic either diverting to other alternates or a suppression in local trips takes place primarily in passenger vehicles due to the perceived congestion profile of the Asset.

6.20 Our forecasts suggest that the Asset will start reaching design capacity FY41 onwards, and in this scenario, we believe that will reduce the frequency of short to medium-distance passenger trips on the Asset. We have incorporated this impact into our projections by introducing a growth dampener from FY35 onwards, that results in a slowing year-over-year growth rate of passenger vehicles post FY35.

Summary of impact assessments

6.21 Table 6.11 below summarises the potential impacts on the Asset due to the several ongoing and foreseen improvements on the alternate routes, the Asset route, and other regulatory developments.

Table 6.11: Summary of impact assessments

Impact	Year of impact	Probability/ scale of impact	In-scope traffic	Direction of impact (+/-)
Delhi-Mumbai Expressway Diversion impact from competing under-construction north-south expressway connecting Delhi to Mumbai	FY26 onwards	High	Traffic plying between Indore region and Delhi/north	**-ve**
			Traffic plying between Mumbai region and South India at one end, and Delhi/north at the other	**-ve**

Impact	Year of impact	Probability/ scale of impact	In-scope traffic	Direction of impact (+/-)
Palwal-Tappal-Aligarh Diversion impact due to improved feeder route to alternate corridor	FY28 onwards	High	Trips between Delhi/west/northwest at one end and Lucknow and east at the other	**-ve**
Ganga Expressway Diversion impact from upcoming and competing east-west expressway connecting Delhi to Mumbai	FY26 onwards	Medium	Trips between northwest of Delhi, and Lucknow and east	**-ve**
			Trips between Delhi and west, and Lucknow and east	**-ve**
Yamuna-EPE connector – Northern Ring	FY28 onwards			**+ve**
Capacity induced constraints	FY35 onwards	High	Passenger traffic (CJVs) at the breach of capacity	**-ve**

Revenue forecasting assumptions

6.22 To forecast the revenues for a forecast year, the traffic forecast for each vehicle type is converted into tickets sold, which is then multiplied with the corresponding toll rate. While toll segmentation provides the breakup of trips paying each ticket type, trip factors provide the conversion factor to convert from traffic (trips) to tickets sold. This section discusses assumptions related to toll segmentation, trip factors and toll rates for the forecast period.

Toll evolution

6.23 Based on the concession agreement and the gazetted toll notification, we understand that base toll rates increase every year (revision month is April) based on WPI-linked inflation (as of December 2024). These are rounded up to the nearest five to estimate the final toll rate charged to users.

6.24 We have used actual toll rates from the FY25 toll notifications and FY26 WPI to validate the modelling of future toll evolution. Increase in WPI was calculated based on the Client's WPI forecasts, as shown in Table 6.12 below. These forecasts provided by the Client. The WPI forecasts available from other independent forecasting agencies may vary from this assumption and could be lower or higher than that provided by the client.

Table 6.12: WPI growth forecast assumptions

Financial year	WPI growth (%)
FY26	2.6%
FY27	2.4%
FY28	5.0%

Financial year	WPI growth (%)
FY29	5.1%
FY30	4.9%
FY31	4.4%
FY32 onwards	4.1%

Source: FY27 onwards WPI as per Client input.

6.25 Table 6.13 below provides an overview of toll estimation method as per the FY25 & FY26 toll notifications, and the concession agreement.

Table 6.13: Toll estimation overview

Toll fee escalation	Revision date	Nearest rounding
Linked to 100% WPI increase	April	5

Source: Concession agreement and toll notification

Toll segmentation and trip factors

6.26 The Ministry of Road Transport & Highways has finalized a compensation formula for existing toll concessionaires to offset revenue loss from the Annual Pass scheme for non-commercial vehicles[39].

6.27 Across multiple assets, the number of passes sold has observed to be rising on a day-to-day basis, indicating an early adoption among frequent users since its introduction on 15th August 2025 till 30th September 2025, and a corresponding decline in other ticket categories mainly in the single and return categories. The evolution of proportion of users using the annual pass up to September 2025 is presented below:

%CJV using Annual pass	15th to 31st Aug	1st to 15th Sept	16th to 30th Sept
KM 46 (Gadpuri)	8.4%	15.7%	18.2%
KM 94 (Karman)	12.0%	20.0%	22.9%
KM 164 (Mahuvan)	17.7%	22.3%	24.9%

Source: Steer Analysis of Client data

6.28 CJV Segmentation for FY26 has been developed using the pre annual pass segmentation till 14th August 2025, and daily Annual Pass transaction data from 15th August 2025 till 30th September 2025. Post September 2025, a gradual ramp up is assumed such that they form a large portion of the CJV trips by the end of FY26. This corresponds to a reduction in a proportionate decrease in single and return trips. For FY27 and beyond, we have assumed the share of annual pass trips to be in line with that observed at the end of March 2026, by when we believe the distribution of ticket categories in CJVs should stabilise. Under the above assumptions, the calculated shares of CJV Annual Pass transactions for FY26, FY27 and beyond are presented in Table 6.14 through Table 6.16 below. At this stage the proportion of annual pass is assumed to be around 26% across

[39] Finalization-Concessionaire-Annual-Pass-Facility-on-NHs-01092025.pdf

the plazas, however this proportion may vary given the nature of CJV users of the Asset being close to large urban centres.

6.29 For other vehicle categories we analysed the historical TMS data split by ticket categories to understand the latest trends in ticket segmentation across all three toll plazas. For the traffic and revenue forecast, we have assumed FY26YTD (Apr-Sept '25) segmentation to apply for all non-CJV vehicle categories.

6.30 The Annual pass compensation is separately calculated using the formula prescribed by NHAI in the same circular. Table 6.17 below presents the Annual pass compensation computed for the toll plaza.

Table 6.17: Annual Pass Compensation for CJVs (in INR Crore)

Toll Plaza	FY26	FY28	FY30	FY35	FY40	FY44
KM 46	16.1	39.7	50.1	84.0	140.1	199.6
KM 94	8.7	20.9	26.5	47.4	80.8	120.1
KM 164	5.9	15.2	19.2	33.7	58.2	87.2

Source: Steer Analysis

Trip factors

6.31 As for trip factors, based on the implementation of FASTag rules followed by NHAI order restricting sale of discounted passes by cash, and our experience across studying other toll roads in the region as well as across the country, we have assumed trip factors of 1, 2 and 50 for Single, Return and Monthly categories, respectively. There are no major toll categories being charged, apart from the official list of toll categories in the toll notification. This assumes that further changes in toll categories, unless specific discounts are offered, are unlikely.

Traffic and Revenue forecasts

6.32 Based on the traffic and revenue-related forecast assumptions discussed above, we have modelled the traffic and revenue forecasts for the Asset over its remaining concession period i.e., FY26-44. Table 6.18 and Table 6.19 below present the AADT/PCU forecast growth rates and CAGRs for KM46 (Gadpuri). Table 6.22 and Table 6.23 below present AADT/PCU forecasts and associated growth rates for KM94 (Karman), and Table 6.26 and Table 6.27 present the same for KM164 (Mahuvan). In addition, Appendix B presents detailed forecasts of AADT and revenues for all three toll plazas on the Asset over the forecast period.

Upside and Downside cases

Upside and Downside scenario assumptions

6.33 We have developed our base case scenario considering a balanced view on the risks associated with input assumptions around GDP growth and traffic growth elasticities. There is always a risk that the outturn values of these inputs will vary as compared to the assumptions taken due to exogenous impacts, e.g. GDP growth could be influenced both positively and negatively by the impact of monsoons, export-import balances, political changes etc.

6.34 Similarly, traffic growth elasticities could be influenced by increased efficiencies achieved by technology, large shifts in commodity prices globally, changes in local manufacturing practices. However, at this stage we consider that the base case represents a central case scenario given the risks of variation of input assumptions.

6.35 To account for the possible variations in the growth drivers, we also present an Upside (optimistic) and a Downside (pessimistic) scenario. These scenarios are defined by the following variations from the base assumptions:

Table 6.30: Summary of Macro-economic Assumptions for upside and downside cases

Input	Upside	Downside
Macro Assumptions		
GDP/GSDP	+1% every year	-1% every year
WPI	+1% every year	-1% every year
Elasticities	+ 10%	- 10%

Source: Steer analysis

6.36 Further, network developments are highly dependent on governmental directions, policies, legal and financial measures which might result in early or delayed completion of developments. Therefore, we have included an Upside (optimistic) and a Downside (pessimistic) case for our network-related impacts as well. However, consistent with our macro-economic assumptions, we consider that the base case represents a central case scenario given the risks of variation of input assumptions.

Impacts-Upside Case

6.37 The upside case impacts included in forecasts are summarised in Table 6.31 below.

Table 6.31: Summary of impacts on the Assets - Upside Case

Development	Year of impact	Change in impact w.r.t base case	Magnitude of impact		
			TP1 Gadpuri	TP2 Karman	TP3 Mahuvan

Upside and Downside Case Forecasts

6.39 Table 6.33 below presents the difference between the Upside and Downside Case forecasts relative to the Base Case forecasts in FY44 (i.e., the concession end year) for all three Asset toll plazas. Figure 6-3 through Figure 6-8 below plot the Upside and Downside Case forecasts relative to the Base Case forecasts for each Asset toll plaza over the full concession period (FY26-FY44).

Table 6.33: Percentage Difference Upside and Downside Case Forecasts vs. Base Case Forecasts - FY44

Case	Measure	KM46 Gadpuri	KM94 Karman	KM164 Mahuvan
Upside Case	Traffic (PCU)	29.9%	35.1%	34.7%
Downside Case		(20.7%)	(23.6%)	(23.1%)
Upside Case	Revenue	48.0%	55.2%	55.2%
Downside Case		(30.4%)	(33.0%)	(32.8%)

Summary outlook

6.40 The Asset is a 179.5 km toll road between Delhi and Agra which forms a part of the NH44. The Asset forms part of the Grand Trunk Road – which is part of the prominent Asian Highway 1 (AH1) - that forms part of a wider longer strategic corridor that connects Delhi NCR and other regions in North India with other regions in the country.

6.41 The Asset consists of three toll plazas – KM46 Gadpuri, KM94 Karman and KM164 Mahuvan. The Asset's strategic and geographic location is a significant advantage as it offers seamless connectivity to users via the upgraded expressway network in the form of KMP and EPE. It is the preferred route for north-south and north-east movement,

connecting regions such as Jammu and Kashmir, Punjab, Haryana to Karnataka, Tamil Nadu, Telangana, Andhra Pradesh, Eastern Uttar Pradesh, and Bihar.

6.42 The Asset serves a significant volume of local passenger traffic, as it connects densely populated areas such as Palwal, Faridabad, New Delhi to Mathura, Vrindavan, and Agra over short-to-medium distances. We anticipate a healthy growth in car usage on the Asset due to the shift away from public transport by users, and the increasing ownership of cars in the National Capital Region.

6.43 The Asset's provide improved Level of Service (LoS) due to its six-lane configuration. The steady growth in traffic in recent years is expected to continue in the future. Although some of this growth can be attributed to network shifts, we expect a significant share of natural traffic growth to characterise the Asset’s performance going forward.

6.44 We see a positive outlook for the region and the Asset as it serves significant urban centres such as Delhi NCR, Faridabad, Palwal, Agra, Mathura, and Vrindavan. Furthermore, it caters to long-distance movements to/from Chennai, Bangalore, Hyderabad, etc. The underlying growth drivers of the corridor are strong, which we believe will deliver sustained long-term traffic growth on the Asset.

6.45 Our observations, analysis and conclusions in this report are based on thorough analysis of primary and secondary data, site visits, feedback from Client meetings, and macroeconomic assumptions prescribed by the Client. While there may be both positive and negative risks associated with these assumptions and forecasts, the broad growth outlook for the Asset remains positive owing to its strategic position as a key link between Delhi and North India and the rest of the country, including the East, Central and Southern parts of the country. It’s proximity to Delhi NCR and other industrial clusters in and around the region also bode well for the Asset as it will continue to observe traffic flows that originate from or are destined to these production and consumption centres, and will continue to experience the indirect impacts of general economic growth in the region and the country despite network related improvements and developments that may also impact traffic growth on the Asset over time.

Appendices

A Top 10 OD Pairs

A.1 Further to the OD analysis presented in Chapter 3 this appendix presents the top 10 OD pairs at each toll plaza. Please see this data for both CJVs and MAVs and OSVs combined below.

KM46 Gadpuri

Table A.1: CJV and Bus top 10 OD pair shares at KM46 Gadpuri

	OD Pair	Share
1.	Palwal city-Faridabad City	22%
2.	Central Delhi (inside ring road)-Palwal city	11%
3.	Palwal city-Ballabgarh	7%
4.	Faridabad City-Pirthala, Bhagola	5%
5.	Pirthala, Bhagola-Ballabgarh	5%
6.	Mathura-Central Delhi (inside ring road)	5%
7.	South West Agra including Agra City-Central Delhi (inside ring road)	3%
8.	Central Delhi (inside ring road)-Pirthala, Bhagola	2%
9.	Mathura-Ballabgarh	2%
10.	Bhangel, Noida-Central Delhi (inside ring road)	2%

KM164 Mahuvan

Table A.3: CJV top 10 OD pair shares at KM164 Mahuvan

	OD Pair	Share
1.	South West Agra including Agra City-Mathura	53%
2.	South West Agra including Agra City-Central Delhi (inside ring road)	13%
3.	South West Agra including Agra City-Vrindavan, Raya	6%
4.	Mathura-Farah, Parkam	4%
5.	South West Agra including Agra City-Faridabad City	2%
6.	Mainpuri, Etah, Firozabad-Mathura	2%
7.	South West Agra including Agra City-South West Haryana (Gurugram)	1%
8.	Mathura-North Madhya Pradesh	1%
9.	South West Agra including Agra City-Hodal	1%
10.	South West Agra including Agra City-Refinery, Mathura, Mahuan	1%

Source: Steer analysis of OD data

Table A.4: MAV and OSV top 10 OD pair shares at KM164 Mahuvan

	OD Pair	Share
1.	South West Agra including Agra City-Mathura	4%
2.	South West Agra including Agra City-Central Delhi (inside ring road)	4%
3.	Central Delhi (inside ring road)-Tamil nadu	3%
4.	Central Delhi (inside ring road)-West Maharashtra	3%
5.	Central Delhi (inside ring road)-West Bengal and Sikkim	3%
6.	Central Delhi (inside ring road)-Karnataka	2%
7.	Central Delhi (inside ring road)-North Madhya Pradesh	2%
8.	Punjab, Chandigarh-West Bengal and Sikkim	2%
9.	Mathura-North Madhya Pradesh	2%
10.	Central Delhi (inside ring road)-Chhatisgarh	2%

Disclaimer

This report has been produced for the sole benefit of Cube Highways Pvt. Ltd ("the Client"). The report may only be relied upon by Approved Addressees in accordance with the terms of our engagement letter. The report is confidential and disclosed only for information purposes, and it may not be relied upon by any party other than the Client or a Party to a Reliance Letter, and Steer: a) makes no warranty, expressed or implied, with respect to the use of any information or methods disclosed in this Report; and b) assumes no liability with respect to the use of any information or methods disclosed in this document. Any such party by its acceptance or use of this Report releases Steer from any liability for direct, indirect, consequential, or special loss or damage whether arising in contract, warranty, express or implied, tort or otherwise.

The Report is based on standard professional efforts, and information available to us at the time the review took place and is subject to time and budget constraints of the Report's scope of work. This Report, information and statements contained herein, are all based on third party data provided to us, or sourced by us, and Steer has not sought to establish the reliability of the data, except as specifically stated in the Report. Steer bears no responsibility for the results of any actions taken on the basis of third-party data.

Certain forward-looking statements in the Report are estimates based on interpretations or assessments of information available at the time of writing. The Report is thus to be viewed as an assessment that is time-relevant, specifically referring to conditions at the time of the review. Steer undertakes no obligation to update the Report for any reason.

While the estimates contained in the Report are not precise forecasts, they do represent, in our view a reasonable expectation of the future, based on information we have been provided with or sourced. However, the estimates necessarily rely on numerous assumptions and judgements, and circumstances may occur over the timeframe of the project that go counter to these assumptions and judgements and that affect the project's realized revenues. Actual events may differ from those assumed, and events are subject to change. Therefore, Steer makes or provides no warranty, whether implied or otherwise, as to the accuracy of forward-looking information presented. Further, it is important to note that forecasts presented represent long term growth profiles; the results for individual time periods may vary from forecasted values.

Traffic Consultant developed the relationships in the models used to produce the forecasts for the projects based on data available through September 2025. This report does not consider variations in traffic performance due to changing macro and force majeure events such (but not limited to) as global wars, economic uncertainty (high inflation, global recession), and changes in the regulatory environment. The situation remains dynamic and is subject to significant change in the short and medium term. In this challenging context, Traffic Consultant has produced base forecasts with a view on a possible scenario for the traffic forecasts. However, it is important to note that this is only one view, and there continues to remain uncertainty as to the short-term, intermediate or prolonged effects of and responses to such macro-economic/force majeure events. As a result, no assurance can be provided by Traffic Consultant that the scenarios and assumptions Traffic Consultant has identified will prove to be accurate. Given the uncertainty inherent in this scenario, Traffic Consultant advises that all readers of the

Report consider the Report in the context of their own assessment of the impact of such events.

TO THE FULLEST EXTENT PERMITTED BY APPLICABLE LAW, THE LIABILITY OF THE TRAFFIC CONSULTANT FOR ANY LOSS, DAMAGE, COST OR EXPENSE SUFFERED OR INCURRED BY ALL PERSONS OR ENTITIES AND FOR ALL CLAIMS RESPECTING ITS WORK PERFORMED IN CONNECTION WITH THE ISSUE OR THE REPORTS IS HEREBY LIMITED IN THE AGGREGATE TO THE AMOUNT OF FEES ACTUALLY PAID BY THE CLIENT TO THE TRAFFIC CONSULTANT IN RESPECT OF THE REPORTS AND CONNECTED SERVICES.

TMS	Traffic Management System
TVC	Traffic Volume Count
WADT	Weekly average daily traffic
YTD	Year to Date

1 Introduction

1.1 The Cube Highways Fund Advisors Private Limited (the "Client") has commissioned Steer Davies Gleave India Private Limited ("Steer") for a traffic due diligence to be carried out on the Farakka-Raiganj Tollway Road (hereafter called "Asset"). This report forms part of the annual fair market valuation (FMV) undertaken as part of the "Transit 10 project". This report presents an update of the traffic and revenue forecasts based on actual traffic data available up to September 2025 and latest macro-economic assumptions.

1.2 The Asset Farakka-Raiganj consists of a single stretch of toll road with two toll plazas. For the purpose of this report, we hereafter call the toll plazas present on the Asset as TP1 and TP2 respectively as:

- TP1 – Lakshmipur
- TP2 – Gazole

1.3 Our scope of work for the traffic and revenue forecasting process includes:

Table 1.1: Scope of work and sources of data

Scope of work	Data source
• Review of historical Traffic Management System (TMS) data, Vendor reports and documents	• Provided by client for the period between Oct'16 and Sep'25
• Historical analysis and forecasts for baseline growth, including; — Background growth, and — Seasonality trends	• Historical data provided by the Client and benchmarking using plazas in the vicinity or of similar nature of the Asset has been done wherever sufficient data was unavailable.
• Validation of revenue reported in FY26YTD	• TMS data provided by Client • Revenue reconciliation using toll plaza traffic and ticket type data to calculate revenue and reconciling it with toll plaza reported revenue
• Origin Destination (OD) analysis to understand growth drivers: — Zonal influence and Top OD pairs — Commodity distribution — Trip length distribution	• Origin Destination (OD) surveys undertaken by Steer in 2023 (TP1) and 2019 (TP2) respectively
• Analysis of upcoming network improvements and other developments, that may have future impacts on traffic	• Secondary research and our in-house experience of working in the vicinity of the Asset. Impact analysis to be conducted by Steer based on Generalised Journey Cost spreadsheet-based analysis

Scope of work	Data source
• Historical revenue analysis and forecasts for revenue estimation, including — Toll segmentation and trip factors, — Overloading shares	• Calculated from historical data provided by Client
• Final traffic growth forecasts including baseline growth rates and potential future impacts	• Elasticity based base growth and potential impacts from secondary research, Asset historical traffic performance and Steer's in-house experience of working on toll roads on the corridor • Gross Domestic Product (GDP) forecast assumptions provided by Client
• Toll revenue estimation for the entire concession, including toll evolution	• Toll evolution based on latest toll notification published by National Highway Authority of India (NHAI) and latest actual Wholesale Price Index (WPI) trends as shared by the Client. • Assumptions of WPI forecasts and future tolling length changes provided by Client • Revenues estimated as a product of traffic forecasts and toll evolution

Our approach

1.4 Our approach follows well-established practices for forecasting ongoing traffic growth on an existing/brownfield Asset. The analysis has essentially focused on two sets of issues, namely:

- understanding the traffic that is currently using the Asset; and
- identifying how and why that traffic is likely to change in the future.

1.5 To understand the current traffic on the Asset, we have analysed traffic data from multiple independent sources:

- Client-provided secondary data, including:
  - TMS data starting Oct'16 to September 2025.
  - Concession agreement and toll notifications for FY25 and FY26
  - Previous studies related to traffic and revenue
  - Bid documents and studies by lenders
  - In the previous study in 2023, Steer-commissioned OD surveys on one plaza of the Asset, TP1 Lakshmipur to validate any change in growth drivers and travel patterns on the Asset. Survey on TP1 was conducted on 3rd July 2023 and on TP2 in the earlier commission in 2019.
  - In the previous study in 2023, Steer-commissioned TVC counts from 2nd July to 5th July 2023 at TP1 Lakshmipur on behalf of the client to validate TMS data independently. The TVC counts on TP2 Gazole had been undertaken as part of earlier study in 2019.
- We undertook revenue reconciliation on FY26YTD by building up revenue from the traffic reported by each of the toll plaza and subsequently match it to the reported

revenue for FY26YTD using the prevalent toll rates and reported segmentation/toll-frequencies for FY26YTD, this is a key part of our analysis to validate the segmentation/toll-frequency assumptions and the Annual Average Daily Traffic (AADT) reported for each of the toll plaza.

1.6 The estimation of future traffic demand on the Asset was undertaken through:

- Estimating FY26 base year position. The FY25 AADT was calculated using the monthly traffic data for FY25. The annual FY25 AADT was then grown with elasticity linked GDP/GSDP growth to arrive at the FY26 expected traffic. To determine the adopted FY26, the expected FY26 traffic was validated against the ten months of actual traffic (Apr-Sep) and necessary adjustments were made where required.
- Secondary research to understand plans for new developments and progress of ongoing developments on the Asset.
- Steer independent primary surveys and site visits to validate our network and contextual understanding.
- Developing a bespoke growth model for each Asset/plaza/toll class to forecast year-on-year traffic growth from FY26 to the end of concession period.
- Investigating the elasticity of historical traffic growth compared to state (GSDP) and national (GDP) growth. Where historical data is limited, we have benchmarked the Asset against our Steer knowledge base (e.g., similar Asset types in the same state or on the same corridor), to derive appropriate elasticities.
- Applying our elasticities to independent GDP forecasts as provided by client.
- Identifying and analysing the potential impacts of any relevant changes to the competitive position of each Asset – these include impacts of changes to road network including expressways and opening of competitive modes of travel.
- Identifying and analysing any other potential impacts to traffic and revenue on each Asset – these include axle load norms, axle shift for heavy goods, FASTag implementation.
- Considering changes in trends of segmentation over time and making suggestions for changes in exemptions in the future
- Preparing traffic and revenue forecast for the Asset for the complete length of concession. The analysis here includes the specific impacts of network, or other exogenous factors specific to the Asset. We have developed a set of forecasting assumptions for three scenarios: a base case and upside and downside scenarios.

Contents of this report

1.7 The report has been divided into the following chapters, including Chapter 1 providing an introduction:

- Chapter 1 introduces the methodology and approach to undertake the traffic and revenue due diligence;
- Chapter 2 describes the key characteristics of the Asset and its surrounding road network, primarily based on site visits;
- Chapter 3 summarises the current and historical traffic trends on the Asset, including results from the TMS, TVC and OD analysis;
- Chapter 4 presents the socio-economic context of India, the corridor and region/state containing the Asset, along with our approach and results on estimating background along with our key forecasting assumptions,

- Chapter 5 presents our baseline year forecast and summarises our results on estimating background traffic demand growth
- Chapter 6 summarises our assessment of network impacts and presents concession traffic and revenue forecasts for the Asset along with the assumptions for upside and downside cases.

2 The Asset

Introduction

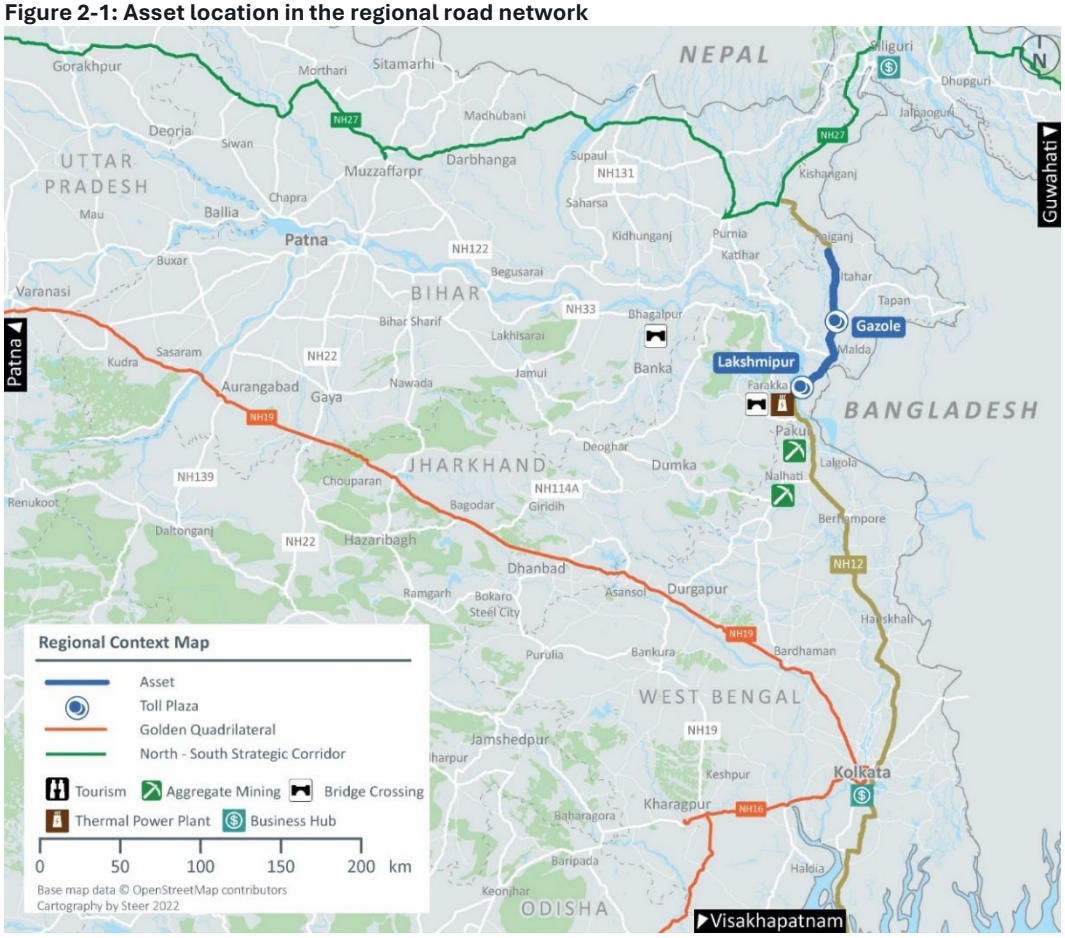
2.1 This chapter provides a description of the Asset, based on both primary data (from site visits), and our understanding of the region and network surrounding the Asset. We cover the strategic network context, followed by key economic activities and network developments around the Asset.

Strategic network

2.2 The Asset is situated in the state of West Bengal, connecting the cities of Farakka and Raiganj and provides connectivity to the city of Malda. The Asset is also located very close to the international border of Bangladesh

2.3 The figure below shows the regional road network in which the Asset is located.

Figure 2-1: Asset location in the regional road network



Source: Steer cartography using OpenStreetMap data.

2.4 As the Asset sits near the border, it also provides connectivity to international land ports on India-Bangladesh border at Mahadipur and Hili (via NH512) connected to the Asset at Malda and Gazole respectively.

2.5 Traffic on the project road is primarily commercial traffic carrying goods to/from different parts of the state of West Bengal, the north-eastern states, adjoining western states (Bihar and Jharkhand) and some southern states (such as Andhra Pradesh and Tamil Nadu).

2.6 The Asset primarily caters to three different types of strategic movements:

- **Short-distance trips** between Malda and other towns in Malda and Murshidabad districts.
- **Medium-distance** trips between southern and northern parts of West Bengal, including movements between Pakur district of Jharkhand, Malda, and Bangladesh.
- **Long-distance trips** between South and East India including Kolkata, and Northeast India. Kolkata is the largest urban agglomeration and one of the four older metropolitan cities of India and is both a large attractor and generator of consumption-linked commodities in East and Northeast India.

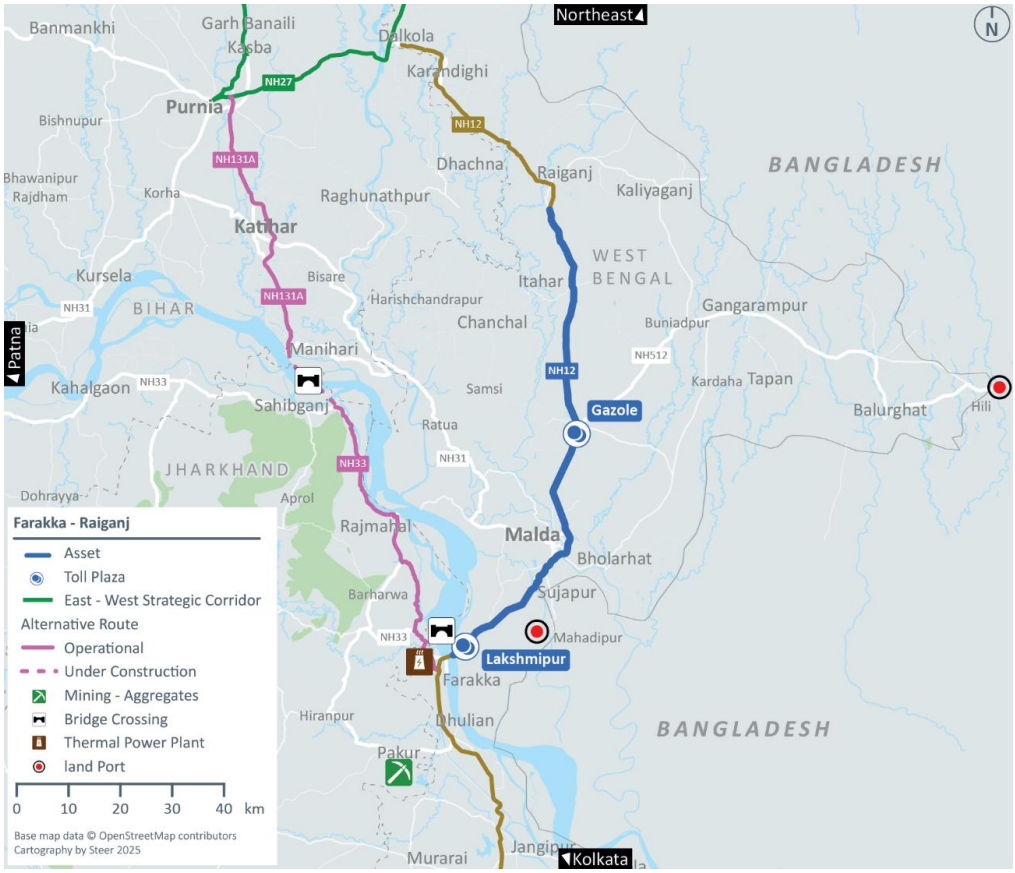
2.7 Essentially, both medium-distance and long-distance movements need to cross the two-lane Farakka Barrage, on the Ganges River, located just at the southern end of the Asset which makes the Asset a crucial funnelling link between southern and northern parts of West Bengal state. Traffic between Kolkata/Durgapur/Bardhhaman and Kishanganj/northeast regions use this barrage, and it is the only bridge crossing available in the region or on this route along the NH12. As a result, the Asset forms part of a strategic corridor that primarily serves long distance commercial traffic.

Asset context

2.8 The Asset is a 100 km toll road section of the NH12 that is the main north-south highway in West Bengal. It is a four-lane highway with two toll plazas, namely, Lakshmipur (TP1) at Km 297.9 (nearer to Farakka) and Gazole (TP2) at Km 351.4 (nearer to Raiganj).

2.9 Malda and Gazole are major settlements situated along the Asset and serve as trip generators / attractors of short – medium distance passenger and commercial traffic that are observed crossing one or both toll plazas on the Asset. Figure 2-2 below provides a closer view of the Asset in the context of its immediate surroundings.

Figure 2-2: Asset context



Source: Steer cartography using OpenStreetMap data

Concession and tolling details

2.10 Both toll plazas on the Asset have been operational since October 2016 and the Client assumed operations in September 2020. Currently, FY42 is expected to be the last year of the concession, implying 16 years remaining in its concession life. Table 2.1 below summarises key aspects of the concession.

Table 2.1: Key concession details

Particulars	Details
State	West Bengal
Highway and lane configuration	NH12, four-laned
Toll plazas	• TP1: Lakshmipur • TP2: Gazole
Appointed date	February 2011
Commencement of operations*	October 2016
Operated by Client since	September 2020
Concession period	30 years
Last year of concession	FY42
Tollable length (Km) as per concession agreement, applicable	TP1: 56.715 km (including 9.05 km Malda Bypass)

Particulars	Details
	TP2: 43.375 km

Source: Client Data

2.11 Figure 2-3 below shows a typical cross-section of the Asset and its toll plazas.

Figure 2-3 (clockwise): TP1 Lakshmipur, TP2 Gazole, Raiganj Bypass and ROB, Stone Chip Stockyard at India-Bangladesh Border in Mahadipur

Source: Steer site visit

2.12 Tolls are collected for the following ticket categories: Single, Return, Local Commercial, and Monthly tickets. The toll plazas have dedicated ETC/FASTag lanes for electronic tolling.

2.13 Table 2.2 below presents single journey toll rates for FY26 at both the toll plazas.

Table 2.2: Single toll rates on the Asset (INR), applicable April 2025 to March 2026

Type of Vehicle	Single Journey Fee	
	TP1 Lakshmipur	TP2 Gazole
CJV	145	65
LCV	230	105
Bus/Truck	470	225
HCM/EME/3A/MAV	720	350
OSV	915	425

Key economic activities

2.14 Traffic on the Asset is primarily commercial traffic carrying agricultural commodities, and construction materials to/from different areas within the state of West Bengal, the north-eastern states, neighbouring states of Bihar and Jharkhand and some southern states (such as Andhra Pradesh and Tamil Nadu). It also serves traffic originating from or destined to neighbouring countries of Nepal, Bhutan and Bangladesh. West Bengal is regarded as the gateway for India's Act East Policy[1], which aims to strengthen India's strategic, economic, and cultural ties with the Southeast Asian countries, including Bangladesh. In this context, the Asset can be classified as providing critical infrastructure connecting India to Bangladesh via land ports at Mahadipur and Hili.

2.15 Pakur district (JH), located 25 km south of the Asset, is an important region for the production and transportation of stone aggregate to Bangladesh via land ports at Mahadipur, Hili, and other locations further north and along the India-Bangladesh international border. As of January 2018, there were 246 operative and non-operative stone mines across the full district[2] and 255 stone-crushing units[3] that process stone mined from quarries into stone chips/aggregates that are transported to serve construction demand both domestically and across the border in Bangladesh. Seasonal changes, mining regulation, and govt. policies such as vehicle overloading restrictions all have direct and indirect impacts on commercial traffic growth on the Asset as they relate to the productivity and operations of these mines.

2.16 Thus, key economic activities in the region include agriculture and related activities (cotton, rice, and vegetables being the major commodities) and stone (aggregate) mining. Agricultural commodities that are produced and transported via the asset from local farms and cold storages vary by season, and specific externalities. Mining output and materials carried on the asset are impacted by market demand dynamics in both domestic and international markets (primarily Bangladesh), government policies and regulation, as well as seasonal variation. The extent to which these factors do and could continue to impact traffic growth on the Asset is discussed briefly in Chapter 6 below.

Influence of Bangladesh Economy and Domestic Policies on Asset Performance

2.17 As aforementioned, international demand for construction material, particularly stone chips/aggregate demand in Bangladesh serves as an important driver of commercial traffic growth on the Asset. Given the strategic significance of Bangladesh’s economy to the Asset, it is important to review how economic conditions in Bangladesh over the past year have evolved and impacted traffic growth on the Asset:

2.18 In FY24, the country's commercial banks had struggled to meet their import payment obligations, which reduced their foreign exchange reserves[4] and made it more challenging

[1] **Bangladesh corridor vital to India’s ‘Act East’ policy (World Bank blog, September 2017)**

[2] **(PAKUR) DISTRICT SURVEY REPORT FOR STONE MINING (2016-2017)**

[3] **https://dcmsme.gov.in/dips/Pakur.pdf**

[4] **Major challenges for Bangladesh economy in 2023 | The Financial Express**

to get "Letters of Credit". This continued through the early part of FY25 as well before significantly improving over the past five months[5].

2.19 According to a report published by the Asian Development Bank[6], the downturn in the Bangladesh economy in FY23 and early months of FY24 reflected falling private and public investment tied to high inflation and lower export demand. In FY24, GDP growth in Bangladesh slowed further and expectations of growth in FY25 were also qualified given impact of global supply chain disruption and political transition.

2.20 In addition to the above, which has affected construction activity in Bangladesh and subsequently reduced stone chip/aggregate exports from India (see Figure 2-4 below), domestic policies such as the crackdown on illegal stone mining and quarrying in Jharkhand (and across the wider nation) and other market factors[7] have also impacted production of stone chips/aggregate in Pakur district over the past few years. Both these developments have contributed to suppressed growth of commercial volumes on the Asset. Based on this, expectations of future growth in commercial traffic on the asset is discussed in more detail in Chapter 6.

Alternate and feeder routes

Alternate routes

2.21 Following from the strategic network context of the Asset (as described above), this section details alternate routes that are either currently available or may be potentially

[5] Overdue import bills down to $88m from $445m in five months | The Business Standard

[6] Asian Development Outlook (ADO) April 2024: Bangladesh

[7] Mechanisation, shutting down of stone quarries push Pakur's workers to the brink - Daijiworld.com

available (in future) to users of the Asset. As part of this study, we have conducted an extensive review of these alternate routes and network developments and have incorporated the impact of those that we believe would impact the Asset significantly into our final traffic and revenue forecasts. These impacts can be summarized as follows:

- Ro-Ro service between Rajmahal and Manikcha[8] : For north-south movements on road, the NH12 (Asset) is the only option for medium-distance traffic between Pakur district (JH) and Malda (WB) or Bangladesh. However, according to truck driver interviews conducted during our site inspections, the unofficial Ro-Ro service between Rajmahal (JH) on the southern bank, and Manikchak (WB) on the northern bank of the Ganges offers an alternative north-south route to the Asset. This route is typically used during times of severe traffic congestion on the Asset, generally due to roadworks and construction activity on the Farakka Barrage. Based on our site visit observations and general understanding of travel patterns within the regional network, the service provided by the Ro-Ro route is currently of an informal set-up, and unlikely to form a competing alternative to the asset for medium-distance commercial volumes carrying stone chip/aggregate materials to/from Pakur to other parts of WB and into Bangladesh. Therefore, we have excluded any potential impact of this route alternative on future traffic growth on the Asset.
- New bridge over Ganga River in Sahibganj, Bihar: A four-lane bridge of length 6km on the Ganges River near Sahibganj, is currently under construction between Sahibganj and Manihari. It is expected to be completed by FY27-FY289. This would provide a route choice to the OD pairs including but not limited to, south of Farakka (including Kolkata, Bardhhaman, Pakur) and North of Raiganj (area between Kishanganj and Supaul including Purnia, Katihar). This impact is evaluated in Chapter 6 below.

Feeder routes

2.22 Over the past few years, several sections of the NH12 highway have been upgraded over time and have significantly improved the overall Level of Service provided by the highway for vehicular traffic travelling both short and long-distances between north, central, and south WB, as well as from/to neighbouring states. While the 4-laning of Farakka-Raiganj section of the NH12 (i.e., the Asset) was completed in FY22[10], the upgrade of the highway extending further north and south of the Asset generally bodes well for traffic growth on the Asset as overall Level of Service (LoS) across a longer stretch of the NH12 is improved and made more attractive to users travelling both short and longer distances. Some of these improvements considered in our network analysis include the following:

- The Dalkhola bypass on the NH12 that was completed in FY22.
- By March ‘24, the section of the NH12 north of the Asset between Raiganj and Dalkhola had also been fully upgraded to 4-lanes[10], along with the opening of the Raiganj Bypass and ROB by May 2024[11].

[8] **What Is RoRo Shipping? A Guide for Businesses & Individuals**

[9] **Project Details - NHAI (4L of Sahibganj - Manihari Ganga Bridge including Manihari Bypass)**

[10] **AS172.pdf**

[11] **Opposition slams Centre’s move to open unfinished road before LS elections**

- 4-laning of the Krishnanagar-Behrampore section of the NH12, expected to be completed by FY26[12].
- The new Farakka Setu, which is a ~2.6km 4-lane road bridge connecting Farakka to Baishnabnagar across the Ganga is under construction. Though construction was expected to get completed by the end of August 2025, the bridge has still not been opened to the public[13]. This can be expected to be opened around mid-FY27.

2.23 We understand that the new bridge will act as a replacement to the existing Farakka Barrage where road traffic will be fully restricted post completion of the new bridge. Plans to construct a rail bridge alongside the completed road bridge have been voiced but not officially sanctioned.

2.24 Based on the network developments listed above, we believe the impact of the improved LoS of the NH12 highway due to completion of the Dalkhola Bypass, Raiganj Bypass and ROB, as well as 4-laning of the full Farakka to Dalkhola section of the NH12 is already being observed on the Asset. The construction of the New Farakka Setu over the past several years and expected construction of the rail bridge beside it is expected to keep construction related traffic growth on the Asset consistent over the near to medium-term. In our analysis, we have not included any additional LoS impact due to the New Farakka Setu as it is meant to replace the access currently being provided by the Farakka Barrage. Given that the Krishnanagar-Behrampore section of the NH12 is still not full upgraded to 4-lane configuration, we have incorporated the impact of this improved LoS on NH12 in our future traffic growth forecasts on the Asset.

Overloading

2.25 Given the nature of commodities carried by commercial vehicles on the Asset, which primarily comprise heavy weight high-volume items such as construction materials - particularly stone chips/aggregates - overloading of commercial vehicles has been historically prevalent on this corridor. Overloaded vehicles are charged through a staggered overloading penalty system, where truckers pay up to 10 times the toll as a penalty.

2.26 Due to historical prevalence of overloading on the corridor, several truckers using the NH12 to transport commodities have also become accustomed to paying overloading penalties and have pre-determined routes that account for the various hidden and apparent transaction costs of transporting goods in overloaded vehicles.

3 Traffic Description

Introduction

3.1 This chapter presents historical traffic and revenue growth trends on the Asset, as well as our analysis of origin-destination (OD) data and traffic count data sourced from primary surveys. This covers data which was collected as a part of this study and previous studies, as well as data provided by the Client.

3.2 Traffic count data is generally collected and analysed to understand the volume and vehicle composition of demand currently using the Asset, while OD data is used to obtain a better understanding of travel patterns, trip lengths, trip purposes and areas of influence in the vicinity of the Asset, as well as the commodities being moved by goods vehicles. This analysis, combined with our understanding of the Asset (based on our site visits), enables us to identify the key drivers of demand on the Asset.

3.3 Toll plaza data is used as the primary basis from which the current/base year annual average daily traffic (AADT) is established. This data is typically provided by the Client and independently analysed and validated by us using traffic volume count (TVC) information.

PCU Factor assumption for Forecasts

3.4 The PCU factors considered in Table 3.1 below are as per IRC64 1990[14]. Based on the discussion with the Client, we have referred to the rigid and trailer splits from the TVC data collected earlier for calculating the effective PCU for MAVs. For Rigid trailer trucks we have assumed a PCU factor of 3, whereas for Trailer trucks we have assumed a PCU factor of 4.5 as defined in IRC64 1990

Table 3.1: PCU factors

Vehicle Category	PCU Factor
CJV	1.0
Mini LCV	1.0
LCV	1.5
Bus	3.0
2A	3.0
3A	3.0
MAV	3.35
OSV	4.5

Historical trends

3.5 The table below presents the historical traffic evolution for each of the Asset toll plazas. Historical traffic data on the Asset is available from October 2016 through FY26YTD (September 2025). However, since the data for the complete FY17 is not available, Table 3.2 to Table 3.5 below present the data between FY18 and FY26YTD.

Table 3.2: Traffic levels at TP1 Lakshmipur

Source: Steer analysis of Client data; FY26YTD includes data till September'25; Tollable traffic excludes exemption and violation; *2A includes Buses till March 2021

3.6 TP1 (Lakshmipur) observed a CAGR of 2.1% in terms of PCU between FY18 and FY25, while TP2 grew by CAGR 3.2% in the same period. The increase in CJV volumes at both toll plazas in FY25 can be attributed to an increased LoS offered by the completion of the Raiganj Bypass and ROB north of the Asset as well as the completion of the 4-laning of the Dalkhola-Raiganj section of the NH12 by March 2024 making CJV travel more attractive.

3.7 TP2 (Gazole) carries more CJV traffic compared to TP1, as TP2 is closer to the town of Malda which contributes to higher passenger traffic on the Asset. Additionally, 2A+Bus account for a considerable share of total traffic at both plazas, at around 1,600 and 2,000 AADT in FY25 at TP1 and TP2 (respectively).

3.8 The growth trend of tollable traffic on the Asset has been at the same level as that of total traffic. For the period of FY18-25, TP1 Lakshmipur recorded an average annual growth of 2.0% per year for its tollable PCU compared to 2.1% per year for total PCU. Over the same

period, TP2 recorded an annual growth of 3.2% per year for its tollable PCU vs. 3.2% per year for total PCUs.

3.9 3A category has shown a negative trend historically. The reduction in 3A volume is a result of the declining demand for 3A vehicles, which are being replaced by 2As and MAVs – a trend not unique to the Asset or region. MAVs offer higher tonnage capacity making them more cost-effective for transporters with the Asset primarily catering to construction traffic, movement towards MAV's is more favourable for users. While the increase in 2A volume reflects the growing preference for these vehicles due to favourable changes in the legal permissible loads for 2As and their suitability for e-commerce-related freight, particularly high-value, low-volume goods over medium to long distances. This is consistent with our discussion with various transporters and OEMs across the country who are favouring 2A and 5A vehicles for commodity movement due to better unit economics.

3.10 The recent decline in commercial volume especially in FY25 and FY26YTD has been partly contributed by decline in exports to Bangladesh, due to the recent economic and political turmoil the country has seen (refer chapter 2). It is expected that the Bangladesh economy should revive in the medium term resulting in improved traffic performance on the Asset.

3.11 Table 3.6 and Table 3.7 below present total annual revenue (in INR Cr) and AADC (in INR Lakhs) at TP1 and TP2 respectively over the period FY21-FY26YTD.

Table 3.6: Total revenue (INR Crores) and AADC (annual average daily collection) in INR Lakhs at TP1 Lakshmipur

Year	TP1 (INR Crores)	AADC	AADC Growth (%)
FY21	88.3	24.2	-
FY22	140.2	38.4	58.8%
FY23	155.6	42.6	10.9%
FY24	162.2	44.3	4.0%
FY25	165.8	45.4	2.5%
FY26YTD	91.2	49.6	9.1%

Source: Steer analysis of the Client data; FY26YTD includes data till September'25

Table 3.7: Total revenue (INR Crores) and AADC in INR Lakhs at TP2 Gazole

Time Period	TP2 (INR Crores)	AADC	AADC Growth (%)
FY21	78.4	21.5	-
FY22	63.2	17.3	(19.4%)
FY23	69.7	18.7	7.9%
FY24	70.5	19.3	3.1%
FY25	54.0	17.8	(7.5%)
FY26YTD	40.6	22.0	23.7%

Source: Steer analysis of the Client data; FY26YTD includes data till September'25

3.12 As of FY26YTD, TP1 Lakshmipur reported an AADC of ~INR 49.6 Lakhs – significantly higher than the ~INR 22.0 Lakhs reported by TP2 Gazole.

3.13 In FY25, the Asset recorded an average daily collection of INR 63.2 lakhs. This is at the same level observed in FY24 (INR 63.6 Lakhs).

Toll Frequencies

3.14 Toll frequency or ticket segmentation is typically the share of each ticket category recorded for a particular vehicle type. This is based on the toll policy which forms a part of the concession agreement. Each vehicle category has a different ticket segmentation. As a part of our historical data analysis, we calculate toll frequencies for each vehicle category from the latest monthly traffic data shared by the Client. The most common ticket categories observed on a typical National Highway concession are: Single, Return, Monthly, Local and Exempt. Given the local nature of traffic, some toll plazas offer custom made local passes to attract local commuters to opt for these category passes instead of evading toll. Further, the toll plazas also record violations which are non-paying users, who are not officially allowed under exemptions category but are forced exemptions. For the Asset, the segmentation discussed below reports Exemptions and Violations together.

3.15 Understanding toll frequencies provide us insights into the nature of traffic using the Asset. CJVs generally have higher shares of return passes or local monthly passes because they travel for short to medium distances, while heavy trucks mostly have single tickets since they travel longer distances. The Asset catering to short distance local traffic generally observes high share of return or other local monthly passes while the Asset catering to strategic long-distance traffic generally observes high share of single ticket traffic. Table 3.8 below presents ticket types currently sold at both the Asset plazas.

Table 3.8: Typical ticket types sold at NHAI plazas

Category	Description
Single	Allows the vehicle to cross the toll plaza once
Return	Allows the vehicle to cross the plaza twice in a day at discounted rates.
Monthly Pass	Discounted ticket for all road users issued at toll plaza who intend to undertake multiple single trips using the toll plaza. 50 trips are allowed on a discounted rate to be used within 30 days of issue.
Local Personal	Discounted single entry pass only for private cars of residents within 20km radius of toll plaza
Local Commercial	50% discount on single trips for commercial vehicles registered in the local district. This pass allows single entry only
Exemptions	Officially exempted vehicles like ambulance, police cars, key political personnel etc.

Source: Client data

3.16 As a general pattern, the shares of single/return/monthly tickets tend to stabilise within 2-3 years of the commencement of Asset operations. Only in the cases where trip patterns are expected to change significantly due to urban expansion is where we expect these shares to change over the period or due to some external events impacting the trip patterns. During FY21 and FY22, however, two key events impacted the traffic patterns throughout the country: COVID-19 and FASTag implementation.

3.17 FY21 had multiple disruptions in traffic patterns related to the pandemic. In February 2021, there was also significant change in ticket segmentation observed across several toll roads around the country due to the imposition of the use of FASTag, the electronic toll payment system mandated by the National Highway Authority of India (NHAI). This mandate significantly changed ticket patterns in FY21 and FY22 across most (if not all) toll road assets across the country including the Asset. However, by FY23, travel patterns had stabilised, following which they can be considered to follow normal travel behaviours on the Asset.

Introduction of Annual pass for CJVs

3.18 The National Highway Authority of India launched the “The FASTag Annual Pass” on August 15, 2025, a prepaid facility that allows private CJVs to travel across designated National Highway and National Expressway toll plazas. The annual pass is worth INR 3,000. The pass is valid for one year or 200 trips, whichever occurs first and is applicable only to private, non-commercial vehicles (Car/Jeep/Vans).

Since this pass has been introduced by NHAI, it is not valid on

- state governed toll plazas on highways
- state governed toll plazas expressways
- Parking areas or other non-NHAI tolling locations

3.19 The pass can be activated via the RajmargYatra app or the NHAI website, and links directly to an existing FASTag.

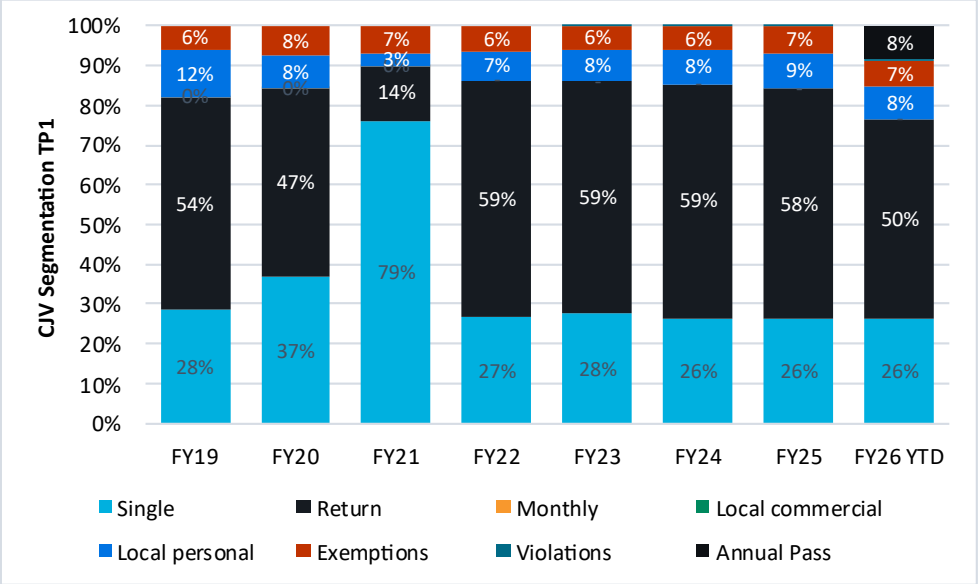
The Annual Pass aims to:

- Promote cashless and seamless travel on national highways.
- Reduce congestion and improve traffic flow at tolls
- Provide cost-effective travel for frequent users of NH/NE toll roads

Share of traffic by payment type

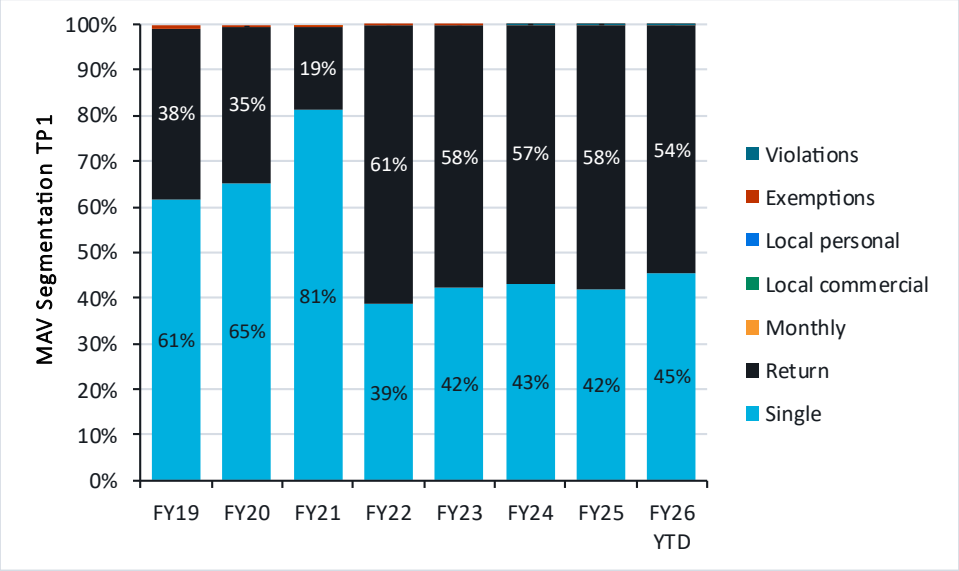
3.20 In our forecasted segmentation we have used the average ticket distribution by vehicle category observed in FY26YTD (April - September 2025) and held that constant through the end of the forecast. Figure 3-1 through Figure 3-4 below present historical changes in toll segmentation at both TP1 and TP2 for CJVs and MAVs.

Figure 3-1: Ticket-segmentation for CJV, TP1 Lakshmipur



Source: Steer analysis of the Client data; FY26YTD includes data till September'25

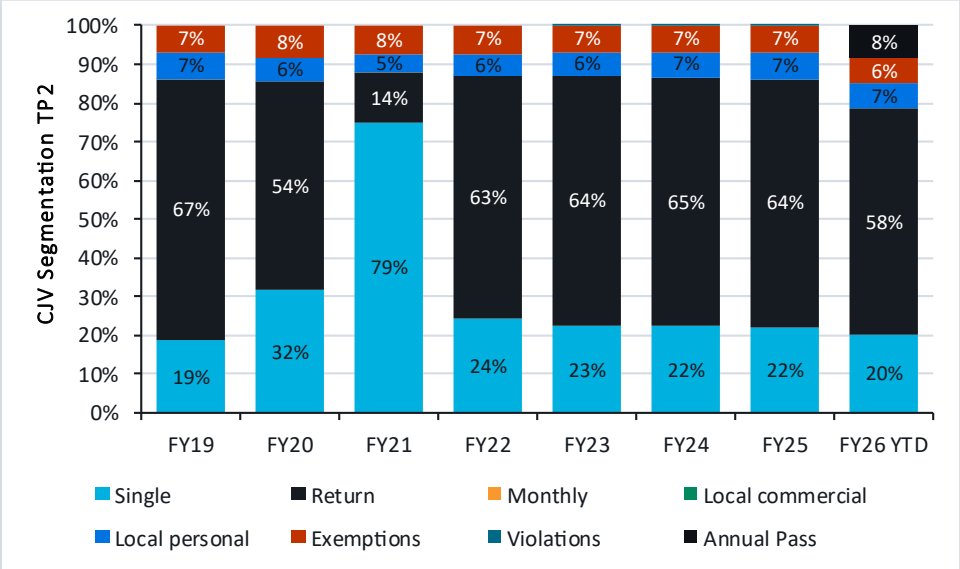
Figure 3-2: Ticket-segmentation for MAV, TP1 Lakshmipur



Source: Steer analysis of the Client data; FY26YTD includes data till September'25

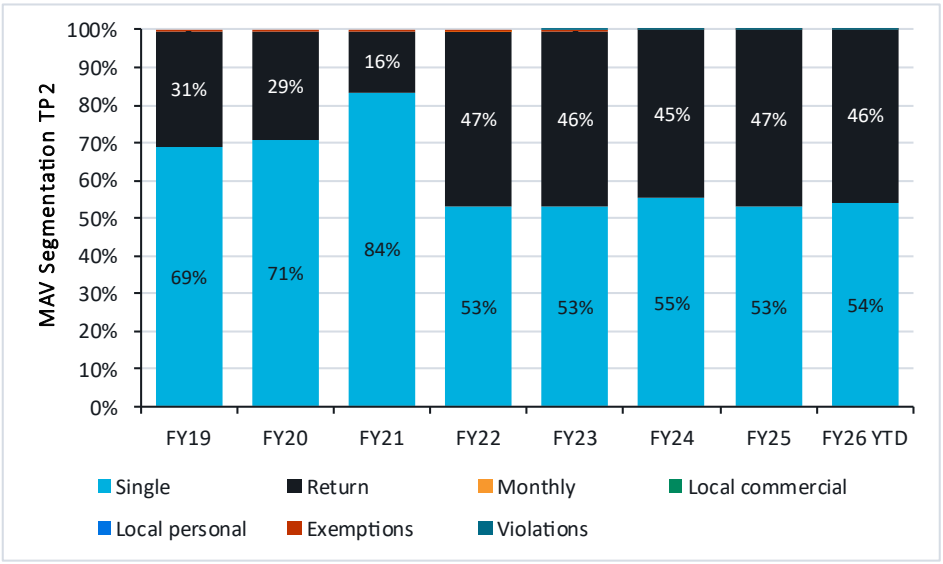
3.21 Ticket segmentations for both CJVs and MAVs at TP1 in FY26YTD are consistent with FY24 and FY25 segmentations. Return tickets remain as the dominant ticket category in FY26YTD accounting for more than 55% of tickets in both CJVs and MAVs. At TP1, the share of local personal tickets and exemptions for CJVs are 9% and 7% (respectively) as of FY26YTD and comparable to FY25 shares of the same tickets. This indicates stability in the travel patterns with no major differences. The high share of return tickets in MAVs (at 58% in FY26YTD) reflects the prevalence of short-medium distance commercial trips.

Figure 3-3: Ticket-segmentation for CJV, TP2 Gazole



Source: Steer analysis of the Client data; FY26YTD includes data till September'25

Figure 3-4: Ticket Segmentation for MAV, TP2 Gazole



Source: Steer analysis of the Client data; FY26YTD includes data till September'25

3.22 At Gazole, travel patterns are like Lakshmipur for CJVs where return remains the dominant ticket category. For MAVs however, the share of single tickets at TP2 is higher than observed at TP1. Additionally, the ticket segmentation across all vehicle categories in FY26YTD is consistent with FY25 levels.

3.23 Table 3.9 below depicts the FY26YTD segmentation (Apr-Sep'25) for LCV, Bus and 2As at TP1 Lakshmipur and TP2 Gazole.

Table 3.9: Ticket-segmentation for LCV, Bus and 2As at TP1 Lakshmipur and TP2 Gazole (FY26YTD)

Ticket Category	TP1 Lakshmipur				TP2 Gazole			
	LCV	Bus	2A	3A	LCV	Bus	2A	3A
Single	43%	58%	75%	78%	43%	54%	65%	73%
Return	52%	41%	23%	22%	57%	45%	34%	27%

Ticket Category	TP1 Lakshmipur				TP2 Gazole			
	LCV	Bus	2A	3A	LCV	Bus	2A	3A
Monthly	-	-	-	-	-	-	-	-
Local commercial	-	-	-	-	-	-	-	-
Exemption	6%	1%	1%	0%	1%	0%	1%	0%

Source: Steer analysis of Client data

Overloading

3.24 Based on our analysis of the historical data as shown in Figure 3-5 and Figure 3-6 below, the Asset shows a notable share of overloaded vehicles, especially for 2As, 3As and MAVs. This is due to the high share of denser commodities like aggregate and stone being carried on commercial vehicles on the Asset. FY26YTD overloading trends (compared to FY25) show a decline in LCVs and a rise in MAVs. The below figure and table layout the historical levels of observed overloading on the Asset.

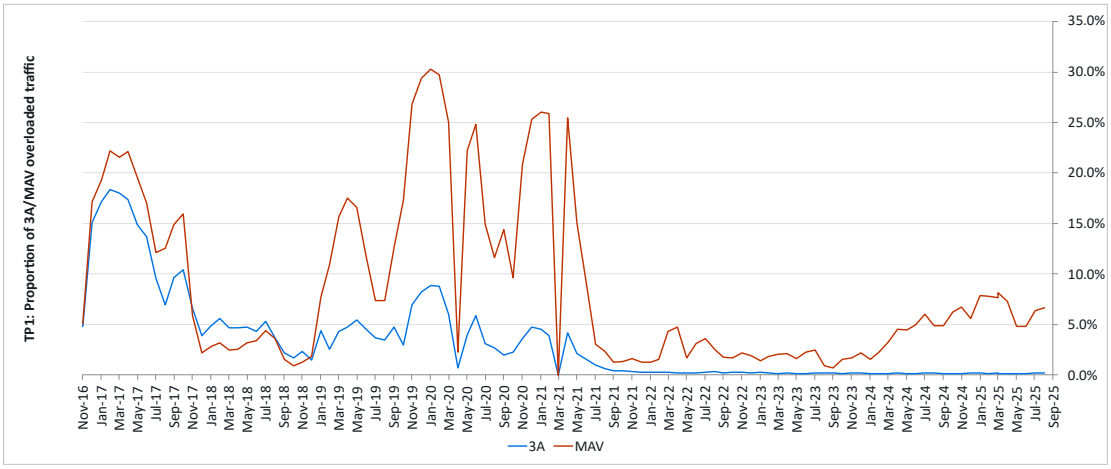
3.25 As observed in Table 3.10 below, due to strict restriction on overloading, the shares have consistently declined across all vehicles categories since FY21.

Table 3.10: Overloading shares between FY21-FY26YTD

Vehicle type	FY21	FY22	FY23	FY24	FY25	FY26 YTD
TP1						
LCV	6.2%	11.2%	5.1%	2.5%	1.7%	1.3%
2A	4.6%	0.8%	0.5%	0.3%	0.5%	0.4%
3A	3.6%	0.3%	0.2%	0.2%	0.2%	0.1%
MAV	15.1%	2.0%	2.4%	1.7%	6.0%	6.4%
TP2						
LCV	4.3%	8.7%	5.2%	3.4%	2.2%	2.1%
2A	2.5%	0.7%	0.5%	0.5%	0.6%	0.7%
3A	3.0%	0.4%	0.4%	0.3%	0.4%	0.7%
MAV	10.7%	1.5%	1.4%	0.0%	2.7%	3.3%

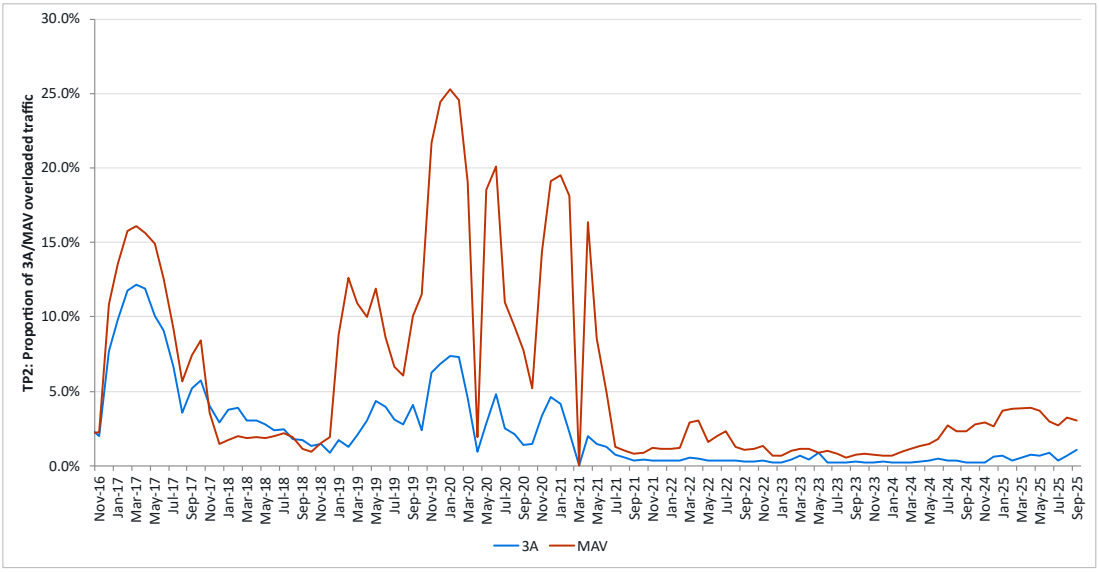
Source: Steer review of Client TMS data; FY26YTD includes data till September'25

Figure 3-5: 3A, MAV overloading shares at TP1 Lakshmipur (October 2016 – September 2025)



Source: Steer analysis of Client data

Figure 3-6: 3A, MAV overloading shares at TP2 Gazole (October 2016 – September 2025)



Source: Steer analysis of Client data

3.26 As shown in Figure 3-5 and Figure 3-6 above, the share of overloaded 3A and MAV vehicles at both plazas (TP1 and TP2) show a consistent drop since FY21. Historical overloading shares show large variations due to exogenous impacts - local authority restrictions leading to the drops in overloaded traffic from Jan-18 to Jul-18 and Jul-19; monsoons; repair works of Farakka Barrage and COVID-19.

3.27 Overloaded MAV traffic at both plazas have observed growth over FY24 levels. Between FY22 and FY24, the share of overloaded vehicles observed on the Asset was low due to the strict enforcement of government restrictions on overloaded vehicles across the state. This trend showed signs of abatement late FY24 onwards as non-compliance increased. In September 2024, the Federation of West Bengal Truck Operators Association (WBTOA) called for a three-day strike[15] demanding stronger enforcement

[15] **West Bengal truckers announce 72-hour strike over overloading and illegal fees | Kolkata News - Times of India**

across the state. As a result, the Asset observed a drop in the share of overloaded commercial traffic briefly during that time. However, as time progressed, the share of overloaded vehicles continued to increase with January 2025 observing 7.8% overloaded MAVs relative to 1.5% observed the previous year (January 2024).Figure 3-5 and Figure 3-6 above present historical growth in the share of overloaded 3As and MAVs at both plazas on the Asset.

3.28 In our forecasting models, to avoid high variability in overloading revenues going forward, and to reflect the assumption that growth in overloaded vehicles will not sustain, we have assumed overloading to remain constant at the average shares (by vehicle category at both plazas) observed over the period Apr-Sep '25. Any increase in overloading from current levels will be an upside on revenue on this Asset.

3.29 Historically, overloaded vehicles were charged a flat nine-times penalty of the Single fee for the vehicle type, on the Asset. However, based on an NHAI circular[16] dated 25 September 2018, the Client has been charging overloading penalties as per the staggered penalty system presented in Table 3.9 below. It is important to note that as per the information available 75% of the overloaded revenue is allocated to the old Concessionaire[17] and 25% of the overloaded revenue will be allocated to the new concessionaire.

Table 3-9: Overloading penalties on Asset

Percentage of excess load over Maximum Permissible Gross Vehicular Weight	Multiplying factor to Single rate of fees (including normal fees)	Penalty
0% to 20%	2	Single fee multiplied by multiplying factor
>20% to 40%	4	
>40% to 60%	6	
>60% to 80%	8	
>80% and above	10	

Source: NHAI circular [F. No. H-25016/1/2018-Toll]

3.33 Aside from the NHAI rules on overloading and penalties for the same, the local administration around the Asset has introduced bans on overloading at various times and lifted them later in the history of the Asset's operation. This reflects in the swinging shares of overloading observed on the Asset. As changes in the ability to overload change the number of trucks required to operate a certain payload, we observe associated swings in truck volumes as well during these periods. We discuss this in further detail in Chapter 6.

Data Collection exercise

3.34 As aforementioned, to validate and inform various inputs used in our forecasting, we undertook primary data collection on the Asset, comprising the surveys listed in Table 3.11 below. OD survey data was collected on behalf of the Client, TVC surveys were commissioned by Steer with a third party. OD data collection typically involves manual

[16] NHAI circular numbered F. No. H-25016/1/2018-Toll

[17] HCC is the old Concessionaire and the Client is the new Concessionaire

data entry by enumerators based on oral surveys with road users crossing toll plazas, which Steer also commissioned with a third party. TVC data collection involves video-graphic capture of traffic passing crossing the toll plazas, followed by manual counting.

Table 3.11: Data collection schedule

Toll Plaza	3-day videography based TVC			1-day OD survey	
	Start date	End date	Time (hrs)	Start date	Start time
TP1	2nd Jul 2023	4th Jul 2023	00:00-23:59	3rd Jul 2023	2000 hours
TP2	9th Dec 2020	15th Dec 2020	0000-2359	13th Nov 2019	0900 hours

Source: Steer analysis

3.35 It should be noted that, in our experience, traffic on national highways shows variation across the week due to the economic activities surrounding each road. To derive a representative TVC count considering daily variation, three-day to seven-day traffic counts are generally recommended, and hence, in order to fully understand the impact of this weekly fluctuation on the Asset, we had collected seven-day counts at each toll plaza.

Key findings of the TVC data analysis

WADT estimates

3.36 Taking an average of the TVC counts, we obtained the following weekly average daily traffic (WADT) for each toll plaza. This WADT excludes non-tollable vehicle such as tractors, two-wheelers, bullock-carts, etc., but includes officially exempt vehicles such as police cars, ambulances, emergency response vehicle, government vehicle and other vehicle types officially allowed as 'exempted' under the concession agreement.

3.37 As presented in Table 3.12 below, CJVs are largest vehicle category at TP1 (3,927), closely followed by MAVs at 3,483. However, at TP2, CJVs are the largest vehicle category (5,720), followed by MAVs 3,592. Lower truck volumes at TP1 and TP2 can be attributed to ongoing economic slowdown in Bangladesh. TP1 being closer to Bangladesh border Mahadipur observes heavy export items of stone chips/aggregate carried to Bangladesh. However, with the economic slowdown and reduced exports, total traffic has reduced on both plazas reflecting lower growth. Higher CJV volumes at TP2 is due to its proximity to more urban and densely populated town of Malda (as compared to Farakka for TP1).

Table 3.12: WADT from TVC counts

Toll Plaza	CJV	LCV	Bus/2A	3A/MAV	Total
TP1 Lakshmipur	3,927	882	955	3,483	**9,248**
TP2 Gazole	5,720	809	1,390	3,592	**12,454**

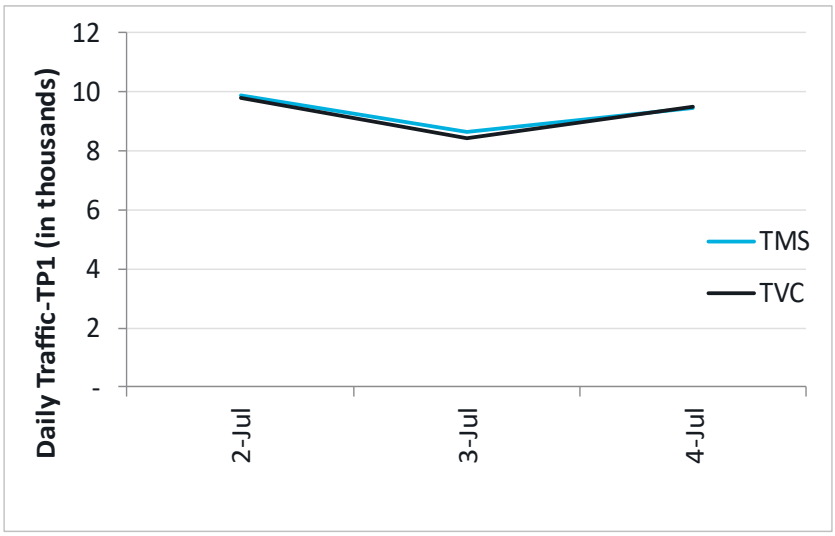
Source: Steer analysis

TVC v/s TMS analysis

3.38 We used our TVC data to validate the toll plaza data for the same days, as supplied by the Client via their toll management system (TMS). This TMS data was then used as the base data, for our forecasting model.

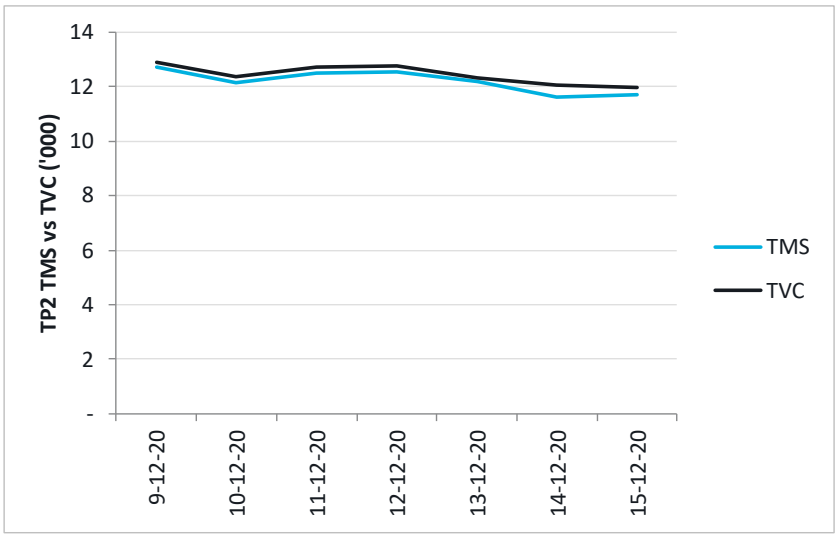
3.39 The following figures show the comparison between the daily traffic observed by TVC and TMS for the two toll plazas.

Figure 3-7: Comparison between TVC and TMS daily traffic data, TP1 Lakshmipur



Source: Steer analysis of TVC and Client TMS data

Figure 3-8: Comparison between TVC and TMS daily traffic data, TP2 Gazole



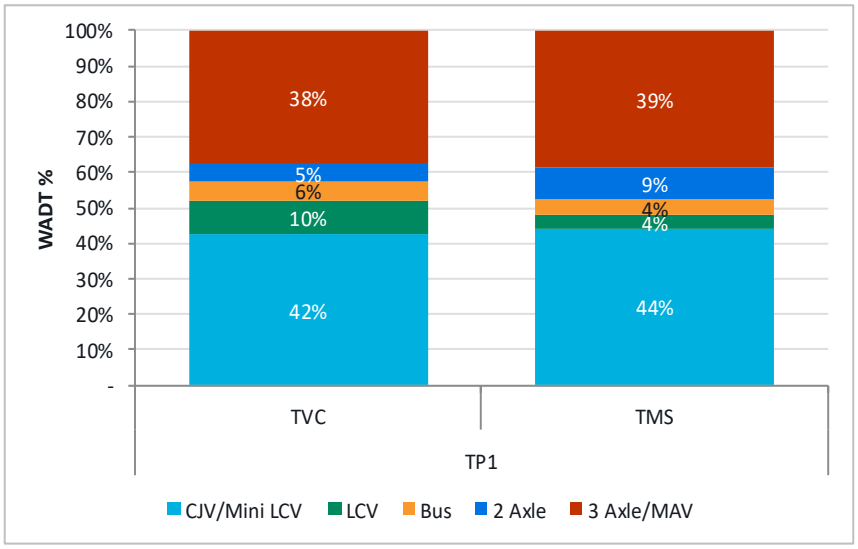
Source: Steer analysis of TVC and Client TMS data

3.40 Figure 3-7 through Figure 3-10 show the comparison between daily traffic data and shares of vehicle categories in TVC and TMS for the two toll plazas. As presented in Figure 3-7 and Figure 3-8 above, the difference between daily traffic from both sources is minimal at both TP1 and TP2. However, in both cases, the TVC is consistently 1-2% higher than the TMS across the week. These differences can be attributed to technical differences between the two independent traffic counting systems.

3.41 Further, Figure 3-9 and Figure 3-10 below compare the shares of vehicle types at both plazas, between TVC and TMS data. As seen below, there is a good fit between TVC and TMS data in terms of proportions, except for LCV and Buses/2A. However, as we have observed in several toll roads across the country, this can be attributed to classification

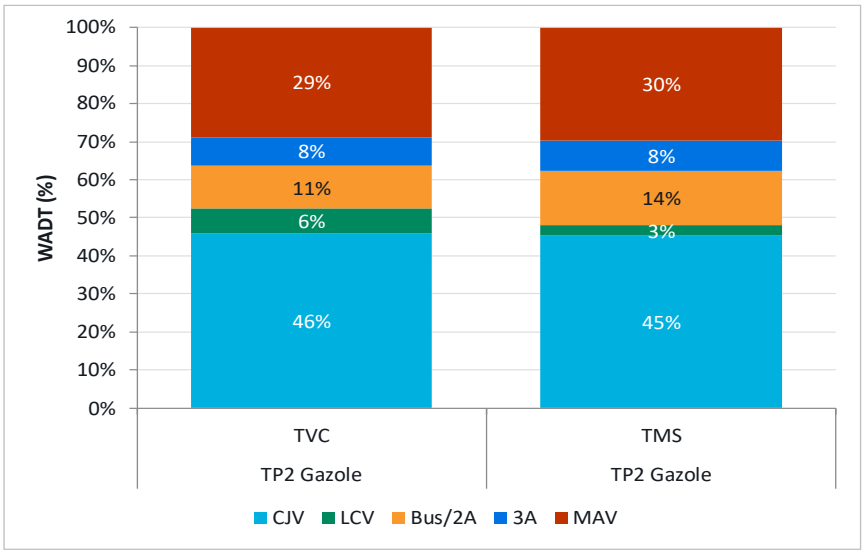
differences in different counting systems, especially as often observed for LCV and Buses/2A.

Figure 3-9: Comparison between vehicle shares from TVC and TMS WADTs for TP1



Source: Steer analysis of TVC and client TMS data

Figure 3-10: Comparison between vehicle shares from TVC and TMS WADTs for TP2



Source: Steer analysis of TVC and client TMS data

3.42 Upon combining vehicle categories into two super-categories (light and heavy vehicles), we see that for light vehicles (including CJV, LCV, 2A and Buses), the difference comes down to about 6% and 3% at TP1 and TP2 respectively. Heavy vehicles comprising 3A and MAVs show minimal differences at less than 2%. Given the overall good fit of the data at a WADT level and minimal variation between the TVC and TMS data for the largest revenue generator (3A and MAVs), we believe the base year traffic calculated using the Client TMS data forms a reasonable estimate.

Key findings of origin-destination analysis

Overview

3.43 Origin-destination (OD) analysis enables us to understand the nature of traffic movement on the Asset. The OD analysis presented here is based on data collected on behalf of the Client in July 2023 and November 2019. More recent OD surveys were not undertaken as this Asset has a long operational history and we did not believe material changes in these patterns would have occurred in this period.

3.44 We have analysed the regional drivers of demand based on the following analyses:

Zonal influence
Commodity distribution
Top OD pairs
Trip length distribution

3.45 While zonal analysis and list of top OD pairs help us to understand 'where' people and goods travel, commodity distribution sheds light on 'what' goods get transported. Trip length distribution show 'how far' vehicles and people travel, and goods get transported. This set of analyses is generally used to estimate the key drivers of traffic and aid the making of informed forecasting assumptions around traffic demand elasticities, growth drivers and exogenous impacts.

Sample rates

3.46 Sample rates help understand the reliability of OD data. They are calculated by dividing OD samples captured by the traffic counts (based on the TVC data) during the same period. Table 3.13 below presents the sample rates for key vehicle type aggregations at both the toll plazas. We believe that the sample rates of the OD data are reasonable.

Table 3.13: Sample rates for OD data

Vehicle type	TP1 Lakshmipur	TP2 Gazole
Passenger (CJV + Bus)	51%	33%*
Goods (LCV+ 2A + 3A + MAV)	73%	79%

Source: Steer analysis of OD data, * The surveys took place during the COVID-19 pandemic due to which the vehicles were reluctant to stop and answer the enumerators.

Zone categories

3.47 To facilitate better interpretation of key regional drivers of traffic as determined by their OD zones, and influenced by various towns, cities, states, and regions in the vicinity of the Asset, we have aggregated zonal data as described in the following table.

Table 3.14: Zone aggregations for zonal influence analysis

Aggregate Zone	Description
Local	On or very close to the Asset.
Immediate area of influence (IAOI)	IAOI zones are the locations which generate traffic and lie within approximately 75-150 km distance from the Asset.
Rest of State	Rest of the cities/Districts in the state that Asset lies in (other than Local/IAOI)

Aggregate Zone	Description
Odisha	All the trips that originate or end in the neighbouring state of Odisha
Bihar	Bihar
Northeast India	Northeast Indian states
Chhattisgarh	Chhattisgarh
Jharkhand	Jharkhand
Madhya Pradesh	Madhya Pradesh
West India	Rajasthan, Gujarat
Maharashtra	Maharashtra (including Mumbai)
North India	Uttarakhand, Jammu and Kashmir, Delhi NCR, Uttar Pradesh, Punjab
South India	Andhra Pradesh, Tamil Nadu, Karnataka, Kerala
Rest of India	Rest of Indian states.
Outside India	Nepal, Bhutan, Bangladesh.

Source: Steer analysis

Zonal influence

3.48 The zonal influence is the contribution of the zone or the zonal aggregation to trips by a vehicle type. This section presents the zonal influence[18] at each toll plaza of each Asset, aggregated based on zonal aggregation listed in the previous sub-section. Please note that zonal influence is analysed on trip ends and not trips.

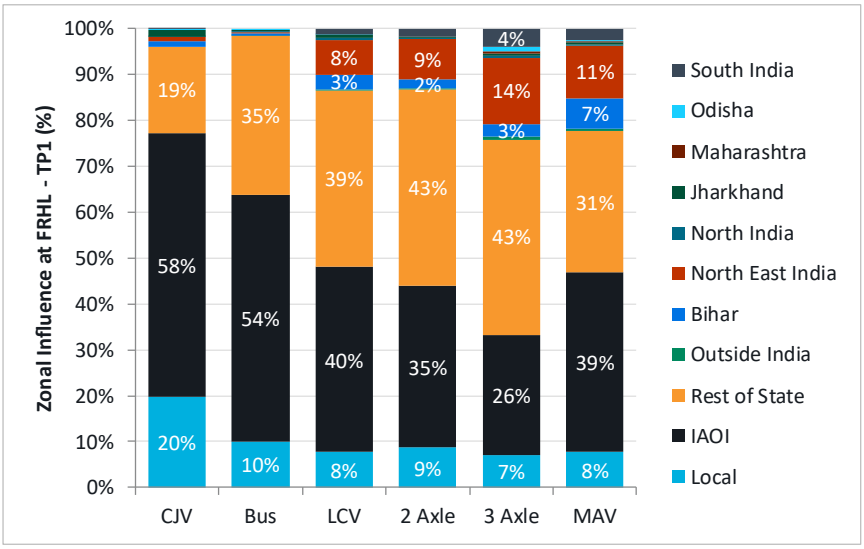
3.49 Figure 3-11 and Figure 3-12 below presents the zonal influence of different regions on all types of vehicular traffic observe at each of the toll plazas. We can see that 'IAOI' trips consistently account for the largest share of trips across all vehicle types. This follows from the earlier observation of the high share of 'return' trips observed at both plazas on the Asset. We observe the highest share of IAOI trips for CJVs (58% at TP1, and 60% at TP2). Trips between Farakka and Malda are the largest contributor to the CJV traffic on TP1, whereas Malda and Gazole contribute to almost 36% of the total CJV trips at TP2.

3.50 In case of 3A/MAVs too, we see a very high share of IAOI trips at 39% and 34% respectively, at TP1 and TP2. Rest of West Bengal contributes to about 25% of traffic volume. The trip ends with highest zonal influence for 3A/MAV on the Asset are Farakka, Raiganj, Kolkata and Darjeeling, with each of these contributing to about 10-15% of the total trips on the Asset.

3.51 Other contributors are North-east India with about 11-14% share in 3A/MAV vehicles and South India with about 3-4% share in 3A/MAV category.

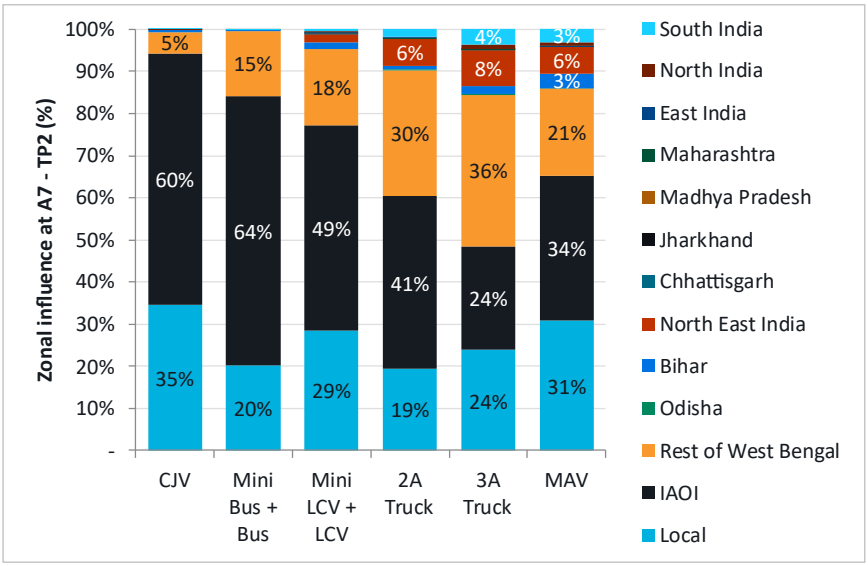
[18] For example, if out of 100 trips at a toll plaza on an Asset, 10 trips are between Hyderabad and Delhi and 90 trips are between Hyderabad and Chennai, then zonal influence of Hyderabad is 50% since one trip end of all trips are at Hyderabad. Likewise, zonal influence of Delhi and Chennai would be 5% and 45%, respectively.

Figure 3-11: Zonal influence, TP1 Lakshmipur



Source: Steer analysis of OD data

Figure 3-12: Zonal influence, TP2 Gazole



Source: Steer analysis of OD data

Internal External analysis

3.52 Internal-External analysis helps in identifying the trips which have both the origin and destination on or near the Asset i.e., local/IAOI zones (Internal-Internal or I-I), any one end on the Asset (Internal-External or I-E), or neither end on the Asset i.e., through trips (External-External or E-E). RoS (Rest of State) here represents areas within the state which are neither local nor IAOI. 'Internal' zones are those that were analysed as 'local' and 'IAOI' in the zonal influence analysis, i.e. lying on the Asset, while 'External' zones are areas lying outside the state. The graphs below show the distribution of trips based on these categories. These reflect observations from the zonal influence analysis presented earlier, except at a higher level of aggregation and at a trip level.

3.53 As evidenced in Figure 3-13 and Figure 3-14 below, a significant share of I-I trips is observed across all vehicle categories at both toll plazas due to significant generators of economic activity like Pakur located relatively near the Asset. The share of E-E movements in heavy goods vehicles is also low, reflecting the local/regional nature of the movements facilitated by the Asset.

Figure 3-13: Internal-External distribution, TP1 Lakshmipur

	Internal	Rest of State	External
External	4%	18%	39%
Rest of State	1%	11%	18%
Internal	1%	3%	5%

Source: Steer analysis of OD data

Figure 3-14: Internal-External distribution, TP2 Gazole

	Internal	Rest of State	External
External	6%	6%	3%
Rest of State	8%	6%	6%
Internal	50%	8%	6%

Source: Steer analysis of OD data

Commodity distribution

3.54 We have grouped various commodities into aggregate categories for ease of interpretation, as shown in Table 3.4 below. The charts in the following sub-section present information in terms of aggregate commodity categories.

Table 3.15: Aggregate commodity categories

Commodity Description	Code	Combined codes used for charts
Agriculture Products / Cash crops (Wheat, Rice, Sugar cane, Maize etc.)	AGR	AGR
Cattle Food / Livestock (sheep, goat, cow, cattle food etc)	LIV	
Perishable Items (Fruits, vegetables)	PER	GRO
Animal Products/Dairy/Eggs/Fish/Meat/Animals	DFM	
Groceries / Food items (Soap, Salt, Sugar, Pulses, Spices, Biscuits, bread, cool drinks, beer etc.)	GRO	
Building Material / Construction (Cement, Lime, Brick, fly ash, etc)	CNS	CNS
Sand/Clay	SND	
Stone (kota stone, marble, Granite, Aggregate stone etc.)	STN	
Ceramic	CRM	
Petroleum Products (Oil, LPG, CNG, etc.)	PET	PET
Chemicals / Fertilizers (Acids, Fertilizers etc.)	CHM	
Electrical/Manufacturing items (Electronic items, Medicine, Leather, Wine, Rubber/ Tyre, Plastics, Cloth, Paper etc.)	MAN	MAN
Raw Wood, Cork & Wood Products, Furn	WUD	
Machinery / Spare parts	MAC	
Automobiles (Finished products, auto parts, Car/bike manufacturing, New Chassis)	AUT	AUT
Basic / Fabricated Metals (Iron, Steel / Metal)	MET	MET
Mining Minerals (Coal, Gypsum, Cobalt etc.)	MIN	
Empty	EMT	EMT
Container	CTR	MSC
Miscellaneous (Parcel, Courier, Household items etc.)	MSC	
Passengers	PAS	
Scrap	SCR	

Source: Steer analysis

3.55 Figure 3-15 and Figure 3-16 below show the commodity distribution at each toll plaza, at the total level, and by direction. The commodity distribution for goods vehicles, indicates the importance of stone quarries and crushers in the immediate vicinity of the Asset; about 21% of MAVs carry construction material, primarily stones and aggregates at TP1 Lakshmipur. Based on the analysis of the OD movements of the CNS category, we observe the movement of stone and other building material originating from the nearby towns of Pakur and Nalhati to the Bangladesh border and parts of North Bengal.

3.56 Agricultural and grocery products are carried by a significant share (32%) of 3As at TP1 Lakshmipur. These trips are generally between agricultural areas of northern West Bengal, including tea plantations in Darjeeling, and large urban consumption centres like Kolkata and cities in the southern states.

3.57 The share of empty vehicles is high at 28% and 34% for MAVs at TP1 and TP2 respectively. This is mainly due to the high share of trucks carrying aggregate material at TP1, which tend to return empty in the other direction. We also observe a 7-8% of share of petroleum-related products in MAVs across both plazas. The remaining commodities are a heterogeneous mix, comprising of machinery, automobile, cotton, jute, petroleum products and containers.

Trip length analysis

3.58 Trip-length distribution provides us the distance-based profile of various vehicle types. This helps to validate our assumptions on the influence of macro-economic variables on traffic growth on the Asset, as well as our outputs from the zonal influence and toll segmentation analyses. For ease of interpretation, we have categorised distances into 5

groups — local (0-100km), short-distance (100-300 km), medium-distance (300-500 km), long-distance (500-1000 km) and very-long-distance (+1,000 km). The trip distances were derived as driving distances from Google Distance Matrix Tool based on zonal coordinates for OD pairs.[19]

3.59 Traffic on the project road is primarily commercial traffic carrying goods to/from different parts of the state of West Bengal, the north-eastern states, adjoining western states (Bihar and Jharkhand) and some southern states (such as Andhra Pradesh and Tamil Nadu). In addition, a significant proportion of this commercial traffic is cross-border (into/out of Bangladesh) and a small share of traffic carries goods to Nepal and Bhutan.

3.60 Travel patterns of vehicles crossing both the Asset plazas are also dependent on various factors including local market conditions for stone chips and aggregates as well as external demand for the same in Bangladesh. After consultations with local truckers, toll plaza managers and other stakeholders during our site visit, we noted that demand for Pakur stone in West Bengal is weaker that it is in Northeast India. To support this, we reviewed the outputs of our trip length analysis from the OD surveys conducted at both the plazas (as shown in Figure 3-17 and Figure 3-18 below), and found that there was a marked difference in the trip lengths observed at both the plazas.

3.61 At TP1, we find that the trip lengths are more evenly distributed (relative to TP2), where the majority of 3A trips are long distance (>500 km), and MAVs also show a similar distribution where the proportion of trips longer than 500 km is high (~45%).

3.62 In contrast to TP1, trip lengths of 3A/MAV vehicles crossing TP2 are more skewed towards shorter distances (<500km). Generally, smaller vehicles have shorter-distance trips as compared to goods-carrying heavy vehicles, but in case of TP2, we see that trips distances in the range of 100-300 km are most common. These trips pre-dominantly constitute movements between stone-mining sites in the Pakur region and the India-Bangladesh border-crossing site at Mahadipur, as well as sand-distribution hubs located near Malda. These findings are consistent with the expectation that traffic crossing TP1 must travel longer distances to serve consumption centres further north and towards northeast Indian states, whereas traffic crossing TP2 would travel need to travel shorter distances as TP2 is located further north from TP1 and is closer to the NE Indian states.

3.63 MAVs have a considerable share at 53% and 20% respectively at TP1 and TP2, of vehicles undertaking long-distance trips covering more than 300 km but less than 1000 km. Share of vehicles undertaking very long-distance trips of greater than 1000 km, including those with trip ends in the southern states, is 18% and 12% at TP1 and TP2, respectively.

[19] Google Distance API is a tool that is available on a chargeable basis from Google Maps Platform. Link: **https://developers.google.com/maps/documentation/distance-matrix/start**. Travel distance and time information for driving/transit under various congestion scenarios can be extracted through this tool by using macro-enabled Excel, R, etc.

Figure 3-17: Trip length distribution, TP1 Lakshmipur

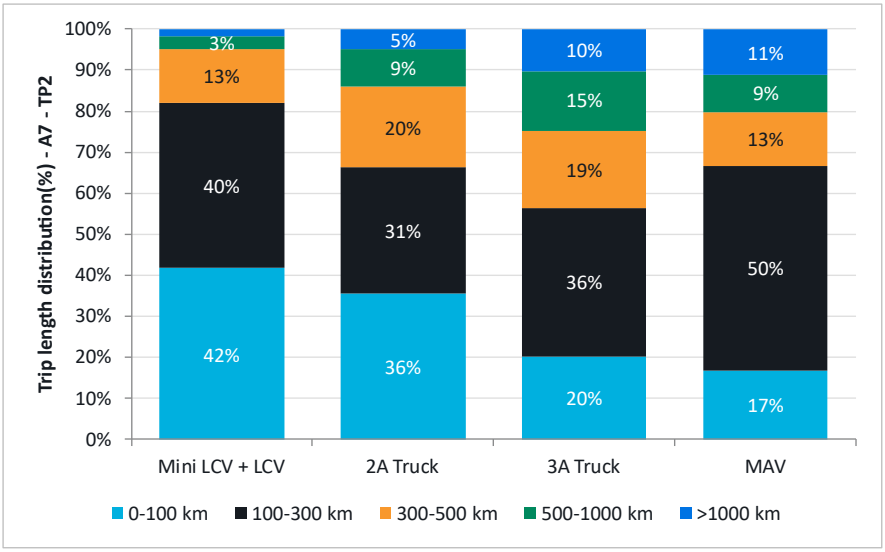
Figure 3-18: Trip length distribution, TP2 Gazole



Source: Steer analysis of OD data

Conclusions

3.64 The historical traffic trends reveal that over the period FY18 to FY25, both toll plazas have observed growth. Over this period, TP1 Lakshmipur grew at an AADT CAGR of 2.6% and PCU CAGR of 2.1%, while the corresponding growth for TP2 Gazole were 4.0% and 3.2% (respectively). However, FY26YTD vs FY25 registers a decline in commercial traffic due to subdued exports to Bangladesh, which directly use the Asset to reach the land ports of Hilly and Mahadipur.

3.65 When considering ticket segmentation, return tickets remain the dominant category at both plazas - except for MAVs at TP2, wherein single tickets have accounted for roughly 55% of total trips since FY22. As of FY26YTD, 50% of CJV tickets are return trips at TP1,

and 58% at TP2, with the corresponding numbers for MAVs being 54% and 46% respectively.

3.66 The TVC counts show minimal variation from the TMS data; at the total level, TMS counts were 1% higher than TVC counts at TP1, and 2% lower than TVC counts at TP2. The difference in the vehicle shares of the two dominant categories, CJVs and MAVs, is also minimal.

3.67 The OD analysis found that in terms of zonal influence, 'IAOI' trips make up the largest share for all vehicle types. This follows from the earlier observation of the high share of 'return' trips across all vehicle categories. Trips between Farakka and Malda are the largest contributor to the CJV traffic on TP1 Lakshmipur, whereas Malda and Gazole contribute to almost 36% of total CJV trips at TP2 Gazole.

3.68 The commodity distribution analysis highlights the Asset's vicinity to stone quarries and crushers (and their consequent influence on the Asset), with construction materials accounting for 21% and 29% of commodities carried by MAVs at TP1 and TP2 respectively. Agricultural products and groceries also accounted for a considerable share of total commodities carried at both plazas. TP1 has a particularly high share of empty goods vehicles (45%) and can be attributed to the high share of trucks carrying stone chips/aggregate material at TP1 in one direction, and return empty in the opposite direction.

3.69 When considering the internal and external distribution, internal trips are dominant at both plazas for all vehicle categories. It is important to note from the zonal influence analysis that through trips observed at both plazas are not very long distance, and are primarily IAOI trips. The trip length analysis outputs support this, with the dominant trip length across all vehicle categories being shorter distance trips (<300km) specially at TP2.

4 Socio-economic context and traffic growth

Introduction

4.1 The growth of traffic on existing (brownfield) roads depends on, firstly, how fast the background travel demand grows (background growth); and secondly, how successful the Asset is in attracting that traffic (traffic capture). Background travel demand is driven by the socio-economic conditions of the region where the Asset is located and conditions on a national scale. These include:

Changes in factors such as population, economic growth (regional and national) and industrial production; and,

Other local factors such as strategic port growth, and growth in local industries near the Assets.

4.2 In turn, the change in the competitive position of the Asset (and thus of the traffic capture it will achieve) derives from how the service offered and the prices charged on the Asset change in comparison to competing roads; and whether any new competing road facilities are available.

4.3 In this chapter, we assess the socio-economic indicators relevant to traffic growth on the Asset.

Population growth

4.4 We have analysed the key socioeconomic drivers of the background traffic demand in the state of West Bengal where the Asset is located.

National Level

4.5 Table 4.1 below shows that the total population in India has grown at a Compound Annual Growth Rate (CAGR) of 1.5% since 2000, decreasing over the years, as shown in Table 4.1 below. The World Bank forecasts this growth to decrease to 0.6% CAGR by the 2030-45 period.

Table 4.1: CAGR of population in India

Years	CAGR		
	Total Population (m)	Rural Population (m)	Urban Population (m)
1970 - 1985	2.3%	1.9%	3.8%
1985 - 2000	2.0%	1.7%	2.9%
2000 - 2015	1.5%	1.0%	2.6%

Years	CAGR		
	Total Population (m)	Rural Population (m)	Urban Population (m)
2015 – 2030*	1.0%	0.3%	2.3%
2030 – 2045*	0.6%	-0.3%	1.9%

Source: World Bank Data on Health Nutrition and Population Statistics, *forecast population growth

State Level

4.6 Table 4.2 below shows the historical population growth in the state of West Bengal compared to national population growth. Overall, the population of West Bengal has grown at a slower rate than observed across the country; between FY12 and FY24, the state's population grew at a CAGR of 0.7% per year, while the corresponding growth for the country was 1.2% per year.

Table 4.2: Population Growth in West Bengal and India (2012 – 2024)

State	2012 Population (m)	2024 Population (m)	CAGR (2012 – 2024)
West Bengal	91.8	99.3	0.7%
India	1210	1395	1.2%

Source: MoSPI estimates

4.7 Due to the complexities of urbanisation, and the dynamic nature of local population migration (both of which are very difficult to forecast with accuracy), we do not use population growth as a proxy for understanding future travel demand growth on the Asset. It has been included in this section simply to provide the underlying socio-economic context of the state/trends in the regions in which the Asset is located.

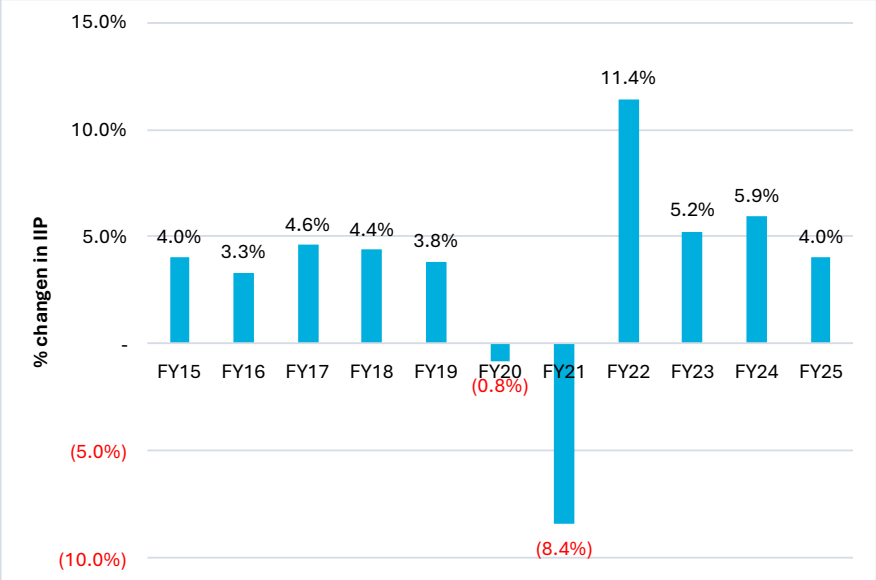
Economic Indicators

Industrial Production

4.8 The Index of Industrial Production (IIP) is a composite indicator that measures the short-term changes in the volume of production for a basket of industrial products. The IIP data tracks the manufacturing activity in different sectors of an economy, with mining, manufacturing, and electricity being the three broad sectors constituting the IIP.

4.9 The figure below shows that at an annual level, national IIP was growing at an average of 4% per year over the period FY15-19, before the country underwent a liquidity crisis and experienced an overall economic slowdown in FY20. In the aftermath, IIP shrank by over 8% in FY21 due to a decline in economic activity in the wake of global lockdowns introduced to curb the Covid-19 pandemic. Post the immediate recovery in FY22, IIP growth has since stabilised, with FY25 recording 4% growth over FY24.

Figure 4-1: Annual growth – Index of Industrial Production (FY15-FY25)



Source: Ministry of Statistics and Program Implementation (MoSPI)

4.10 Since state-level IIP data is not as readily available as national-level IIP, we have presented national IIP here to indicate nationwide activity in key industrial sectors like power, manufacturing, and mining, all of which influence long-distance commercial movements across the nation, and not unique to this asset. We however, do not use it to forecast future travel demand growth since long-term forecast for IIP is not available through official sources such as MoSPI, RBI or through multilateral organisations like WB, or the IMF.

Vehicle Ownership

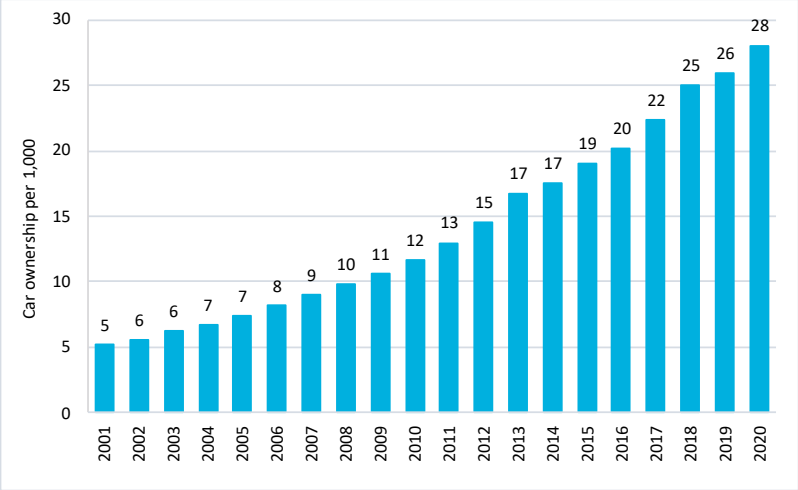
4.11 The gap in car ownership between India and developed nations remains substantial according to recent data. As of 2018, India had approximately 22 cars per 1,000 individuals, a fraction of the 980 cars per 1,000 individuals in the United States[20]. However, this pattern is changing with the increasing per capita income levels. As can be seen in Figure 4-2 below, between 2007-17, number of cars per 1,000 people has more than doubled and increased at a CAGR of about 11%.

4.12 Overall, India still stands at a very nascent stage in the vehicle saturation curve, offering huge potential for growth going forward. As the income per capita of India and the region itself grow further, we expect car ownership levels to increase. As per the India Energy Outlook (2015), car ownership is projected to grow steeply to 175 cars per 1,000 population by 2040 in India.[21]

[20] India has 22 cars per 1,000 individuals: Amitabh Kant, Auto News, ET Auto

[21] https://www.gita.org.in/Attachments/Reports/IndiaEnergyOutlook_WEO2015.pdf

Figure 4-2: Car ownership in India per 1,000 population



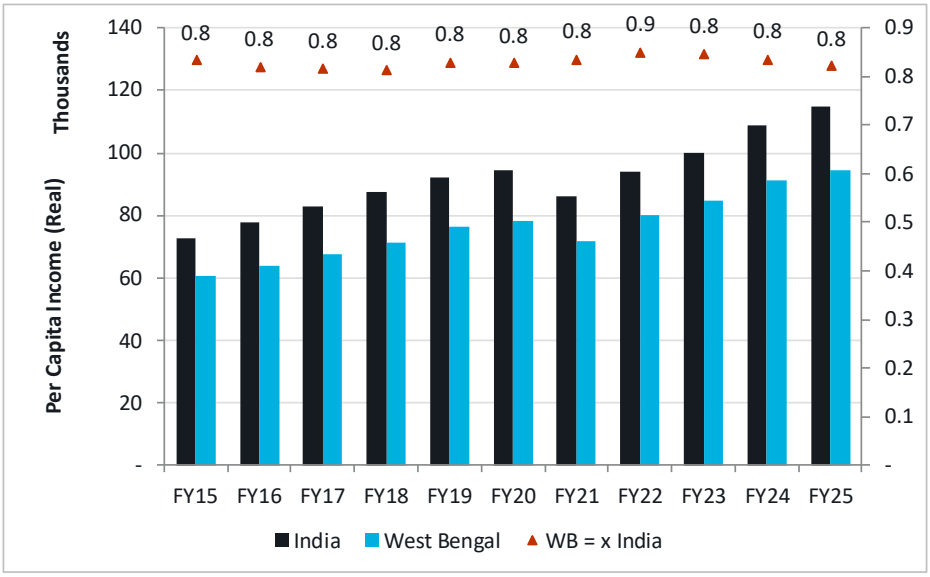
Source: International Energy Agency (IEA)

Per Capita Income (PCI)

4.13 As shown in Figure 4-3 below, the per capita income of the state where the Asset lies, i.e., West Bengal, has historical been lower than the national average, and has been at about 80% of the national level over the past few years. During the period 2015-2025, India's average PCI has grown at a rate of 4.7% whereas that of West Bengal has grown at rate of 4.5%.

4.14 Though lower than the national average, per capita incomes have grown at about 4.0% per year between FY15 and FY24 - consistent with national trends over the same period.

Figure 4-3: Historical Growth in Per Capita Incomes – West Bengal vs. India (FY15-FY25)



Source: Ministry of Statistics and Program Implementation (MoSPI)

4.15 Given the difficulty in obtaining granular district level PCI data, it is not advisable to use this as a growth driver in our forecasts. Additionally, long-term forecasts for PCI are not

available from official sources and we therefore refrain from using it to forecast traffic growth.

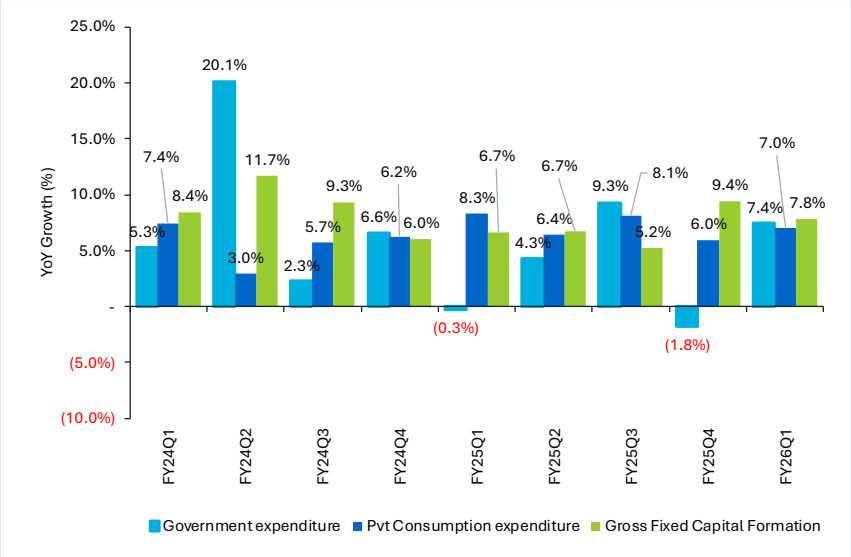
Economic growth

India's Performance

4.16 Despite a slowdown in the economy during H1FY25, the Indian economy has observed strong growth each quarter since FY25Q2, with the latest published estimates for FY26Q1 GDP at 7.8% over FY25Q1. This performance has been driven by strong growth in investment and consumption expenditures and higher consumer optimism for the year ahead[22].

4.17 The figure below, we present quarterly Y-o-Y growth in three major components of GDP – government expenditures, consumption expenditures, and business investment (gross fixed capital expenditure) over the past two years (FY24-FY26Q1).

Figure 4-4: Government final consumption expenditure



Source: Steer Analysis of MOSPI Data

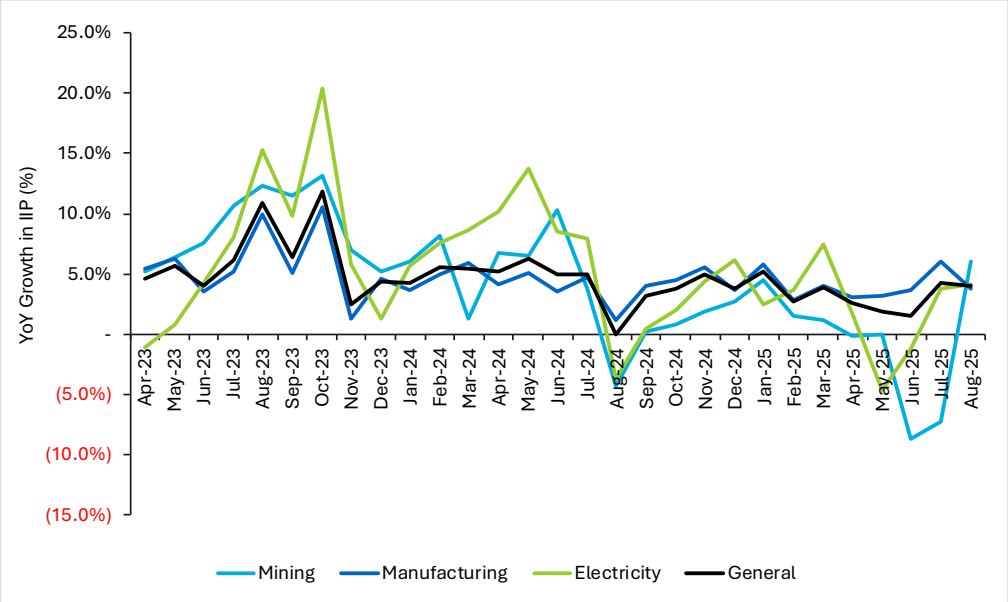
4.18 While consumption and investment expenditures have continued to show consistent growth over the past two quarters, government expenditures observed a marginal decline in FY25Q4. In FY26Q1, government expenditures rebounded, recording 7.4% growth over FY25Q1 levels.

4.19 Performance across different types of industrial activities (such as Mining, Manufacturing, and Power Generation) directly impact freight movement and commercial traffic volume growth across the country, including on the Asset. In the figure below, we present growth trends in IIP – a measure that tracks the performance of the economy across these activities. As of FY26YTD (Apr-Aug '25), the Manufacturing sector continues to perform strongly, recording positive y-o-y growth since FY25Q3. While industrial activity across the

[22] Government of India, PIB Release Oct 1 '25

two other sectors (i.e., Power Generation and Mining) dropped between May and Jun/Jul '25, they have since rebounded and show signs of continued growth going forward.

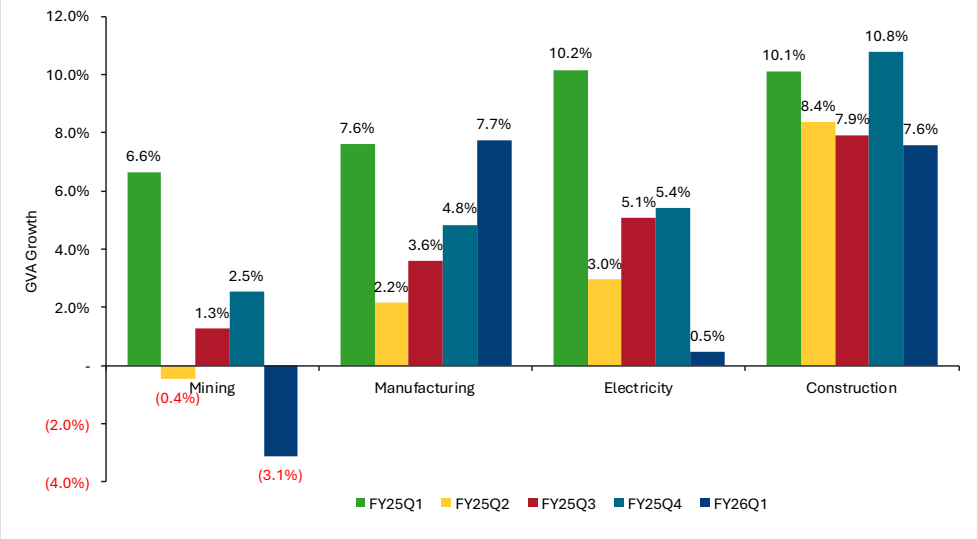
Figure 4-5: Month on Month IIP performance



Source: Steer Analysis of MOSPI Data

4.20 In addition to monthly trends in IIP, the figure below presents y-o-y growth of quarterly GVA in four industrial sectors - Mining (& Quarrying), Manufacturing, Electricity (and other Utilities), and Construction. While the Mining and Power sectors observed decline and muted growth in FY26Q1, the Manufacturing and Construction sectors experienced strong growth. While overall economic growth has remained resilient as of FY26YTD, performance across industries have varied, impacting economic growth across different regions and on the Asset as well.

Figure 4-6: Industrial components of GVA



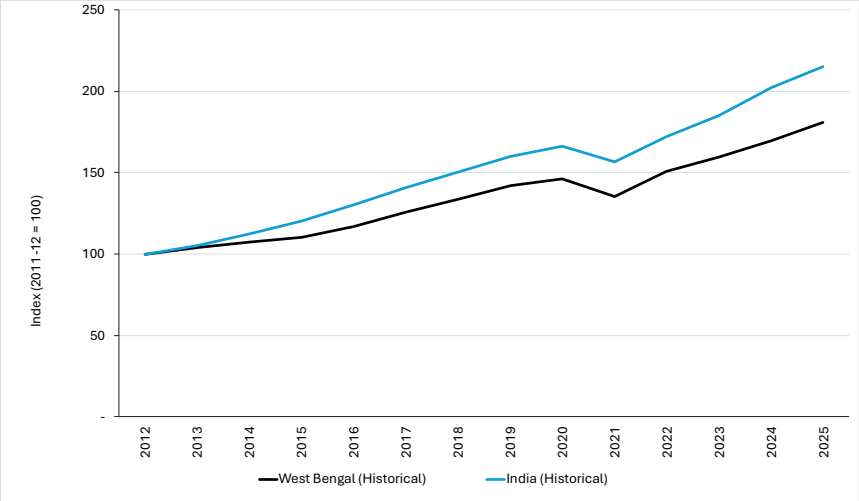
Source: Steer Analysis of MOSPI Data

GDP and GSDP Growth

4.21 Over the period FY12-FY24, the Indian economic has grown at a CAGR of approx. 6% aided by growth in the tertiary sector which grew at a CAGR of approx. 6.9% over the same period. Over the same period, economic growth of West Bengal has been slower than the country overall; between FY12-24, the state's GSDP grew at a 4.7% CAGR.

4.22 The state contributes approximately 5.1% to India's GDP, and has a 7.1% share in India's population in FY24. It is the fourth-most populated state in the country, with a population of 99.3 million in FY24. Figure 4-7 below shows historical growth in West Bengal GSDP compared to India GDP.

Figure 4-7: Evolution of West Bengal's state GDP and national GDP, FY12-25



Source: Ministry of Statistics and Program Implementation (MoSPI)

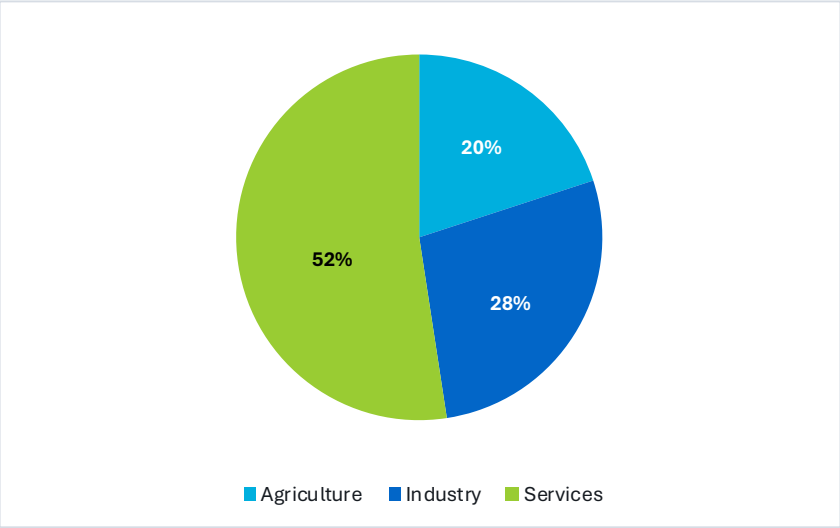
4.23 As can be seen in Figure 4-8, the state economy is largely driven by the tertiary sector which contributed approximately 52% to state GSVA as of FY24.[23] The tertiary sector is followed by the secondary and primary sectors, which account for 28% and 20% of statewide GSDP (respectively).

4.24 Within the secondary/industrial sector, Chittaranjan, Dankuni, Kharagpur (railway locomotive manufacturing), Haldia (petrochemical) and Durgapur (steel and iron ore) constitute the key industrial regions within the state. The state is also home to the Shyama Prasad Mookherjee Port – one of the 12 major ports under the aegis of the Government of India, and an Indian Oil Corporation's refinery at Haldia.

4.25 The key primary industries in the state include agro and food processing and crop production. The state is mainly known for production of tea (in Darjeeling and Jalpaiguri) and rice.

[23] **GSVA/NSVA by economic activities | Ministry of Statistics and Program Implementation | Government Of India**

Figure 4-8: Sectoral contribution to West Bengal's GSDP in FY25



Source: Ministry of Statistics and Program Implementation

4.26 The official historical GDP and GSDP data for India are released by the Ministry of Statistics and Program Implementation (MoSPI). The GDP forecasts for India are available from various reliable sources such as Oxford Economics and Consensus Economics[24], but state-specific GSDP forecasts are not published by any such sources. To derive state GSDP forecasts, we rely on past trends of the relationship between GDP and GSDP, and develop GSDP forecasts as a function of our assumed GDP forecasts[25].

4.27 For any indicator to be used as a growth driver to forecast traffic, a reliable source of historical and forecast data availability for that indicator is the key requirement. Of the key socioeconomic indicators discussed above, GDP was assessed to be the only growth driver for which reliable data is available both in terms of historical and forecast data. Therefore, to forecast traffic, we use GDP/GSDP as our key growth drivers.

Forecasts for growth drivers

4.28 Following the discussion in Chapter 4 on the nature of economic activity in the state of Uttar Pradesh and in Delhi, in this section, we describe the assumptions in relation to forecasts of the key macro-economic drivers of traffic growth on the Asset.

4.29 We have based our forecasts of West Bengal GSDP using forecasts of GDP provided by the Client.

National GDP

4.30 After the last period of economic slowdown in FY11-12, the country experienced an economic downturn again in late FY19 with FY20 having reported a GDP growth of 4% (relative to an average growth rate of 7% per year between FY13 and FY19). India's GDP growth declined as domestic investment and consumption demand were already under

[24] **Consensus Economics - Economic Forecasts and Indicators**

[25] Assuming that the historical long-term relationship between GSDP and GDP sustains over the short-term, we project future growth in GSDP as a function of our GDP growth forecast. We taper the relationship of GSDP growth to converge to GDP growth gradually over the long-term.

stress because of the liquidity crunch before Covid-19. Other factors that contributed to the economic slowdown included reduced growth rates in automobile sales and production, liquidity crunch in credit markets and rising number of Non-Performing Assets (NPAs) within the banking sector, as well as lower manufacturing production and lower rural consumption.[26]

4.31 The Covid19 outbreak had a significant impact on the Indian economy during the first two quarters of FY21 as government mandated lockdowns across the country effectively stalled economic activity and growth. The growth momentum eventually picked up in Q3 of FY21, with a sharp rebound in the economy in FY22 (GDP recorded 9.7% growth over FY21) and has since observed a consistent growth of 7.6% in FY23, 9.2% in FY24 (as per the SAE) before slowing down to 6.5% in FY25 due to several domestic and external factors discussed in paragraph 4.9.

4.32 Figure 4-9 below shows Client-provided GDP projections for India. The forecast provided expects the Indian GDP to grow at 6.5% between FY25-FY27[27] and gradually tapering down to 5.2% by FY50. The India GDP growth forecast is broadly in line with other independent forecasts available from reliable sources such as IMF, World Bank and RBI[28] in the medium term.

[28] Survey of Professional Forecasters on Macroeconomic Indicators – Results of the 93rd Round (April 2025)

5 FY26 Base year AADT and Traffic growth Analysis

Introduction

5.1 In this chapter, we present our approach, assumptions and results for base (or background) traffic growth for each vehicle category on the Asset.

5.2 Traffic growth is commonly related to a variety of macro-economic and industry- or commodity-specific factors (hereafter referred to as 'traffic growth drivers'). These growth drivers are typically identified from the results of the OD data analysis and the site visits that help us appreciate the nature of traffic movement – 'what' travels 'where' and 'why'.

5.3 To understand historical traffic trends observed on the Asset in relation to these underlying growth drivers, we carry out regression analyses to determine the historical relationship between traffic growth (by vehicle category) and the underlying macroeconomic driver assumed to influence its growth on the Asset. The dynamics of traffic demand is the dependent variable while the dynamics of one or more identified growth drivers are the independent or explanatory variables.

5.4 Typically, passenger and light commercial vehicle traffic like cars, buses, LCVs and 2-axle trucks grow in line with the GSDP of the state in which the toll road is located. Heavy vehicle traffic like 3-axle trucks and MAVs grow in line with the national GDP. This is because most light vehicles tend to travel shorter distances within the state, whereas heavy vehicles typically carry commodities over long-distances across the country. These commodities also tend to be part of industry ecosystems whose demand-supply relationships are scattered across the country and therefore relate more with GDP growth than more local or regional growth drivers.

FY26 Base year AADT estimates

5.5 The base year is the year on which long-term background forecast growth rates are applied to derive year-wise average annual daily traffic (AADT) estimates for forecast years. This is therefore an important aspect of our forecasting approach as traffic and ultimately revenue forecasts for future years are built on top of the base year traffic estimate. For this traffic study, we have used FY26 as the base year for generating or future year traffic forecasts for the Asset.

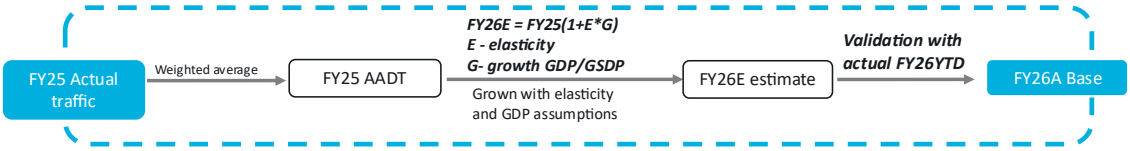
5.6 To establish the base year (FY26) traffic position, we utilised information from various sources including historical traffic data from the Client (FY25 and FY26YTD), latest information on FY26 estimated GDP and GSDP growth (as published by official sources), as well as our own contextual knowledge of the region and wider economy, and transportation network the Asset forms a part of.

Methodology

5.7 The base traffic for FY26 is estimated by utilizing actual 12 months of FY25 as well as latest available data for FY26 that included the first 6 months of FY26 for this study. To arrive at an initial estimate for full year FY26 AADT ("FY26E"), we apply elasticity-based growth assumptions of GSDP or GDP to the FY25 actual AADT as a first step.

5.8 In the second step, the monthly profile of the FY26E AADT was compared to the actual traffic observed in the six months (April to September) of FY26 traffic data (FY26YTD) that was available. After reviewing how actual traffic performed over this period relative to our initial estimate, we make necessary adjustments to the FY26E AADT to arrive at our Adopted FY26 AADT ("FY26A") that reflects the outturn traffic in FY26YTD (adjusted for seasonality). The methodology is represented using the below schematic:

Figure 5-1: FY26 Base Estimation methodology



Source: Steer Analysis

Seasonal Correction Factors

5.9 Traffic on any Asset varies on a month-on-month level. Such variations maybe due to monsoons (typically Jul to Sept) or due to festivals in the region. E.g., it is observed that typically the truck traffic during the first half of the financial year (April-September) is generally lower than the annual average, mainly because of peak summer season followed by monsoons affect the freight movement patterns in large parts of the country in the July-September period. In addition to these, there may be other seasonal variations specific to the Asset.

5.10 To normalise for these variations across the year when estimating AADT, Seasonality Correction Factors (SCFs) are used. SCFs are estimated to convert the monthly traffic numbers to an AADT level while accounting for seasonal variation due to local/national festivals, weather changes and/or temporary external impacts. These are typically estimated using historical data for each plaza and vehicle category over multiple years. An SCF greater than one implies that the traffic for that month is lower than the annual average and vice-versa.

5.11 We have analysed the seasonality trends between monthly average daily traffic (MADT) and AADT for data during the historical years of tolling (as described in Chapter 3 above), excluding the years that were impacted by specific events. Historical traffic data was available for all toll vehicle categories up-to September 2025. With FY21 and FY22 being pandemic-impacted years, we consider FY23 onwards for the base estimation. Thus, an average of FY23 and FY24 SCFs has been considered to arrive at the FY25 base year estimates.

5.12 Table 5.1 and Table 5.2 below present the average of FY23, FY24, and FY25 SCFs, used for the estimation of our FY26 base traffic position.

Table 5.1: Adopted SCF for the Asset for TP1 Lakshmipur

Source: Steer analysis: FY25 actual full year, FY26YTD includes 6 months of FY26, FY26A is adopted base for FY26

5.14 The tables above show that PCU growth from the full year FY25 AADT to the FY26A has been 2.1% at TP1 and 6.8% at TP2. Across all vehicle categories, we observed modest growth in FY26A, relative to FY25. LCVs observed a healthy growth in FY26 owing to stronger consumption trends in local areas near the Asset. Buses have observed muted growth; this could be attributed to shifting preferences towards personal mobility reflected in growth of CJVs.

5.15 For 3A/MAVs the muted growth trends are a result of two major factors - (1) continued decline in trade exports to Bangladesh, and (2) crackdown on illegal stone mining in Pakur District and other quarrying districts of Bengal, explained in more detail in Chapter 2 above and Chapter 6 below

Estimation of background elasticities

5.16 Elasticities, in the case of traffic growth, are the relationships between traffic growth and the growth of underlying macro-economic drivers of traffic. Multiplied with forecasts of growth drivers like GDP or GSDP, they provide the forecasts of background traffic growth.

5.17 The TMS data for the Asset reports 3A and MAV separately along with Bus and 2A hence no further splits were required to understand the growth pattern of these vehicle categories. Following the brief note on historical trends provided in Chapter 3 above, we now delve deeper into the results of the historical growth analysis for each major vehicle type. Table 5.5 below shows the share of influence of each macroeconomic driver variable considered for estimating the background traffic growth of each vehicle category on the Asset.

Table 5.5: Identified growth drivers to model traffic growth

Vehicle type	GDP India	GSDP West Bengal
Car		100%
LCV		100%
Bus		100%
2A	100%	
3A	100%	
MAV	100%	

Source: Steer analysis of Client data

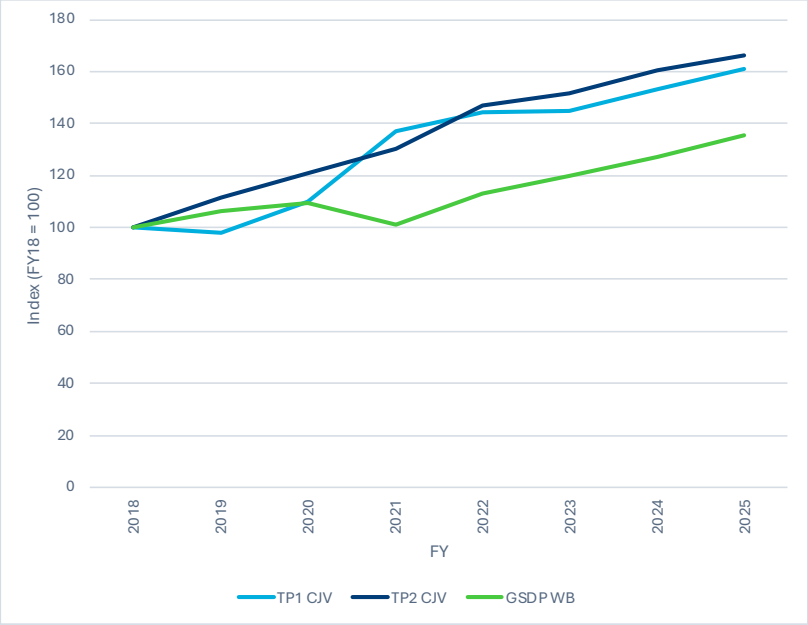
5.18 Since cars (CJVs), buses and LCVs cater to more regional movements (as validated from the OD trip lengths and zonal analyses above), growth of these vehicle categories are more influenced by regional economic drivers such West Bengal state GSDP. However, for 2As, 3As and MAVs that carry heavy commodities like construction material and agricultural products into West Bengal and Bangladesh, growth of these vehicle volumes on the Asset are more linked to nationwide GDP growth.

CJV

5.19 We see from the OD analysis (conducted in 2019 at TP2 and 2023 at TP1) that the CJVs primarily cater to regional movements between Farakka, Malda, Gazole, Raiganj and other towns lying on the Asset. We have therefore taken West Bengal GSDP to be the growth driver to model the growth of CJV traffic. Figure 5-2 below shows the relationship between the historical AADT CJV traffic on TP1 and TP2, over the period FY17 and FY24 and the GSDP of West Bengal.

5.20 Over the period FY18-25, CJV traffic at TP1 and TP2 grew at a CAGR of 7.0% and 7.5% per year respectively, while WB state GSDP grew at an average of 4.4% per year over the same period.

Figure 5-2: Relationship between CJV traffic GSDP of West Bengal – TP1 & TP2



Source: Steer analysis of Client TMS data and MoSPI data

5.21 Generally, we would expect that in fast-growing economies with relatively low car ownership levels, car traffic growth rates are often in line with or slightly higher than growth in GSDP/GDP (i.e. suggesting elasticities at or just above 1.0). Further, there is an expected increase in car ownership proportion of overall population as the economy grows. This assumption is however contextual and subject to changes in economic policies of government as well as overall regional economic conditions.

5.22 Considering the robust growth in CJV traffic observed over the operational history of the Asset, with trips largely between urban areas in and around the Asset, we have assumed a forecast background elasticity of 1.1 at TP1 and 1.0 at TP2 for CJVs, with respect to West

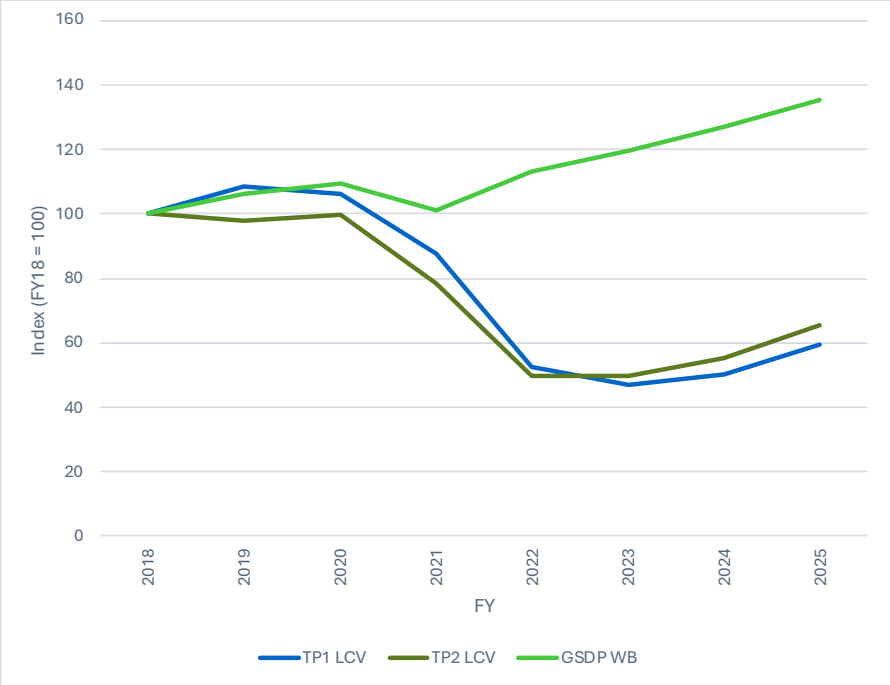
Bengal GSDP. This is line with benchmarks we have observed at toll roads across the country, which have a considerable concentration of inter-urban areas.

LCV

5.23 Compared to heavy vehicles like 3A and MAV, LCVs on the Asset have more regional movements within the state, as observed in the OD data analysis (conducted in 2019 at TP2 and 2023 at TP1), where 70% of LCVs have one end of their trips within West Bengal. Hence, we have taken GSDP West Bengal as the growth driver for LCV.

5.24 Post FY20, due a change in national axle-load norms, there was nationwide shift in truckers' preferences from using LCVs to 2A trucks to carry more tonnage in commodities. Additionally, after the complete implementation of FASTag, there has been a significant reclassification of LCVs as either CJVs or 2As. This has also contributed to the declining LCV volumes on the Asset – between FY21 and FY25, LCV traffic witnessed a degrowth of CAGR 7.1% at TP1 and CAGR 7.7% at TP2.

Figure 5-3: Relationship between LCV traffic and GSDP of West Bengal – TP1 & TP2



Source: Steer analysis of Client TMS data and MoSPI data

Bus and 2A

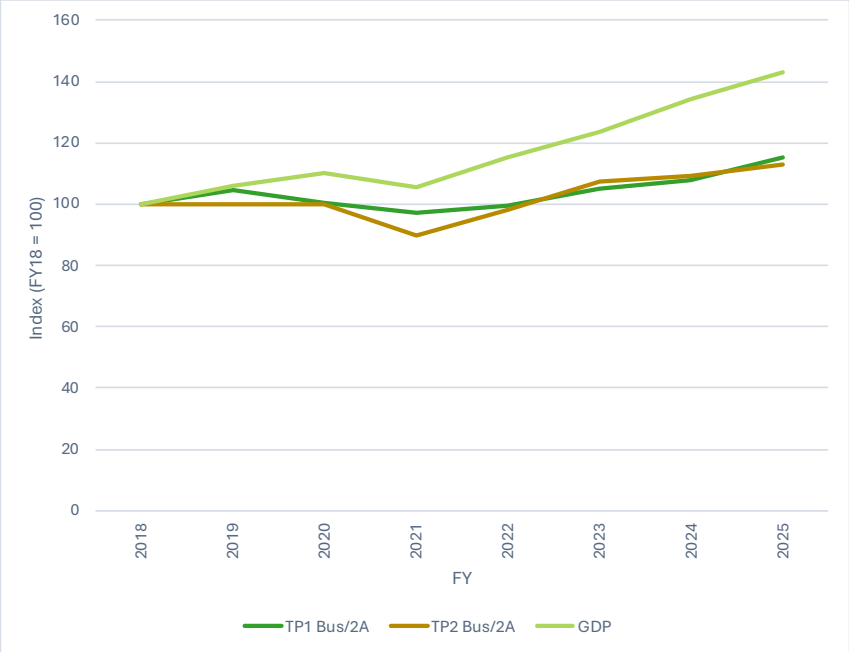
5.25 From FY22 onwards, Bus and 2A traffic were recorded separately, prior to which they were recorded together. Thus, given the limited period of three years (FY22-FY25) to understand the growth of Bus and 2A traffic trends separately we undertook regression analysis on the combined Bus and 2A traffic volumes. Bus growth tends to be largely supply-driven in many parts of the country, with new buses being bought and deployed by the government during different intervals of time. Based on our experience across the country, buses on inter-urban and tourism corridors show elasticities of 0.4 to 0.6 with respect to the GSDP.

5.26 In the period of FY18-25, combined Bus and 2A traffic grew at a CAGR of 2.0% on TP1 and 1.8% on TP2, while WB state GSDP grew at an average 4.4% per year and national GDP

grew at an average 4.8% per year over the same period. With its closer proximity to Malda town, Bus+2A volumes at TP2 are higher than observed at TP1.

5.27 As a result, for the purpose of forecasting traffic growth at both plazas, we have considered an elasticity of 0.25 for buses and 0.75 for 2As, at both toll plazas respectively.

Figure 5-4: Relationship between Bus and 2A traffic with GSDP West Bengal and GDP – TP1 & TP2

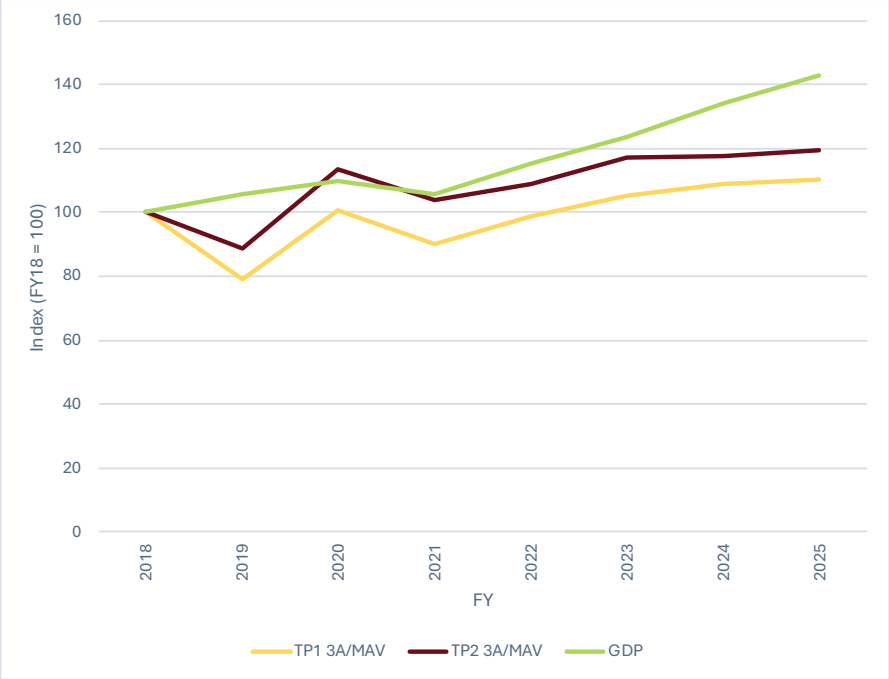


Source: Steer analysis of Client TMS data and MoSPI data

3A/MAV Trucks

5.28 Compared to lighter trucks like LCVs and 2As, 3As and MAVs have more national or long-distance movements covering several states. Given that manufacturing-related commodities typically take prominence in their commodity distributions, traffic growth of 3As and MAVs is more influenced by industrial demand-supply ecosystems spread across the country. For the purpose of forecasting 3A and MAV traffic growth on the Asset, we have used national GDP as the growth driver for 3A and MAV in our forecasting model. Figure 5-5 below presents the relationship between indexed values of 3A+MAV (combined) traffic volumes on the Asset and National GDP over the period FY18-25.

Figure 5-5: Relationship between 3A and MAV traffic with GSDP West Bengal and GDP – TP1 & TP2



Source: Steer analysis of Client TMS data and MoSPI data

5.29 As seen in Figure 5-5 above, 3A/MAV traffic at both toll plazas has seen consistent growth in the past years. Though late FY19 saw a big temporary drop in traffic due to the closure of the Farakka Barrage for six months, FY20 showed a strong recovery growth, before the start of the pandemic. Based on FY18-25 growth, TP1 shows 1.4% 3A+MAV growth while TP2 shows 2.6% MAV growth against GDP growth of 5.2%.

5.30 A slowdown in the Bangladesh economy over the past few years (FY23-FY26YTD) in addition to domestic policies to curb illegal stone mining across the country including parts of WB and JH from where stone chips/aggregate materials are transported via trucks on the Asset has resulted in muted 3A/MAV growth on the Asset (at both plazas) over the past couple of years (FY25 and FY26YTD).

5.31 In the combination of 3A+MAV, 3As have grown slower than MAVs due to a shift in axle preferences over the last several years, as truckers and transporters have continued to favour MAVs over 3As for long-distance movements since ~FY20. This is because MAVs have higher load capacity allowing transporters to enjoy economies of scale through lower per unit costs of moving material over longer distances when doing so through MAVs instead of 3-Axle trucks. It is however, unlikely that 3A truck volumes will reduce to zero as there are certain commodities or movements that remain best served by 3As.

Forecasts for background elasticities

5.32 Table 5.6 below presents a summary of our assumed forecast elasticities for background traffic growth in comparison to our derived elasticities from our regression analyses.

5.33 The forecast elasticities for buses and LCVs are projected to remain constant throughout the concession period. The elasticity for CJVs at TP1 Lakshmipur is reduced from FY30 onwards, while that of MAVs has been increased from FY27 to FY30- in view of the expected recovery of exports to Bangladesh - This assumption is grounded in historical

trends and a long-term perspective on regional and national growth, suggesting market maturity is still several years away. These trends are based on a long-term understanding of historical relationships and an overall outlook on the growth of the region and the country.

Table 5.6: Assumed forecast elasticities for background growth

Vehicle type	Growth driver	Derived Elasticity	Period Considered (Without Dummy)	Forecast	
				Assumed forecast elasticity	Evolution of elasticity
TP1 Lakshmipur					
Car	GSDP West Bengal	1.41	FY18-25	1.10	Reduced to 1.0 by FY30
LCV	GSDP West Bengal	0.80*	FY18-25	0.50	No change
Bus+2A	GSDP West Bengal	0.42	FY18-25	0.25 for Bus and 0.75 for 2A	No change
3A+MAV	GDP	0.62*	FY18-25	0.20 for 3A and 0.9 for MAV	No change
TP2 Gazole					
Car	GSDP West Bengal	1.50	FY18-25	1.00	No change
LCV	GSDP West Bengal	1.26	FY18-25	0.40	No change
Bus+2A	GSDP West Bengal	0.45	FY18-25	0.25 for Bus and 0.75 for 2A	No change
3A+MAV	GDP	0.60	FY18-25	0.30 for 3A and 0.9 for MAV	No change

Source: Steer analysis of Client data; *insignificant results; FY25 AADT used in to derive the elasticities via regression analyses was the actual FY25 AADT; The derived elasticities for the Bus + 2A models at both plazas are with respect to GSDP WB, whereas in the models, Buses are driven by WB GSDP while 2As are driven by National GDP (as per Table 5.5 above).

6 Forecast: Network overlays and forecasts

Introduction

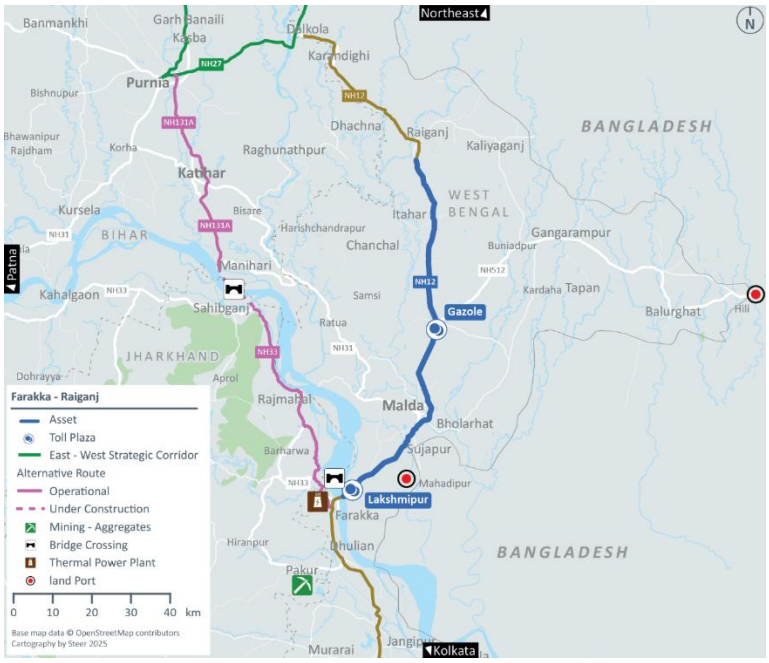
6.1 Following the discussion on estimated and assumed forecast background growth rates in the previous chapter, this chapter first deals with the forecasting assumptions around base year AADT and potential impacts on traffic growth on the Asset. Later, it presents the assumed toll segmentation, trip factors and evolution of toll rates for the forecast period which are used to estimate the forecasted revenue based on the forecast traffic. In the final section, the chapter summarises the traffic growth rates for the forecast years.

Analysis of potential network impacts

Alternate routes and improvements

6.2 The section below details the impacts which we believe would affect traffic on the Asset during the concession period. As discussed in Chapter 2, to assess the impacts on the Asset, whether positive or negative, we have studied developments (alternate roads, and feeder roads) in the surrounding road network. Figure 6-1 below shows the road network surrounding the Asset.

Figure 6-1: Asset route shown against the regional network context



Source: Steer analysis and cartography

6.3 Table 6.1 below summarizes upcoming network/other developments considered for this Asset, corresponding alternate/feeder routes associated with these developments, their year of completion, and indicative direction of each impact on the Asset.

Table 6.1: List of network/other developments

S. No.	Development	Route affected	Year of completion	Impact (+/-)
1	Completion of Sahibganj Bridge	Trips between south of Farakka and North of Raiganj.	FY31	-ve
2	LoS improvement (4-laning of Krishnanagar-Behrampore section of the NH12)	Asset Corridor	FY27	+ve
3	Recovery of Bangladesh bound traffic	Asset Corridor	FY28	+ve

Source: Steer analysis

Impact assessment for network/other developments

6.4 The subsection below includes a narrative of the improvement, as listed in the table above, and impacts associated to that development.

Completion of Sahibganj Bridge

6.5 As discussed in Chapter 2, the completion of 6-km 4-lane Sahibganj bridge across the Ganges between Sahibganj (JH) and Manihari (BH) is expected to be completed by FY28[9]. Upon its completion, we expect that some of the traffic currently plying on the Asset moving between Farakka, Pakur, Nalhati and further south (of Bengal) and parts of Bihar (including Purnia, Katihar), and north of Raiganj (in WB) will divert to this alternative route especially short to medium distance trips.

6.6 It can be seen from Figure 6-1 above that the northern section of the longer corridor i.e., Purnia and Manihari section of the NH131A is already 4-laned and currently being tolled at the Routara toll plaza. Going forward we expect the southern section of the corridor i.e., the Sahibganj-Farakka section of the NH33 to also become fully upgraded to a 4-lane configuration, improving the overall LoS of alternative route to the Asset. The impact estimated is applied over 4 years – 25% from FY28 to FY30, and 100% FY31 onwards

6.7 Table 6.2 below presents the impacts estimated for both the toll plazas.

Table 6.2: Impact of completion of Completion of Sahibganj Bridge

Vehicle type	FY28-FY30	FY31 Onwards

4-laning of Krishnanagar-Behrampore section of NH12

6.8 As seen in Figure 6-2 below, while the Raiganj bypass and ROB as well as the Raiganj-Dalkhola section of the NH12 have been fully upgraded (to 4-lane configuration) as of early FY25[10], the southern section of the NH12 (i.e., 4-laning between Krishnanagar and Behrampore) is still under construction in several sections (as of August 2025) and is expected to completed by end of FY26.

Figure 6-2: Impact of 6-laning LOS improvement

Source: Steer analysis and cartography

6.9 Given the 4-laning of the NH12 section between Kolkata and Krishnagar is also completed as of early FY25[29], **the completion of the Krishnanagar-Behrampore section** will significantly increase the LoS offered by the NH12 across its full length from Kolkata to Raiganj, improving long-distance commercial traffic access to the Asset. To incorporate the positive impact of this development on future traffic growth on the Asset, we performed a GJC cost analysis of the NH12 pre and post-completion of the project.

6.10 A comparison of generalised journey costs (GJC) provides how different elements of cost and time affect traffic. This comparison was done for both light and heavy vehicles. Lower GJCs correspond to higher induced traffic. Based on Steer's studies and research in India, we have found that for every 1% reduction in the GJCs, the traffic increases by a factor of 0.3. We then applied the difference of GJCs to the elasticity of 0.3 to get net influence on the traffic.

6.11 The improvement in travel costs or GJC is translated into the impact on that share of local + IAOI OD movements using a linear inverse relationship. Thereafter, the GJC influence is applied on the corresponding shares of traffic, which were extracted from OD data.

6.12 Table 6.3 and Table 6.4 below present the extent of the LoS impact on both Asset toll plazas and the expected timelines of the impact on the Asset.

Table 6.3: Impact of 6 laning LOS improvement for TP1 Lakshmipur

Recovery of Bangladesh bound Traffic

6.13 The overall slowdown and rising inflation in Bangladesh's economy has led to overall drop in export and import and in addition affected the construction activity in the country, due to which demand of construction materials has declined. The political instability in the country[30] has also had an impact on trade, with FY25 seeing a major dip following the crisis that emerged in August 2024. This has been observed to pursue in FY26 YTD as well.

6.14 Bangladesh's economy has recently been affected by economic downturn due to high inflation, dwindling foreign reserves, high debt among others resulting in a decline in overall economic activity in the country. Private consumption growth, public investments witnessed a fall in Bangladesh, as a result the country's imports have also gone down, according to a report published by the Asian Development Bank, earlier discussed in section 2.17. This had led to fall in India's overall exports to Bangladesh by ~19% in FY24 vs FY23. This drop continues in FY25 and FY26. In terms of commodities this drop is seen in cement, stone, minerals, cotton and steel.

6.15 However, with the recovery in Bangladesh economy, we expect construction activity in the country to pick up and export demand will start increasing.[31] This recovery impact is assumed from FY27 onwards and expected to materialise in full by FY28 in a phased manner as shown in Table 6.5 and Table 6.6 below.

Table 6.5: Impact of Bangladesh Recovery on TP1

Overloading

6.16 Overloading contributes to a significant share of both traffic and revenue at both Asset toll plazas. Over the past years since commencement of tolling, the proportion of overloading has varied significantly, mainly due to the decisions taken by the local administration to either ban or lift the ban on overloading at various times. Since overloading proportions are already at historic lows, (as discussed in Chapter 3), no further reduction in overloading shares has been assumed in our future traffic and revenue forecasts for the Asset. FY26YTD (Apr-Sep 2025) average overloading shares have been considered for the forecasts.

Revenue forecasting assumptions

6.17 To forecast the revenues for a forecast year, the traffic forecast for each vehicle type is converted into tickets sold, which is then multiplied with the corresponding toll rate. While toll segmentation provides the breakup of trips paying each ticket type, trip factors provide the conversion factor to convert from traffic (trips) to tickets sold. This section discusses assumptions related to toll segmentation, trip factors and toll rates for the forecast period.

Toll segmentation

6.18 As discussed in Chapter 3, segmentation trends have largely been stabilising over the years, with FY26YTD indicating the latest segmentation trends. Table 6.9 and Table 6.10 below provide the toll segmentation assumed for the period of forecast. For the traffic and revenue forecast, FY26YTD (Apr- Aug) as discussed in the earlier sections, can be considered a normal period. Therefore, we believe the FY26YTD segmentation is representative of the travel patterns on the Asset and the same has been assumed for forecast years as well.

6.19 Across multiple assets, the number of passes sold has observed to be rising on a day-to-day basis, indicating an early adoption among frequent users since its introduction on 15th August 2025 till 30th September 2025, and a corresponding decline in other ticket categories mainly in the single and return categories. The evolution of proportion of users using the annual pass up to September 2025 is presented below:

Table 6.8: Annual pass adoption between 15th August and 30th September 2025

	15th to 31st Aug	1st to 15th Sept	16th to 30th Sept
Lakshmipur	3.0%	5.9%	8.5%
Gazole	3.0%	5.7%	7.7%

Source: Steer analysis of TMS data

6.20 CJV Segmentation for FY26 has been developed using the pre annual pass segmentation till 14th August 2025, and daily Annual Pass transaction data from 15th August 2025 till 30th September 2025. Post September 2025, a gradual ramp up is assumed such that they form a large portion of the CJV trips by the end of FY26. This corresponds to a reduction in a proportionate decrease in single and return trips. For FY27 and beyond, we have assumed the share of annual pass trips to be in line with that observed at the end of March 2026, by when we believe the distribution of ticket categories in CJVs should stabilise.

6.21 In FY26, the share of CJVs using the Annual Pass on Lakshmipur is projected at 8.4% (on an annual basis) with a March 2026 estimate of around 21%, which from FY27, expected to stabilize at March 2026 levels. On Gazole, the share of CJVs using annual pass is projected at 8.4% (on an annual basis) with March 2026 estimated to be around 22%, which from FY27 is expected to stabilize at March 2026 levels.

6.22 For other vehicle categories we have analysed the historical TMS data split by ticket categories, to understand trends, as shown in Chapter 3. For the traffic and revenue forecast, FY26YTD (Apr- Aug) as discussed in the earlier sections, can be considered a normal period.

Table 6.9: Toll segmentation at TP1 Lakshmipur

Forecast	CJV (FY26)	CJV (FY27)	Mini-LCV	LCV	Bus	2A	3A	MAV

Toll evolution

6.24 Based on the concession agreement and the gazetted toll notification, we see that base toll rates increase every year based on WPI-linked inflation to provide us unrounded toll rates. These are rounded up to the nearest five rupees to estimate the rounded toll rates charged to the road user.

6.25 We have used actual toll rates from FY25 toll notifications to validate the modelling of the toll evolution. Forecasted growth in WPI was adopted from Client based inputs of WPI growth forecasts, presented in Table 6.13 below. The upward trend in inflation is expected to continue in the medium term, before gradually tapering to 4.1% in the long term.

6.26 These WPI forecasts provided by the Client. The WPI forecasts available from other independent forecasting agencies may vary from this assumption and could be lower or higher than that provided by the Client.

Table 6.13: WPI growth forecast assumptions

Financial year	WPI growth (%)
FY26	2.57%
FY27	2.4%
FY28	5.0%
FY29	5.1%
FY30	4.9%
FY31	4.4%
FY32 onwards	4.1%

Source: FY27 onwards WPI print as per client inputs

Revenue reconciliation

6.27 As part of validating the data provided by the Client, as well as our assumptions around toll calculations, we have reconciled the actual reported revenue for FY26YTD. To reconcile we have used the FY26YTD segmentation, FY26YTD AADT and compared it with the reported revenue for the year. The exercise was undertaken at an annual level. The comparison, as shown in Table 6.14 below, depicts the modelled revenue vs the reported revenue difference, and the difference lies within 0.1%. This gives us the confidence in the assumptions around segmentation and trip factors for future forecast purposes.

Table 6.14: Revenue reconciliation summary (AADC INR lakhs)- FY26YTD

Toll Plaza	Modelled Revenue	Actual Revenue	Difference (%)
TP1 Lakshmipur	47.34	47.34	0.0%
TP2 Gazole	21.62	21.63	(0.1%)

Source: Steer analysis

Traffic and Revenue forecasts

6.28 Based on the traffic and revenue related forecast assumptions discussed above, we modelled traffic and revenue forecasts for the Asset over its full concession period. Table 6.15, Table 6.16, Table 6.19, and Table 6.20 below present the AADT/PCU forecasts and associated forecasted growth rates on the Asset. Further, Appendix A presents the AADT and revenue forecasts for the Asset.

6.29 As presented in Table 6.16 and Table 6.20 above, concession end CAGRs (i.e., for the period FY26-FY42) of our final traffic forecasts (i.e., background growth + impacts) in PCUs are 4.9% and 4.6% per year at TP1 Lakshmipur, and TP2 Gazole (respectively). While the background growth is primarily driven by car growth followed by MAV growth, the minimal uplift in final growth rates (as evidenced in Figure 6-3 and Figure 6-4 below) is due to two impacts expected going forward namely, (1) Recovery in Bangladesh-bound construction traffic movement on the Asset, and (2) Increased long-distance and within state traffic flows on the Asset due to significant LoS improvement on the NH12 corridor due to 4-laning completion of the Krishnanagar-Behrampore section of the NH12.

6.30 Figure 6-3 and Figure 6-4 below present the PCU volumes and growth rates from the Base Year (FY26) through the end of the concession in FY42.

Figure 6-3: Forecast traffic and growth rates in PCUs - Background and final, TP1

Upside and Downside cases

Upside and Downside scenario assumptions

6.31 We have developed our base case scenario considering a balanced view on the risks associated with input assumptions around GDP growth and traffic growth elasticities. There is always a risk that the outturn values of these inputs will vary as compared to the assumptions taken due to exogenous impacts, e.g. GDP growth could be influenced both positively and negatively by the impact of monsoons, export-import balances, political changes etc.

6.32 Similarly, traffic growth elasticities could be influenced by increased efficiencies achieved by technology, large shifts in commodity prices globally, changes in local manufacturing practices. However, at this stage we consider that the base case represents a central case scenario given the risks of variation of input assumptions.

6.33 To account for the possible variations in the growth drivers, we are also presenting an Upside (optimistic) and a Downside (pessimistic) scenario. These scenarios are defined by the following variations from the base assumptions:

Table 6.23: Summary of Macro-economic Assumptions for upside and downside cases

Input	Upside	Downside
Macro Assumptions		
GDP/GSDP	+1% every year	-1% every year
WPI	+1% every year	-1% every year
Elasticities	+ 10%	- 10%

Source: Steer analysis

6.34 Further, network developments are highly dependent on governmental directions, policies, legal and financial measure which might result in early or delayed completion of developments. Therefore, we have included an Upside (optimistic) and a Downside (pessimistic) case. However, at this stage, we consider that the base case represents a central case scenario given the risks of variation of input assumptions.

Impacts-Upside Case

6.35 The upside case impacts included in forecasts are summarised in below.

Table 6.24: Summary of impacts on the Assets – upside case

Development	Year of impact	Change in impact w.r.t base case	Magnitude of impact	
			TP1 Lakshmipur	TP2 Gazole
Sahibganj Bridge Completion	FY31*	+25% of base case	2A: (1.7%) 3A: (1.5%) MAV: (2.5%)	2A: (1.5%) 3A: (1.5%) MAV: (3.3%)

Upside and Downside Case Forecasts

6.37 Table 6.26 below presents the difference between the Upside and Downside Case forecasts relative to the Base Case forecasts in FY42 (i.e., the concession end year) for both Asset toll plazas. Figure 6-5 through Figure 6-8 below plot the Upside and Downside Case forecasts relative to the Base Case forecasts for each Asset toll plaza over the full concession period (FY26-FY42).

Table 6.26: Percentage Difference Upside and Downside Case Forecasts vs. Base Case Forecasts - FY42

Case	Measure	TP1 Lakshmipur	TP2 Gazole
Upside Case	Traffic (PCU)	+26.0%	+24.5%
Downside Case		(18.7%)	(17.7%)
Upside Case	Revenue	+42.7%	+41.2%
Downside Case		(28.6%)	(24.9%)

Summary outlook

6.38 Overall, passenger traffic on the Asset is mainly influenced by leisure travel between major urban centers in the state and near the Asset including Kolkata in south Bengal as well as other towns like Farakka, Malda, Gazole, and Raiganj that lie along the Asset route. In contrast to the passenger traffic profile on the Asset, most of the goods traffic observed on the Asset is influenced by economic productivity of local stone mines/quarries and crushing units near the Asset (i.e., in Pakur district of Jharkhand) and trade export flows of construction materials (particularly stone chips) and agricultural products from India to Bangladesh, which is further linked to the Bangladeshi economy.

6.39 Between FY22 and FY25, both passenger and goods traffic on the Asset have observed robust growth, with TP1 growing at an AADT CAGR of 4% and TP2 at 4.3% , attributable to growing household incomes and local tourism activity in the region, as well as the ongoing construction of the New Farakka Setu, which has kept demand for construction material buoyant, and induced growing construction traffic movement on the Asset over the same period. Further, a slowdown in supply of stone and construction material from Jharkhand for Bangladesh was observed due to erratic mining on account of the monsoon. On the demand side, it was observed that the demand for stone aggregate still has not fully stabilised in Bangladesh. As a result, traffic on Lakshmipur has seen lower growth than Gazole.

6.40 While most of the NH12 between Kolkata and Dalkhola has already been upgraded to 4-lane configuration, some sections such as the Krishnanagar-Behrampore section are still yet to complete in full. These upgrades are anticipated to enhance the overall service level along the entire corridor, leading to not only steady traffic growth on the Asset via traditional movements but also an increase in induced traffic volumes on the Asset.

6.41 The Asset acts as the primary route connecting Kolkata and southern West Bengal with the northern parts of the state and Northeast India. Consequently, improvements in service levels due to the completion of construction in various planned and ongoing

sections are expected to encourage more passenger movement and stimulate additional traffic. The strategic and geographical advantage of its unique location works in favour of the Asset, as there are currently no other viable alternative routes for users moving between these regions.

6.42 In summary, future traffic growth outlook of the Asset remains promising given its captive commercial traffic market and strategic nature as the only viable route connecting South Bengal and beyond to parts of North Bengal and the NE states. Furthermore, it serves as the main artery on the tourism corridor, with both state and national governments focusing on developing northeastern states as tourism hubs in the near future. Despite recent declines in commercial traffic volumes over the past few years (FY23-FY26YTD), we expect traffic on the Asset to rebound in-step with a revival of the Bangladeshi economy which is forecast to return to trend growth by FY27 and beyond[32]. Thus, the underlying growth drivers of the corridor remain robust and are expected to deliver sustained long-term growth.

B Data Collection Exercise

B.1 To validate and inform various inputs used in our forecasting, we undertook primary data collection on the Asset. OD survey data was collected on behalf of the Client, TVC surveys were commissioned by Steer with a third party. OD data collection typically involves manual data entry by enumerators based on oral surveys with road users crossing toll plazas. TVC data collection involves video-graphic capture of traffic passing crossing the toll plazas, followed by manual counting.

TVC count

Table B.1: 3-day TVC counts at TP1 Lakshmipur

Disclaimer

This report has been produced for the sole benefit of Cube Highways Pvt. Ltd ("the Client"). The report may only be relied upon by Approved Addressees in accordance with the terms of our engagement letter. This Report (the "Report") is confidential and disclosed only for information purposes, and it may not be relied upon by any party other than the Client or a Party to a Reliance Letter, and Steer: a) makes no warranty, expressed or implied, with respect to the use of any information or methods disclosed in this Report; and b) assumes no liability with respect to the use of any information or methods disclosed in this document. Any such party by its acceptance or use of this Report releases Steer from any liability for direct, indirect, consequential, or special loss or damage whether arising in contract, warranty, express or implied, tort or otherwise.

The Report is based on standard professional efforts, and information available to us at the time the review took place and is subject to time and budget constraints of the Report's scope of work. This Report, information and statements contained herein, are all based on third party data provided to us, or sourced by us, and Steer has not sought to establish the reliability of the data, except as specifically stated in the Report. Steer bears no responsibility for the results of any actions taken on the basis of third-party data.

Certain forward-looking statements in the Report are estimates based on interpretations or assessments of information available at the time of writing. The Report is thus to be viewed as an assessment that is time-relevant, specifically referring to conditions at the time of the review. Steer undertakes no obligation to update the Report for any reason.

While the estimates contained in the Report are not precise forecasts, they do represent, in our view a reasonable expectation of the future, based on information we have been provided with or sourced. However, the estimates necessarily rely on numerous assumptions and judgements, and circumstances may occur over the timeframe of the project that go counter to these assumptions and judgements and that affect the project's realized revenues. Actual events may differ from those assumed, and events are subject to change. Therefore, Steer makes or provides no warranty, whether implied or otherwise, as to the accuracy of forward-looking information presented. Further, it is important to note that forecasts presented represent long term growth profiles; the results for individual time periods may vary from forecasted values.

Traffic Consultant developed the relationships in the models used to produce the forecasts for the projects based on data available through September 2025. This report does not consider variations in traffic performance due to changing macro and force majeure events such (but not limited to) as global wars, economic uncertainty (high inflation, global recession), and changes in the regulatory environment. The situation remains dynamic and is subject to significant change in the short and medium term. In this challenging context, Traffic Consultant has produced base forecasts with a view on a possible scenario for the traffic forecasts. However, it is important to note that this is only one view, and there continues to remain uncertainty as to the short-term, intermediate or prolonged effects of and responses to such macro-economic/force majeure events. As a result, no assurance can be provided by Traffic Consultant that the scenarios and assumptions Traffic Consultant has identified will prove to be accurate. Given the uncertainty inherent in this scenario, Traffic Consultant advises that all readers of the Report consider the Report in the context of their own assessment of the impact of such events.

TO THE FULLEST EXTENT PERMITTED BY APPLICABLE LAW, THE LIABILITY OF THE TRAFFIC CONSULTANT FOR ANY LOSS, DAMAGE, COST OR EXPENSE SUFFERED OR INCURRED BY ALL PERSONS OR ENTITIES AND FOR ALL CLAIMS RESPECTING ITS WORK PERFORMED IN CONNECTION WITH THE ISSUE OR THE REPORTS IS HEREBY LIMITED IN THE AGGREGATE TO THE AMOUNT OF FEES ACTUALLY PAID BY THE CLIENT TO THE TRAFFIC CONSULTANT IN RESPECT OF THE REPORTS AND CONNECTED SERVICES.

Glossary Items

Acronym	Meaning
2A/ Truck	2 Axle/ Truck
3A	3 Axle
AADT	Annual Average Daily Traffic

MADT	Monthly average daily traffic
MAV	Multi Axle Vehicle
NH	National Highway
NHAI	National Highways Authority of India
NSDP	National State Domestic Production
OD	Origin Destination
OSV	Oversized vehicles
PCU	Passenger Car Unit: it is a measure of standard vehicle unit to convert all vehicle classes to a single unit by using PCU factors to compute total traffic on an Asset.
Q1	Quarter 1 of financial year, from April to June
Q2	Quarter 2 of financial year, from July to September
Q3	Quarter 3 of financial year, from October to December
Q4	Quarter 4 of financial year, from January to March
RNP	Registered Number Plate

SCF	Seasonality Correction Factor
SH	State Highway
T&R	Traffic and Revenue
TMS	Traffic Management System
TVC	Traffic Volume Count
WADT	Weekly average daily traffic
YTD	Year to Date

1 Introduction

The assignment

1.1 The Cube Highways Fund Advisors Private Limited (the "Client") has commissioned Steer Davies Gleave India Private Limited ("Steer") for a traffic due diligence to be carried out on the Ghaziabad Aligarh Expressway Private Limited (hereafter called "Asset"). This report forms part of the annual fair market valuation (FMV) undertaken as part of the "Transit 10 project". This report presents an update of the traffic and revenue forecasts based on primary surveys undertaken in 2025, actual traffic data available up to September 2025 and latest macro-economic assumptions.

1.2 The Asset Ghaziabad- Aligarh consists of a single stretch of toll road with two toll plazas. For this report, we hereafter call the toll plazas present on the Asset as TP1 and TP2 respectively.

- TP1 – Luharli
- TP2 – Somna (Gabana)

1.3 Our scope of work for the traffic and revenue forecasting process includes:

Table 1.1: Scope of work and sources of data

Scope of work	Data source
• Review of historical Traffic Management System (TMS) data, Vendor reports and documents	• Provided by Client for the period between FY16 and Sept '25
• Historical analysis and forecasts for baseline growth, including; — Background growth, and — Seasonality trends	• Historical toll plaza data provided by Client and benchmarks from Asset in the vicinity wherever long time series historical data was not available
• Validation of revenue reported in FY26YTD	• TMS data provided by Client • Revenue reconciliation using toll plaza traffic and ticket type data to calculate revenue and reconciling it with toll plaza reported revenue
• Origin Destination (OD) analysis to understand growth drivers: — Zonal influence and Top OD pairs — Commodity distribution — Trip length distribution	• Origin Destination (OD) surveys undertaken by Steer in 2025
• Analysis of upcoming network improvements and other developments, that may have future impacts on traffic	• Secondary research and our in-house experience of working in the vicinity of the Asset. Impact analysis was conducted by Steer based on

Scope of work	Data source
	Generalised Journey Cost spreadsheet-based analysis
• Historical revenue analysis and forecasts for revenue estimation, including — Toll segmentation and trip factors, — Overloading shares	• Calculated from historical data provided by Client
• Final traffic growth forecasts including baseline growth rates and potential future impacts	• Elasticity based base growth and potential impacts from secondary research, Asset historical traffic performance and Steer's in-house experience of working on toll roads on the corridor • Gross Domestic Product (GDP) forecast assumptions provided by Client
• Toll revenue estimation for the entire concession, including toll evolution	• Toll evolution based on latest toll notification published by National Highway Authority of India (NHAI) and latest actual Wholesale Price Index (WPI) trends as shared by the Client. • Assumptions of WPI forecasts and future tolling length changes provided by Client • Revenues estimated as a product of traffic forecasts and toll evolution

Source: Steer

Our approach

1.4 Our approach follows well-established practices for forecasting ongoing traffic growth on an existing/brownfield Asset. The analysis has essentially focused on two sets of issues, namely:

- Understanding the traffic that is currently using the Asset; and
- Identifying how and why that traffic is likely to change in the future.

1.5 To understand the current traffic on the Asset, we have analysed traffic data from multiple independent sources:

- Client-provided secondary data, including:
  - TMS data starting June 2015 to September 2025.
  - Concession agreement and toll notifications for FY25 and FY26
  - Previous studies related to traffic and revenue
  - Bid documents and studies by lenders
  - Steer-commissioned OD survey on 3rd February 2025 on TP1 and 4th February 2025 at TP2 to validate any change in growth drivers and travel patterns.
  - Steer-commissioned TVC counts between 3rd of February 2025 and 5th of February 2025. TMS for the coinciding dates was available from the data shared by Client.

- We undertook revenue reconciliation for FY26YTD, by building up revenue from the traffic reported by the toll plaza and subsequently matched it to the reported revenue for FY26YTD using the prevalent toll rates and reported segmentation/toll-frequencies for FY26YTD, this is a key part of our analysis to validate the segmentation/toll-frequency assumptions and the Annual Average Daily Traffic (AADT) reported for each of the toll plaza.

1.6 The estimation of future traffic demand on the Asset was undertaken through:

- Estimating FY26 base year position. The FY25 AADT was calculated using the monthly traffic data for FY25. The annual FY25 AADT was then grown with elasticity linked GDP/GSDP growth to arrive at the FY26 expected traffic (FY26E). To determine the adopted FY26 (FY26A), the expected FY25 traffic was validated against six months of actual traffic (Apr'25-Sept'25) and necessary adjustments were made where required.
- Secondary research to understand plans for new developments and progress of ongoing developments on the Asset.
- Steer independent primary surveys and site visits to validate our network and contextual understanding.
- Developing a bespoke growth model for each Asset/plaza/toll class to forecast year-on-year traffic growth from FY27 to the end of concession period.
- Investigating the elasticity of historical traffic growth compared to state (GSDP) and national (GDP) growth. Where historical data is limited, we have benchmarked the Asset against our Steer knowledge base (e.g., similar Asset types in the same state or on the same corridor), to derive appropriate elasticities.
- Applying our elasticities to independent GDP forecasts as provided by Client.
- Identifying and analysing the potential impacts of any relevant changes to the competitive position of each Asset – these include impacts of changes to road network including expressways and opening of competitive modes of travel.
- Identifying and analysing any other potential impacts to traffic and revenue on each Asset – these include axle load norms, axle shift for heavy goods, FASTag implementation.
- Considering changes in trends of segmentation over time and making suggestions for changes in exemptions in the future
- Preparing traffic and revenue forecast for the Asset for the complete length of concession. The analysis here includes the specific impacts of network, or other exogenous factors specific to the Asset. We have developed a set of forecasting assumptions for three scenarios: a base case and upside and downside scenarios.

Contents of this report

1.7 The report has been divided into the following chapters, including Chapter 1 providing an introduction:

- Chapter 1 introduces the methodology and approach to undertake the traffic and revenue due diligence;
- Chapter 2 describes the key characteristics of the Asset and its surrounding road network, primarily based on site visits;
- Chapter 3 summarises the current and historical traffic on the Asset, including results from the TMS, TVC and OD analyses;

- Chapter 4 presents the socio-economic context of the corridor and region/state containing the Asset, along with our approach and results on estimating background traffic demand growth; and
- Chapter 5 summarises our approach and results on estimating background traffic demand growth along with our key forecasting assumptions,
- Chapter 6 presents our baseline year forecast, concession traffic and revenue forecasts for the Asset along with assessment of network impacts.

2 The Asset

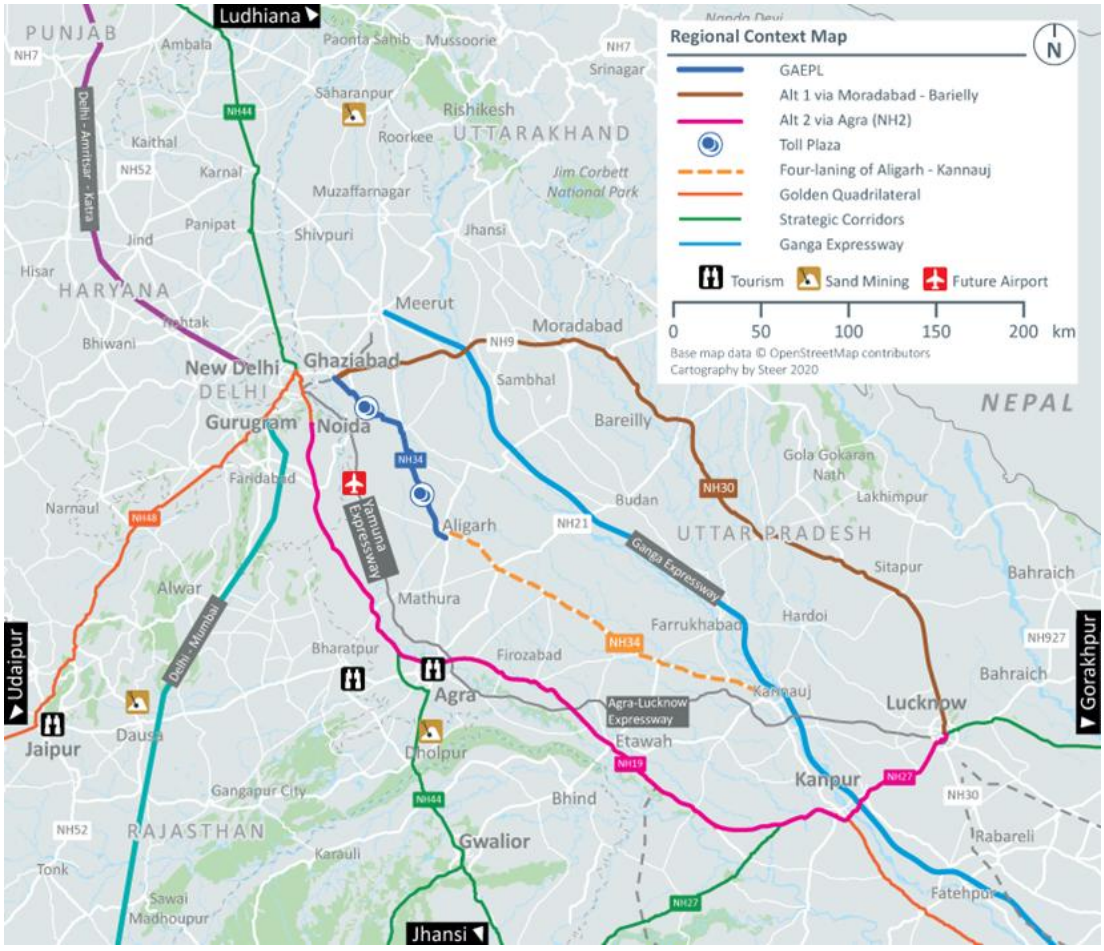
Introduction

2.1 This chapter provides a description of the Asset, primarily based on both primary (site visits) and our understanding of the regional and network context of the Asset. Starting with the strategic network context, the chapter discusses the Asset-level context, followed by economic activities and network developments around the Asset.

Strategic network

2.2 The Asset is situated in western Uttar Pradesh (UP), connecting the cities of Ghaziabad and Aligarh via Khurja and Bulandshahar. Figure 2-1 below shows the regional and wider road network in which the Asset is located.

Figure 2-1: Asset Location



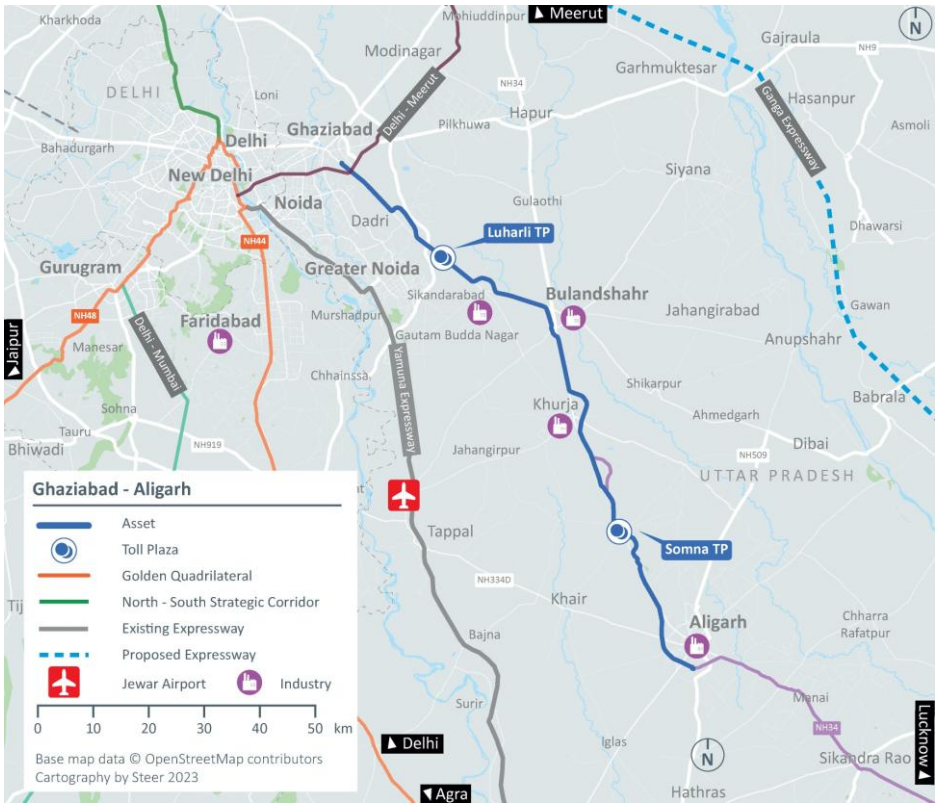
Source: Steer cartography

2.3 This 125.175-km asset is a six-lane toll road, a segment of NH 91 in Uttar Pradesh. It features two toll plazas: Luharli (TP1), situated closer to Ghaziabad, and Somna (TP2), near Aligarh. In October 2023, the Asset was expanded to a six-lane configuration, significantly enhancing capacity and unlocking growth across all vehicle categories that has sustained until present. In July of 2025, Luharli (TP1) was expanded to 16 lanes from 8 lanes earlier to ease congestion at the plaza during peak times[1].

Figure 2-2: Completed 6-Laning of the Asset

Source: Steer site visit

Figure 2-3: Asset context



Source: Steer cartography using OpenStreetMap data

[1] Jagran News, July '25

2.5 The Asset primarily caters to three different types of movements, by virtue of its strategic location on various corridors:

- Local traffic between cities in western UP, Delhi Central NCR (consisting of Delhi state) and Ghaziabad.
- Trips to the industrial area of Sikandrabad which is located on the Asset and serves as a major attractor/generator of traffic.
- Heavy vehicle traffic originating from the states of Haryana, Punjab and Jammu and Kashmir in the north travelling to states in the east of India including West Bengal, Orissa, and the north-eastern states. The Asset is part of strategic north – east movement.

2.6 On TP1, most of the traffic is to/from Delhi NCR and Sikandrabad Industrial Area which has small and medium scale manufacturing industries such as tiles, pesticides, pipes, paint, and furniture. Some of the key players such as Orient Bell tiles, Ultratech Cement, Vishal Pipes, Goodluck Industries have their presence in the vicinity of the Asset. Apart from these, there is also long-distance traffic going towards Kanpur present at TP1.

2.7 On TP2 Somna, majority of the traffic is medium to long distance going to and from Kanpur and Etawah. Also, local transportation of meat and hardware from processing plants and industries near/in Aligarh also contribute to traffic on the Asset. There exists significant bus traffic between Delhi and Aligarh that appears on this plaza as well. TP2 also has presence of THDC power plant in Khurja opened in January 2025[2].

Concession and tolling

2.8 The toll plazas on the Asset have been operational since June 2015. As per the original concession agreement the concession period was of approx. 20 years, which was scheduled to complete by 2035. But as per the settlement agreement dated 08th April 2022 an extension of 4.32 years has been granted and agreed upon by National highways Authority of India (NHAI) based on the clause 29 of the concession agreement and now the end of concession has been extended to FY40.

Table 2.1: Concession details

Item	Description
State	Uttar Pradesh
Highway and lane configuration	NH 91 six-lane
Toll plazas	TP1: Luharli TP2: Somna
Length (km) as per concession agreement, applicable	TP1: 62.175 Km TP2: 63.00 Km
Commencement of operations*	TP1: June 2015 TP2: June 2015
Concession period	24 years
Last year of concession	FY40

2.9 The following pictures indicate a typical cross-section of the Asset and its toll plazas.

Figure 2-4: Typical cross section of the Asset and toll plazas

Source: Steer photos from site visit

2.10 In July '25, the Luharli toll plaza (TP1) was expanded to a 16-lane staggered configuration. The new plaza is expected to ease congestion at the toll plaza during peak times and increase capture of traffic that earlier bypassed the plaza via a nearby micro diversion route (discussed later). Overloading is charged on TP1 only and not on TP2.

2.11 Tolls are collected for Car/Jeep/Van (CJV), LCV/Minibus, Bus/Truck, 3A/MAV/HCH/EME/OSV categories. The toll plazas have dedicated ETC/FASTag lanes for electronic tolling, apart from hybrid lanes. The toll rates for FY26 are as shown in Table 2.2 below.

Table 2.2: Vehicle wise toll rates on GAEPL (INR)

Type of Vehicle	Single Journey Fee	
	TP1 Luharli	TP2 Somna*
CJV	150	200
LCV	235	305
Bus/2A	480	615
3A/MAV	735	935
OSV	940	1220

Source: NHAI Revision of User fee rate, w.e.f. 01.04.2025; *For TP2, these reflect official toll rates as per the FY26 NHAI Toll Notification. Toll rates assumed in our forecast models are lower as we exclude 2.185 km from the total tolling length of TP2 from FY26 onwards as per Client input.

2.12 Apart from single tickets, the typical NHAI ticket categories like return, monthly, local personal and local commercial passes are also available on the Asset.

Key economic activities

2.13 Uttar Pradesh is the most populous state in India and is largely an agrarian economy with agriculture being a major source of employment and livelihood. With several urban centres located on the Asset, including Ghaziabad, the toll plazas, especially TP1 Luharli, serve large volumes of local and regional light vehicular traffic with its proximity from Delhi/NCR and Ghaziabad.

2.14 The part of the state, where the Asset is located, is an industrial region with towns like Sikandrabad, Khurja and Aligarh that serve as separate distinct hubs of medium and large-scale industries specializing in manufacturing (e.g., ceramics, hardware). Commercial traffic on the Asset reflects characteristics consistent with this industrial profile carrying manufactured commodities from nearby factories to consumption centres elsewhere or intermediate goods destined for these factories for further processing on their production lines.

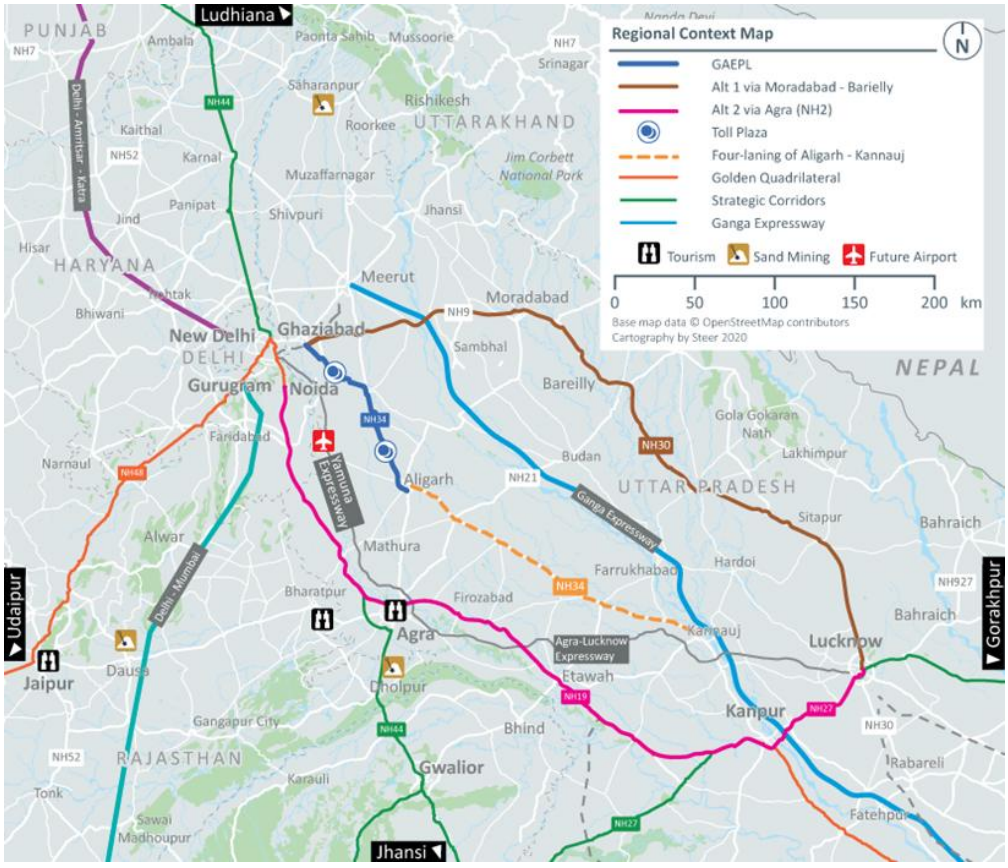
2.15 At TP1, majority of the commercial traffic is plying between Sikandrabad Industrial Area and National Capital Region (NCR). The influence of these economic drivers on the Asset's performance is discussed in more detail in Chapter 3 and 5 below.

Alternate Routes

2.16 The Asset occupies a strategically vital position along the east-west corridor connecting Delhi and the west with Lucknow and beyond. Figure 2-5 below illustrates other alternate routes available to long-distance users while travelling between Delhi and Lucknow. Currently, for travelling between Delhi and Lucknow there are four major routes:

- Asset: Delhi-Ghaziabad-Aligarh-Kannauj-Lucknow via NH91
- Alternate 1: Delhi-Moradabad-Bareilly-Sitapur-Lucknow via NH 24
- Alternate 2: Delhi-Faridabad-Agra-Kanpur-Lucknow via NH2 (NH19).
- Alternate 3: Delhi-Agra (via Yamuna Expressway)-Lucknow (via Agra-Lucknow expressway).

Figure 2-5: Alternate routes



Source: Steer Cartography

2.17 Medium-distance traffic, particularly those traveling southeast of the Asset, now have access to several recently upgraded state highways (such as the 4-laned Aligarh-Kanpur section). These improvements have enhanced the quality of the local road network, offering cheaper, and often free, alternative routes to industrial hubs such as Sikandrabad and Ghaziabad.

2.18 Chapter 6 provides a discussion and estimation of potential impacts due to these alternate routes in addition to the impact of new routes not currently operational (but expected to become operational in the near term) such as the Ganga Expressway

2.19 On the northbound side (towards Ghaziabad direction) near TP1, a micro leakage exists which could earlier be accessed from points on the Asset roughly 400-500m away from the earlier in-line plaza location. It is a two-lane local road which mostly caters to local Car and Mini-LCV traffic, that previously offered users the opportunity to evade the toll by taking a 1 km longer detour that could be travelled in roughly 10 minutes.

2.20 To address the issue of micro diversion of toll paying traffic, a Check Plaza was opened in Aug'23 at the location where local leak was connecting to the Asset. After almost a year of being operational, during which the existence of the check plaza significantly reduced leakage at TP1, the check plaza was vandalized by locals in September 2024.

Staggered Plaza for TP1 : Luharli

2.21 While the check plaza was not under operation since September 2024, the newly operational staggered plaza configuration is expected to reduce this leakage going forward. The staggered plaza was opened mid-July 2025, and daily traffic data available through 30 September 2025 did not suggest any significant change in the ticket segmentation distribution at TP1 prior to the introduction of the Annual Pass on 15 August 2025. Thus, beyond assumptions of how we expect the share of Annual Pass CJV trips to evolve going forward (and its impact on residual CJV ticket shares), we have not assumed any further changes in segmentation that may or may not result from operationalisation of the staggered plaza configuration of TP1 relative to its earlier in-line configuration.

2.22 There exists a local diversion road at TP2 Somna as well. However, the TP2 micro diversion road is unmetalled and local villagers show resistance against vehicles using this road, suggesting that TP2 does not suffer the same or any significant level of revenue loss due to existence of this local diversion road.

Figure 2-6: Local leak at TP1 (first row) and TP2 (second row)

3 Traffic Description

Introduction

3.1 This chapter describes current traffic and revenue trends on the Asset, as well as Steer's analysis of origin-destination (OD) data and traffic count data, including that which was collected as a part of this study, and data provided by the Client.

3.2 Traffic demand data is generally collected and analysed to understand the volume and vehicle composition of demand currently using the Asset, while OD data is used to obtain a better understanding of travel patterns, trip lengths, trip purposes and areas of influence in the vicinity of the Asset, as well as the commodities being moved by goods vehicles. This analysis, combined with our understanding of the Asset (based on our site visits), enables us to identify the key drivers of demand on the Asset.

3.3 Actual toll plaza data is used as the basis from which the current/base year Monthly Average Daily Traffic (MADT) is established. This data is typically provided by the Client and independently analysed and validated by us using Traffic Volume Count (TVC) information.

PCU Factor assumption

3.4 The PCU values have been taken from 'IRC 64:1990- Guidelines for Capacity of Roads in Rural Areas'. For MAV, based on the discussion with the Client, we have referred to the rigid and trailer splits for calculating the effective PCU for MAVs. For rigid trailer trucks we have assumed a PCU factor of 3, whereas for trailer trucks we have assumed a PCU factor of 4.5. These factors have been used to arrive at the PCU values presented in Table 3.1 below.

Table 3.1: PCU factors

Vehicle Category	PCU Factor
CJV/ Mini LCV	1.0
LCV	1.5
Bus/2A/3A	3.0
MAV*	3.6
OSV	4.5

Source: Steer analysis and IRC64,1990

Historical Trends

3.5 Table 3.2 and Table 3.3 below present the historical variation in total traffic and tollable traffic volumes at TP1 Luharli toll plaza, by vehicle category and in total PCU terms.

Table 3.2: Historical evolution in AADT by vehicle class at TP1 – Luharli

Vehicle	FY19	FY20	FY21	FY22	FY23	FY24	FY25	FY26YTD	CAGR (FY19-25)	FY26YTD vs FY25YTD (%)

Source: Steer analysis of the Client data. FY26YTD consists of data from Apr'25 to Sep'25.

3.6 Between FY19 and FY25, total PCUs on TP1 have grown at approximately 3% per year. This modest PCU growth on TP1 is primarily due to variability in CJV traffic capture due to the micro leakage route near the toll plaza. Since TP1 is located in the NCR region, it observes a higher share of CJV, Mini LCV, and LCV traffic relative to TP2. In addition, the plaza has historically had a high share of non-paying users within the more local CJV, Mini LCV, and LCV vehicle categories.

3.7 However, in contrast to growth in total traffic, growth in tollable traffic over the same period (i.e. FY19-FY25) has been significantly faster, having grown at roughly 8% per year since FY19. This growth in tollable volumes can be attributed to a number of factors

- The mandatory implementation of FASTag in Feb '21.
- Capacity expansion of the Asset to six-lane configuration in October '23, and;
- Operation of a Check Plaza between Aug '23 and Sept '24.

3.8 All vehicle categories (except LCV and 3A) registered positive growth over FY19-FY25.

3.9 The strategic location of TP1 Luharli, in proximity to major urban centers such as Ghaziabad and Delhi, and serving significant intercity movement towards Sikandrabad,

further influences traffic dynamics on the Asset. CJVs constitute the dominant traffic segment, representing over 70% of total traffic in FY25. This substantial share is due to the Asset's location, serving large urban and industrial hubs including Ghaziabad, Aligarh, Khurja, Bulandshahar, as well as other areas in and around Delhi NCR.

3.10 As mentioned earlier, TP1 Luharli has witnessed a positive increase in total as well as tollable traffic volume in FY26YTD due to a combination of factors including completion of 6 -lane configuration of the Asset and opening of check plaza at TP1 which has led to improved reporting and compliance resulting in increase in FY25 and FY26YTD traffic volumes as well as tollable traffic[3]. Further as discussed in chapter 2, opening of a new staggered toll plaza starting July-25 has resulted in increased capture of CJV traffic and reduced the congestion faced by users using the earlier toll plaza. This has resulted in higher capture of traffic (effectively nullifying the effect of the micro leakage), better reporting of vehicles as well as reduced wait time for users at the Luharli toll plaza.

3.11 Moreover, 4-laning of NH-914 Aligarh-Kanpur section in H2 of 2024 – located east of the Asset has further improved LOS of the corridor, paving way for growth on the Asset.

3.12 The historical classification of LCV-2As has presented challenges due to the similar physical characteristics of vehicles in these categories which has led to the share of LCVs decreasing over the past five years, attributable to classification shifts between the LCV and 2A categories. The implementation of FASTag has further contributed to this trend, resulting in the reclassification of some Mini LCVs, previously counted under the LCV category to CJVs. Consequently, LCV traffic at the plaza has exhibited a declining trend since FY19, with a 6.4% annual decline observed between FY19 and FY25. Post reclassification in FY22-23 however, LCV volumes have exhibited strong growth, with FY26YTD at 5.2% above FY25 levels.

3.13 The 2A/Bus category has also experienced strong growth since FY19, benefiting from the positive impact of the Asset's six-lane expansion, as well as the 4-laning of the Aligarh-Kanpur section of the NH91. 2A trucks have also benefitted from a shift in preference from 3A trucks due to favourable changes in the legal permissible loads for 2As[5] and their suitability for e-commerce-related freight, particularly high-value, low-volume goods over medium to long distances.

3.14 3A traffic on the Asset has declined consistently since FY19, at a CAGR of -13.3%. This decline stems from lower demand for 3A vehicles as transporters increasingly opt for 2A and MAVs. MAVs offer greater tonnage capacity over long distances while 2As are cheaper for shorter distances. Discussions with transporters and OEMs nationwide

[3] Luharli toll plaza witnessed tollable traffic growth due to behavioral shifts among local users during the brief operationalization of the check plaza in FY24. Although the check plaza was later vandalized in September 2024, its presence temporarily curbed toll evasion and led to a sustained increase in users opting to pay tolls. Additionally, local villagers blocked the micro diversion route used to evade tolls, increasing the detour distance from roughly 1 km to nearly 3 km. This reduced the attractiveness of the alternate route and further limited leakage, helping maintain higher tollable traffic volumes despite the check plaza's destruction in late FY24.

[4] **Kanpur-Aligarh four-lane highway nears completion | Kanpur News - Times of India**

[5] **New axle load norm gets two amendments, ETAuto**

corroborate this shift towards 2A and 5A vehicles for commodity movement due to improved unit economics.

3.15 Table 3.4 and Table 3.5 below present the historical variation in total traffic and tollable traffic volumes at the TP2 Somna toll plaza, by vehicle category and in total PCU terms.

Table 3.4: Historical evolution in AADT by vehicle class at TP2 – Somna

Vehicle	FY19	FY20	FY21	FY22	FY23	FY24	FY25	FY26YTD	CAGR (FY19-25)	FY26YTD vs FY25YTD

Source: Steer analysis of Client data; FY26YTD consists of data from Apr'25 to Sep'25.; Tollable traffic excludes exemption and violation.

3.16 Between FY19 and FY25, TP2 has seen similar muted growth at a PCU level , which can be attributed to (1) the impact of the Covid-19 pandemic in FY21, and (2) the impact of the 4-lane expansion of the NH91 Kanpur-Aligarh section which led to a reduction in level of service during the construction period (FY22-FY24).

3.17 As of FY26YTD, TP2 Somna has observed strong growth in MAV traffic, having grown from 1,531 AADT in FY25 (Apr-Sept '24) to 1,695 AADT in FY26YTD i.e., ~11% annual growth. The strong continued growth in MAV volumes at TP2 (and TP1) since H2FY24 is primarily driven by the overall upgradation of the NH91 corridor, increasing the attractiveness of the Asset as a facilitator of east-west long-distance goods movement. Post 6-laning of the Asset in late 2023, traffic growth at TP2 picked up and has since sustained well, with FY26YTD traffic recording roughly 21% growth over FY25 levels. As per our conversation with the toll plaza authorities, FY26YTD increase in volumes is also a result of a temporary

diversion due to construction of local road in the vicinity. The estimates for full FY26 have been adjusted accordingly to reflect this temporary effect

3.18 Similar to TP1, 2A and MAV traffic at TP2 have exhibited strong growth since FY19, while 3A volumes have consistently declined over time.

Historical Revenue

3.19 Table 3.6 below shows the historical reported revenue on the Asset.

Table 3.6: Historical evolution in annual revenue (in INR Crore) and AADC (in INR Lakhs)

Toll Plaza	FY23	FY24	FY25	FY26YTD
TP1	129.7	158.7	186.7	103.8
TP2	121.6	139.3	163.5	90.6
Total	251.3	298.0	350.2	194.4
AADC (INR Lakh)	**68.8**	**81.4**	**96.0**	**105.7**
Growth		**18.2%**	**17.9%**	

Source: Steer analysis based on data provided by the Client; FY26YTD consists of data from Apr'25 to Sep'25

3.20 The opening of Check Plaza between Aug'23 and Sept '24 at TP1 Luharli resulted in improved reporting and compliance. This was observed as increased volumes of tollable traffic between August'23 and September'24 specifically for Cars and LCVs along with segmentation changes that showed a reduction in exemptions and violations during the same period. Thus, better reporting and growth in tollable traffic coupled with the impact of improved LOS on the Asset in FY24 resulted in strong AADC growth in FY24 and FY25. As of FY26YTD, AADC is at INR 106 Lakh per day.

Toll Frequencies

3.21 Toll frequency or segmentation is the distribution of different ticket categories recorded for all vehicle categories. This is based on the toll policy which is a part of the concession agreement. Each vehicle category has a different segmentation. As a part of our historical analysis, we calculate the toll frequency for each vehicle category from the monthly data shared by the Client. The most common ticket categories observed on a typical National Highway concession are: Single, Return, Monthly, Local and Exempt. Given the local nature of traffic, some toll plazas offer custom made local passes to attract the local commuters to opt for these category passes instead of evading toll.

3.22 Understanding the toll frequency gives us insights into the nature of traffic plying on the Asset. CJVs generally have higher shares of return passes or local monthly passes because they travel shorter distances, while heavy trucks mostly have single tickets since they travel longer distances. Exemptions and Violations are typically observed for CJVs and smaller vehicles since they are not tolled per government mandates (e.g. 2-wheelers and tractors), or include state vehicles (e.g., police cars and govt convoys) that are exempted from paying tolls as per NHAI policy. An Asset catering to short distance local traffic generally observes high share of return or other local monthly passes while one catering to strategic long-distance traffic generally has high share of single ticket traffic.

3.23 Further, the toll plazas also record violations which are non-paying users, who are not officially allowed under exemptions category but are forced exemptions. For the Asset, the segmentation discussed below reports Exemption and violations together.

3.24 Table 3.7 below summarizes the types of tickets being sold at both toll plazas of the Asset.

Table 3.7: Typical ticket types sold at NHAI plazas

Category	Description
Single	Allows the vehicle to cross the toll plaza once
Return	Allows for a return journey within a day with a 50% discount on the return trip.
Monthly	Discounted single entry ticket for users who undertake multiple trips within a month can buy the monthly pass.
Local Personal	Discounted single entry pass only for private cars of residents within 20km radius of toll plaza
Local Commercial	50% discount on single trips for commercial vehicles registered in the local district. This pass allows single entry only
Exemptions	Officially exempted vehicles like ambulance, police cars, key political personnel etc.

Introduction of Annual pass for CJVs

3.25 The National Highway Authority of India launched the “The FASTag Annual Pass” on August 15, 2025, a prepaid facility that allows private CJVs to travel across designated National Highway and National Expressway toll plazas. The annual pass is worth INR 3,000. The pass is valid for one year or 200 trips, whichever occurs first and is applicable only to private, non-commercial vehicles (Car/Jeep/Vans).

Since this pass has been introduced by NHAI, it is not valid on

- state governed toll plazas on highways
- state governed toll plazas expressways
- Parking areas or other non-NHAI tolling locations

3.26 The pass can be activated via the RajmargYatra app or the NHAI website, and links directly to an existing FASTag.

The Annual Pass aims to:

- Promote cashless and seamless travel on national highways.
- Reduce congestion and improve traffic flow at tolls
- Provide cost-effective travel for frequent users of NH/NE toll road

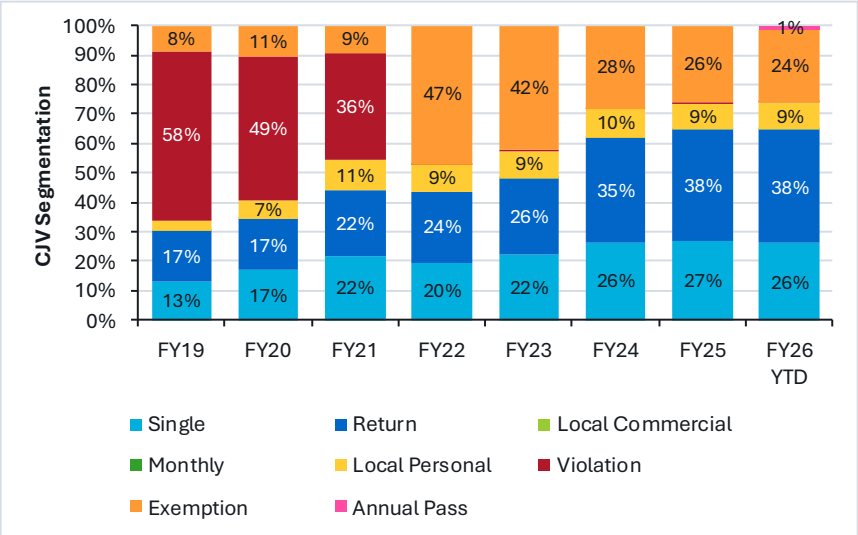
3.27 Figure 3-1 through Figure 3-4 below present toll segmentation for the historical years at TP1 and TP2 for CJVs and MAVs. Table 3.8 below presents the same for the remaining vehicle types at both the Asset toll plazas.

3.28 As a general pattern, the shares of single/return/monthly tickets tend to stabilise within 2-3 years of the commencement of Asset operations. Only in the cases where trip patterns are expected to change significantly due to urban expansion is where we expect these shares to change over the period or due to some external events impacting the trip patterns. During FY21 and FY22, however, two key events impacted the traffic patterns throughout the country: COVID-19 and FASTag implementation. Despite large variations

in ticket segmentations observed during those two years, segmentation trends on the Asset have slowly stabilised since, with FY25 and FY26YTD showing more consistent segmentation trends for CJVs and MAVs at both TP1 than in previous years (see Figure 3-1 through Figure 3-4 below).

3.29 Given stable segmentation trends observed over the past few years and through Aug '25, we have used FY26YTD (thru Aug'25) segmentation as the base segmentation for all vehicle categories **except CJVs** for forecasting purposes. For CJVs however, we have incorporated the assumption of Annual Pass adoption through the rest of FY26 and beyond into our forecasts – this is discussed in more detail in Chapter 6.

Figure 3-1: Ticket segmentation for CJV at TP1 (Luharli)



Source: Steer analysis of the Client data; FY26YTD contains data thru Aug'25

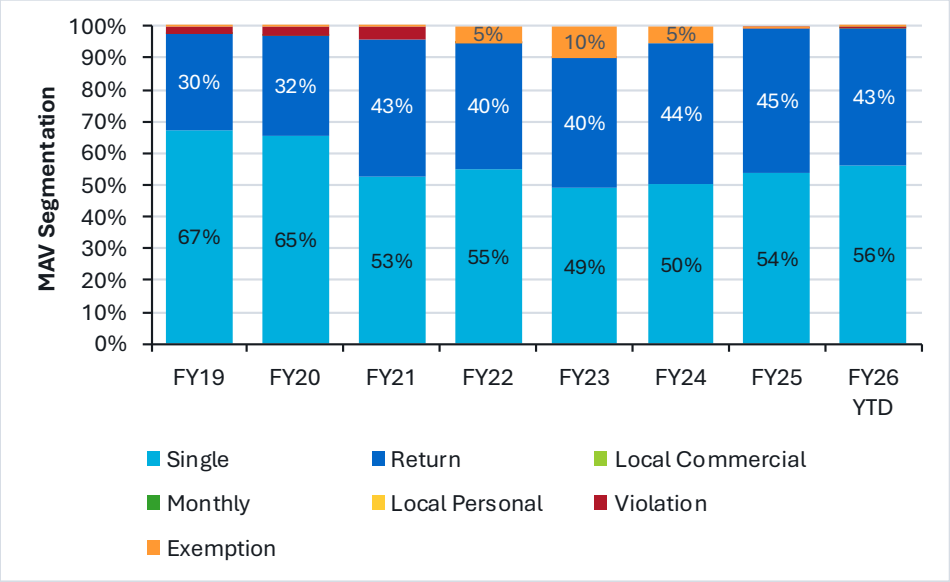
3.30 As observed from Figure 3-1 above, we see a major share of the CJV traffic under the Exemption+Violation category ranging from 40% to 65% over the years. This share has reduced to around 24% as of FY26YTD as compared to 66% in FY19. This decrease can be attributed to a few factors namely FASTag implementation in FY22, operation of Check Plaza at TP1 between in Aug '23 and Sept '24, as well as other measures that improved reporting and compliance over the past few years.

3.31 The magnitude of the share of exemptions observed on this Asset is much higher than our observations on similar Assets across the country. As per our observation during the site visits and our understanding of the region, local political influences and aggressive attitudes of local road users resistant to pay the toll play a role in this high share.

3.32 Single trips have shown an upward trend, growing from 13% in FY19 to 26% in FY26YTD. Return trips have experience more significant growth – more than doubling from 17% in FY19 to 38% in FY25 and FY26YTD

3.33 Figure 3-2 below presents the ticket segmentation for MAVs at TP1. For MAVs, single ticket shares grew 4% and return ticket shares declined 1% in FY25 relative to FY24. This coincided with a 5% decrease in traffic exemptions, suggesting a greater capture of both long-distance and local traffic.

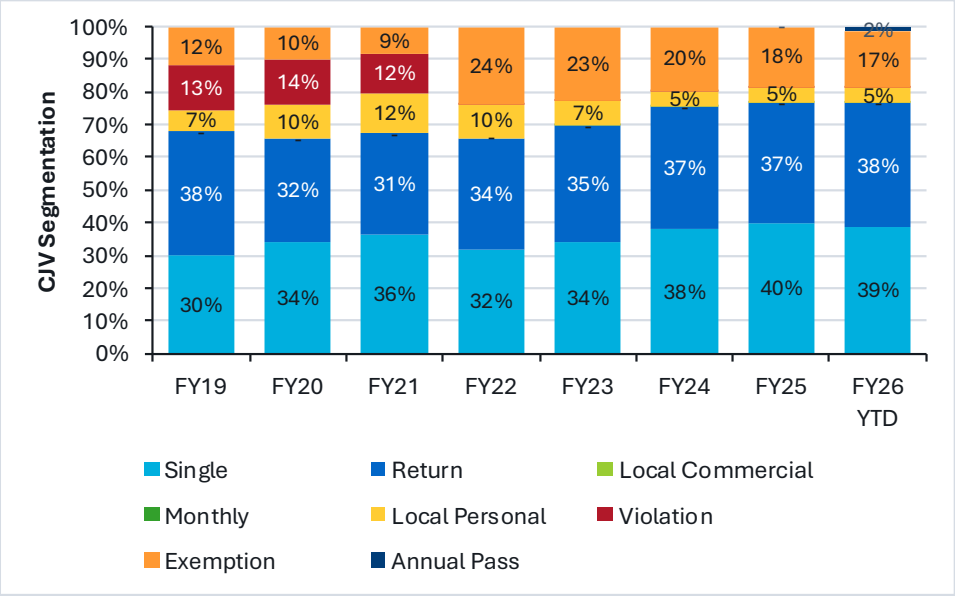
Figure 3-2: Ticket segmentation for MAV at TP1 (Luharli)



Source: Steer analysis of the Client data; FY26YTD contains data thru Aug'25

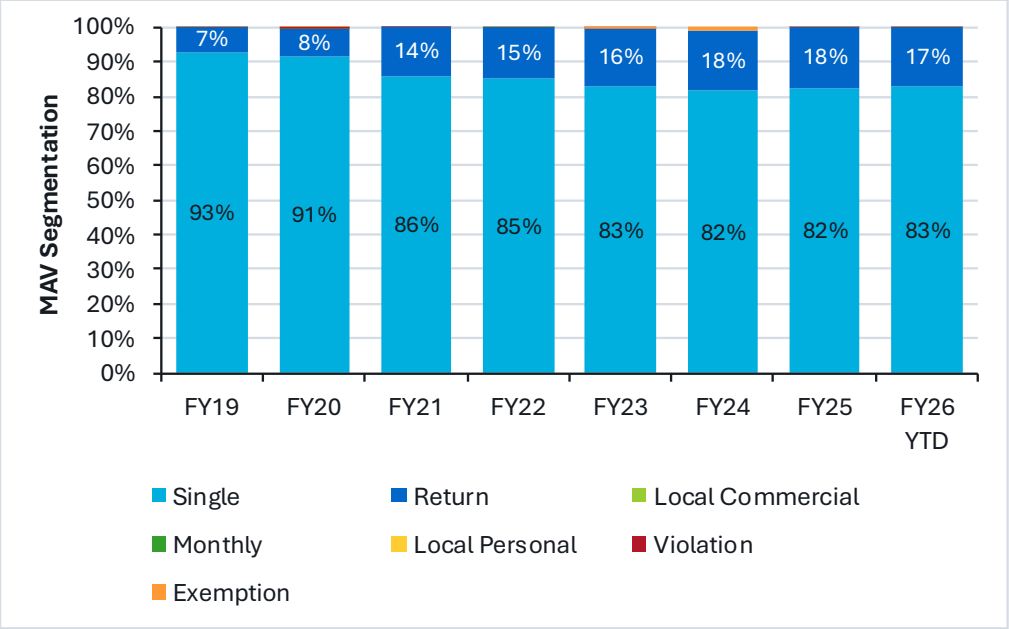
3.34 Figure 3-3 and Figure 3-4 below present the ticket segmentation for CJVs and MAVs (respectively) at the TP2 Somna toll plaza.

Figure 3-3: Ticket segmentation for CJV at TP2 (Somna)



Source: Steer analysis of the Client data; FY26YTD contains data thru Aug'25

Figure 3-4: Ticket segmentation for MAVs at TP2 (Somna)



Source: Steer analysis of the Client data; FY26YTD contains data thru Aug'25

3.35 As shown in Figure 3-3 above, return journey tickets and local personal tickets together have historically accounted for the majority share of CJV trips at TP2 Somna. The high share of local trips in CJVs is validated by their average trip length of around 260kms[6], suggested that majority of CJV traffic at TP2 is regional in nature. Exemptions and violations in FY26YTD are similar to FY25 shares, whereas exemptions on TP2 is lower than the TP1 given lower volumes and urban density compared to TP1.

3.36 Figure 3-4 above shows that as of FY26YTD, MAV trips observed at TP2 Somna had a high share of single journey tickets (at approx. 83% of total trips). This high share of single tickets suggests the dominance of long-distance movements, further validated by the OD analysis outputs— with MAVs averaging a trip length of approx. 650 kms.

3.37 The segmentation shows us that both the plazas on the Asset have very distinct characteristics. TP1 has a high share of local traffic catering to the travel demand generated by the regions of Dadri, Sikandrabad and Ghaziabad whereas TP2 serves long haul trips connecting north-west Uttar Pradesh, Punjab etc. to cities like Kanpur, Lucknow, Patna, Kolkata.

3.38 Table 3.8 below presents the FY26 YTD (thru Aug'25) segmentation for LCV, Bus, 2A and 3A categories.

Table 3.8: Segmentation for LCV, Bus, 2A and 3A category – FY26YTD

Ticket Category	TP1 (Luharli)				TP2 (Somna)			
	LCV	Bus	2A	3A	LCV	Bus	2A	3A
Single	39%	7%	58%	69%	59%	10%	78%	85%

[6] Value is achieved by Steer's analysis of Origin-Destination survey data conducted on 3rd February 2025 on TP1 and 4th February 2025 on TP2.

Data collection exercise

3.39 As aforementioned, to validate and inform various inputs used in our forecasting, we undertook primary data collection on the Asset comprising the surveys listed in the table below. While TVC survey data were provided by the Client, OD surveys were commissioned by Steer with a third party. OD data collection typically involves manual data entry by enumerators based on oral surveys with road users crossing toll plazas. TVC data collection involves video graphic capture of traffic passing crossing the toll plazas, followed by manual counting. Table 3.9 below summarizes the details of the primary surveys Steer conducted as part of this study.

Table 3.9: Data collection schedule

Toll plaza	1-day OD survey		3-day videography based TVC			
	Start date	End date	Start date	Start Time	End Date	End Time
TP1 Luharli	3rd February 2025	4th February 2025	3rd February 2025	0900 hours	5th February 2025	0900 hours
TP2 Somna	4th February 2025	5th February 2025	3rd February 2025	0900 hours	5th February 2025	0900 hours

3.40 It should be noted that, in our experience, traffic on national highways shows variation across the week due to the economic activities surrounding each road. To derive a representative TVC count considering daily variation, three-day to seven-day traffic counts are generally recommended, and hence, in order to fully understand the impact of the fluctuation on the Asset.

Key findings of the TVC data analysis

ADT estimates

3.41 Taking a simple average of the three-day TVC counts, we obtained the following average daily traffic (ADT) for each toll plaza. This ADT excludes non-tollable vehicle such as tractors, two-wheelers, bullock-carts, etc., but includes officially exempt vehicles such as police cars, ambulances, emergency response vehicle, government vehicle and other vehicle types officially allowed as 'exempted' under the concession agreement.

3.42 As presented in Table 3.10 below, CJVs are largest vehicle category at TP1 (approx. 20,000 AADT), closely followed by LCVs and MAVs at approx. 2,870 and 2,318 ADT respectively. TP2 mirrors this trend with CJVs being the largest vehicle category (approx. 8,200 AADT), followed by LCVs and MAVs at approx. 1,890 and 1,700 AADT.

Table 3.10: ADT at TP1 Luharli & TP2 Somna

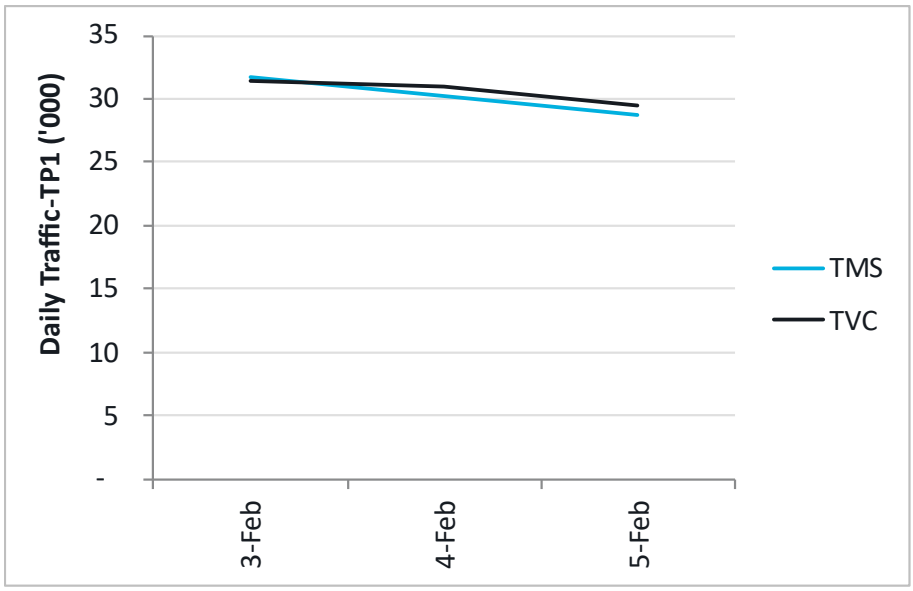
Toll Plaza	CJV	Mini LCV	LCV	Bus	2 Axle	3 Axle	MAV	OSV	Total	PCU
TP1 Luharli	20,061	2,109	2,870	1,617	927	680	2,318	6	**30,588**	**44,596**
TP2 Somna	8,249	1,025	1,889	1,245	987	656	1,694	7	**15,751**	**26,954**

Source: Steer analysis of TVC data

3.43 We used the TVC data to validate the toll plaza data for the same days, as supplied by the Client via their toll management system (TMS). This TMS data was then used as the base data, for our forecasting model.

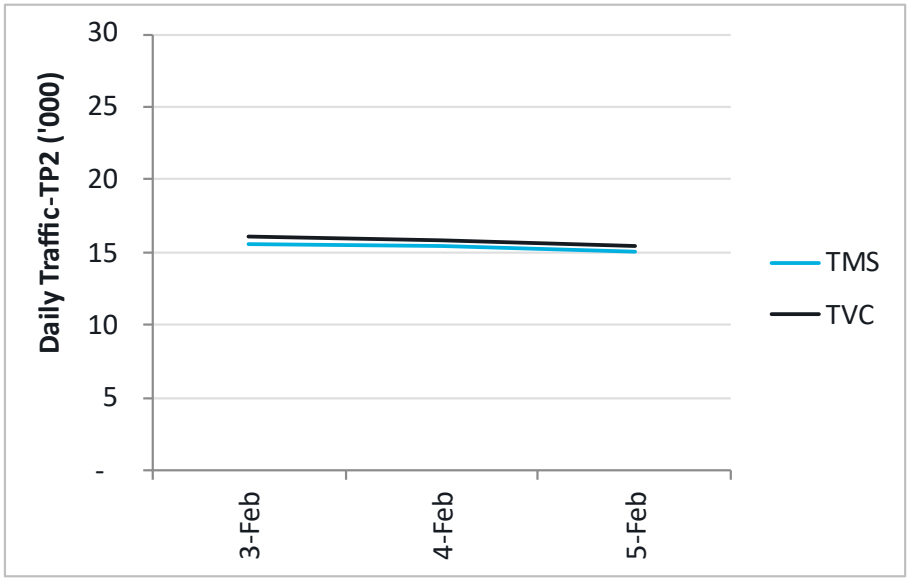
3.44 Figure 3-5 and Figure 3-6 below show the comparison between daily traffic data and shares of vehicle categories in TVC and TMS for the two toll plazas. The variation between the TVC ADT and TMS data on TP1 is approx. 1.2% at a total level and the same for TP2 is around 2.7%. The difference between daily traffic from both sources is minimal at both TP1 and TP2 and can be attributed to technical differences between the two independent traffic counting systems.

Figure 3-5: Comparison between TVC and TMS daily traffic data, TP1 Luharli



Source: Steer analysis of TVC and Client TMS data

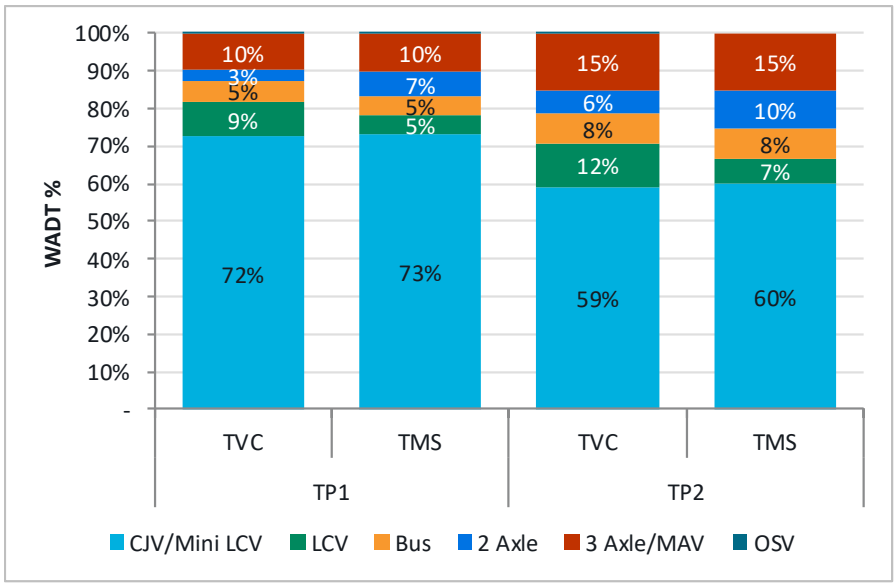
Figure 3-6: Comparison between TVC and TMS daily traffic data, TP2 Somna



Source: Steer analysis of TVC and Client TMS data

3.45 Figure 3-7 below displays the shares of vehicle types at both plazas, between TVC and TMS data. As can be seen, in the figure and as aforementioned, TP1 sees a higher influence of CJVs.

Figure 3-7: Comparison between vehicle shares from TVC and TMS WADTs



Source: Steer analysis of TVC and Client TMS data

3.46 Due to certain vehicle types like LCV and Mini LCV often showing issues in classification at various toll roads across the country, we combine the light vehicle categories (CJV/Mini LCV, LCV, Bus, 2A) and heavy vehicles (3A, MAV) as we compare TMS versus TVC. Table 3.11 below presents a comparison of the difference between these aggregated totals between the TVC and TMS data for both the Asset toll plazas. Post combining, we observe the absolute differences in light and heavy vehicles on TP1 is approx. 0.2% and 4.2% respectively. TP2 on the other hand sees an absolute difference of 0.7% in light vehicles

and 5.8% in heavy vehicles. Given the overall good fit of the data at a WADT level and minimal variation between the TVC and TMS data for the largest revenue generator (3A and MAVs), we believe the base year traffic calculated using the Client TMS data forms a reasonable estimate.

Table 3.11: Difference in TVC and TMS in combined categories

Vehicle type	TP1 Luharli			TP2 Somna		
	TVC	TMS	TMS vs TVC (%)	TVC	TMS	TMS vs TVC (%)
CJV+MLCV	22,170	22,132	**0.2%**	9,274	9,207	**0.7%**
LCV+Bus+2A+3A+MAV+OSV	8,418	8,081	**4.2%**	6,477	6,122	**5.8%**

Source: Steer analysis of TVC and Client TMS data

Key findings of origin-destination analysis

Overview

3.47 Origin-destination (OD) analysis enables the understanding of the nature of traffic movement on the Asset. As part of this assignment, we have analysed the regional drivers of demand based on the following OD analyses on the data as provided by the Client:

- Zonal influence
- Internal External analysis
- Commodity distribution
- Trip length distribution

3.48 While zonal analysis and list of top OD pairs help us to understand 'where' people and goods travel, commodity distribution sheds light on 'what' goods get transported. Trip length distribution show 'how far' vehicles and people travel, and goods get transported. This set of analysis is used to estimate key drivers of traffic and aid the making of informed forecasting assumptions around traffic demand elasticities, growth drivers and exogenous impacts.

Sample rates

3.49 Sample rates help understand the reliability of OD data. They are calculated by dividing OD samples captured by the traffic counts (based on the TVC data) during the same time period. Table 3.12 below presents the sample rates for key vehicle type aggregations at both the toll plazas. Lower samples in Passenger at both the plazas is due to reduced stopping time of Cars especially at the plazas post FASTag implementation. However, we believe that the sample rates of the OD data are reasonable.

Table 3.12: Sample rates for OD data

Vehicle type	TP1 Luharli	TP2 Somna
Passenger (CJV+Bus)	35%	15%
Goods (LCV+2A+3A+MAV)	78%	80%

Source: Steer analysis of OD data

Commodity Categories

3.50 We have grouped various commodities into aggregate categories for ease of interpretation, as shown Table 3.13 below. The charts in the following sub-section present information in terms of aggregate commodity categories.

Table 3.13: Aggregate commodity categories

Commodity Description	Code	Aggregation code
Agriculture Products / Cash crops (Wheat, Rice, Sugar cane, Maize etc.)	AGR	AGR
Cattle Food / Live Stock (sheep, goat, cow, cattle food etc)	LIV	
Perishable Items (Fruits, vegetables)	PER	GRO
Animal Products/Dairy/Eggs/Fish/Meat/Animals	DFM	
Groceries / Food items (Soap, Salt, Sugar, Pulses, Spices, Biscuits, bread, cool drinks, beer etc.)	GRO	
Building Material / Construction (Cement, Lime, Brick, fly ash, etc)	CNS	CNS
Sand/Clay	SND	
Stone (kota stone, marble, Granite, Aggregate stone etc.)	STN	
Ceramic	CRM	
Petroleum Products (Oil, LPG, CNG, etc.)	PET	PET
Chemicals / Fertilizers (Acids, Fertilizers etc.)	CHM	
Electrical/Manufacturing items (Electronic items, Medicine, Leather, Wine, Rubber/ Tyre, Plastics, Cloth, Paper etc.)	MAN	MAN
Raw Wood, Cork & Wood Products, Furniture	WUD	
Machinery / Spare parts	MAC	
Automobiles (Finished products, auto parts, Car/bike manufacturing, New Chassis)	AUT	AUT
Basic / Fabricated Metals (Iron, Steel / Metal)	MET	MET
Mining Minerals (Coal, Gypsum, Cobalt etc.)	MIN	
Empty	EMT	EMT
Container	CTR	MSC
Miscellaneous (Parcel, Courier, Household items etc.)	MSC	
Passengers	PAS	
Scrap	SCR	

Source: Steer analysis

3.51 To facilitate better interpretation of key regional drivers of traffic as determined by their OD zones and influenced by various cities, states, and regions in the proximity of the Asset, we have aggregated zonal data as described in Table 3.14 below. The methodology behind zone aggregation may vary based on the characteristics displayed by each Asset.

Table 3.14: Zone aggregations for zonal influence analysis

Aggregate Zone	Description
Local	Local zones are those that fall on or very close to the Asset.
Immediate area of influence (IAOI)	IAOI zones are the locations which generate traffic and lie within approximately 75-150 km distance from the Asset.
Rest of State	Rest of cities/Districts in the state that Asset lies in (other than Local/IAOI)
Haryana	Haryana
Rajasthan	Rajasthan
Uttarakhand	Uttarakhand
Bihar	Bihar
North India	Punjab, Himachal Pradesh, Jammu & Kashmir
Central India	Madhya Pradesh
West India	Gujarat, Maharashtra, Goa
South India	Southern Indian states
East & Northeast India	Jharkhand, Odisha, West Bengal and Northeast Indian states
Outside India	Nepal, Bhutan, Bangladesh

Source: Steer analysis

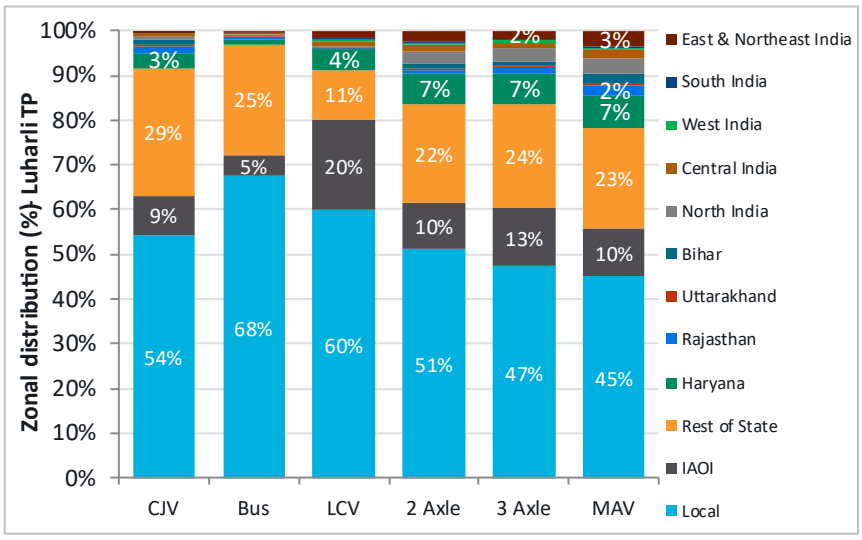
Zonal influence

3.52 The zonal influence is the contribution of the zone or the zonal aggregation to trips by a vehicle type. This section presents the zonal influence of different regions (as defined in the table above) on traffic volumes crossing at each of the Asset toll plazas. Please note that zonal influence is analysed on trip ends and not trips.

3.53 Figure 3-8 and Figure 3-9 below present the zonal influence of different zones/regions on all the vehicle types crossing the toll plazas. We can see that ‘local’ trips make up the largest share for all vehicle types on TP1 whereas TP2 sees a mix of rest of state and local trips dominating the zonal distribution of the plaza. The influence of local trips is seen decreasing as the size of vehicle type increases, consistent with general trends observed across most highways across the country, given that heavier vehicles travel longer distances. In this context, the high incidence of local trips can be specifically attributed to the urban nature of the Asset and proximity to several industrial and growing urban centres like Ghaziabad, Sikandrabad, Khurja and Aligarh. The distribution also varies between the toll plazas, with TP2 showing lower ‘local’ influence.

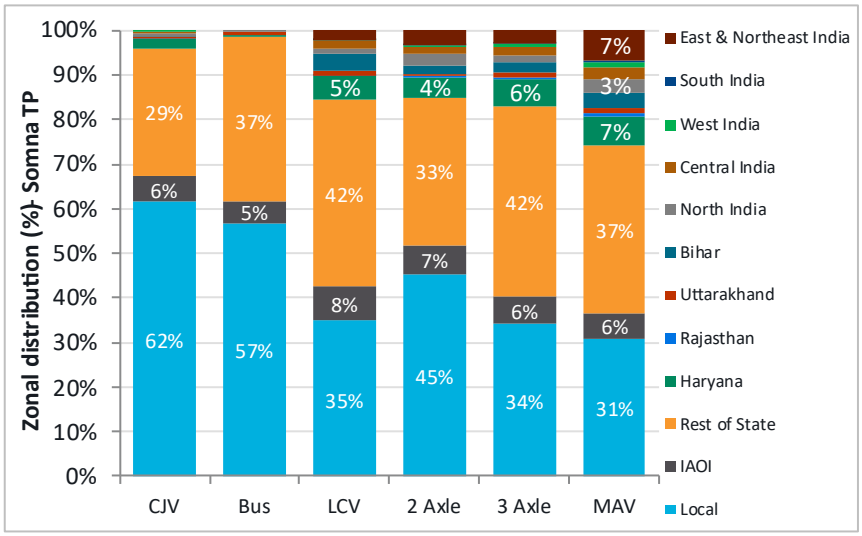
3.54 We observe the highest share of 'local’ influence for CJV’s (54%, and 62% at TP1, and TP2 respectively). MAVs see lower but significant ‘local’ influence (45%, and 31% at TP1 and TP2 respectively), which is still much higher than observations made at long-distance corridors across roads in the country. Compared with competing long-distance corridors, this indicates potentially larger share of traffic having one trip end lying on the Asset i.e., dependent on the regional economy. This is further discussed in the sub-sections presenting top OD pairs and trip length analysis.

Figure 3-8: Zonal influence, TP1 Luharli



Source: Steer analysis of OD data

Figure 3-9: Zonal influence at TP2, Somna



Source: Steer analysis of OD data

3.55 TP2 shows a much greater influence of Rest of State, with all categories showing shares above 25%, touching 37% for MAVs. The zonal distribution of both plazas indicates a high influence of within state trips across all vehicle categories

Internal External analysis

3.56 Internal-External analysis helps in identifying the trips which have both the origin and destination on the Asset (Internal-Internal), both trips ends within the state (RoS) or or neither end on the Asset i.e. through trips (External-External). 'Internal' zones are those that were analysed as 'local' in the zonal influence analysis, i.e., lying on the Asset, while 'External' zones are all other zones.

3.57 Figure 3-10 and Figure 3-11below show the distribution of MAV trips based on these categories at both the Asset toll plazas TP1 Luharli and TP2 Somna (respectively). These supplement observations made in the zonal influence analysis presented earlier, but at a higher level of aggregation and at a trip level.

3.58 For CJVs and light vehicles at TP1 Luharli and TP2 Somna, we see that the zonal influence maps to a combination of internal and rest of state trips which means that there are both short-distance and medium-distance trips that contributed to the high 'local' zonal influence. MAVs, on the other hand, show difference between TP1 and TP2, with TP1 having a high share of trips having one 'internal' trip end. On the contrary, TP2 sees a slightly more balanced share between trips having one end 'internal' and one end as 'rest of state'.

3.59 As demonstrated in Tables 3.10 and 3.11, TP1's proximity to industrial zones in Khurja, Sikandrabad, and Bulandshahar results in shorter trip lengths (as detailed in the trip length analysis in Figure 3.14). Consequently, internal trips constitute approximately 60% of the traffic on TP1. In contrast, TP2's zonal influence (refer to Figure 3-9), extending to the rest of the state and northeastern states, leads to a higher proportion of rest of state and external trips.

Figure 3-10: Internal-external distribution, TP1 Luharli

	Internal	Rest of State	External
External	15%	9%	6%
Rest of State	11%	5%	4%
Internal	34%	13%	4%

Source: Steer analysis of OD data

Figure 3-11: Internal-external distribution, TP2 Somna

	Internal	Rest of State	External
External	11%	8%	7%
Rest of State	15%	11%	10%
Internal	9%	20%	8%

Source: Steer analysis of OD data

Commodity distribution

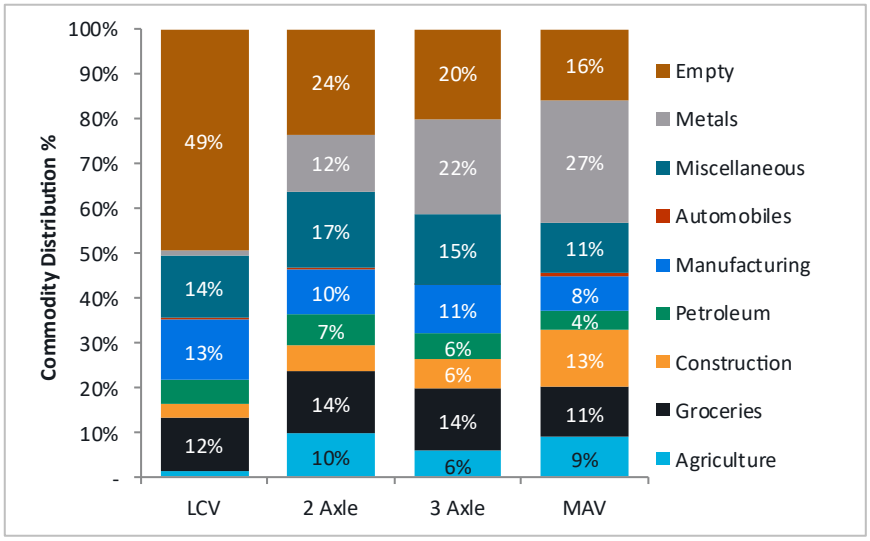
3.60 Figure 3-12 and Figure 3-13 below present the commodity distribution for goods vehicles at TP1 Luharli and TP2 Somna respectively. As also observed during our site visits, we see a high proportion of vehicles that are 'empty', which is consistent with the high 'local' zonal influence and significant shares of 'return' trips observed in our historical analysis section above.

3.61 There is a significant volume of construction, manufacturing, metals and petroleum related commodities on both plazas the Asset along with agricultural materials. Vehicles carrying these products generally have one end of their trips in the industrial areas of Sikandrabad, Ghaziabad, Bulandshahar or Aligarh. The share of construction traffic observed on the Asset can be attributed to cement being transported from Sikandrabad to Delhi NCR region.

3.62 The metal traffic observed on both the toll plazas is primarily iron pipes travelling in both directions from Sikandrabad to Delhi NCR region and from Ghaziabad to Sikandrabad and Aligarh.

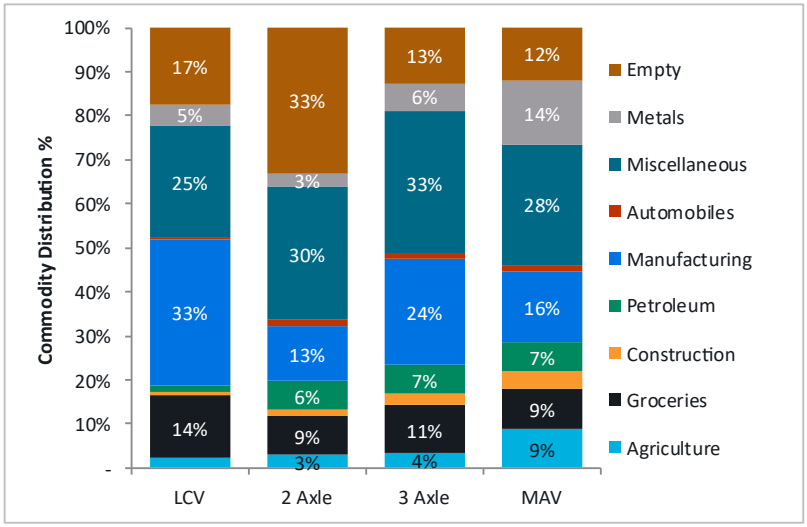
3.63 Somna toll plaza shows more efficient vehicle utilization with a lower share of empty trips and a high concentration of manufacturing and miscellaneous goods across all vehicle types, pointing to a diverse industrial catchment.

Figure 3-12: Commodity distribution, TP1 Luharli



Source: Steer analysis of OD data

Figure 3-13: Commodity distribution, TP2 Somna

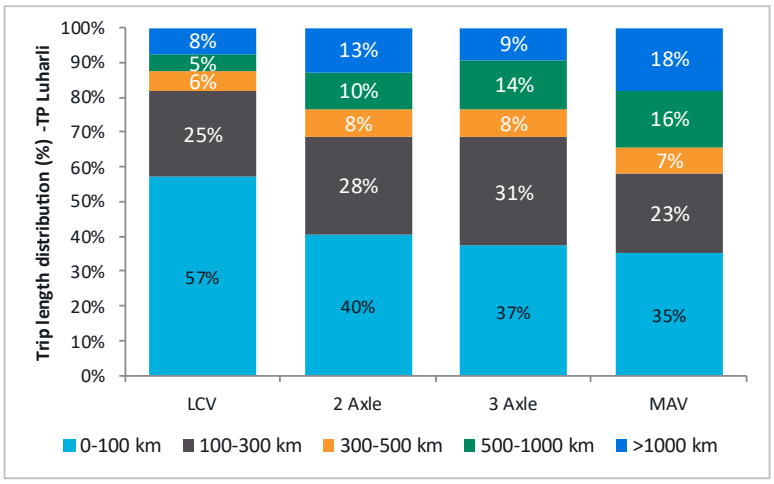


Source: Steer analysis of OD data

Trip length analysis

3.64 Trip-length distribution provides the distance-based profile of various vehicle types. This helps to validate assumptions around the share of macro-economic drivers, inputs from zonal influence and toll segmentation. For ease of interpretation, we have categorised distances into groups – 0-100 km, 100-300 km, 300-500 km, and 500-1000 km and >1,000 km. The trip distances were derived as driving distances from Google Distance Matrix Tool based on zonal coordinates for OD pairs.[7]

Figure 3-14: Trip length distribution TP1



Source: Steer analysis of OD data

3.65 In keeping with observations in the zonal influence analyses, we see that up to approx. 77% (CJVs at TP1) and approx. 87% (CJVs at TP2) make trips that are less than 300 km

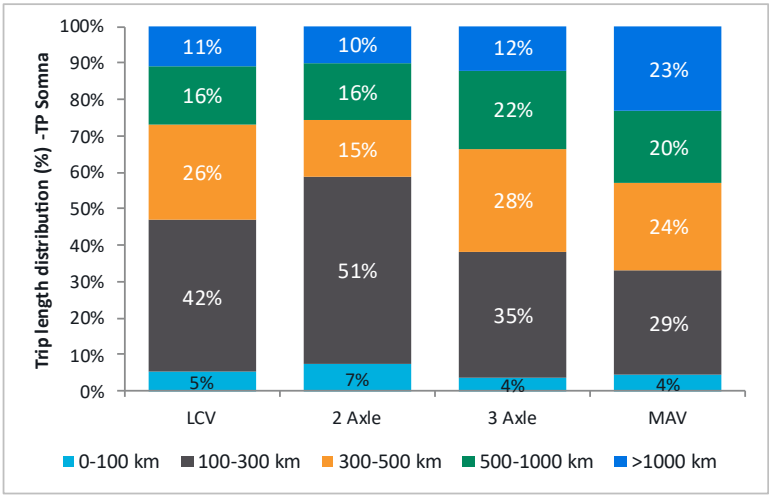
[7] Google Distance API is a tool that is available on a chargeable basis from Google Maps Platform. Link: https://developers.google.com/maps/documentation/distance-matrix/start. Travel distance and time information for driving under various scenarios can be extracted using macro-enabled Excel, R, etc.

long. This supports the urban nature of the Asset with relatively shorter trips and a higher percentage of passenger vehicles.

3.66 Consistent with the zonal influence analysis, a majority of CJVs undertake relatively short trips, with approximately 77% at TP1 and about 87% at TP2 traveling less than 300 km. This reinforces the urban character of the Asset, characterized by shorter journeys and a greater prevalence of passenger vehicles.

3.67 Also, it is observed that TP1, being closer to urban centres of Sikandrabad, Khurja and Ghaziabad, has a higher share of short distance local trips i.e., travelling within 300kms compared to TP2. The trend is similar in higher vehicle categories as well where one of the trips end is in the Asset region (within Delhi, UP or Haryana). In contrast, TP2 has a comparatively higher share of long-distance trips (i.e., more than 300kms) as evidenced in Figure 3-15 below. These long-distance trips primarily move between Delhi, Haryana and Punjab towards eastern UP regions of Kanpur and further towards north-eastern states such as West Bengal and Bihar.

Figure 3-15: Trip length distribution TP2



Source: Steer analysis of OD data

Conclusions

3.68 In summary, TP1 Luharli has witnessed strong growth in both total and tollable traffic as of FY26YTD due to combination of factors including the impact of increased LoS across the full NH91 corridor from Delhi to Kanpur through (1) the 6 lane expansion of the Asset by October 2023, and (2) completion of 4-laning on the Kanpur-Aligarh stretch of the NH91 by H2FY24. Other factors include the impact of the opening of check plaza at TP1 between August 2023 and September 2024 which led to improved reporting and compliance in recent years. The recent operationalisation of the 16-lane Luharli (TP1) staggered configuration plaza is expected to enable these growth trends to continue in the near term by alleviating congestion and curbing leakage from toll evaders.

3.69 The TVC analysis confirmed the reliability of the Toll Management System (TMS) data, with minimal variation between TVC and TMS counts (1.2% at TP1, 2.7% at TP2). These differences are within acceptable limits, validating the use of TMS data for base year traffic estimates.

3.70 The OD analyses highlighted significant local influence, particularly at TP1, where local trips form the largest share for most vehicle types as it serves demand being generated by the industrial regions of Dadri, Sikandrabad and Ghaziabad. TP2 on the other hand, shows a greater influence from the 'Rest of State'. MAVs exhibit higher 'local' influence than typical long-distance corridors, suggesting dependence on the regional economy and nearby industrial hubs (such as the Sikandrabad industrial area). Key commodities observed on the Asset include construction materials, manufacturing goods, metals, petroleum and agricultural produce.

3.71 The overall characteristic of the Asset is strategic in nature connecting several key urban and economic activity centres of New Delhi, Ghaziabad, Sikandrabad, Khurja, and Aligarh in the immediate vicinity with wider generators and attractors in Western-Uttar Pradesh, Punjab, Kanpur and Lucknow region, Bihar, and West Bengal also being connected by the Asset. High population density and contiguous development of urban centres are drivers for healthy CJV and Bus traffic growth on the Asset as well.

4 Socio Economic Context

4.1 The growth of traffic on existing (brownfield) roads depends on, firstly, how fast the background travel demand grows (background growth); and secondly, how successful the Asset is in attracting that traffic (traffic capture). Background travel demand is driven by the socio-economic conditions of the region where the Asset is located and conditions on a national scale. These include:

- Changes in factors such as population, economic growth (regional and national) and industrial production; and,
- Other local factors such as strategic port growth, and growth in local industries near the Assets.

4.2 In turn, the change in the competitive position of the Asset (and thus of the traffic capture it will achieve) derives from how the service offered and the prices charged on the Asset change in comparison to competing roads; and whether any new competing road facilities are available.

4.3 In this chapter, we assess the socio-economic indicators relevant to traffic growth on the Asset.

Population growth

National Level

4.4 The total population in India has grown at a Compound Annual Growth Rate (CAGR) of 1.5% since 2000, decreasing over the years, as shown in Table 4.1 below. The World Bank forecasts this growth to decrease to 0.6% CAGR by the 2030-45 period.

Table 4.1: CAGR of population in India

Years	CAGR		
	Total Population (m)	Rural Population (m)	Urban Population (m)
1970 – 1985	2.3%	1.9%	3.8%
1985 – 2000	2.0%	1.7%	2.9%
2000 – 2015	1.5%	1.0%	2.6%
2015 – 2030*	1.0%	0.3%	2.3%
2030 – 2045*	0.6%	-0.3%	1.9%

Source: World Bank Data on Health Nutrition and Population Statistics, *forecast population growth

State Level

4.5 Table 4.2 shows the evolution of population in the state of Uttar Pradesh and Delhi (containing the Asset), compared to that of the country.

4.6 As the tables show, the populations of both Uttar Pradesh and Delhi have grown at a faster pace, compared to that of India between 2012-2024. As of FY24, Uttar Pradesh holds an 8.1% share in India's population, while Delhi has a 3.8% share.

Table 4.2: Population Growth in Uttar Pradesh, Delhi and India (2012-2024)

State	2012 Population (m)	2024 Population (m)	CAGR (2012 – 2024)
Uttar Pradesh	201.5	237.0	**1.4%**
Delhi	17.0	21.6	**2.0%**
India	1,210	1,395	**1.2%**

Source: National Institution for Transforming India (NITI Aayog) – Census Data

4.7 Due to the complexities of patterns of urbanisation, and the very dynamic nature of local population migration (which are very difficult to forecast with accuracy), we do not use population growth as a proxy for understanding future travel demand growth on the Asset. It has been included in this section simply to provide the underlying socio-economic context of the state/trends in the regions in which the Asset is located.

Economic Indicators

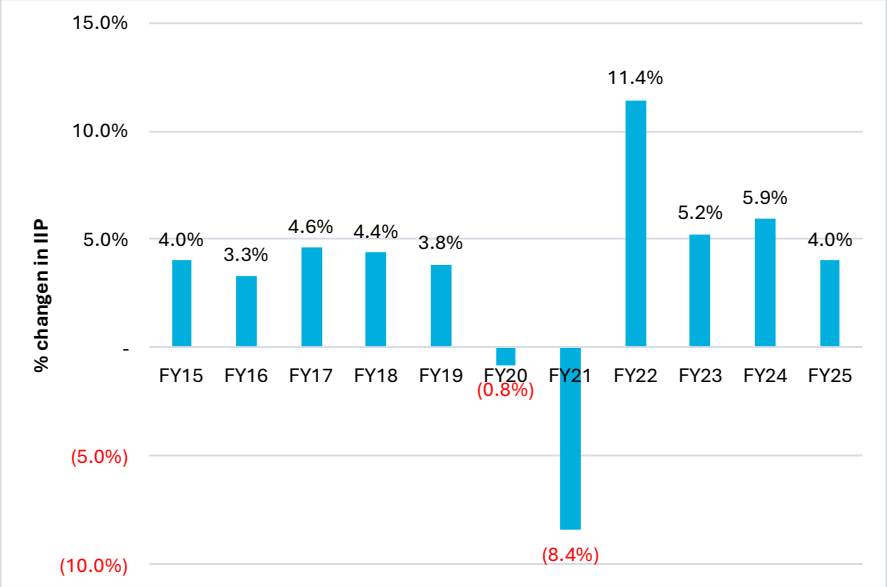
Industrial Production

4.1 The Index of Industrial Production (IIP) is a composite indicator that measures the short-term changes in the volume of production for a basket of industrial products. The IIP data tracks the manufacturing activity in different sectors of an economy, with mining, manufacturing, and electricity being the three broad sectors constituting the IIP.

4.2 Figure 4-1 below shows that at an annual level, national IIP was growing at an average of 4% per year over the period FY15-19, before the country underwent a liquidity crisis and experienced an overall economic slowdown in FY20. In the aftermath, IIP shrank by over 8% in FY21 due to a decline in economic activity in the wake of global lockdowns introduced to curb the Covid-19 pandemic. Post the immediate recovery in FY22, IIP growth has since stabilised, with FY25 recording 4% growth over FY24.

4.3 Since state-level IIP data is not as readily available as national level IIP, we have presented national IIP here to indicate nationwide activity in key industrial sectors like power, manufacturing, and mining, all of which influence long-distance commercial movements across the nation, and not unique to this asset. However, we do not use it to forecast future travel demand growth since long-term forecast for IIP is not available through official sources such as MOSPI, RBI or through multilateral organisations like WB, or the IMF.

Figure 4-1: Annual growth – Index of Industrial Production



Source: Ministry of Statistics and Program Implementation (MoSPI)

Vehicle ownership

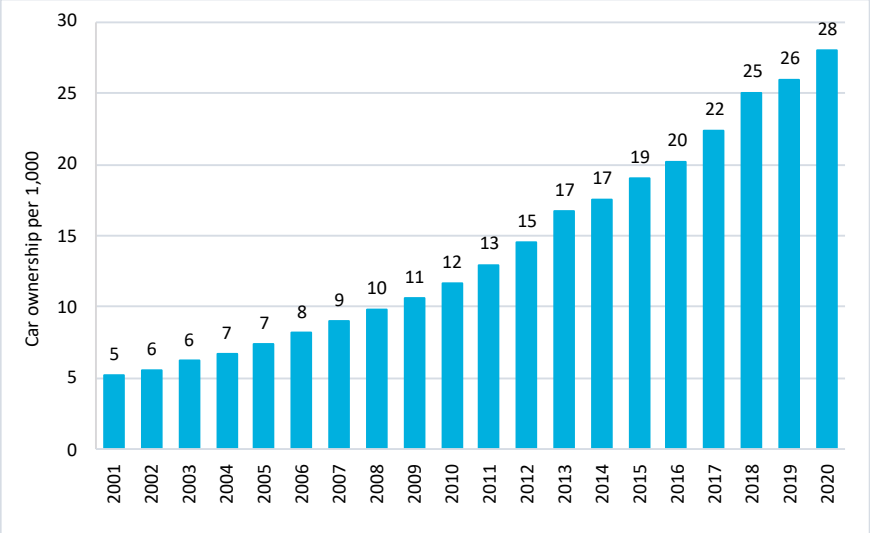
4.4 The gap in car ownership between India and developed nations remains substantial according to recent data. As of 2018, India had approximately 22 cars per 1,000 individuals, a fraction of the 980 cars per 1,000 individuals in the United States[8]. However, this pattern is changing with the increasing per capita income levels. As can be seen in Figure 4-2 below, between 2007-17, number of cars per 1,000 people has more than doubled and increased at a CAGR of about 11%.

4.5 Overall, India still stands at a very nascent stage in the vehicle saturation curve, offering huge potential for growth going forward. As the income per capita of India and the region itself grow further, we expect car ownership levels to increase. As per the India Energy Outlook (2015), car ownership is projected to grow steeply to 175 cars per 1,000 population by 2040 in India.[9]

[8] India has 22 cars per 1,000 individuals: Amitabh Kant, Auto News, ET Auto

[9] https://www.gita.org.in/Attachments/Reports/IndiaEnergyOutlook_WEO2015.pdf

Figure 4-2: Car Ownership in India per 1,000 population



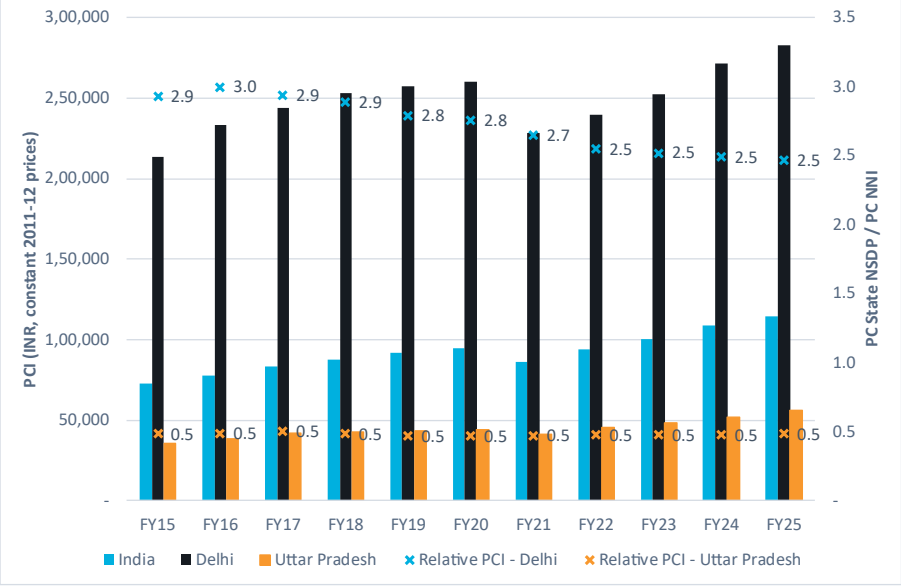
Source: International Energy Agency (IEA)

Per Capita Income (PCI)

4.6 The Asset lies in Uttar Pradesh and Delhi. As shown in Figure 4-3 below, since FY15, the per capita income of Uttar Pradesh has been at roughly 40-50% of the national average. In contrast, the per capita income of Delhi has consistently been much higher – varying between 2-3 times the national average over the period FY15-FY25.

4.7 Traffic on the Asset is influenced by both Delhi and Uttar Pradesh – specifically, the western region of UP, which has grown at a faster rate than the rest of the state in recent years and is expected to continue this trajectory (as discussed in 4.21 below). The higher per capita income of Delhi and the higher growth in western UP indicates sustained economic growth in the region, driving traffic growth on the Asset over time.

Figure 4-3: Relative Per Capita Income (FY15-FY25)



Source: Steer Analysis of MoSPI data

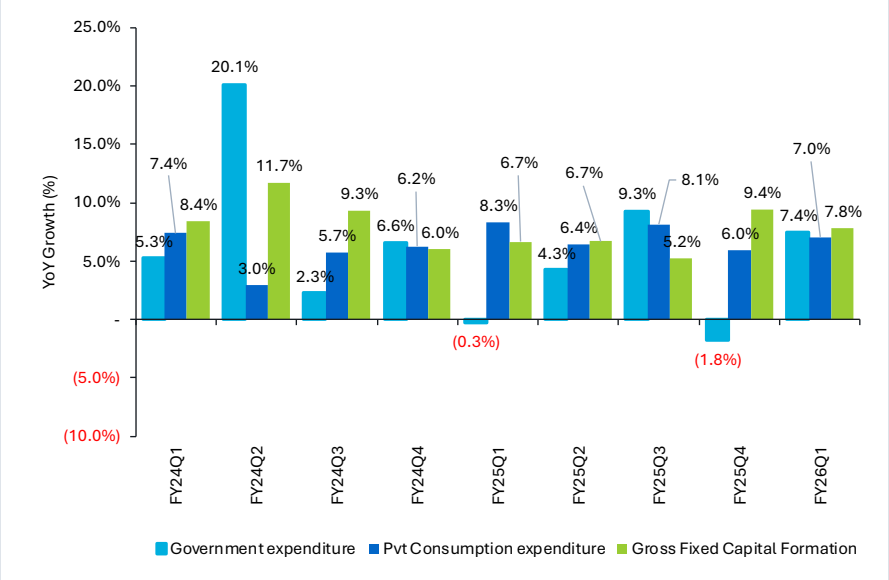
Economic growth

India's Performance

4.8 Despite a slowdown in the economy during H1FY25, the Indian economy has observed strong growth each quarter since FY25Q2, with the latest published estimates for FY26Q1 GDP at 7.8% over FY25Q1. This performance has been driven by strong growth in investment and consumption expenditures and higher consumer optimism for the year ahead[10].

4.9 In Figure 4-4 below, we present quarterly Y-o-Y growth in three major components of GDP – government expenditures, consumption expenditures, and business investment (gross fixed capital expenditure) over the past two years (FY24-FY26Q1).

Figure 4-4: YoY Growth in Government, Consumption and Business Expenditures



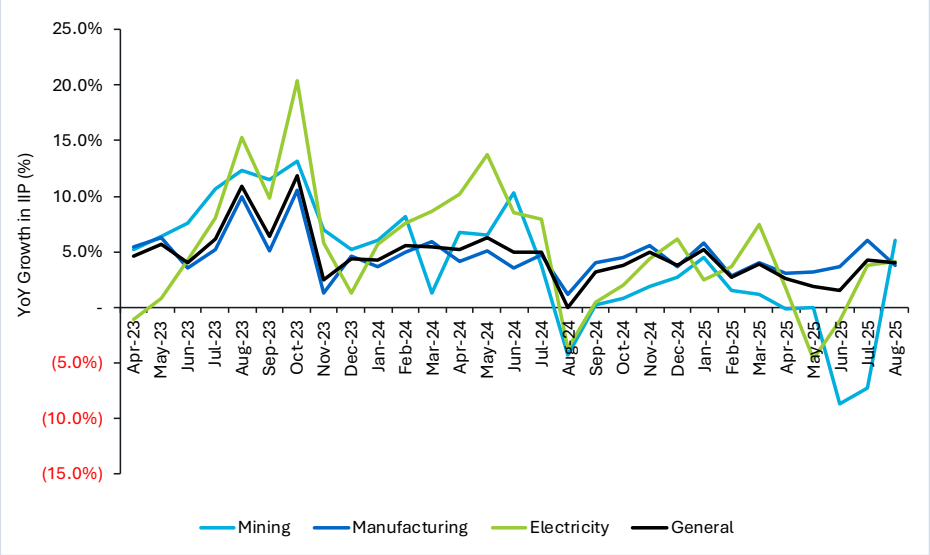
Source: Steer Analysis of MOSPI Data

4.10 While consumption and investment expenditures have continued to show consistent growth over the past two quarters, government expenditures observed a marginal decline in FY25Q4. In FY26Q1, government expenditures rebounded, recording 7.4% growth over FY25Q1 levels.

4.11 Performance across different types of industrial activities (such as Mining, Manufacturing, and Power Generation) directly impact freight movement and commercial traffic volume growth across the country, including on the Asset. In Figure 4-5 below, we present growth trends in IIP – a measure that tracks the performance of the economy across these activities. As of FY26YTD (Apr-Aug '25), the Manufacturing sector continues to perform strongly, recording positive y-o-y growth since FY25Q3. While industrial activity across the two other sectors (i.e., Power Generation and Mining) dropped between May and Jun/Jul '25, they have since rebounded and show signs of continued growth going forward.

[10] Government of India, PIB Release Oct 1 '25

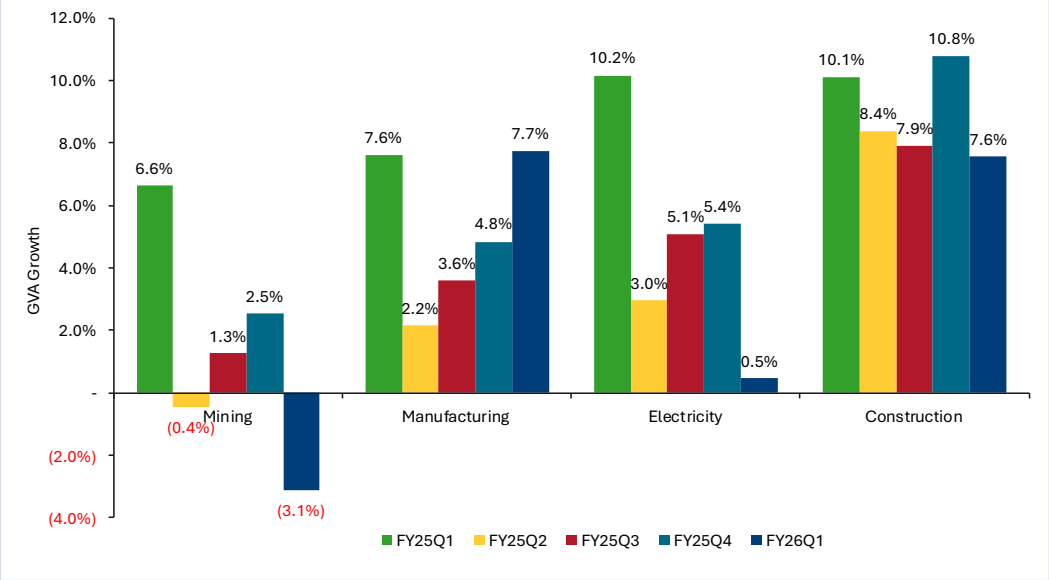
Figure 4-5: Month on Month IIP performance



Source: Steer Analysis of MOSPI Data

4.12 In addition to monthly trends in IIP, Figure 4-6 below presents y-o-y growth of quarterly GVA in four industrial sectors - Mining (& Quarrying), Manufacturing, Electricity (and other Utilities), and Construction. While the Mining and Power sectors observed decline and muted growth in FY26Q1, the Manufacturing and Construction sectors experienced strong growth. Generally, economic growth has remained resilient as of FY26YTD, but performance across industries have varied, impacting economic growth across different regions and on the Asset as well.

Figure 4-6: Industrial components of GVA



Source: Steer Analysis of MOSPI Data

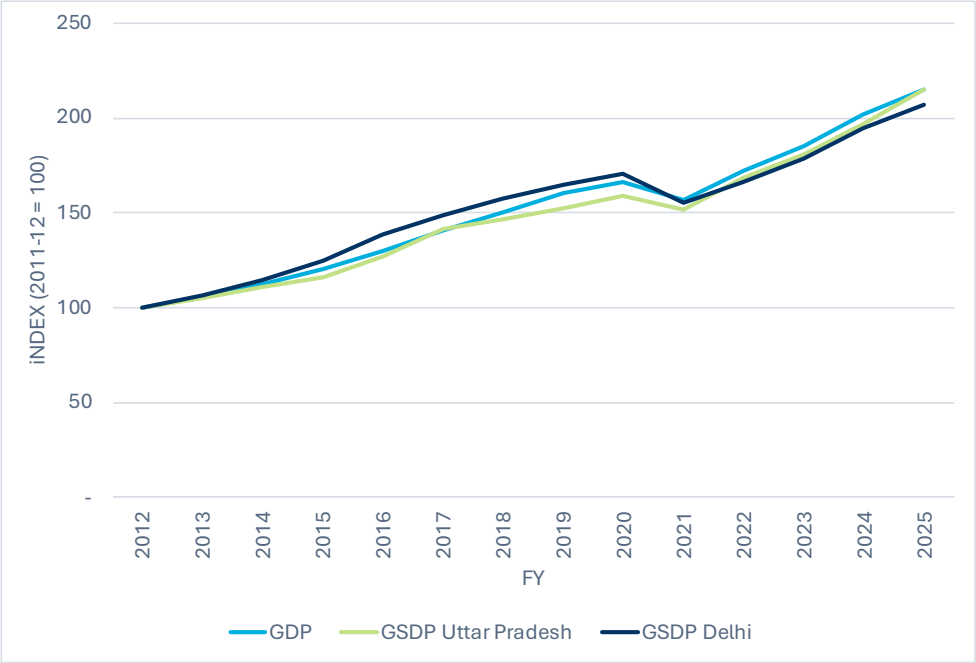
GDP and GSDP Growth

4.13 Figure 4-7 below presents historical growth in Delhi and Uttar Pradesh GSDP, and the GDP of India. Between the period of FY12 and FY25, the Indian economy grew at a CAGR

of 6.1% per year – aided by strong growth in the services/tertiary sector, which grew at a CAGR of 6.9%per year over the same period. UP GSDP and Delhi GSDP grew at 6.1% and 5.8% per year (respectively) between FY12 and FY25 – in step with the national economy.

4.14 As shown in Table 4.2 above, Delhi and UP respectively accounted for 1.5% and 17% of national population in FY24. In terms of national economic contribution, Delhi and Uttar Pradesh contributed approximately 4% and 8% respectively to India's GDP in FY24. Therefore, Delhi's per capita GDP contribution in FY24 far exceeded the same for UP statewide, highlighting the importance of the region in driving consumption demand and regional traffic growth near the Asset.

Figure 4-7: Evolution of Delhi's and Uttar Pradesh's GSDP and national GDP



Source: Ministry of Statistics and Program Implementation (MoSPI)

Economic activity in the state

Uttar Pradesh

4.15 Uttar Pradesh is the most populous state in India with a population of ~237 million people (as of FY24). The state has a large pool of skilled, semi-skilled and unskilled labour. A shown in Figure 4-8 below, the tertiary sector has the highest sectoral contribution (49%) to the state GSVA followed by the secondary (28%) and primary (23%) sectors, as of FY25.

4.16 Uttar Pradesh is considered one of the primary tourist destinations in India, with key tourist attractions being Agra, Varanasi, Mathura and Prayagraj. The state recorded a tourist footfall of 64.90 crore in 2024, a significant increase of over 17 crore in 2023, as per Union Ministry of Tourism[11]. Overall, Uttar Pradesh had an 8.2% contribution to national GDP as per FY24 data by the Ministry of Statistics and Program Implementation.

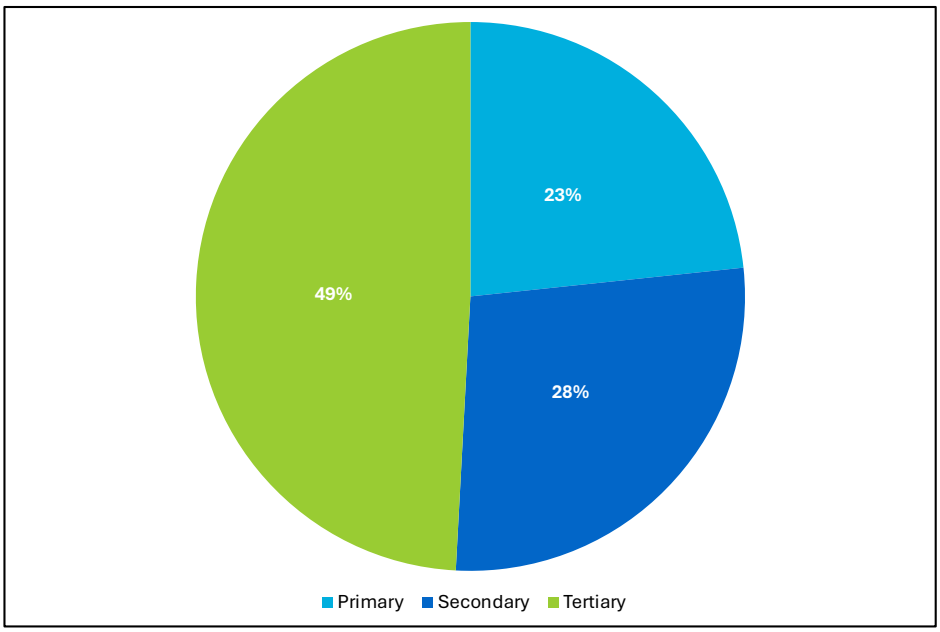
4.17 In terms of secondary sector, the state has key industrial areas in Khurja (Ceramic); Moradabad (Metals); Meerut, Bareilly, Mirzapur and Lucknow (Handloom & Handicrafts);

[11] up-sees-65-crore-tourists-in-2024-over-17-crore-more-from-2023

and Kanpur and Noida (Leather and tannery). The state also has an oil refinery in Mathura, operated by Indian Oil Corporation.

4.18 Uttar Pradesh has very fertile Gangetic land with a large share of population dependent upon agriculture sector for the livelihood. The key primary industries in the state include crop production and horticulture. The state is mainly known for production of wheat, sugarcane, potato and mango.

Figure 4-8: Sectoral contribution to Uttar Pradesh's GSDP as of FY25



Source: Steer Analysis of MoSPI data

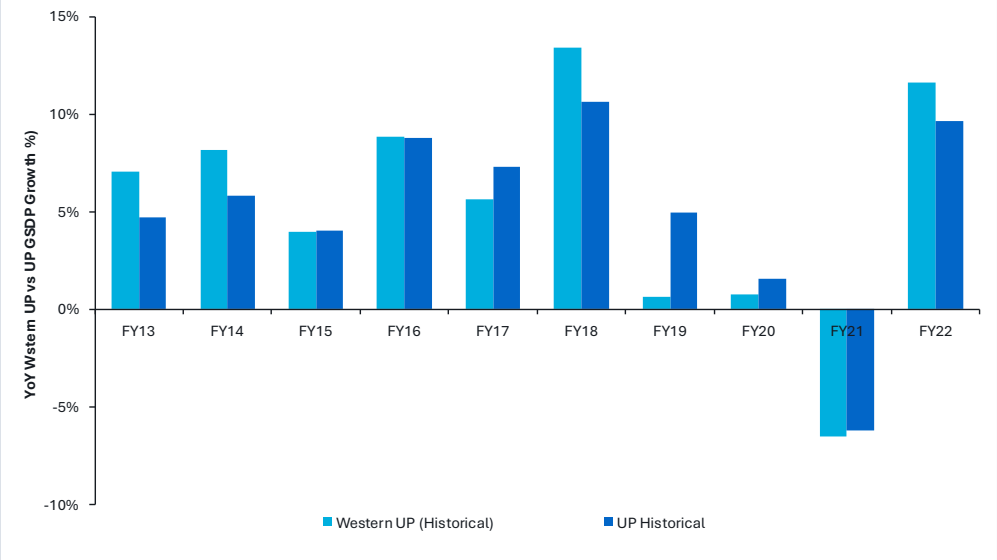
Western UP vs UP GSDP Growth

4.19 Since FY13, growth of Western UP GSDP[12] has remained relatively stable, and in line with UP statewide GSDP growth. In Figure 4-9 below, we see that between FY13 and FY22, GSDP growth in Western UP exceeded that of UP overall in 5 of the 10 years (FY13, FY14, FY18, FY21 and FY22), was consistent with UP in 2 of the 10 years (FY15 and FY16), and was below UP GSDP growth in 3 of the 10 years (FY17, FY19 and FY20). While UP statewide growth is largely influenced by Western UP, in recent years (FY21-22), Western UP GSDP has exhibited growth more sensitive than statewide trends.[13]

[12] The Western UP region consists of 30 districts, prominent among which are Ghaziabad, Gautam Budh Nagar, Agra, Meerut, Mathura and Bareilly. Historically, this collective region has been the more economically developed part of Uttar Pradesh, and as of FY22 accounted for half of the statewide total GSDP.

[13] Steer analysis of data sourced from the Directorate of Economics and Statistics, Uttar Pradesh (**UPDES website**)

Figure 4-9: Western UP vs UP GSDP Growth



Source: Directorate of Economics and Statistics, Uttar Pradesh

4.20 This can be explained due to a combination of policy- and market-driven factors which have contributed to higher growth in the Western region of the state. Some of these major developments pertaining to large-scale infrastructure investments in the region include:

- Delhi – Meerut Expressway[14]
- Ganga Expressway [15]
- Noida International Airport (Jewar Airport) [16]
- Logistics hub in Agra, by the Agra Development Authority [17]
- 'New Noida' initiative by the Uttar Pradesh government [18]

4.21 Between FY12–FY25, the GSDP of Uttar Pradesh grew at a CAGR of 6.1% per year. Over the same period, national GDP grew at 6.1%[19] per year, implying that the long-term elasticity factor of UP GSDP growth to national GDP growth is roughly 1. In this context, as Western UP has exhibited more elastic growth relative to UP state overall in recent years, as well as expectations of strong near-term growth in the Western region driven by large-scale infrastructure and commercial investments, we have assumed the near-term growth forecast for Western UP to be similarly elastic to India's GDP growth forecast.

4.22 Figure below presents the Client-provided forecasts of national (India) GDP growth from FY26 to FY45, and our assumed GSDP forecast for Western Uttar Pradesh over the same period. In the short term, we have assumed GSDP of Western UP to grow at 1.2 times that of national GDP growth forecast, eventually tapering down to a factor of 1.0 over time as it converges to the national growth rate forecast by FY45.

[19] Steer analysis of MoSPI data

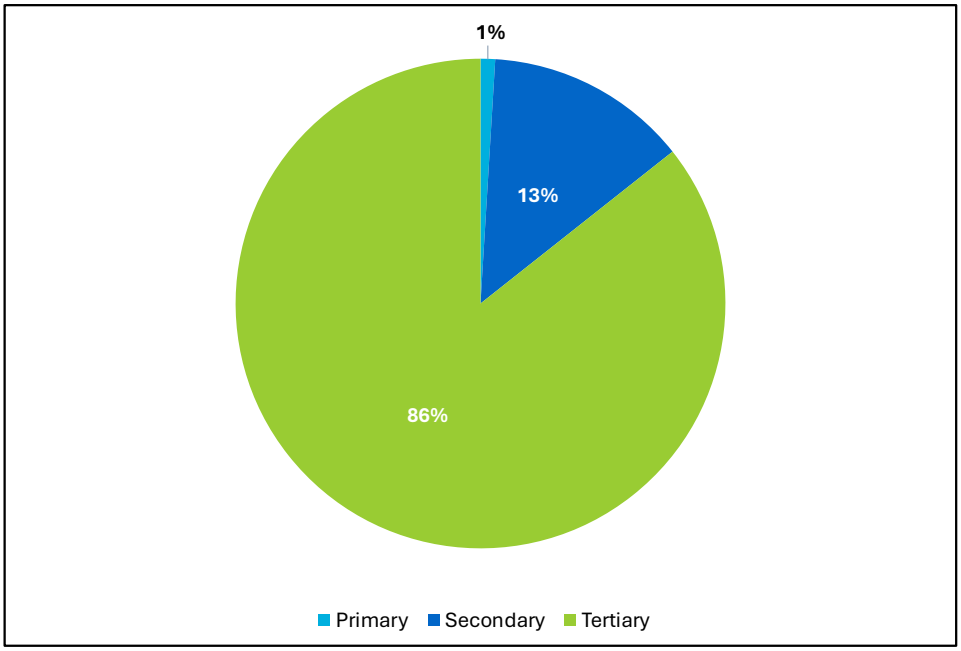
Delhi

4.23 Delhi, the capital city of India, is one of the largest metropolises in the country. In terms of the GSVA composition of Delhi, as shown in Figure 4-10, the tertiary sector has the highest share (86%) followed by the secondary sector (13%) as of FY25.

4.24 The biggest contributors to the tertiary sector in Delhi are tourism, trade, financial services and real estate. Owing to its location, connectivity and rich cultural history, Delhi has always been a prime tourist attraction of the country with key tourist places being India Gate, Lotus Temple, Humayun's Tomb and Akshardham. The Indira Gandhi International Airport of Delhi serves both domestic and international passengers and as of 2024, it was the tenth-busiest airport in the world[20], catering to approximately 72.2 million passengers.

4.25 In terms of secondary sector, NCT of Delhi has key industrial clusters at Narela, Naraina, Okhla and Mayapuri. The primary/agricultural sector accounts for a small share of Delhi's GSVA.

Figure 4-10: Sectoral contribution to Delhi's GSDP in FY25



Source: Steer Analysis Ministry of Statistics and Program Implementation (MoSPI) Data

Forecasts for growth drivers

4.26 Following the discussion in Chapter 4 on the nature of economic activity in the state of Western Uttar Pradesh and in Delhi, in this section, we describe the assumptions in relation to forecasts of the key macro-economic drivers of traffic growth on the Asset.

4.27 We have based our forecasts of the GSDPs for Western Uttar Pradesh and Delhi based on the forecasts of the GDP of India as provided by the client.

[20] Delhi's IGI airport is the 10th busiest airport in the world: Report | World News - The Indian Express

National GDP

4.28 After the last period of economic slowdown in FY11-12, the country experienced an economic downturn again in late FY19 with FY20 having reported a GDP growth of 4% (relative to an average growth rate of 7% per year between FY13 and FY19). India's GDP growth declined as domestic investment and consumption demand were already under stress because of the liquidity crunch before Covid-19. Other factors that contributed to the economic slowdown included reduced growth rates in automobile sales and production, liquidity crunch in credit markets and rising number of Non-Performing Assets (NPAs) within the banking sector, as well as lower manufacturing production and lower rural consumption.[21]

4.29 The Covid-19 outbreak had a significant impact on the Indian economy during the first two quarters of FY21 as government mandated lockdowns across the country effectively stalled economic activity and growth. The growth momentum eventually picked up in Q3 of FY21, with a sharp rebound in the economy in FY22 (GDP recorded 9.7% growth over FY21) and has since observed a consistent growth of 7.6% in FY23 and 9.2% in FY24, before showing signs of slowdown again in FY25 due to several domestic and external factors. Since H2FY25, the economy has shown strong growth, driven by improved consumer optimism, and growing consumption and investment demand.

4.30 Figure 4-11 below shows Client-provided GDP projections for India. The forecast projects the GDP of India to grow at an average of 6.3% between FY26-FY30 and 5.8% between FY31-FY44, gradually tapering down to 5.2% by FY50. The GDP growth forecast is broadly in line with other independent forecasts available from reliable sources such as IMF, World Bank and RBI[22] in the medium term.

4.31 We assume the GSDP growth of Delhi to be in line with India's GDP growth throughout the concession period. For our forecast of the GSDP growth of Uttar Pradesh, we have considered the growth expectations for the western region of UP – as opposed to UP state-wide, due to the location of the Asset in the western region of UP. Additionally, we have assumed the GSDP growth of western UP to higher than that of the GDP of India going forward, across the concession period.

4.32 In particular, we expect it to grow at 1.2 times the GDP of India in the short-term, tapering down to be in line with national GDP growth by FY45. This assumption is based on the recent performance of the GSDP of western UP relative to statewide GSDP growth (as discussed in detail in 4.19 above), as well as expectations of continued investment and economic growth in the region owing to a variety of factors.

4.33 There are significant investments expected to take place as part of the UP and Delhi state/regional government plans over the near to medium term (as described in 4.20 above). Given its leading position in industrial investments, western UP is expected to benefit significantly from these future investment plans. In this context, we believe it is

reasonable to assume that Western UP will observe more robust economic growth over the near and medium term relative to UP state overall, and national GDP growth.

4.34 Figure 4-11 below shows the assumed growth forecasts for Western UP and Delhi GSDP, and the GDP of India.

5 Traffic growth analysis

Introduction

5.1 In this section, we present our approach, assumptions, and results for base (or background) traffic growth for each vehicle category on the Asset.

5.2 Traffic growth is commonly related to a variety of macro-economic and industry- or commodity-specific factors (hereafter referred to as 'traffic growth drivers'). These growth drivers are typically identified from the results of the OD data analysis and the site visits that help us appreciate the nature of traffic movement – 'what' travels 'where' and 'why'.

5.3 To understand the historical traffic trends in relation to these growth drivers, we carried out regression analyses to determine the historical relationship between each major vehicle category and its macroeconomic growth driver at each toll plaza. The dynamics of traffic demand is the dependent variable while the dynamics of one or more identified growth drivers are the independent or explanatory variables.

5.4 Typically, passenger and light commercial vehicle traffic like cars, buses, LCVs and 2-axle trucks grow in line with the GSDP of the state in which the toll road is located. Heavy vehicle traffic like 3-axle trucks and MAVs grow in line with the national GDP. This is because most light vehicles tend to travel shorter distances within the state, whereas heavy vehicles typically carry commodities over long-distances across the country. These commodities also tend to be part of industry ecosystems whose demand-supply relationships are scattered across the country and therefore relate more with GDP growth than more local or regional growth drivers.

FY26 Base year AADT estimates

5.5 The base year is the year on which long-term background forecast growth rates are applied to derive year-wise average annual daily traffic (AADT) estimates for forecast years. This is therefore an important aspect of our forecasting approach as traffic and ultimately revenue forecasts for future years are built on top of the base year traffic estimate. For this traffic study, we have used FY26 as the base year for generating or future year traffic forecasts for the Asset.

5.6 To establish the base year (FY26) traffic position, we utilised information from various sources including historical traffic data from the Client (FY25 and FY26YTD), latest information on FY26 estimated GDP and GSDP growth (as published by official sources), as well as our own contextual knowledge of the region and wider economy, and transportation network the Asset forms a part of.

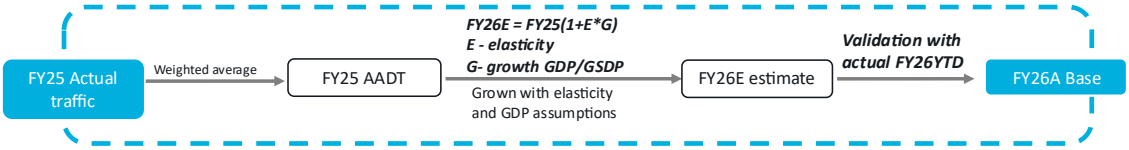
Methodology

5.7 The base traffic for FY26 is estimated by utilizing actual 12 months of FY25 as well as latest available data for FY26 that included the first six months of FY26 for this study. To arrive at an initial estimate for full year FY26 AADT ("FY26E"), we apply elasticity-based growth assumptions of GSDP or GDP to the FY25 actual AADT as a first step.

5.8 In the second step, the monthly profile of the FY26E AADT was compared to the actual traffic observed in the six months (April to September 2025) of FY26 traffic data (FY26YTD) that was available. After reviewing how actual traffic performed over this period relative to our initial estimate, we make necessary adjustments to the FY26E AADT to arrive at our Adopted FY26 AADT ("FY26A") that reflects the outturn traffic in FY26YTD (adjusted for seasonality).

5.9 The methodology is represented in Figure 5-1 below:

Figure 5-1: FY25 Base Estimation methodology



Source: Steer Analysis

Seasonal Correction Factors

5.10 Traffic on any Asset varies on a month-on-month level. Such variations maybe due to monsoons (typically Jul to Sept) or due to festivals in the region. E.g., it is observed that typically the truck traffic during the first half of the financial year (April-September) is generally lower than the annual average, mainly because of peak summer season followed by monsoons affect the freight movement patterns in large parts of the country in the July-September period. In addition to these, there may be other seasonal variations specific to the Asset.

5.11 To normalise for these variations across the year when estimating AADT, Seasonality Correction Factors (SCFs) are used. SCFs are estimated to convert the monthly traffic numbers to an AADT level while accounting for seasonal variation due to local/national festivals, weather changes and/or temporary external impacts. These are typically estimated using historical data for each plaza and vehicle category over multiple years. An SCF greater than one implies that the traffic for that month is lower than the annual average and vice-versa.

5.12 We have analysed the seasonality trends between monthly average daily traffic (MADT) and AADT for data during the historical years of tolling, excluding the years that were impacted by specific events. Historical traffic data was available for all toll vehicle categories up-to September 2025. With FY21 and FY22 being pandemic-impacted years, we consider FY23 onwards for the base estimation. Thus, an average of FY23 and FY24 SCFs has been considered to arrive at the FY26 base year estimates.

5.13 Table 5.1 and Table 5.2 below present the average of FY23 and FY24 SCFs (TP1) and FY23 SCFs (TP2), used for the estimation of our FY26 base traffic position.

PCU	**24,760**	**26,372**	**27,164**	**9.7%**

Source: Steer analysis ; FY26YTD includes 6 months of FY26 (Apr – Sept '25), FY26A is adopted base for FY26

5.15 In PCU terms, the FY26A estimates show robust growth at both toll plazas, reflecting our assumption strong growth observed at both plazas through H1FY26 (Apr – Sept '25) is expected to continue through end of FY26. In PCU terms, we estimate TP1 and TP2 to grow by 12.3% and 9.7% (respectively) over FY25 levels.

5.16 Strong traffic growth on the Asset since FY24 is driven by the expansion of the Asset from four lanes to six lanes in October 2023, which significantly improved the Level of Service (LoS). Additionally, the four-laning of the NH91 Aligarh-Kanpur section, construction on nearby state roads (affecting Somna toll plaza), which extends east of the Asset towards Kanpur, has also improved highway conditions significantly, particularly for long-distance commercial movements.

5.17 Other contributing factors include better traffic reporting and compliance at TP1 from the check plaza that was operational between Aug'23 and Sept '24, continued operations of Wonder Cements' Aligarh Grinding Unit near TP2 since April 2023, the opening of the THDC Thermal Plant in Khurja (Unit 1) in January 2025, and most recently, the opening of Unit 2 in September 2025[23]. TP1, which was recently expanded from an 8-10 lane in-line plaza configuration to a 16-lane staggered (split) plaza configuration (July 2025) is also expected to improve travel times and curb leakage going forward.

5.18 While both plazas observed robust growth in FY26YTD, 3A volumes have remained relatively flat across both plazas. As discussed in 3.14 above, flat growth in 3A trucks is due to shift of preference from 3A to MAV/2A category for long-distance traffic movement.

Estimation of background elasticities

5.19 Elasticities, in the case of traffic growth, are the relationships between traffic growth and the growth in underlying macroeconomic drivers of traffic. Multiplied with forecasts of growth drivers like GDP or GSDP, they provide forecasts of background traffic growth.

5.20 Typically, we rely on national GDP as a growth driver for 3A/MAV trucks, given their characteristics of travelling across multiple states and carrying varied types of commodities which contribute to national GDP.

[23] Press Release:Press Information Bureau

5.21 OD analysis reveals a strong link to Delhi and Uttar Pradesh, with approximately 92% of cars and 78% of MAVs at TP1, and 96% of cars and 74% of MAVs at TP2 having one end of their trip in these regions. This contributes to the fact that about 67% of all vehicle traffic on the asset travels within 300kms, suggesting traffic growth is significantly influenced by the Gross State Domestic Product (GSDP) of UP and Delhi. In contrast, the growth in traffic volume for 2-axle, 3-axle, and MAVs, which are key for transporting heavy commodities such as construction materials, manufactured goods, and metals, and make longer distance inter-state trips is more dependent on the national GDP growth.

5.22 Table 5.5 below presents the growth drivers identified to model the forecast background traffic growth rates.

Table 5.5: Identified growth drivers to model traffic growth

Vehicle type	TP1 Luharli			TP2 Somna		
	GDP India	GSDP Delhi	GSDP Western UP	GDP India	GSDP Delhi	GSDP Western UP
Car		50%	50%			100%
LCV		20%	80%			100%
Bus		30%	70%			100%
2A	100%			100%		
3A	100%			100%		
MAV	100%			100%		

Source: Steer analysis of Client data; *

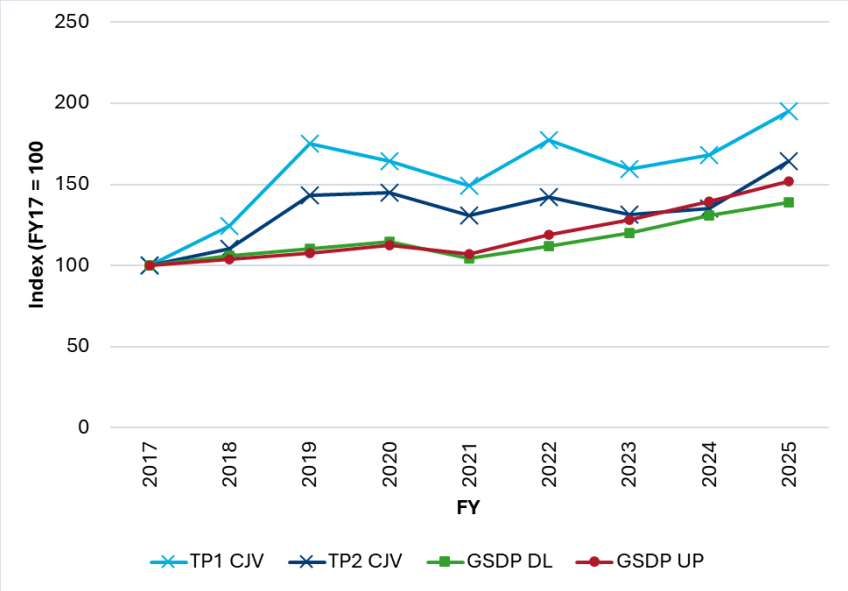
5.23 To understand the traffic growth on the Asset, we undertook regression analysis using traffic data over the period FY17-25 for all vehicle types at both the Asset toll plazas. However, since the Asset has shown variable growth trends every year since FY17, the results of the econometric regression analyses did not yield sufficiently reliable estimates of the elasticities to our assumed underlying growth drivers. We have therefore, analysed trends of each vehicle category and compared them with the growth of key drivers to arrive at assume elasticities, as described below.

CJV

5.24 We see from the OD data that the CJVs primarily cater to regional movements between Ghaziabad, Sikandrabad, Bulandshahr, Delhi, Aligarh and other towns lying on the Asset. In the period of FY17-24, Cars have grown by 6.7% at TP1 and 3.4% at TP2 per year, while the corresponding GSDP growth of Delhi was 1.9% and UP was 1.2% per year. In our understanding this is consistent with the Asset being closer to urban clusters of Delhi NCR and Aligarh, both of which are characterized by high per capita incomes, and levels of car ownership. Hence, we observe slightly higher growth of Cars (higher at TP1) with respect to GSDP.

5.25 Figure 5-2 below shows the relationship between the indexed values of CJV traffic and Uttar Pradesh GSDP at TP1 Luharli and TP2 Somna.

Figure 5-2: Relationship between CJV traffic and Delhi/Uttar Pradesh GSDP, TP1 and TP2



Source: Steer analysis of Client TMS data and publicly available GDP/GSDP data. CJV traffic includes reported exemptions.

5.26 Taking note of the positive outlook for passenger traffic on the Asset, regression results on earlier historical years and the urban nature of the Asset, we have assumed a forecast background elasticity of 1.1 for TP1 and 1.0 for TP2 Somna for CJVs going forward.

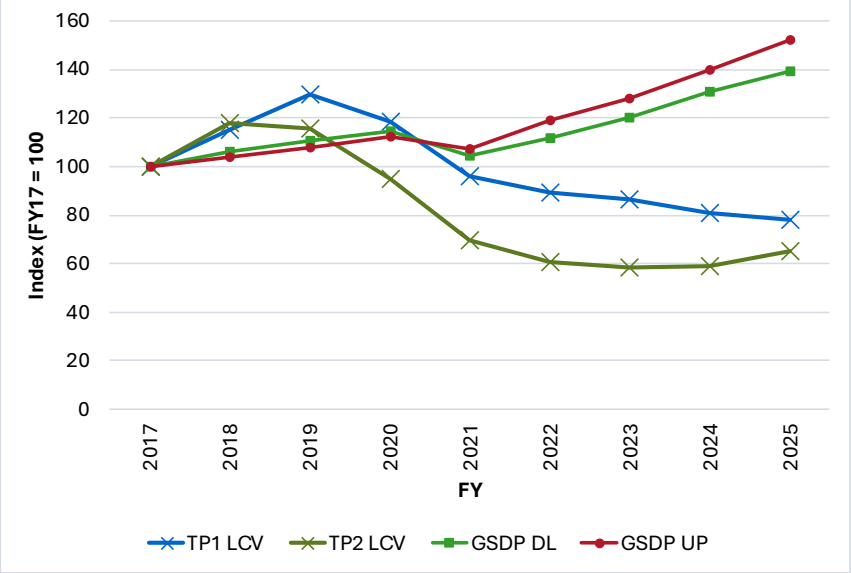
LCV, Bus & 2A

LCV

5.27 Prior to FY19-20, LCV growth on the Asset was strong. However, after FY20, axle load regulations switched in favour of 2A to carry higher tonnage of goods; this shift in preferences impacted LCV traffic growth across the country, and on the Asset as well. The impact of the Covid-19 pandemic in FY21 and reclassification LCVs into CJVs (Mini LCVs) post mandatory FASTag implementation in FY22 also resulted in degrowth of LCVs on the Asset since FY17. Since FY22 however, LCV volumes at both Asset plazas have observed muted or flat growth through FY25. Figure 5-3 below shows the relationship between indexed values of LCVs at both Asset plazas and Uttar Pradesh and Delhi's GSDP.

5.28 LCVs demonstrate more regional travel within Uttar Pradesh and Delhi NCR compared to 3A and MAV vehicles, as validated by the zonal distribution analyses above. As a result, the growth in LCVs at TP1 is modelled using the GSDP of both Uttar Pradesh and Delhi, while growth at TP2 is modelled using only the GSDP of Uttar Pradesh due to its closer proximity. We have assumed LCV will grow at a background elasticity of 0.5 for TP1 Luharli and 0.4 for TP2 Somna.

Figure 5-3: Relationship between LCV traffic and Delhi/Uttar Pradesh GSDP, TP1 and TP2



Source: Steer analysis of Client TMS data and publicly available GDP/GSDP data

Bus & 2A

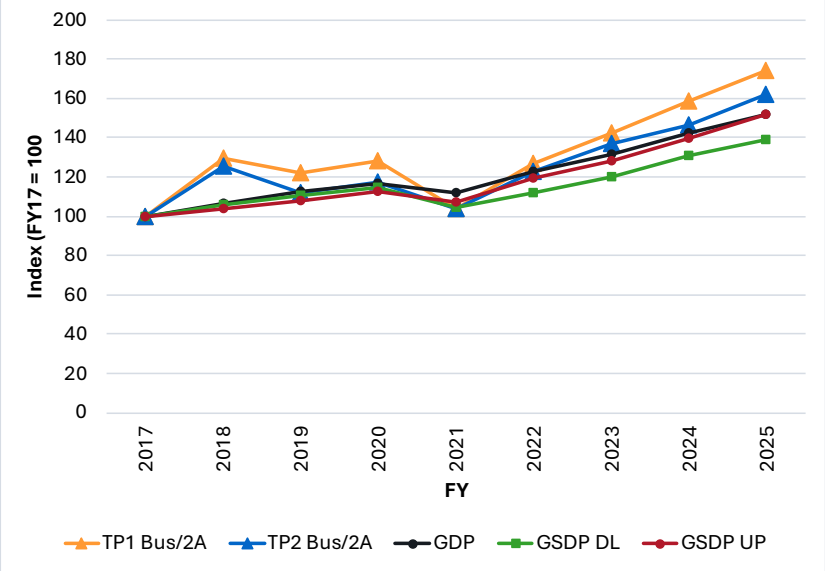
5.29 Bus growth tends to be largely supply-driven in many parts of the country, with new buses being bought and deployed by the government at different intervals of time. Based on our experience across the country, buses on inter-urban corridors show moderate elasticities of 0.4 to 0.6 with respect to the regional/state GSDP in which the asset is located.

5.30 Given that manufacturing-related commodities tend to take prominence in their commodity distribution, growth in 2A traffic is dependent on industry demand-supply ecosystems in the vicinity of the Asset and across the country. We have thus taken GDP as the growth driver to model the traffic growth in 2As. Compared to lighter trucks like LCVs, 2As have more national or long-distance movements covering several states.

5.31 Due to reporting issues (i.e., Buses and 2As being reported together prior to FY19), we present the relationship between the underlying growth drivers (i.e., GSDP Delhi, UP, and GDP) with the growth trend of the combined Bus/2A volumes in Figure 5-4 below. In terms of their split within the aggregate, Buses and 2As accounted for roughly 50% of the total at both toll plazas (53% of the total at TP1 and 48% of the total at TP2 in FY25).

5.32 Since FY17, Bus/2A volumes have exhibited robust y-o-y growth. Between FY17 and FY25, Bus/2A volumes grew at a CAGR of 7.2% and 6.2% at TP1 and TP2 respectively. Post the impact of the Covid-19 pandemic (FY21), and the mandatory implementation of FASTag (FY21-22), Bus+2A volumes have growth at CAGR of 9-10% per year (at both plazas) between FY23 and FY25. This growth is driven largely off the growth of 2As, as Bus volumes have witnessed a relatively muted growth profile over this period. Therefore, we have assumed an elasticity of 0.40 for Buses (with respect to Western UP/Delhi GSDP), and a more positive elasticity of 0.90 for 2As across both toll plazas on the Asset.

Figure 5-4: Relationship between Bus/2A traffic and Delhi/Uttar Pradesh GSDP and GDP, TP1 and TP2

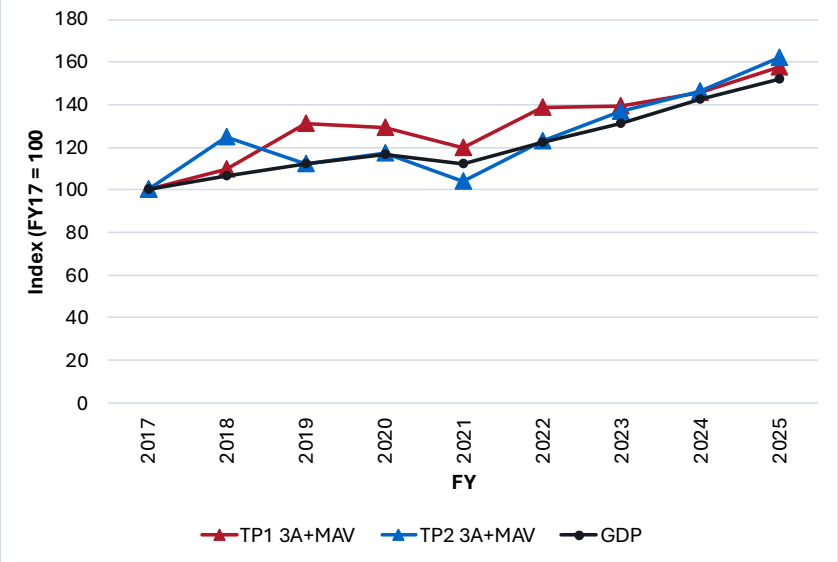


Source: Steer analysis of Client TMS data and publicly available GDP/GSDP data

3A/MAV Trucks

5.33 Given that manufacturing-related commodities tend to take prominence in their commodity distribution, growth in 3A and MAV traffic is dependent on industry demand-supply ecosystems in the vicinity of the Asset and across the country. We have thus taken GDP as the growth driver to model the traffic growth in 3As and MAVs. Compared to lighter trucks like LCVs, 3As and MAVs have more national or long-distance movements covering several states. Figure 5-5 below compares growth trends of 3As and MAVs at both TP1 and TP2 and India's GDP.

Figure 5-5: Relationship between 3A+MAV traffic and India GDP, TP1 and TP2



Source: Steer analysis of Client TMS data and publicly available GDP/GSDP data

Forecasts for background elasticities

5.34 Table 5.6 below presents a summary of the results of the regression analysis carried out on the historical toll plaza data and the macroeconomic (GDP/GDSP) growth, along with the assumed forecast elasticities for background traffic growth.

Table 5.6: Comparison of Derived Elasticities and Assumed Elasticities for Forecasting

Vehicle type	Growth driver	History		Forecast
		Derived elasticity	Years considered	Assumed forecast elasticity
TP1 Luharli				
Car	GSDP UP and Delhi	1.35	FY17-FY25	1.1*
LCV	GSDP UP and Delhi	0.9	FY17-FY25	0.5*
Bus	GSDP UP and Delhi	0.5	FY17-FY25	0.4*
2A	GDP India	1.2	FY17-FY25	0.9 reducing to 0.8 by FY30
3A+MAV	GDP India	1.0	FY17-FY25	0.2 for 3A
				0.8 for MAV
TP2 Somna				
Car	GSDP UP	0.8	FY17-FY25	1.0*
LCV	GSDP UP	N/A[24]	FY17-FY25	0.4*
Bus	GSDP UP	0.6	FY17-FY25	0.4*
2A	GDP India	1.0	FY17-FY25	0.9 reducing to 0.8 by FY30
3A+MAV	GDP India	N/A[24]	FY17-FY25	0.2 for 3A
				0.8 for MAV

Source: Steer analysis; FY25 AADT used in the model is FY25A, *wrt GSDP Western UP

5.35 In recent historical traffic performance across national highway corridors and as discussed in paragraph 3.14 in Chapter 3, a notable trend has emerged: there is a discernible shift in axle preference towards 2As and MAVs, resulting in a dampening effect on the growth of 3As. This trend is mirrored in the Assets performance as well, which has been discussed in detail in the subsequent sections. Due to these evolving axle

[24] Regression results were invalid.

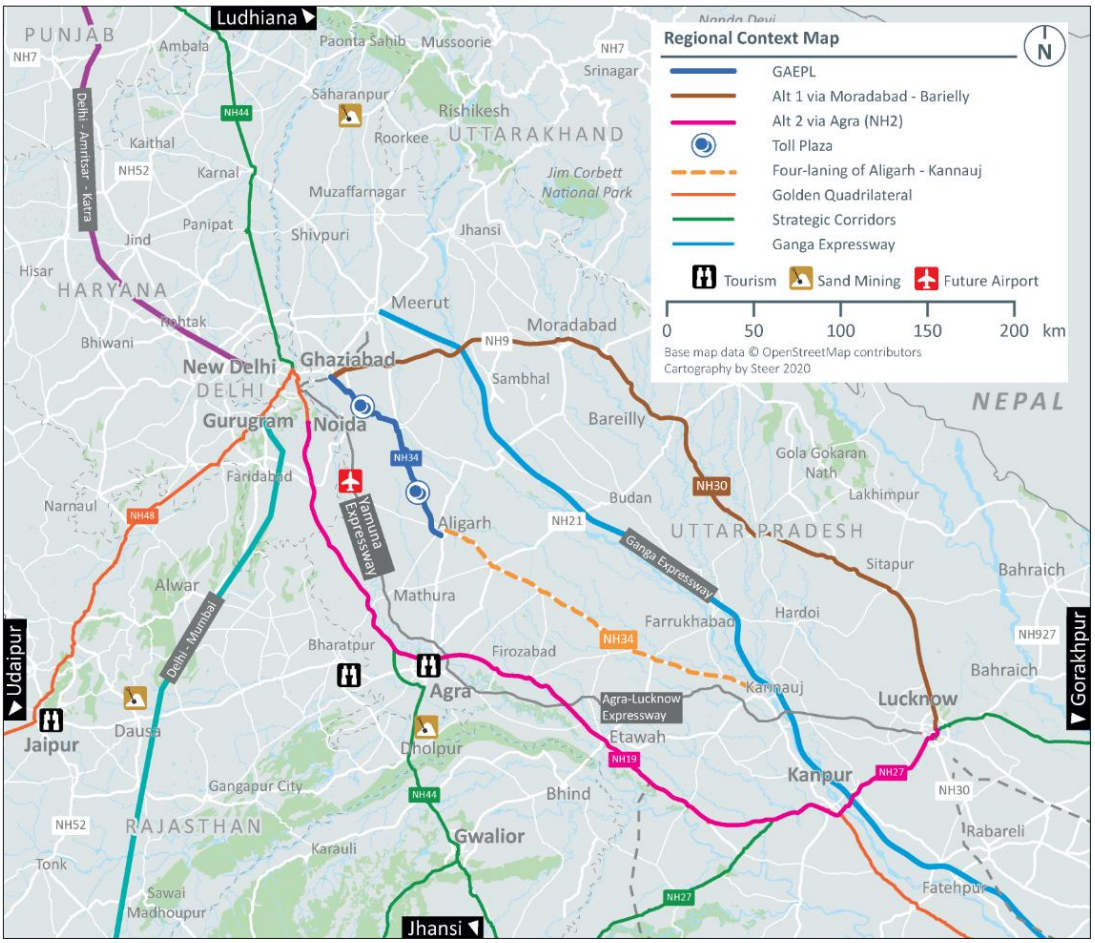
preferences, it has been assumed that the relationship between 3As and GDP will be relatively muted, whereas 2As and MAVs are expected to grow more closely in line with the country's GDP.

6 Forecasts: Base year AADT and Impacts

Introduction

6.1 Following the discussion on estimated and assumed forecast background growth rates in the previous chapter, this chapter first deals with the forecasting assumptions around base year AADT and potential impacts on traffic growth on the Asset. Later, it also presents the assumed toll segmentation, trip factors and evolution of toll rates for the forecast period which are used to estimate the forecast revenue based on the forecast traffic. In the final section, the chapter summarises the traffic growth rates for the forecast years.

Figure 6-1: Alternate routes and Asset shown against the regional network context



Source: Steer analysis and cartography

6.2 The section below details the impacts which we believe would affect traffic on the Asset during the concession period. As discussed earlier in Chapter 2, in order to assess the impacts on the Asset, whether positive or negative, we have studied developments (alternate roads, feeder roads and regulatory) in the surrounding road network. Figure 6-1 below shows the road network surrounding the Asset.

6.3 A few key network-related and other developments are expected to impact traffic growth on the Asset going forward, including the Ganga Expressway, and the increased movement of fly-ash from recently completed THDC thermal power plants in Khurja (UP) that are accessible via the Asset. The impact of the recently operationalised 16-lane staggered plaza at TP1 was not conclusive from our analysis of daily traffic and ticket segmentation trends between 15-20 July through 14th Aug '25 i.e., prior to the introduction of the Annual Pass, which impacted ticket segmentation trends independently. Therefore, beyond the assumptions relating to Annual Pass adoption rates for FY26 and FY27 onwards for CJVs, we have not assumed further changes to ticket segmentation that may (or may not) be attributable to the operationalisation of the staggered plaza at TP1.

6.4 Table 6.1 below presents the upcoming network/other developments, corresponding alternate/feeder routes, year of completion and indicative direction of impact on the Asset.

Table 6.1: List of network/other developments

S. No.	Development	Route affected/ nature of impact	Year of completion	Impact (+/-)	
				TP1 Luharli	TP2 Somna
1.	THDC Khurja thermal Plant	Fly ash related movement from the thermal plant	FY26*	+ve	+ve
2.	Ganga Expressway + Shamli-Gorakhpur Expressway Impact	Trips between Delhi/North and Lucknow/east	FY26	-ve	-ve

Source: Steer analysis; *in our forecasts we have assumed the positive impact of this development on the Asset to be gradual and begin from FY27.

Impact assessment for network/other developments

6.5 The subsections below include a narrative of each of the improvements, as listed in the table above, and impacts associated from each of these. Please note that all traffic volumes for impacts were estimated as impact rates applied on FY26 Base AADT.

THDC Khurja super thermal power project

6.6 The THDC Khurja Super Thermal Power Project (Khurja STPS) is a 1320-megawatt coal-fired supercritical power plant situated in Khurja, Bulandshahr, Uttar Pradesh, India. On January 25th, 2025, THDC India Limited declared the commercial operation date for Unit 1 of the power plant[2]. The second unit of the power plant (Unit 2) was recently

operationalised in September 2025[25]. Thermal plants generate fly ash as residue of burning coal which is used in construction and manufacturing of cement and bricks.

6.7 As the THDC plant is expected to generate Fly ash carrying traffic and we have estimated the impact as shown in the Table 6.2 below.

Table 6.2: Impact of THDC Khurja super thermal power projects

FY27 onwards	TP1	TP2
3A	0.6%	0.5%
MAV	0.4%	0.5%

Source: Steer analysis of Client OD data and publicly available information.

Ganga Expressway and Shamli-Gorakhpur Expressway Impact

6.8 The Ganga Expressway is a 596-km long greenfield expressway being developed to provide an improved level of service to long-distance traffic between western and eastern India. Competing with the traditional route using the Asset, the upcoming Ganga Expressway could provide faster and unhindered connectivity, as illustrated in Figure 6-1 above[26].

6.9 We have considered North (India)-East (India) movements for this impact for long distance traffic between Delhi/North of Delhi and Lucknow/east of Lucknow towards east, as these have distinct cost comparisons between the Asset corridor and the upcoming expressway. The route through the expressway provides a competitive route for long-distance traffic from Delhi and west to reach Lucknow and east. While toll costs are favourable for the Asset route, distance and time costs are lower on the expressway.

6.10 On the other hand, The Gorakhpur-Shamli Expressway is a planned 700-kilometre, six-lane greenfield corridor connecting Gorakhpur in eastern Uttar Pradesh to Shamli in the western part of the state. Designed to pass through 22 districts and 37 tehsils, this project aims to significantly reduce travel time between the two ends to just 6 hours, cutting the distance by 200 kilometres compared to current routes like the Agra-Lucknow Expressway. The National Highways Authority of India (NHAI) is preparing a detailed project report (DPR), after which land acquisition will commence, paving the way for construction estimated to cost around Rs 35,000 crore. Once operational, the expressway will also enhance connectivity to popular destinations like Haridwar, Dehradun, Mussoorie, and Rishikesh[27]. This expressway will provide an alternate route to vehicles on the Asset and is expected to negatively affect north – east movement of traffic served by the Asset.

6.11 While both the above expressways will effectively serve the same alignment i.e., long-distance movements between the North of India and the East of India, and being parallel to the Asset near Delhi and North India, will act as a direct competing route for these movements, the estimated impacts as shown in Table 6.3 below, using a GJC-based logit

[25] **Press Release:Press Information Bureau**

[26] **Development of 'Ganga Expressway'**

[27] **Gorakhpur-Shamli Expressway: 700-Km-Stretch To Connect Haridwar, Dehradun And Mussoorie | Full Details Here**

model is primarily that of the Ganga Expressway as it is expected to become fully operational by FY27-28 (assuming some delay beyond current estimates)[28]. The Shamli Gorakhpur Expressway, while being considered in combination with the Ganga Expressway for this impact estimation is still in its early stages, with its eventual future impact on the Asset less immediate or clear relative to the already under construction and soon-expected-to-open Ganga Expressway.

Table 6.3: Impact of Ganga Expressway and Gorakhpur-Shamli Expressway

Vehicle type	TP1 Luharli			TP2 Somna		
	FY26	FY27	FY28 Onwards	FY26	FY27	FY28 Onwards

Revenue forecasting assumptions

6.12 To forecast the revenues for a particular financial year, the traffic forecast for each vehicle type is converted into tickets sold, which is then multiplied with the corresponding toll rate, which grows over the years as defined in the Concession Agreement. While "trip factors" provide the conversion factor to the former, i.e. traffic (trips) to tickets sold, "toll segmentation" provides the latter i.e. the breakup of trips paying each ticket type. This section discusses assumptions related to trip factors, toll segmentation and toll rates for the forecast period.

Trip Factors

6.13 Trip factors are used to calculate the revenue for the trips made on passes such as return, local personal, monthly passes. The trip factors assumed are based on the latest FY25 data available and listed in Table 6.4 and Table 6.5 below:

Table 6.4: Trip factors for the forecast years for TP1 Luharli

Vehicle category	CJV	LCV/Mini Bus	Bus	2A	3A	MAV	OSV
Single	1	1	1	1	1	1	1
Return	2	2	2	2	2	2	2
Monthly	59	51	45	42	45	45	45
Local	26	1	1	1	1	1	1
Exemptions	1	1	1	1	1	1	1

Source: Steer analysis of Client TMS data

Table 6.5: Trip factors for the forecast years for TP2 Somna

Vehicle category	CJV	LCV/Mini Bus	Bus	2A	3A	MAV	OSV
Single	1	1	1	1	1	1	1
Return	2	2	2	2	2	2	2
Monthly	45	45	45	45	45	45	45
Local	32	1	1	1	1	1	1
Exemptions	1	1	1	1	1	1	1

Source: Steer analysis of Client TMS data

6.14 There is no major toll category being charged, apart from the official list of toll categories in the toll notification. This assumes that further changes in toll categories, unless specific discounts are offered, are unlikely.

Toll Segmentation

6.15 The Ministry of Road Transport & Highways has finalized a compensation formula for existing toll concessionaires to offset revenue loss from the Annual Pass scheme for non-commercial vehicles[29].

6.16 Across multiple assets, the number of passes sold has observed to be rising on a day-to-day basis, indicating an early adoption among frequent users since its introduction on 15th August 2025 till 30th September 2025, and a corresponding decline in other ticket categories mainly in the single and return categories. The evolution of proportion of users using the annual pass up to September 2025 is presented below:

%CJV using Annual pass	15th to 31st Aug	1st to 15th Sept	16th to 30th Sept
Luharli (TP1)	12.6%	19.9%	23.2%
Somna (TP2)	14.9%	21.9%	25.3%

Source: Steer Analysis of Client data

6.17 CJV Segmentation for FY26 has been developed using the pre annual pass segmentation till 14th August 2025, and daily Annual Pass transaction data from 15th August 2025 till 30th September 2025. Post September 2025, a gradual ramp up is assumed such that they form a large portion of the CJV trips by the end of FY26. This corresponds to a reduction in a proportionate decrease in single and return trips. For FY27 and beyond, we have assumed the share of annual pass trips to be in line with that observed at the end of March 2026, by when we believe the distribution of ticket categories in CJVs should stabilise. Under the above assumptions, the calculated shares of CJV Annual Pass transactions for FY26, FY27 and beyond are presented in Table 6.6 and Table 6.7 below.

6.18 For all other vehicle categories, we analysed the historical TMS data split by ticket categories to understand the latest trends in ticket segmentation across both Asset toll plazas. For the traffic and revenue forecast, we have assumed FY26YTD (Apr-Sept '25) segmentation to apply for all non-CJV vehicle categories.

Toll evolution

6.19 Based on the concession agreement and the gazetted toll notification, we understand that base toll rates increase every year (revision month is April) based on WPI-linked inflation. These are rounded up to the nearest five to estimate the final toll rate charged to users.

6.20 We have used actual toll rates from the FY25 and FY26 WPI toll notifications to validate the modelling of future toll evolution. These forecasts provided by the Client. The WPI forecasts available from other independent forecasting agencies may vary from this assumption and could be lower or higher than that provided by the client

Table 6.8: WPI growth forecast assumptions

Financial year	WPI growth (%)
FY26	2.6%
FY27	2.4%
FY28	5.0%

FY29	5.1%
FY30	4.9%
FY31	4.4%
FY32 onwards	4.1%

Source: FY27 onwards WPI print as per Client inputs

Revenue reconciliation

6.21 As part of validating the data provided by the Client, as well as our assumptions around toll calculations, we have reconciled the actual reported revenue against the modelled revenue at the AADC level. We have reconciled reported revenue with the modelled revenue for the year FY26YTD (Apr – July '25) to exclude the impact of Annual Pass introduction in Aug '25 on ticket segmentation distribution for CJVs. To reconcile the revenues, toll rates assumed in the model incorporate the additional 2.185 km within the tolling length of TP2 to make toll revenue calculations across both the TMS data and our model consistent. For the revenue forecasts, as per Client input, we do not assume the additional tolling length to calculation TP2 toll rates in FY26 and beyond.

6.22 The comparison, as shown in Table 6.9 below, shows that modelled revenue overall is within a variation of 0.9% from the reported revenue for TP1 and 0.5% for TP2. This gives us confidence that the revenues estimated using the traffic data in our forecasts are accurately representing the revenues being reported from the Asset.

Table 6.9: Revenue reconciliation summary (INR Lakhs)

Asset	Modelled AADC	Actual AADC	Difference (%) Modelled vs Actual
	FY26YTD	FY26YTD	
TP-1 Luharli	55.39	55.89	(0.9%)
TP-2 Somna	48.80	49.02	(0.5%)

Source: Steer comparison between modelled and reported revenue; FY26YTD here refers to the period prior to introduction of Annual Pass in Aug '25 (i.e., Apr – July '25)

Traffic and Revenue forecasts

6.23 Based on the traffic and revenue-related forecast assumptions discussed above, we have modelled the traffic and revenue forecasts for the forecast period for the Asset. Table 6.10 through Table 6.17 below present the AADT/PCU forecast growth rates and forecasted revenue CAGRs on this Asset (at both TP1 and TP2).

Table 6.10: Traffic forecast (With Impacts) for TP1 Luharli

Source: Steer analysis

6.24 As presented in Table 6.11 above, Total PCUs at TP1 Luharli is forecasted to grow at 4.8% per year over the remaining life of the concession (FY26-FY40); over the same period, total revenue (incl. AP compensation for CJVs) is forecasted to grow at 9.2% per year. PCU growth at TP2 Somna is forecasted to be 4.0% per year, while total revenue is forecasted to grow at 8.4% per year through the end of FY40. The Asset performance is largely impacted by the commissioning of the Ganga Expressway which is expected to significantly affect commercial traffic movement.

6.25 While the background growth is primarily driven by car growth and MAVs to some extent, the enhanced capacity of the Asset (from earlier 4-lane to current 6-lane), as well as the overall upgradation of the NH91 through Kanpur has significantly improved the attractiveness of the Asset for long-distance east-west movement between Delhi - Kanpur and beyond. This has been captured in the historical growth since FY24 and is expected to continue over the near term given the increasing economic importance of the region.

6.26 The high growth in CJVs on both the Asset plazas is attributable to Asset's proximity to large urban settlements, allowing it to capture local movements near and between Delhi, Ghaziabad, Bulandshahr as well as Lucknow, Kanpur, Etah, and so on. The projected MAV growth (CAGR) for TP1 over the remaining concession period is approximately 3.9%, driven by local freight demand. Similarly, TP2 is expected to experience a comparable CAGR of around 3.5% per year through FY40, given its role in transporting a significant portion of manufacturing and fast-moving consumer goods (FMCG) traffic between Haryana, Punjab, and Uttar Pradesh, as well as industrial traffic connecting Meerut, Aligarh, Kanpur, and Lucknow.

Upside and Downside cases

Upside and Downside scenario assumptions

6.27 We have developed our base case scenario considering a balanced view on the risks associated with input assumptions around GDP growth and traffic growth elasticities. There is always a risk that the outturn values of these inputs will vary as compared to the assumptions taken due to exogenous impacts, e.g. GDP growth could be influenced both positively and negatively by the impact of monsoons, export-import balances, political changes etc.

6.28 Similarly, traffic growth elasticities could be influenced by increased efficiencies achieved by technology, large shifts in commodity prices globally, changes in local manufacturing practices. However, at this stage we consider that the base case represents a central case scenario given the risks of variation of input assumptions.

6.29 To account for the possible variations in the growth drivers, we are also presenting an Upside (optimistic) and a Downside (pessimistic) scenario. These scenarios are defined by the following variations from the base assumptions:

Table 6.18: Summary of Macro-economic Assumptions for upside and downside cases

Input	Upside	Downside
Macro Assumptions		
GDP/GSDP	+1% every year	-1% every year
WPI	+1% every year	-1% every year
Elasticities	+ 10%	- 10%

Source: Steer analysis

6.30 Further, network developments are highly dependent on governmental directions, policies, legal and financial measure which might result in early or delayed completion of developments. Therefore, we have included an Upside (optimistic) and a Downside (pessimistic) case. However, at this stage, we consider that the base case represents a central case scenario given the risks of variation of input assumptions.

Impacts-Upside Case

6.31 The upside case impacts included in forecasts are summarised in Table 6.19 below.

Table 6.19: Summary of impacts on the Assets – Upside case

Development	Year of Impact	Change in impact w.r.t base case	Magnitude of impact	
			TP1 Luharli	TP2 Somna
THDC Khurja thermal Plant	FY27*	+25% of base case	3A: 0.7% MAV: 0.5%	3A: 0.6% MAV: 0.6%
Ganga Expressway + Shamli-Gorakhpur Expressway Impact	FY26*		CJV: (0.9%) 2A: (8.5%) 3A: (12.0%) MAV: (11.0%)	CJV: (2.5%) 2A: (13.0%) 3A: (12.1%) MAV: (15.6%)

Upside and Downside Case Forecasts

6.33 Table 6.21 below presents the difference between the Upside and Downside Case forecasts relative to the Base Case forecasts in FY40 (i.e., the concession end year) for both Asset toll plazas. Figure 6-2 through Figure 6-5 below plot the Upside and Downside Case forecasts relative to the Base Case forecasts for each Asset toll plaza over the full concession period (FY26-FY40).

Table 6.21: Percentage Difference Upside and Downside Case Forecasts vs. Base Case Forecasts - FY40

Case	Measure	TP1 Luharli	TP2 Somna
Upside Case	Traffic (PCU)	22.8%	22.1%
Downside Case		(16.8%)	(16.5%)
Upside Case	Revenue	35.5%	36.4%
Downside Case		(24.8%)	(24.8%)

Summary outlook

6.34 Passenger traffic on the Asset primarily serves local needs, connecting the densely populated Delhi NCR, Sikandrabad, Bulandshahr, Khurja, Ghaziabad, Luharli, Somna, and Aligarh over short distances, as well as connecting the medium-to-long distance cities of Meerut, Muzaffarnagar, Kanpur, and Lucknow. The check plaza previously in place contributed to better compliance and fewer exemptions between August 2023 and September 2024, before its vandalism by locals (discussed earlier). The newly operational staggered plaza at TP1 is expected to further curb leakage from forced exemptions.

6.35 This Asset is unique in nature as both the toll plazas have very different traffic profiles serving key strategic movements specific to each of them. TP1 caters to industrial demand generated by local centres of Luharli, Sikandrabad, Ghaziabad, Aligarh, and Dadri while also serving the consumption demand of the Delhi-NCR region. On the other hand, TP2 serves a significant proportion of agricultural, construction and grocery carrying traffic traveling between Haryana, Punjab and Uttar Pradesh along with industrial traffic between Meerut, Aligarh, Kanpur, and Lucknow.

6.36 Following the opening of the TP1 check plaza, traffic volume on the Asset stabilized, leading to improved reporting and compliance. Operational between August 2023 and September 2024 (before getting vandalised by locals), the check plaza contributed to an increase in tollable traffic and a subsequent positive rise in per day collection (as shown in Table 3.6 above). Another major reason which contributes to positive performance of the Asset is the completion of 6 lane expansion of the Asset in October 2023 which significantly improved level of service of the Asset and consequently led to an increase in local traffic of Car, LCV, Buses and MLCV.

6.37 We anticipate a positive future for the Asset, driven by the increasing demand for agricultural and manufacturing goods between the key connecting centers of Delhi NCR and Aligarh/Uttar Pradesh. These essential commodities are projected to experience continued healthy growth in the coming years. Further, to cater to this growing demand and increasing traffic movement, the new 16-lane staggered plaza at TP1 will allow for effective management of heavy traffic movement in peak hours and ease congestion.

6.38 Overall, we see a positive outlook for the region and the Asset, given that it serves major urban centres of Delhi NCR, Ghaziabad, Aligarh, Lucknow and it being the part of the traditional Grand Trunk Road serving the east-west movement across the country. The underlying growth drivers of the corridor are strong and are expected to deliver long term sustained growth.

6.39 In conclusion, we anticipate a positive future for both the region and the Asset. This is due to its strategic location serving major urban centers like Delhi NCR, Ghaziabad, Aligarh, and Lucknow, and its position along the historic Grand Trunk Road, facilitating east-west movement across India. Improved LOS on the Asset post August 2023, introduction of the split plaza in July ‘25 along with strong underlying growth factors of this corridor are expected to drive sustained long-term growth.

Appendices

A Detailed forecasts

A.1 Further to the summary of forecasts presented in Chapter 6, this appendix presents detailed forecasts.

Traffic forecasts

A.2 This section presents the detailed traffic forecasts for the forecast period until FY40.

Table A.1: Traffic Forecast (with impacts) over horizon years at TP1 Luharli

Disclaimer

This report has been produced for the sole benefit of Cube Highways Pvt. Ltd. This Report (the "Report") is confidential and disclosed only for information purposes, and it may not be relied upon by any party other than the Client or a Party to a Reliance Letter, and Steer: a) makes no warranty, expressed or implied, with respect to the use of any information or methods disclosed in this Report; and b) assumes no liability with respect to the use of any information or methods disclosed in this document. Any such party by its acceptance or use of this Report releases Steer from any liability for direct, indirect, consequential, or special loss or damage whether arising in contract, warranty, express or implied, tort or otherwise.

The Report is based on standard professional efforts, and information available to us at the time the review took place and is subject to time and budget constraints of the Report's scope of work. This Report, information and statements contained herein, are all based on third party data provided to us, or sourced by us, and Steer has not sought to establish the reliability of the data, except as specifically stated in the Report. Steer bears no responsibility for the results of any actions taken based on third-party data.

Certain forward-looking statements in the Report are estimates based on interpretations or assessments of information available at the time of writing. The Report is thus to be viewed as an assessment that is time-relevant, specifically referring to conditions at the time of the review. Steer undertakes no obligation to update the Report for any reason.

While the estimates contained in the Report are not precise forecasts, they do represent, in our view a reasonable expectation of the future, based on information we have been provided with or sourced. However, the estimates necessarily rely on numerous assumptions and judgements, and circumstances may occur over the timeframe of the project that go counter to these assumptions and judgements and that affect the project's realized revenues. Actual events may differ from those assumed, and events are subject to change. Therefore, Steer makes or provides no warranty, whether implied or otherwise, as to the accuracy of forward-looking information presented. Further, it is important to note that forecasts presented represent long-term growth profiles; the results for individual time periods may vary from forecasted values.

Traffic Consultant developed the relationships in the models used to produce the forecasts for the projects based on data available through September 2025. This report does not consider variations in traffic performance due to changing macro and force majeure events such (but not limited to) as global wars, economic uncertainty (high inflation, global recession), and changes in the regulatory environment. The situation remains dynamic and is subject to significant change in the short and medium term. In this challenging context, Traffic Consultant has produced base forecasts with a view on a possible scenario for the traffic forecasts. However, it is important to note that this is only one view, and there continues to remain uncertainty as to the short-term, intermediate, or prolonged effects of and responses to such macro-economic/force majeure events. As a result, no assurance can be provided by Traffic Consultant that the scenarios and assumptions Traffic Consultant has identified will prove to be accurate. Given the uncertainty inherent in this scenario, Traffic Consultant advises that all readers of the Report consider the Report in the context of their own assessment of the impact of such events.

TO THE FULLEST EXTENT PERMITTED BY APPLICABLE LAW, THE LIABILITY OF THE TRAFFIC CONSULTANT FOR ANY LOSS, DAMAGE, COST OR EXPENSE SUFFERED OR INCURRED BY ALL PERSONS OR ENTITIES AND FOR ALL CLAIMS RESPECTING ITS WORK PERFORMED IN CONNECTION WITH THE ISSUE OR THE REPORTS IS HEREBY LIMITED IN THE AGGREGATE TO THE AMOUNT OF FEES ACTUALLY PAID BY THE CLIENT TO THE TRAFFIC CONSULTANT IN RESPECT OF THE REPORTS AND CONNECTED SERVICES.

YTD	Year to Date

1 Introduction

The assignment

1.1 The Cube Highways Fund Advisors Private Limited (the "Client") has commissioned Steer Davies Gleave India Private Limited ("Steer") for a traffic due diligence to be carried out on the Hazaribagh- Ranchi Toll Road (hereafter called "Asset"). This report forms part of the annual fair market valuation (FMV) undertaken as part of the "Transit 10 project. This report presents an update of the traffic and revenue forecasts based on actual traffic data available up to September 2025 and latest macro-economic assumptions.

1.2 The Asset Hazaribagh-Ranchi consists of the single toll road section with its own special purpose vehicle (SPV). For this report, we hereafter call the toll plaza on the Asset as TP1.

- Hazaribagh Tollway Limited: HTL: TP1 - Pundag

1.3 Our scope of work for the traffic and revenue forecasting process includes:

Table 1.1: Scope of work and sources of data

Scope of work	Data source
• Review of historical Traffic Management System (TMS) data, Vendor reports and documents	• Provided by client for the period between Oct'20 and Sept'25
• Historical analysis and forecasts for baseline growth, including; — Background growth, and — Seasonality trends	• Historical data provided by the Client and benchmarking using plazas in the vicinity or of similar nature of the Asset has been done wherever sufficient data was unavailable.
• Validation of revenue reported in FY26YTD	• TMS data provided by Client • Revenue reconciliation using toll plaza traffic and ticket type data to calculate revenue and reconciling it with toll plaza reported revenue
• Origin Destination (OD) analysis to understand growth drivers: — Zonal influence and Top OD pairs — Commodity distribution — Trip length distribution	• Origin Destination (OD) surveys undertaken by Steer. The surveys were undertaken in year 2024.
• Analysis of upcoming network improvements and other developments, that may have future impacts on traffic	• Secondary research and our in-house experience of working in the vicinity of the Asset. Impact analysis to be conducted by Steer based on Generalised Journey Cost spreadsheet-based analysis

Scope of work	Data source
• Historical revenue analysis and forecasts for revenue estimation, including — Toll segmentation and trip factors, — Overloading shares	• Calculated from historical data provided by Client
• Final traffic growth forecasts including baseline growth rates and potential future impacts	• Elasticity based base growth and potential impacts from secondary research and Steer's in-house experience of working in the vicinity of the Asset
• Toll revenue estimation for the entire concession, including toll evolution	• Toll evolution based on latest toll notification published by National Highway Authority of India (NHAI); and latest Wholesale Price Index (WPI) trends as shared by the client

Our approach

1.4 Our approach follows well-established practices for forecasting ongoing traffic growth on an existing/brownfield Asset. The analysis focused on two sets of issues, namely:

- understanding the traffic that is currently using the Asset; and
- identifying how and why that traffic is likely to change in the future.

1.5 To understand the current traffic on the Asset, we have analysed traffic data from multiple independent sources:

- Client-provided secondary data, including:
  - TMS data from October 2020 to September 2025.
  - Concession agreement and toll notifications for FY25 and FY26.
  - Previous studies related to traffic and revenue
  - Steer-commissioned OD survey on 7th July 2023 to validate any change in growth drivers and travel patterns.
  - Steer-commissioned TVC survey in 2021 as a part of study in earlier commission.
- We undertook revenue reconciliation for FY26YTD, by building up revenue from the traffic reported by each of the toll plaza and subsequently match it to the reported revenue for FY26YTD using the prevalent toll rates and reported segmentation/toll-frequencies for FY26YTD, this is a key part of our analysis to validate the segmentation/toll-frequency assumptions and the Annual Average Daily Traffic (AADT) reported for each of the toll plaza.

1.6 The estimation of future traffic demand on the Asset was undertaken through:

- Estimating FY26 base year position. The FY25 AADT was calculated using the monthly traffic data for FY25. The annual FY25 AADT was then grown with elasticity linked GDP/GSDP growth to arrive at the FY26 expected traffic. To determine the adopted FY26, the expected FY26 traffic was validated against the six months of actual traffic (Apr-Sept) and necessary adjustments were made where required.
- Secondary research to understand plans for new developments and progress of ongoing developments on the Asset.

- Steer independent primary surveys and site visits to validate our network and contextual understanding.
- Developing a bespoke growth model for each Asset/plaza/toll class to forecast year-on-year traffic growth from FY26 to the end of concession period.
- Investigating the elasticity of historical traffic growth compared to state (GSDP) and national (GDP) growth. Where historical data is limited, we have benchmarked the Asset against our Steer knowledge base (e.g., similar Asset types in the same state or on the same corridor), to derive appropriate elasticities.
- Applying our elasticities to independent GDP forecasts as provided by client.
- Identifying and analysing the potential impacts of any relevant changes to the competitive position of each Asset – these include impacts of changes to road network including expressways and opening of competitive modes of travel.
- Identifying and analysing any other potential impacts to traffic and revenue on each Asset – these include axle load norms, axle shift for heavy goods, FASTag implementation.
- Considering changes in trends of segmentation over time and making suggestions for changes in exemptions in the future
- Preparing traffic and revenue forecast for the Asset for the complete length of concession. The analysis here includes the specific impacts of network, or other exogenous factors specific to the Asset. We have developed a set of forecasting assumptions for three scenarios: a base case and upside and downside scenarios.

Contents of this Report

1.7 The report has been divided into the following chapters, including Chapter 1 providing an introduction:

- Chapter 1 introduces the methodology and approach to undertake the traffic and revenue due diligence;
- Chapter 2 describes the key characteristics of the Asset and its surrounding road network, primarily based on site visits;
- Chapter 3 summarises the current and historical traffic on the Asset, including results from the TMS, TVC and OD analysis;
- Chapter 4 presents the socio-economic context of the corridor and region/state containing the Asset, along with our approach and results on estimating background traffic demand growth; and
- Chapter 5 presents our baseline year forecast and summarises our results on estimating background traffic demand growth
- Chapter 6 summarises our assessment of network impacts and presents concession traffic and revenue forecasts for the Asset along with the assumptions for upside and downside cases

2 The Asset

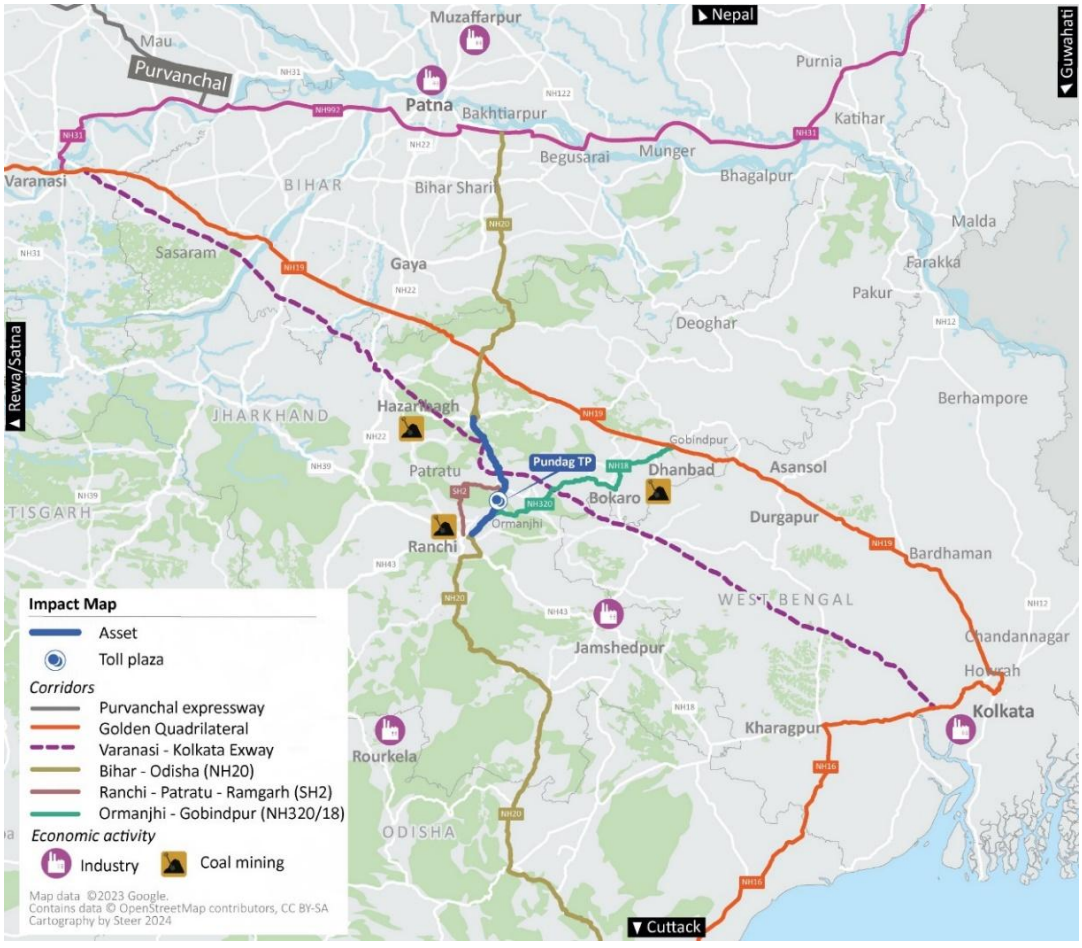
Introduction

2.1 This chapter provides a description of the Asset, based on both primary data (from site visits), and our understanding of the region and network surrounding the Asset. We cover the strategic network context, followed by key economic activities and network developments around the Asset.

Strategic network

2.2 The Asset is situated in the state of Jharkhand, connecting Ranchi, the capital of Jharkhand, and Hazaribagh, on the NH 20 (old NH 33). The following figure shows the regional road network in which the Asset is located.

Figure 2.1: Asset location in the regional network context



Source: Steer cartography using OpenStreetMap data

2.3 This Asset primarily caters to three different types of strategic movements:

- **Short-distance trips** including tourism and leisure travel trips between some of the key tourist destinations in Jharkhand. Many CJV users are either local or travel between Ramgarh and Patratu at one end and Ranchi at the other.
- **Medium-distance trips** between Bihar/rest of Jharkhand connecting the mines situated close to the Asset, to industries in Jharkhand. The Asset also transports a significant number of minerals, steel, and related products across the states of Bihar, West Bengal, and Odisha.
- **Long-distance trips** between Bihar/southern West Bengal and southern as well as central states of India.

2.4 The Asset is a 73.79 km long toll road which forms a part of the NH 20 (old NH 33) in Jharkhand. It is a four-lane divided road with one toll plaza, namely, Pundag at Km 100.4. The toll plaza is situated nearer to the Ranchi side of the Asset than to the Hazaribagh side. A detailed view of the Asset and its adjacent area is shown in Figure 2.2.

Figure 2.2: Asset context

Source: Steer Cartography

2.5 About 67% of vehicles on the Asset are CJVs, in FY26YTD which predominantly commute between Ranchi, Ramgarh, Hazaribagh and other local destinations along the Asset. The commercial vehicles on the Asset cover a mix of medium and long distances. Trucks from Jharkhand, Bihar are observed, as well as those from UP, Delhi, Haryana, and Rajasthan.

Concession and tolling details

2.6 The toll plaza on the Asset has been operational since September 2013 and the Client took over the operations in October 2020. The concession period ends in FY51. Table 2.1: Summary of concession presents a summary of the concession.

Table 2.1: Summary of concession

Particulars	Details
State	Jharkhand
Highway and lane configuration	NH 33 (old NH 20), 4-lane divided
Toll plaza	Pundag
Length (km) as per concession agreement, applicable	73.79 km
Commencement of operations	September 2013
Operated by Client since	20th October 2020
Concession period	30 years
Last year of concession	2051

Source: Client data

2.7 The following images show a typical cross section of Asset and its toll plaza.

Figure 2.3: Road cross section of the Asset

Source: Steer site visit

2.8 The toll rates for single category are shown in the following table. The toll plazas have dedicated ETC/FASTag lanes for electronic tolling. Like the other National Highway plazas, the Asset has Single, Return, Local Commercial, Local Personal, Monthly, and Local Monthly tickets.

2.9 Due to general elections in India from Apr-May'24 the toll rates on National highways across the country for next financial year were applicable Jun'24 onwards instead of Apr'24.

Table 2.2: Single toll rates on the Asset (INR), applicable FY26

Type of Vehicle	Single Journey Fee
	Pundag
CJV	125
LCV	205
Bus/Truck	425
3A	465
HCM/EME/MAV	670
OSV	815

Source: NHAI Revision of User fee Rate w.e.f 01.06.2025

2.10 Apart from single tickets, ticket categories like monthly, local personal and local commercial passes are also available on the Asset.

Key economic activities

2.11 The Asset is situated in Jharkhand, a state rich in mineral resources, contributing 40% to India's mineral reserve. Minerals ranging from iron ore, coal, copper ore, mica, bauxite, Manganese, limestone, China clay, fire clay, graphite, kainite, chromite asbestos, thorium, sillimanite, uranium (Jarsuguda mines, Narwa Pahar) and even gold (Rakha Mines) and silver and several other minerals are found in Jharkhand.

2.12 The presence of large deposits of coal and iron ore in the vicinity has resulted in the concentration of industries, in centres like Jamshedpur, Dhanbad, Bokaro and Ranchi. Particularly, Hazaribagh and Chattra near the Asset contribute significantly to the state's total coal reserves, making coal one of the common commodities being transported on the Asset.

2.13 Jharkhand contributes 20-25% of the total steel produced in India and is home to industries like Tata Steel, Steel Authority of India Limited (SAIL), Jindal Steel and Power Limited (JSPL) etc. TATA Steel in Jamshedpur is 130 km from Ranchi towards the south-east of the Asset and accounts for a significant amount of traffic on the Asset. As per the 2023 report, Tinplate Company of India Limited (TCIL) is investing more than 2000 cr to increase capacity of steel production by 3L Ton per annum[1]. Jindal Steel and Power Limited (JSPL) operates a steel plant as well as power plant in Patratu (40 km from the Asset) and is planning to invest to add 2-2.5 million tonnes per annum to its current capacity of 0.6 million tonnes per annum (wire rod mill) and 1.2 million tonnes per annum (bar mill)2. The expansion is expected to add further steel carrying tollable traffic from Ranchi – Patratu.

2.14 The Ramgarh and Hazaribagh areas are rich in limestone mines. Since the state has reserves of cement grade limestone, the region is well-suited for creating additional capacities. Burnpur Cement's plant in Patratu attracts cement carrying traffic towards the Asset. Burnpur Cement is planning to launch new cement products from the Patratu plant

[1] **TCIL expansion project very important for Jamshedpur and Tata Steel: Narendran | The Avenue Mail**

[2] **https://www.thehindubusinessline.com/companies/jspl-looking-to-set-up-2-25-mtpa-steel-plant-at-patratu-in-jharkhand/article31088657.ece**

as well as increase its capacity utilisation[3]. Further exploration of limestone would help in developing new cement plants and hence, would generate additional traffic on our Asset.

2.15 Dalmia Cement (Bharat) Limited is investing ₹758 crore in Bokaro to expand its cement manufacturing capacity and sustainability initiatives. This includes ₹567 crore for a 2.6 MTPA grinding unit (taking total capacity to 6.3 MTPA), ₹250 crore for a solar power plant, and ₹8 crore for waste management facilities under Ranchi Municipal Corporation. The expansion is expected to generate significant employment and contribute to tollable traffic from Bokaro to Ranchi.[4]

2.16 The industrial area in Hazaribagh is also a significant traffic generator for the Asset. 1500+ industries are present in the industrial area involved in the production of cement, coke, and stone.[5] Although no major tourism spot is present on the Asset, Patratu Thermal Power Station (PTPS) dam at Patratu attracts CJV traffic from Ranchi and nearby areas as a weekend getaway.

Alternate Routes

2.17 For short/medium – distance traffic connecting Ranchi to Ramgarh, there is an alternate route via Patratu on SH 2 that bypasses the toll plaza. The same route also leads to Hazaribagh bypassing the whole Asset. The route is not preferred by truck drivers as it is longer and present on hilly terrain. Also, it is two-laned and passes through uninhabited areas. Hence, no traffic shift and impact are assumed for same.

2.18 For Hazaribagh – Jamshedpur traffic, an alternate route is available at Kothar (near Ramgarh). The alternate is two-lane undivided road connecting Hazaribagh – Jamshedpur. During Steer's site visit it was found that a few local coal carrying trucks from Hazaribagh/Barhi take this route instead of the Asset as the route is shorter (23 kms) and has no tolls. However, the route is known to be affected by local Naxal based insurgency and deemed unsafe. Long distance trucks follow the Asset as it is four-laned throughout the way (till Jamshedpur) and is safer as it doesn't pass through uninhabited areas. Therefore, for the reasons stated above the alternate is not considered to be favourable route for majority of the users.

2.19 As per latest updates, the Oramanjhi-Gola-Bokaro section of NH320 between Bokaro-Ranchi is undergoing 4 lane expansion with a construction duration of 24 months. Due to this bottlenecks and road closures are observed on the alternate, which has led to temporary gain in traffic on the Asset particularly moving between Ranchi and Bokaro.[6] The same is validated from monthly traffic data, wherein increased volume is observed on the plaza starting June'23 onwards. This diverted traffic is expected to return to the alternate road when the construction activity is completed, and the ban is lifted.[7] Basis

[4] **Dalmia Bharat to impact 20,000 lives of Bokaro, investing Rs. 758 Cr on Industrial project - India CSR**

[5] **DIPS Hazaribagh.pdf (dcmsme.gov.in)**

[6] **https://www.livehindustan.com/jharkhand/bokaro/story-villagers-protest-nh-320-road-construction-in-lepo-mauja-demand-underpass-201741001945578.html**

[7] ttps://www.livehindustan.com/jharkhand/bokaro/story-villagers-protest-nh-320-road-construction-in-lepo-mauja-demand-underpass-201741001945578.html

the conversations with local stakeholders and secondary research, the construction of Gola – Oramanjhi stretch is expected to be completed by Mar'26[8] and the remaining stretch of the NH320 i.e Gola – Bokaro is expected to be completed by Dec'25. The detailed impact assumed is presented in Chapter 6 of the report.

2.20 National Highway Authority of India (NHAI) has proposed a 4/6 lane greenfield Varanasi Ranchi-Kolkata expressway connecting Varanasi, Ranchi, and Kolkata. As per the latest information available, the alignment of this expressway is supposed to cross the Asset north of the Ramgarh, and hence, is not expected to take away any traffic which is currently moving from east of Hazaribagh to Ranchi or vice versa. In the long-term, trips between Kolkata and Ranchi can benefit from the improved connectivity and act as a positive on the Asset. Hence, impact of the expressway has been considered in our analysis and has been detailed further in Chapter 6.

2.21 During Steer's site visit to the Asset, no major micro-diversions through local roads were observed close to the toll plazas.

3 Traffic description

Introduction

3.1 This chapter outlines the current traffic and revenues on the Asset, as well as our analysis of origin-destination (OD) data and traffic count data. This covers data which was collected as a part of this study and previous studies, as well as data provided by the Client.

3.2 Traffic demand data is generally collected and analysed to understand the volume and vehicle composition of demand currently using the Asset, while OD data is used to obtain a better understanding of travel patterns, trip lengths, trip purposes and areas of influence in the vicinity of the Asset, as well as the commodities being moved by goods vehicles. This analysis, combined with our understanding of the Asset (based on our site visits), enables us to identify the key drivers of demand on the Asset.

3.3 Actual toll plaza data is used as the basis from which the current/base year annual average daily traffic (AADT) is established. This data is typically provided by the Client and independently analysed and validated by us using traffic volume count (TVC) information.

PCU Factor assumption

3.4 The PCU values have been taken from 'IRC 64:1990- Guidelines for Capacity of Roads in Rural Areas'. For MAV, based on the discussion with the Client, we have referred to the rigid and trailer splits in the latest TVC counts conducted in 2024 for calculating the effective PCU for MAVs. For rigid trailer trucks we have assumed a PCU factor of 3, whereas for trailer trucks we have assumed a PCU factor of 4.5. These factors have been used to arrive at the PCU values presented in the following sections.

Table 3.1: PCU factors

Vehicle Category	PCU Factor
CJV	1.0
Mini LCV	1.0
LCV	1.5
Bus	3.0
2A	3.0
3A	3.0
MAV*	3.8
OSV	4.5

Source: Steer analysis, * Rigid-Trailer PCU calculated using TVC splits of such vehicle types

Historical trends of traffic

3.1 The following table illustrates the traffic data over the period of 6 years from October 2020 – September 2025 (provided by the Client) at a plaza level. There is lack of long-term historical data available on the Asset since tolling was started by the client only in October 2020 and the available years of data, FY21 and FY22 were impacted by COVID-19 related restrictions. Starting FY23 traffic on the Asset has started to get normalised with temporary traffic gain starting FY23 due to construction of alternate Oramanjhi- Gola-Bokaro Section.

Table 3.2: Annual Average Daily Traffic (AADT) at TP1 Pundag

Vehicle category	FY21*	FY22	FY23	FY24	FY25	FY26 YTD	CAGR FY23-25
CJV	9,186	8,516	8,935	9,879	10,928	11,949	10.6%
LCV	859	467	445	488	363	390	(9.6%)
Bus	672	447	583	594	797	896	16.9%
2A	490	586	681	845	1,023	1,026	22.6%
3A	516	455	480	529	555	553	7.6%
MAV	1594	1,629	1,690	1,950	2,557	2,687	23.0%
OSV	0	1	2	2	2	2	2
AADT	**13,318**	**12,103**	**12,814**	**14,287**	**16,224**	**17,503**	**12.5%**
PCU	**21,521**	**19,832**	**21,209**	**23,876**	**28,245**	**30,099**	**15.4%**

Table 3.3: Historical Tollable Traffic at TP1 Pundag

Vehicle category	FY21*	FY22	FY23	FY24	FY25	FY26 YTD	CAGR FY23-25
CJV	8,010	7,770	8,172	9,013	9,905	10,773	10.1%
LCV	862	460	442	484	357	385	(10.1%)
Bus	668	441	578	588	772	890	15.6%
2A	501	568	665	832	1,007	1,011	23.1%
3A	514	449	473	526	550	549	7.8%
MAV	1,690	1,624	1,687	1,948	2,551	2,685	23.0%
OSV	4	1	2	2	2	2	12.7%
Tollable AADT	**12,249**	**11,312**	**12,019**	**13,392**	**15,144**	**16,295**	**12.3%**
Tollable PCU	**20,740**	**18,961**	**20,351**	**22,928**	**27,055**	**28,832**	**15.3%**

Source: Steer analysis of Client data, (FY21* includes 6 months of data from Oct'20 to Mar'21); FY26YTD includes data till Sept'25

3.5 CJVs have the dominant share in traffic, comprising more than ~67% share in FY26YTD due to the presence of large urban centres close to the Asset like Ranchi, Hazaribagh and Ramgarh Cantt, which attracts large quantum of CJV traffic. Vehicles from nearby urban settlements in the influence area like Bokaro, Patratu, Jamshedpur also use this Asset. This is further validated by the analysis of the OD data discussed later.

3.6 As can be seen from Table 3.2, the average traffic for the MAV have been consistent up to 2023 and was maintained between ~1,600-1,700 vehicles. However, the Asset has seen an increase in both CJV and MAV traffic since FY24.

3.7 The CJV traffic has increased from ~8,900 AADT in FY23 to ~12,000 AADT in FY26 YTD. Whereas the MAV volume has increased from the earlier range of ~1600-1700 AADT to ~2,700 AADT in FY26YTD. This volume increase is mainly driven by temporary traffic shift on the Asset due to the undergoing four laning of the Ormanjhi-Gola-Bokaro section of NH320 as mentioned in Chapter 2 which is expected to complete by March 2026.

3.8 Furthermore, effective May 2024, minibuses previously tolled as LCVs have been reclassified under the bus category. This reclassification is based on a passenger count system, replacing the earlier gross vehicle weight-based classification. Travel patterns in FY25 and FY26YTD remain largely consistent.

3.9 The trend of tollable traffic on the Asset has largely followed that of total traffic. The Asset has recorded 15.3% tollable PCU CAGR.

3.10 It is seen that the exemption volume in CJV is consistent ~800-1000 vehicles historically with no major change, as seen in Table 3.3.

3.11 The MAV traffic on the Asset is largely influenced by the mineral industries along its alignment, which also contributes to the overall stability of MAV volumes across different time periods.

3.12 The steel industry has seen slowdown over the last couple of years first due to Covid19 related disruptions, slowdown in demand for steel in China, and subsequent high inflation. Recent evidence from various industry players suggests a rebound in Steel production and consumption led by economic activity and urbanization which is expected to boost demand for steel in India to between 240-260 million metric tons by 2035. [9] [10]

3.13 These factors support the growth prospects of the Steel related industry and traffic in the future. Beyond these natural growth factors, higher than usual growth was observed on Asset due to the work on the alternate NH320 as mentioned earlier.

Historical Revenue

3.14 The following table shows the total revenue (in INR Crores) and AADC (Annual Average Daily Collection; in INR Lakhs) by vehicle type at the toll plaza for FY21 to FY26YTD.

Table 3.4: Revenue (INR Crores) and AADC (in INR Lakhs) by vehicle type at TP1 Pundag

FY	CJV	LCV	Bus	2A	3A	MAV	OSV	Total	AADC	AADC Growth
FY21*	1.2	0.2	0.3	0.3	0.3	1.5	0.0	**3.8**	**22**	
FY22	21.4	2.0	3.7	6.8	6.2	35.2	0.0	75.3	**21**	**(4.5%)**
FY23	21.8	1.9	4.7	7.9	6.3	36.4	0.0	79.1	**21.7**	**4.8%**
FY24	31.9	2.8	7.0	11.4	7.9	45.1	0.1	106.3	**29.0**	**31.8%**
FY25	35.6	2.2	9.3	14.0	8.4	59.0	0.1	128.6	**35.2**	**21.3%**
FY26YTD	19.7	1.3	5.5	7.6	4.4	32.9	0.0	71.4	**38.8**	**10.2%**

[9] Evolving with steel: Future growth and opportunities | McKinsey

[10] https://www.moneycontrol.com/news/sector/indian-steel-industry-tapered-now-tempered-for-future-thanks-to-improving-macros-10125481.html

3.15 The MAVs are the biggest revenue contributor on the Asset followed by CJVs. Lower per day collection in FY22 can be attributed to COVID-19 with restricted traffic movements. FY21 and FY23 recorded the similar average per day collection of INR 22 lakh. FY24 onwards there is an increased per day collection jump by 32%, 21% respectively due to incremental traffic gain on the plaza by the ongoing construction activity of the alternate and healthy growth observed in commercial traffic due to increased demand of steel.

Toll Frequencies

3.1 Toll frequency or segmentation is typically the share of each ticket category recorded for a particular vehicle type. This is based on the toll policy which forms a part of the concession agreement. Each vehicle category has different segmentation. As a part of historical analysis, we calculate the toll frequency for each vehicle category from the monthly data shared by the client. The most common ticket categories observed on a typical National Highway are: Single, Return, Monthly, Local and Exempt. Given the local nature of traffic, some toll plazas offer custom made local passes to attract the local commuters to opt for these passes instead of evading toll.

3.2 The following are the types of tickets being sold at the plazas of the Asset.

Table 3.5: Typical ticket types sold at NHAI plazas

Category	Description
Single	Allows the vehicle to cross the toll plaza once
Return	Allows for a return journey within a day with a 50% discount on the return trip.
Monthly Pass	Discounted single entry ticket for users who undertake multiple trips within a month can buy the monthly pass.
Local Personal	Discounted single entry pass only for private cars of residents within 20km radius of toll plaza
Local Commercial	50% discount on single trips for commercial vehicles registered in the local district. This pass allows single entry only
Exemptions	Officially exempted vehicles like ambulance, police cars, key political personnel etc.

3.3 Further, the toll plazas also record violations which are non-paying users, who are not officially allowed under exemptions category but are forced exemptions. For some Assets, the Exemption and violations are at time reported together.

3.4 Generally, over the period the shares of single/return/monthly tickets tend to stabilise within 2-3 years of Asset operations. Only in the cases where trip patterns are expected to change significantly due to urban expansion is where we expect these shares to change over the period or due to some external events impacting the trip patterns.

3.5 Further, FY21 was impacted due to the mandatory implementation of FASTag as a mode of payment, where users were now paying via an online payment system instead of cash payments at the toll plaza. Additionally, in FY22 traffic and travel patterns were impacted by the second wave of COVID-19 in Q1 and Q2. With FY21 and FY22 being impacted these external events, the segmentation began to stabilise from FY23 onwards and reached steady state starting FY24.

Introduction of Annual pass for CJVs

3.6 The National Highway Authority of India launched the "The FASTag Annual Pass" on August 15, 2025, a prepaid facility that allows private CJVs to travel across designated National Highway and National Expressway toll plazas. The annual pass is worth INR 3,000. The pass is valid for one year or 200 trips, whichever occurs first and is applicable only to private, non-commercial vehicles (Car/Jeep/Vans).

Since this pass has been introduced by NHAI, it is not valid on

- state governed toll plazas on highways
- state governed toll plazas expressways
- Parking areas or other non-NHAI tolling locations

3.7 The pass can be activated via the RajmargYatra app or the NHAI website, and links directly to an existing FASTag.

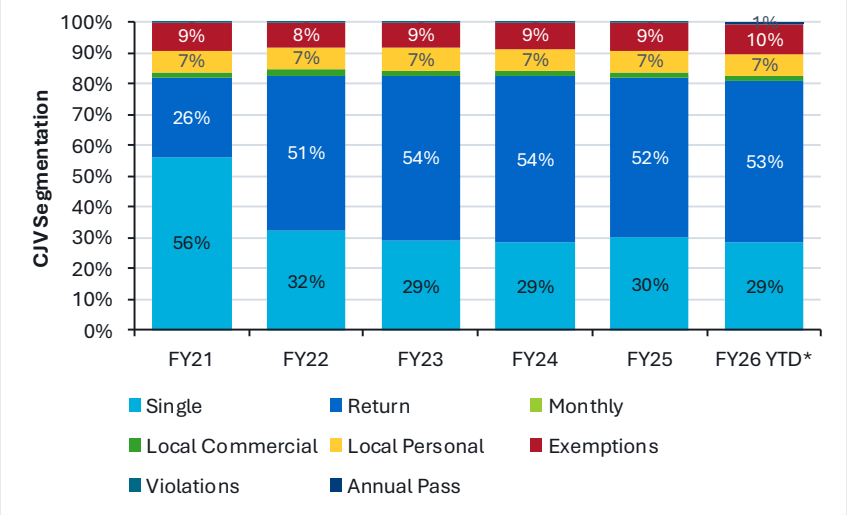
The Annual Pass aims to:

- Promote cashless and seamless travel on national highways.
- Reduce congestion and improve traffic flow at tolls
- Provide cost-effective travel for frequent users of NH/NE toll roads.

Share of traffic by payment type

3.8 As shown in Figure 3.1 from the period of FY26YTD, more than half of the CJVs paid for return tickets, and the remainder ticket-share being made up of single journeys, local passes, and exemptions. High CJV return trips could be attributed to the travel pattern of the daily commuters between Ramgarh and Ranchi. The toll frequencies for CJV have largely remained the same since FY23.

Figure 3.1: Ticket segmentation for CJV at TP1 Pundag

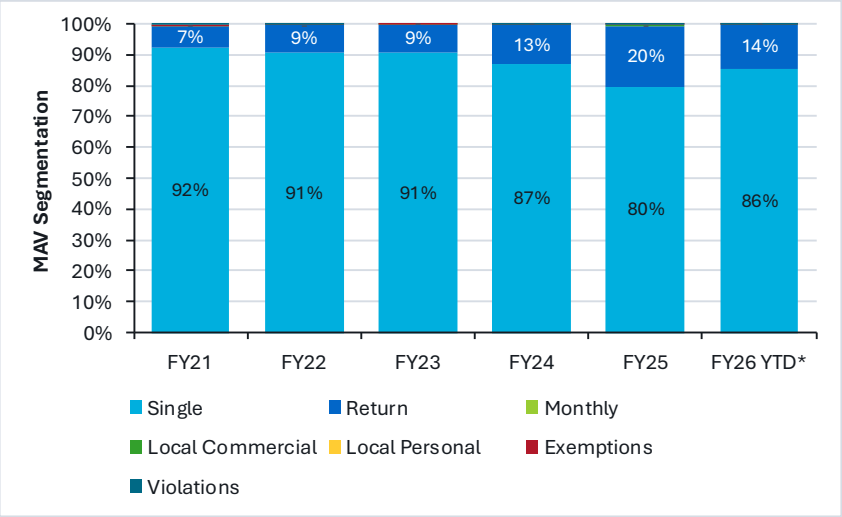


Source: Steer analysis of Client data, (FY21* From Oct-20 (last 12 days) to Mar-21; FY26YTD is for 5 months between April and September 2025

3.9 MAVs are observed to have high share of single tickets since FY21 which is aligned to observation of MAVs doing medium to long distance trips on the Asset. As discussed, and validated from the OD data, around 54% of the MAVs on the Asset travel >500 kms. A slight increase in return tickets is visible due to implementation of FASTag, allowing

trucks to avail return journey discounts if they return within 24 hrs. In addition to this, FY24 and FY25 has observed increase in return tickets primarily could be due to MAVs carrying construction material such as cement, sand, etc. for the ongoing construction of NH320. Ranchi, Ramgarh and Patna are the major trip generators for the MAV traffic

Figure 3.2: Ticket segmentation for MAV at TP1 Pundag



Source: Steer analysis of Client data, (FY21* From Oct-20 (last 12 days) to Mar-21; FY26YTD is for 5 months between April and September 2025

3.10 For FY26YTD, the MAV segmentation observes increase in the single tickets suggesting the decline of construction related traffic on the asset for NH320 alternate.

3.11 Refer below to the table for FY26YTD segmentation for LCV, Bus, 2A and 3A category:

Table 3.6: Ticket segmentation for LCV, Bus, 2A and 3A

Ticket Category	LCV	Bus	2A	3A
Single	42%	8%	64%	67%
Return	51%	91%	34%	30%
Local commercial	5%	1%	0%	4%
Exemption	1%	1%	2%	1%

Source: Steer analysis of Client data

Data Collection exercise

3.12 As mentioned previously, to validate and inform various inputs used in our forecasting, we undertook primary data collection on the Asset, comprising the surveys listed in the table below. Both OD surveys and TVC surveys were commissioned by Steer with a third party. OD data collection typically involves manual data entry by enumerators based on oral surveys with road users crossing toll plazas, which Steer also commissioned with a third party. TVC data collection involves video-graphic capture of traffic passing crossing the toll plazas, followed by manual counting.

Table 3.7: Data collection schedule

TP	7-day videography-based TVC			1-day OD survey			
	Start date	End date	Time (hrs)	Start date	Start time	End Date	End Time
TP1 Pundag	27 Jan 2021	02 Feb 2021	0000-2359	7 Jul 2023	0800 hours	8 Jul 2023	0800 hours

Source: Steer analysis

3.13 It should be noted that, in our experience, traffic on national highways shows variation across the week due to the economic activities surrounding each road. To derive a representative TVC count considering daily variation, three-day to seven-day traffic counts are generally recommended, and hence, to fully understand the impact of this weekly fluctuation on the Asset, we collected seven-day counts at the toll plaza.

Key findings of the TVC data analysis

WADT estimates

3.14 Taking an average of the seven-day TVC counts (27th Jan – 2nd Feb 2021, 0000-2359), we obtained the following weekly average daily traffic (WADT) for each toll plaza. This WADT excludes non-tollable vehicles such as tractors, two-wheelers, bullock-carts, etc., but includes officially exempt vehicles such as police cars, ambulances, emergency response vehicles, government vehicles and other vehicle types officially allowed as 'exempted' under the concession agreement.

Table 3.8: WADT from TVC counts

Toll Plaza	CJV	LCV	Mini LCV	Bus	2A	3A	MAV	Total
TP1 Pundag	7831	862	1,136	756	433	555	1,717	13,290

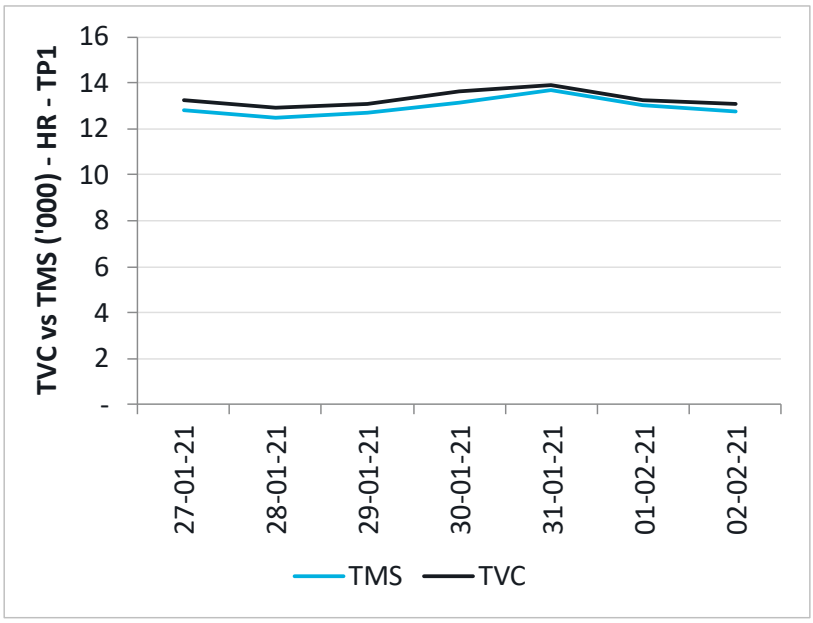
Source: Steer analysis of TVC data

TVC v/s TMS analysis

3.15 As we use the TMS data to estimate the base year AADT, we have used our TVC data to validate the TMS data on those days, as provided by the Client.

3.16 The following figures show the comparison between the daily traffic observed by TVC and TMS for the toll plaza.

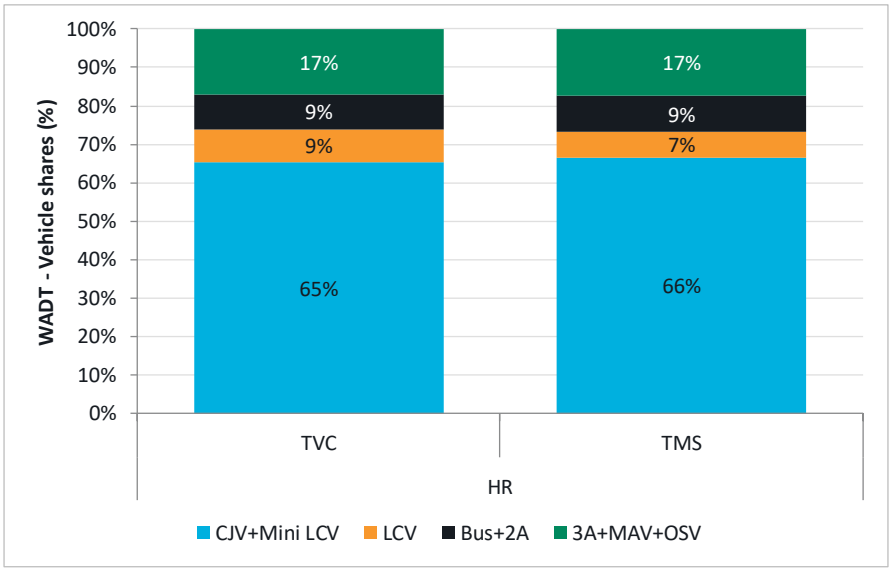
Figure 3.3: Comparison between TVC and TMS daily traffic data on TP1 Pundag



Source: Steer analysis of TVC and Client TMS data

3.17 The figure below compares the shares of vehicle types at both toll plazas observed by the TVC and TMS data. As can be seen, whilst the share of CJVs and 3A+MAV+OSV is marginally higher for TMS compared to TVC, it is equal for bus/2A and lower for LCV category. This difference can be attributed to common misclassification of vehicle categories.

Figure 3.4: Comparison between vehicle shares from TVC and TMS WADTs



Source: Steer analysis of TVC and Client TMS data

3.18 Considering the smaller variation between the TVC and TMS data for the largest revenue generator 3A+MAVs, and an overall match in the traffic volumes, our TVC-TMS analysis gives us confidence that the base year traffic calculated using the Client data forms a reliable base year traffic estimate.

Key findings of origin-destination analysis

Overview

3.19 Origin-destination (OD) analysis enables the understanding of the nature of traffic movement on the Asset. As mentioned previously, the OD analysis presented here has been based on the data collected on 7th-8th July 2023.

3.20 We have analysed the regional drivers of demand based on the following analyses:

- Zonal influence
- Commodity distribution
- Top OD pairs
- Trip length distribution

3.21 While zonal analysis and the list of top OD pairs help to understand 'where' people and goods travel, commodity distribution sheds light on 'what' goods get transported. Trip length distribution show 'how far' vehicles and people travel, and goods get transported. This set of analyses is generally used to estimate the key drivers of traffic and aid the making of informed forecasting assumptions around traffic demand elasticities, growth drivers and exogenous impacts.

Sample rates

3.22 Sample rates help understand the reliability of OD data. They are calculated by dividing OD samples captured by the traffic counts (based on the TMS data) during the same time period. The table below presents the sample rates for key vehicle type aggregations at the toll plaza.

Table 3.9: Sample rates for OD data

Vehicle type	TP1 Pundag
Passenger (CJV+Bus)	37%
Goods (LCV+2A+3A+MAV+OSV)	78%

Source: Steer analysis of OD data

Zone categories

3.23 To facilitate better interpretation of key regional drivers of traffic as determined by their OD zones, and influenced by various towns, cities, states and regions in the vicinity of the Asset, we have aggregated zonal data as described in the table below. The methodology behind this aggregation of zones may vary as per the characteristics displayed by the different Asset being studied.

Table 3.10: Zone aggregations for zonal influence analysis

Aggregate Zone	Description
Local	Local zones are those that fall on or very close to the Asset.
IAOI (Immediate Area of Influence)	IAOI zones are the locations which generate traffic and lie within approximately 75-150 km distance from the Asset.
Rest of State	Rest of the cities/Districts in the state that Asset lies in (other than Local/IAOI)

Aggregate Zone	Description
East & Northeast India	West Bengal, Jharkhand, and Northeast Indian states
Bihar	Bihar (Including Patna etc.)
Odisha	Delhi State, including New Delhi
South India	Tamil Nadu, Karnataka, Kerala, Andhra Pradesh
North India	Uttarakhand, Haryana, Punjab, Jammu and Kashmir
Central India	Madhya Pradesh, Chhattisgarh
West India	Rajasthan, Gujarat
Delhi	Delhi State, including New Delhi
Outside of India	Bangladesh, Nepal etc.

Source: Steer analysis

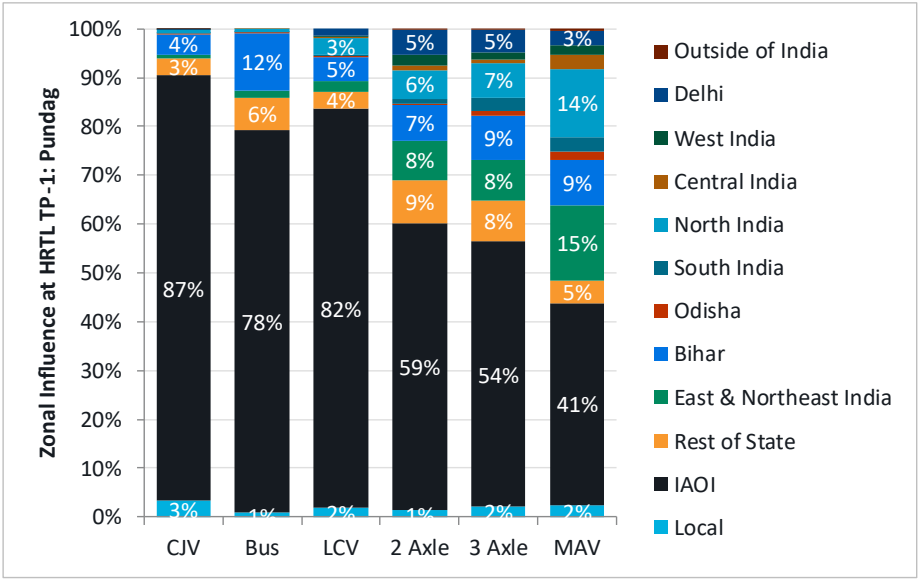
Zonal influence

3.24 The zonal influence is the contribution of the zone or the zonal aggregation to trips by a vehicle type. This section presents the zonal influence[11] at each toll plaza of each Asset, based on zonal aggregation listed in the previous sub-section. it should be noted that zonal influence is analysed on trip ends and not trips.

3.25 From the figures below, it can be observed that the plaza has high share of IAOI trips with 41% for MAVs and 87% for CJVs. 3A and MAV trips are comparable with higher proportion of local trips given the presence of coal mines and large-scale industries close to the Asset. We see a high share of Bihar and East and Northeast India in 2A, 3A and MAV zonal influence. The share of both North India as well as East and Northeast India rise to ~15% each for MAV. This shows that the Asset serves to connect the eastern part of the country to the northern parts. The neighbouring state of Bihar also serves as a major influence across vehicle categories with 5-9% of goods vehicles influenced by it.

[11] For example, if out of 100 trips at a toll plaza on an Asset, 10 trips are between Hyderabad and Delhi and 90 trips are between Hyderabad and Chennai, then zonal influence of Hyderabad would be 50% since one end of all trips are at Hyderabad. Likewise, zonal influence of Delhi and Chennai would be 5% and 45%, respectively.

Figure 3.5: Zonal influence at TP1 Pundag



Source: Steer analysis of OD data

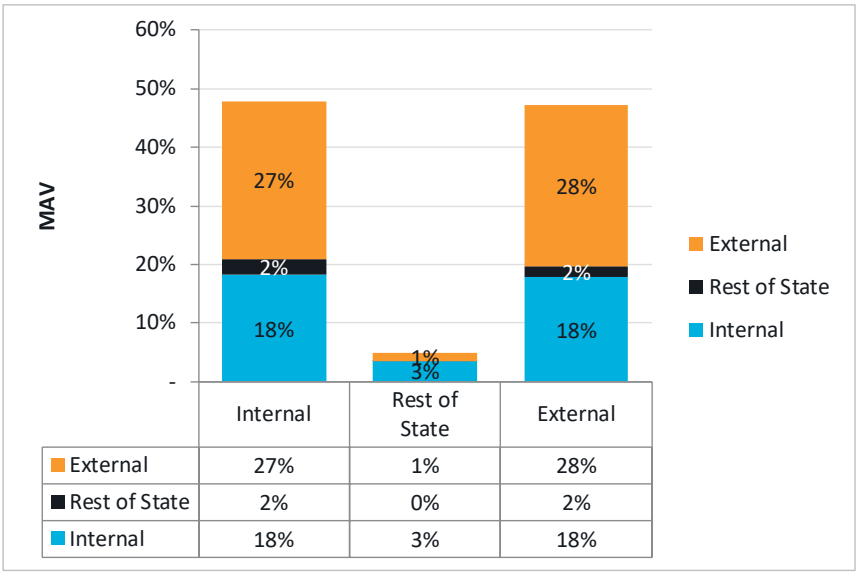
Internal External analysis

3.26 Internal-External analysis helps in identifying the trips which have both the origin and destination on the Asset (Internal-Internal or I-I), any one end on the Asset (Internal-External or I-E), or neither end on the Asset i.e., through trips (External-External or E-E). 'Internal' zones are those that were analysed as 'local' and 'IAOI' in the zonal influence analysis, i.e., lying on the Asset or in the "immediate area of influence", 'Rest of State' zones are those origins and destinations aggregated as "Rest of State" in the zonal analysis while 'External' zones are all other zones.

3.27 Figure 3.6 below show the distribution of trips based on these categories. Understandably, these reflect the observations seen in the zonal influence presented earlier, at a higher level of aggregation.

3.28 We see that I-I, I-E and, E-I trips dominate for MAV category suggesting Jharkhand as a significant origin of truck traffic. Presence of big industries near the Asset as well as in the state can be the reason behind this high number of Internal trips. This proportion also suggests that the trips are local in nature. 28% external-external trips validates the assertion that the Asset is a major connector for locations in East and North East of India with North India.

Figure 3.6 Internal-external distribution at TP1 Pundag



Source: Steer analysis of OD data

Commodity distribution

3.29 We have grouped various commodities into aggregate categories for ease of interpretation, as shown in the table below. The charts in the following sub-section present information in terms of aggregate commodity categories.

Table 3.11: Aggregate commodity categories

Commodity Description	Code	Combined codes used for charts
Agriculture Products / Cash crops (Wheat, Rice, Sugar cane,Maize etc.)	AGR	AGR
Cattle Food / Live Stock (sheep, ghoat, cow,cattle food etc)	LIV	
Perishable Items (Fruits, vegetables)	PER	GRO
Animal Products/Dairy/Eggs/Fish/Meat/Animals	DFM	
Groceries / Food items (Soap, Salt, Sugar, Pulses, Spices, Biscuits, bread,cool drinks, beer etc.)	GRO	
Building Material / Construction (Cement, Lime, Brick, fly ash, etc)	CNS	CNS
Sand/Clay	SND	
Stone (kota stone, marble, Granite, Aggregate stone etc.)	STN	
Ceramic	CRM	
Petroleum Products (Oil, LPG, CNG, etc.)	PET	PET
Chemicals / Fertilizers (Acids,Fertilizers etc.)	CHM	
Electrical/Manufacturing items (Electronic items, Medicine, Leather, Wine, Rubber/ Tyre, Plastics, Cloth, Paper etc.)	MAN	MAN

Commodity Description	Code	Combined codes used for charts
Raw Wood,Cork & Wood Products, Furn	WUD	
Machinery / Spare parts	MAC	
Automobiles (Finished products, auto parts, Car/bike manufacturing, New Chassis)	AUT	AUT
Basic / Fabricated Metals (Iron, Steel / Metal)	MET	MET
Mining Minerals (Coal, Gypsum, Cobalt etc.)	MIN	
Empty	EMT	EMT
Container	CTR	MSC
Miscellaneous (Parcel, Courier, House hold items etc.)	MSC	
Passengers	PAS	
Scrap	SCR	

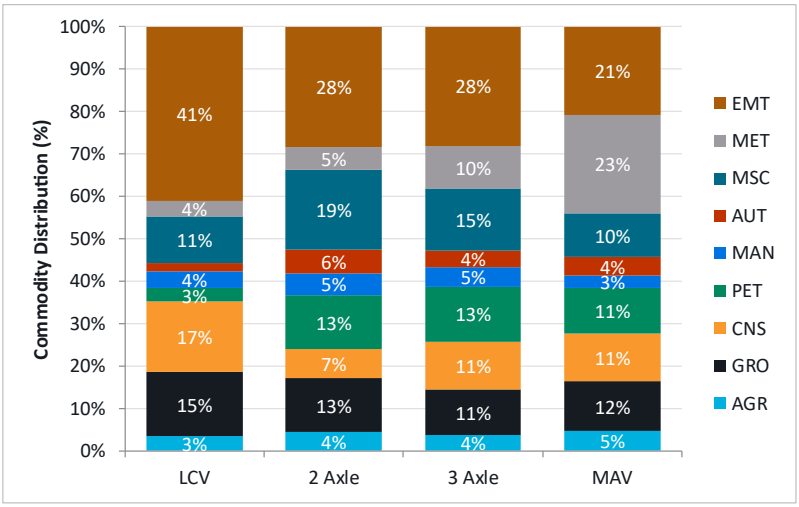
Source: Steer analysis

3.30 The following figures present the commodity distribution for goods vehicles at the toll plaza at the total level and also split by direction, towards Ranchi (Figure 3.9) and towards Hazaribagh (Figure 3.8). As observed during our site visit, a proportion of the vehicles were travelling empty. Those not empty, were carrying manufactured goods and related commodities (10-19%) across all goods vehicles.

3.31 For MAVs, metals and related commodities were observed with the highest share of 23%. Steel plants at Bokaro and Jamshedpur can be the main reason behind high shares. As the vehicle size decreases, the proportion of metal commodities being transported also decreases.

3.32 Agriculture, groceries and related commodities dominated the LCV category. Agricultural and groceries made up 18% of the total share. LCVs also carry 17% construction materials. The share of agriculture and grocery decreases slightly for 2A, 3A and MAV but hovers between 15 and 17%. 13% of 2A trucks and 13% of 3A trucks are also observed to transport petroleum products. The Asset also sees traffic of petroleum products, ~10% of MAV, in both directions carry these products.

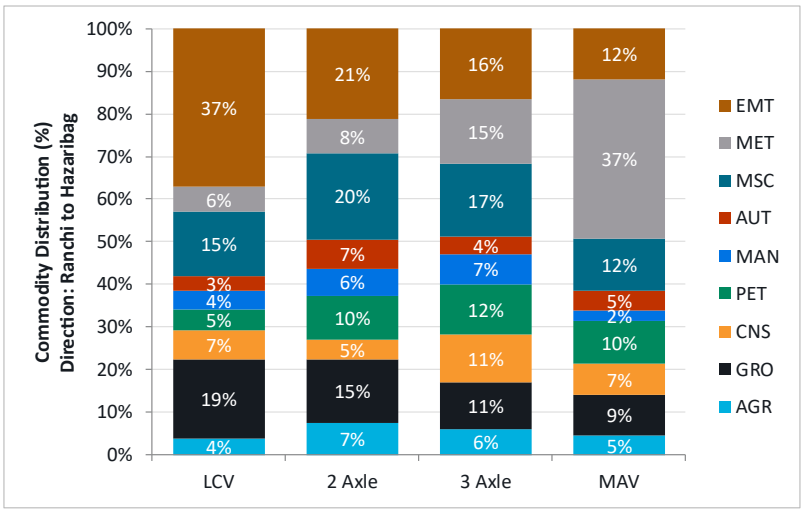
Figure 3.7: Commodity distribution at TP1 Pundag



Source: Steer analysis of OD data

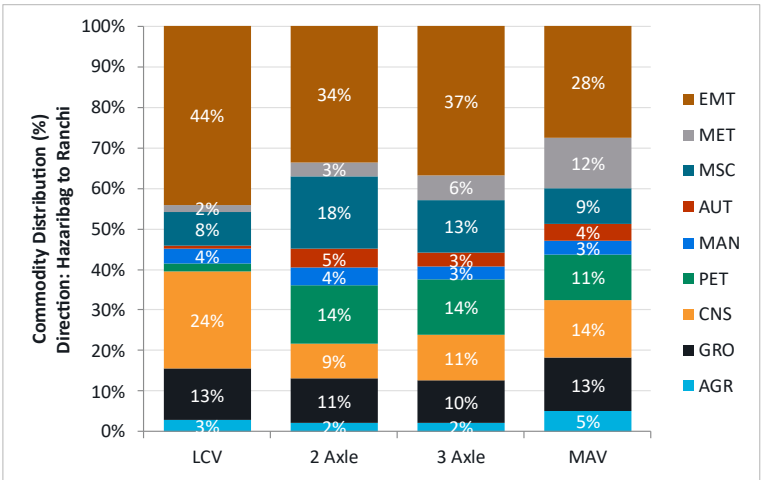
3.33 Considering these trends by direction (shown in the following two figures), a much greater share of vehicles is travelling empty towards Ranchi than those travelling in the opposite direction towards Hazaribagh. For the LCV category, the share of agriculture + groceries drops from 23% to 16% when the origin direction changes from Ranchi to Hazaribagh indicating the production/consumption balance between these two cities, Ranchi being much larger in population. Also, MAV have higher share of metals travelling towards Hazaribagh as areas such as Jamshedpur are located south of Ranchi. Manufactured commodities have slightly higher share towards Hazaribagh.

Figure 3.8: Commodity distribution at TP1 Pundag (Towards Hazaribagh)



Source: Steer analysis of OD data

Figure 3.9: Commodity distribution at TP1 Pundag (Towards Ranchi)



Source: Steer analysis of OD data

Trip length analysis

3.34 Trip-length distribution provides the distance-based profile of various vehicle types. This aids in validating assumptions around the share of macro-economic drivers, inputs from zonal influence and toll segmentation. For ease of interpretation, we have categorised distances into 5 groups – local (0-100 km), short-distance (100-300 km), medium-distance (300-500 km), long-distance (500-1000 km) and very-long-distance (+1,000 km). The trip distances were derived as driving distances from Google Distance Matrix Tool based on zonal coordinates for OD pairs.[12]

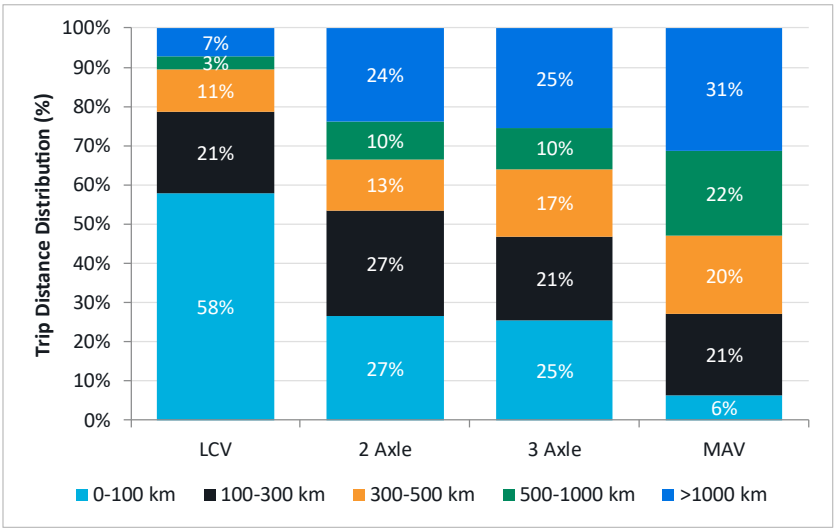
3.35 As observed in the Internal-External analysis, trips at the toll plaza are largely influenced by both internal or local zones and external zones. The same is validated by Figure 3.10, as the share of local and short-distance trips (up to 300 km) is considerably high in all the categories, ranging from 27% for MAVs to 79% for LCVs.

3.36 Medium-distanced trips gain greater share as the vehicles grow heavier from 11% in LCVs to 20% in MAVs. In terms of long-distance and very-long-distance trips (greater than 500 km), LCVs do not have any significant proportion, as has been seen across other Asset around the country. As expected, MAVs show a much higher share, up to 22% for 500-1000 km and 31% for >1000 km trips. These vehicles are travelling largely between East and North India.

3.37 We have seen in Figure 3.5 how the Asset serves to connect these two parts of the country; the trip length analysis also validates this assertion by showing such distribution. It is to be noted that for the category MAV, the proportions of E-E trips in Internal – External Analysis, East-Northeast and North India influence in Zonal Analysis, and >1000 km trips in the Trip Length Analysis are very similar, ranging around ~30%.

[12] Google Distance API is a tool that is available on a chargeable basis from Google Maps Platform. Link: https://developers.google.com/maps/documentation/distance-matrix/start. Travel distance and time information for driving/transit under various congestion scenarios can be extracted through this tool by using macro-enabled Excel, R, etc.

Figure 3.10: Trip length distribution at TP1 Pundag



Source: Steer analysis of OD data

Table 3.12: Average trip length (in km)

	LCV	2 Axle	3 Axle	MAV
Average trip length	234	545	574	768

Source: Steer analysis of OD data

Conclusions

3.38 In summary, as per the traffic volume data, CJVs contribute to the highest share in traffic around 67% followed by MAVs with 16% share. Even though CJVs make up for the highest share in traffic, MAVs are the biggest revenue contributor.

3.39 Both, CJV and MAV category vehicles, predominantly buy single tickets. However, with the onset of strict FASTag implementation, the share of single journeys has reduced across the categories as the share of return journey tickets increased especially in CJV's. For MAVs Single, tickets have remained dominant, holding a share of close to 90% across the months at the plaza. However, with the ongoing demand for construction material in the region with alternate NH320 construction driving daily local travel the share of return ticket in heavy vehicles has increased as witnessed in MAV in FY26YTD with 8% increase. The proportion of local personal tickets as well as exemptions has remained constant over the months. The Asset observes almost negligible non-paying traffic.

3.40 The TVC data shows minor variation on the TMS data, where at a total level, the TVC data is approximately 3% higher than the TMS data. However, the difference is negligible for the larger revenue generating categories (3A, MAV, and OSV combined), 0.4% at a total level. This gives us confidence that the base year traffic calculated using the Client data forms a reliable base year traffic estimate.

3.41 The OD analysis indicates that in terms of zonal influence, the Asset has high share of traffic originating/ending at IAOI areas and hence, the Asset serves largely local traffic, more so for CJVs: Local and IAOI zonal influence ranges from 43% for MAVs to 90% for CJVs. The key commodities transported on the Asset include minerals, groceries, and

manufactured products, which when combined, make up around 54% of the commodity share for MAV traffic. Agricultural products also contribute an average 9% share across all goods vehicle's categories.

3.42 When considering the internal and external distribution, it is observed that healthy mix of internal and external traffic is observed. I-I and I-E trips dominate for 3A and MAV categories suggesting Jharkhand as a significant origin of truck traffic. Since, majority of the traffic is attributed to Internal zones, it can be inferred that the traffic is greatly local in nature, and the growth of traffic is directly proportional to the growth of state. In terms of through traffic, 28% of MAVs have both ends of trip external to the Asset, in terms of trip length analysis this makes up for 31% of trips traveling >1000 km. These vehicles are travelling largely between East and North India.

3.43 In summary, analysing the vehicle share on the Asset and understanding the OD analysis, CJVs are the dominant vehicle class and as found by the zonal influence, internal-external and trip length analysis and are greatly contributing to the local traffic. Heavy goods vehicles, although accounting for 16% of the traffic, are the largest revenue generator for the Asset.

4 Socio economic context and traffic growth

Introduction

4.1 The growth of traffic on existing (brownfield) roads depends on, firstly, how fast the background travel demand grows (background growth); and secondly, how successful the roads are in attracting that traffic (traffic capture). Background travel demand is driven by the socio-economic conditions in the region where the Asset is located and the country. These include:

- Changes in factors such as population, economic growth (regional and national) and industrial production; and
- Other local factors such as strategic port growth, and growth in local industries near the Asset.

4.2 In turn, the change in the relative competitive position of the Asset (and thus of the traffic capture they can achieve) derives from how the relative offer for the roads changes, i.e. the service offered, and the tolls charged on the project roads, in comparison to that on competing roads; and whether any competing road facilities are planned.

4.3 In this chapter, we have assessed the trends of the above growth drivers, as indicators of the socio-economic conditions in the regions surrounding the Asset.

Population Growth

4.4 We have analysed the key socioeconomic drivers of the background traffic demand in Jharkhand state, where the Asset is located.

National level

4.5 The total population in India has grown at a Compound Annual Growth Rate (CAGR) of 1.5% since 2000, decreasing over the years, as shown in Table 4.1 below. The World Bank forecasts this growth to decrease to 0.6% CAGR by the 2030-45 period.

Table 4.1: CAGR of Population in India

Years	CAGR		
	Total Population (m)	Rural Population (m)	Urban Population (m)
1970 - 1985	2.3%	1.9%	3.8%
1985 - 2000	2.0%	1.7%	2.9%
2000 - 2015	1.5%	1.0%	2.6%
2015 – 2030*	1.0%	0.3%	2.3%

Years	CAGR		
	Total Population (m)	Rural Population (m)	Urban Population (m)
2030 – 2045*	0.6%	-0.3%	1.9%

Source: World Bank Data on Health Nutrition and Population Statistics, *forecast population growth

State level

4.6 Table 4.2 below shows the evolution of population in Jharkhand state compared to that of the country. Overall, as can be seen, the trend observed at the country level is also noticeable at the state level, namely, a move towards urban agglomeration with the growth in rural population being slower than that of urban population. Further, the state has grown at a higher rate than the country average, in the decade between 2001 and 2011.

Table 4.2: Population Growth in India (2012-2024)

State	2012 Population (m)	2024 Population (m)	CAGR (2012 – 2024)
Jharkhand	33.3	39.7	1.5%
India	1,210	1,395	1.2%

Source: Ministry of Statistics and Program Implementation estimates

4.7 Due to the complexities of the patterns in which urbanisation takes place, and the very dynamic nature of local population migration (which are very difficult to forecast with accuracy), we do not use population growth as a proxy for understanding future travel demand growth on the Asset. It has been included in this section simply to provide a socio-economic context of the trend in the region in which the Asset is located.

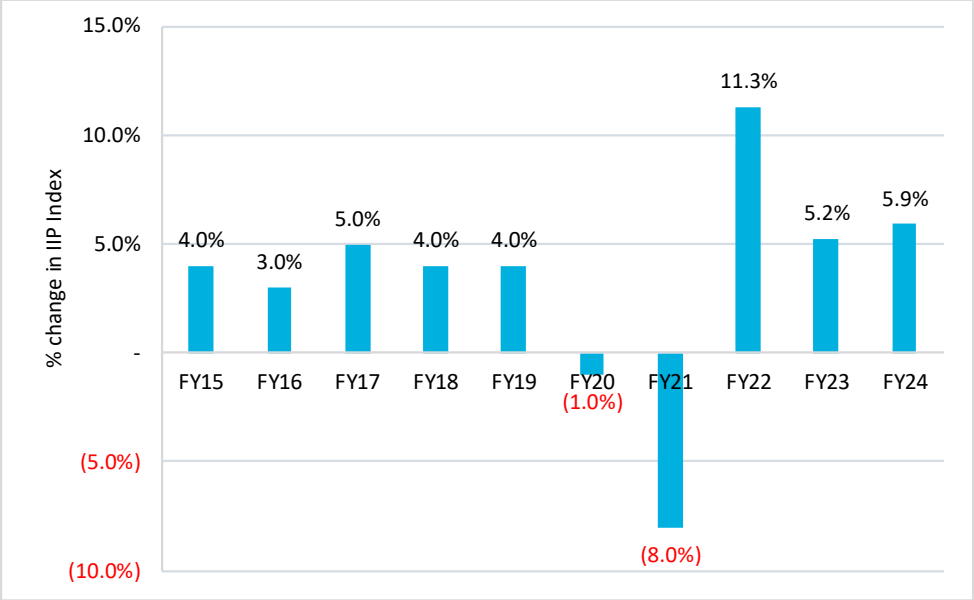
Economic Indicators

Industrial Production

4.8 The Index of Industrial Production (IIP) is a composite indicator that measures the short-term changes in the volume of production for a basket of industrial products. The IIP data tracks the manufacturing activity in different sectors of an economy, with mining, manufacturing, and electricity being the three broad sectors constituting the IIP.

4.9 As seen in Figure 4.1 below, at an annual level, national IIP was growing at an average of 4% per year over the period FY15-19, before the country underwent a liquidity crisis and experienced an overall economic slowdown in FY20. In the aftermath, IIP shrank by over 8% in FY21 due to a decline in economic activity in the wake of global lockdowns introduced to curb the Covid-19 pandemic. Since then, however, with the gradual opening up of economy, and recovery in consumption demand, industrial activity also recovered with time with IIP recording growth of 5% in FY23 and 6% in FY24.

Figure 4.1: Annual growth – Index of Industrial Production



Source: Ministry of Statistics and Program Implementation (MoSPI)

4.10 Since state-level IIP data is not as readily available as national level IIP, we have presented national IIP here to indicate nationwide activity in key industrial sectors like power, manufacturing, and mining, all of which influence long-distance commercial movements across the nation, and not unique to this asset. We however, do not use it to forecast future travel demand growth since long-term forecast for IIP is not available through official sources such as MOSPI, RBI or through multilateral organisations like WB, or the IMF.

Vehicle ownership

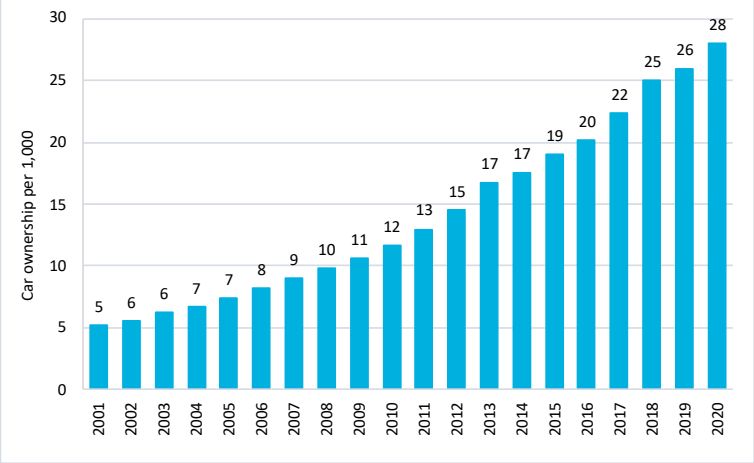
4.11 The gap in car ownership between India and developed nations remains substantial according to recent data. As of 2018, India had approximately 22 cars per 1,000 individuals, a fraction of the 980 cars per 1,000 individuals in the United States[13]. However, this pattern is changing with the increasing per capita income levels. As can be seen in Figure 4.2 below, between 2007-17, number of cars per 1,000 people has more than doubled and increased at a CAGR of about 11%.

4.12 Overall, India still stands at a very nascent stage in the vehicle saturation curve, offering huge potential for growth going forward. As the income per capita of India and the region itself grow further, we expect car ownership levels to increase. As per the India Energy Outlook (2015), car ownership is projected to grow steeply to 175 cars per 1,000 population by 2040 in India.[14]

[13] India has 22 cars per 1,000 individuals: Amitabh Kant, Auto News, ET Auto

[14] https://www.gita.org.in/Attachments/Reports/IndiaEnergyOutlook_WEO2015.pdf

Figure 4.2: Car Ownership in India per 1,000 population

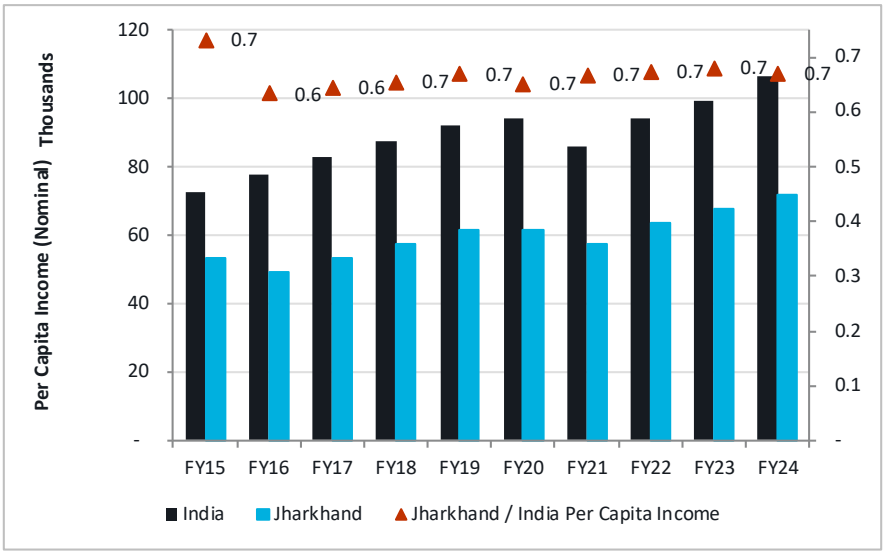


Source: International Energy Agency (IEA)

Per Capita Income (PCI)

4.13 The state of Jharkhand where the Asset lies has a per capita income significantly lower than that of India as a whole. It has been hovering at nearly 67% of the national average for the past few years (FY22-24). Thus, the state is at a very early stage of consumption curve. Going forward, we therefore expect local consumption to be strong which would drive the growth in both passenger and commercial traffic.

Figure 4.3: Per Capita Income



Source: Steer analysis of MoSPI data

4.14 However, given the difficulty in obtaining granular district level PCI data it is not advisable to use this as a growth driver. Also, the long-term forecast for PCI is not available we therefore refrain from using it to forecast traffic.

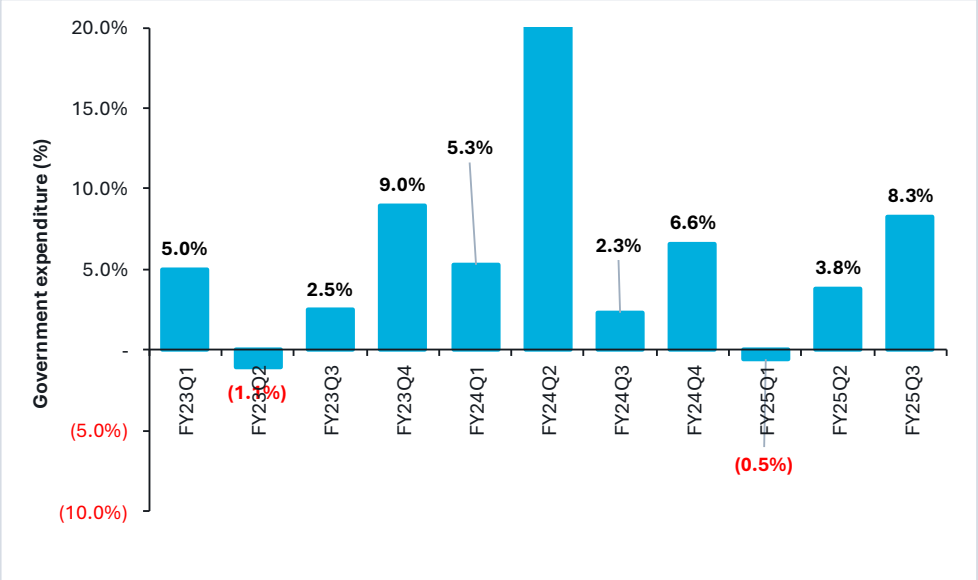
Economic growth

India's Performance

4.15 India's economic performance has shown signs of recovery in the recent months despite a slowdown experienced in H1FY25, as the latest Second Advance Estimates (SAE) released show the GDP growth in FY25 to be 6.5% - which is lower than the 9.2% growth observed in FY24 [15].

4.16 This deceleration can be attributed to a downturn in industrial output – specially manufacturing, electricity, and mining (as shown in Figure 4-6 below) – along with a decline in government capital expenditure in FY25 (presented in Figure 4-4 below). Contributing factors also include the impact of the 2024 general elections on central infrastructure spending, state-level fiscal constraints and rising global uncertainties such as Russia-Ukraine war and Gaza-Israel conflict which have had impact on global supply chains.

Figure 4-4: Government final consumption expenditure



Source: Steer Analysis of MOSPI data

4.17 Weaker industrial activity, as reflected in lower IIP (Figure 4-5) and GVA contribution (Figure 4-6), directly impact freight movement and commercial traffic volume growth across the country, including on the Asset. At the same time, muted government capex had an influence on both construction-linked activity and industrial output which impacted the commercial traffic growth carrying construction material and industrial goods. Export oriented corridors across the country have also seen muted traffic performance in FY25 due to global supply chain disruptions and the Red-Sea crisis, with exported commodities like manufactured goods, marble, and ceramics experiencing declines as well.

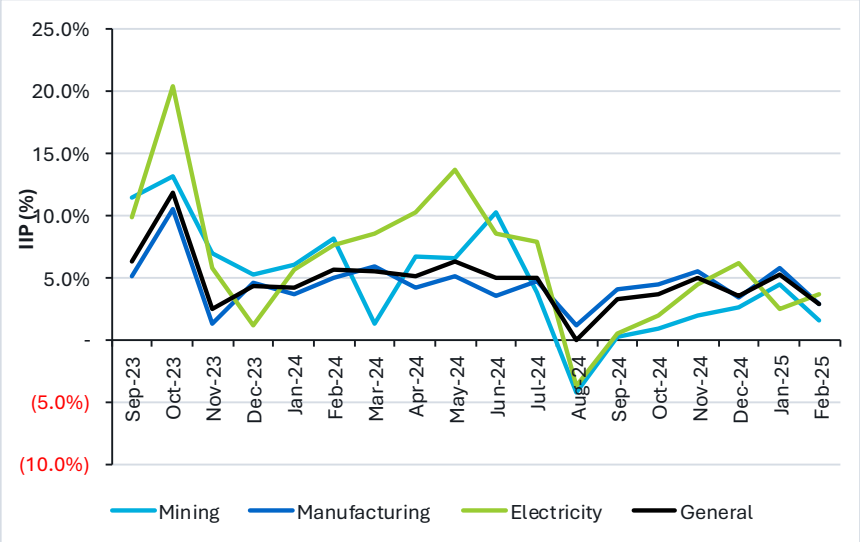
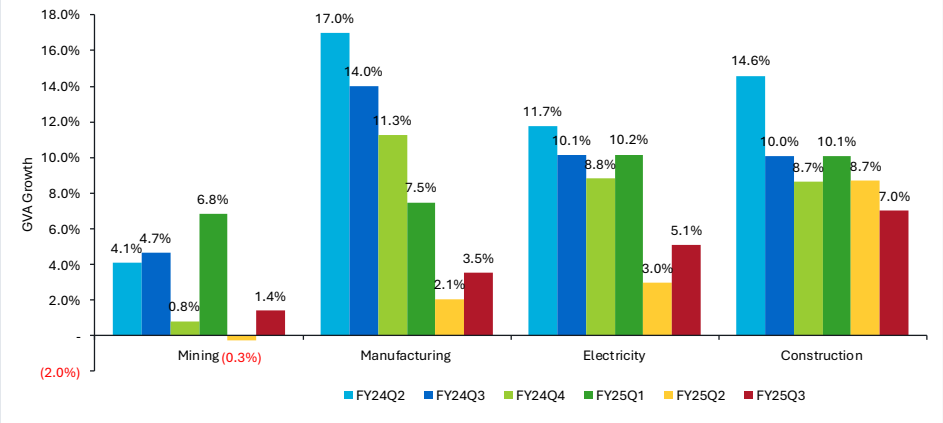
Figure 4-5: Month on Month IIP performance



Source: Steer Analysis of MOSPI data

Figure 4-6: Industrial components of GVA



Source: Steer Analysis of MOSPI data

GDP and GSDP Growth

4.18 Over the period FY12-FY24, the Indian economy grew at a CAGR of approximately 6% aided by growth in the tertiary sector which grew at a CAGR of 6.9% over the same period

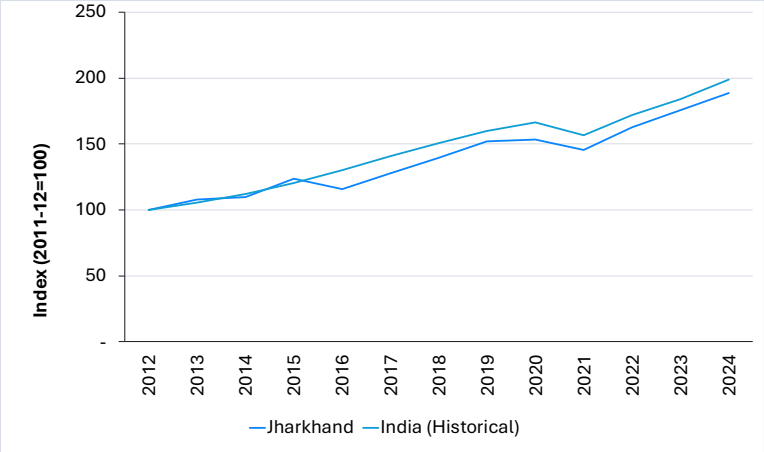
4.19 The Asset lies in the state of Jharkhand. Jharkhand is one of the richest mineral zones in the country with a share of around 40% of India's mineral resources and occupies the first position in the presence of coal reserves.[16] Due to its large mineral reserves, mining and mineral extraction are the major industries driving the state economy. The state houses the country's oldest and one of the largest steel plants, operated by the Tata Steel, in Jamshedpur. Another important steel plant at Bokaro, operated by Steel Authority of India Limited (SAIL) is also present in the state of Jharkhand. Since Jharkhand's economy is largely dependent upon the mining, the state GSDP growth rate fell rapidly after growing by over 10% in FY15 to -6% in FY16, with the ban on illegal mining. Jharkhand's GSDP (at

[16] Minerals | Government of Jharkhand State

constant prices) grew at a CAGR of 5.4% between FY12-24 and contributed 1.6% to India's GDP in FY24.

4.20 Figure 4.7 below illustrates the evolution of the GSDP of Jharkhand with the national GDP between FY12-24.

Figure 4.7: Evolution of Jharkhand's GSDP and the National GDP



Source: Steer Analysis of MOSPI data

4.21 The official historical GDP and GSDP data for India are released by the Ministry of Statistics and Program Implementation (MoSPI). The GDP forecasts for India are available from various reliable sources such as Oxford Economics and Consensus Economics[17], but state-specific GSDP forecasts are not published by any such sources. To derive state GSDP forecasts, we rely on past trends of the relationship between GDP and GSDP and develop GSDP forecasts as a function of our assumed GDP forecasts[18].

4.22 For any indicator to be used as a growth driver to forecast traffic, a reliable source of historical and forecast data availability for that indicator is the key requirement. Of the key socioeconomic indicators discussed above, GDP was assessed to be the only growth driver for which reliable data is available both in terms of historical and forecast data. Therefore, to forecast traffic, we use GDP/GSDP as our key growth drivers.

Forecasts for growth drivers

4.23 Following the discussion in Chapter 4 on the nature of economic activity in the state of Jharkhand, in this section, we describe the assumptions in relation to forecasts of the key macro-economic drivers of traffic growth on the Asset.

4.24 We have based our forecasts of the GSDP of Jharkhand based on the forecasts of GDP as provided by the Client.

[17] **Consensus Economics - Economic Forecasts and Indicators**

[18] Assuming that the historical long-term relationship between GSDP and GDP sustains over the short-term, we project future growth in GSDP as a function of our GDP growth forecast. We taper the relationship of GSDP growth to converge to GDP growth gradually over the long-term.

National GDP

4.25 After the last period of economic slowdown in FY11-12, the country experienced an economic downturn again in late FY19 with FY20 having reported a GDP growth of 4% (relative to an average growth rate of 7% per year between FY13 and FY19). India's GDP growth declined as domestic investment and consumption demand were already under stress because of the liquidity crunch before Covid-19. Other factors that contributed to the economic slowdown included reduced growth rates in automobile sales and production, liquidity crunch in credit markets and rising number of Non-Performing Assets (NPAs) within the banking sector, as well as lower manufacturing production and lower rural consumption.[19]

4.26 The Covid19 outbreak had a significant impact on the Indian economy during the first two quarters of FY21 as government mandated lockdowns across the country effectively stalled economic activity and growth. The growth momentum eventually picked up in Q3 of FY21, with a sharp rebound in the economy in FY22 (GDP recorded 9.7% growth over FY21) and has since observed a consistent growth of 7.6% in FY23, 9.2% in FY24 (as per the SAE) before slowing down to 6.5% in FY25 due to several domestic and external factors.

4.27 Figure 4.8 below shows Client-provided GDP projections for India. The forecast provided expects the Indian GDP to grow at 6.5% between FY25-FY27[20] and gradually tapering down to 5.2% by FY50. The India GDP forecast is broadly in line with other independent forecasts available from reliable sources such as IMF, World Bank and RBI[21] in the short term Going forward, the forecast provided expects the Indian GDP to grow at an average of 6.5% between FY25-FY27, 5.9% between FY31-FY40 and gradually tapering down to 4.9% by FY51, end of concession.

4.28 Since Jharkhand is largely a mineral and manufacturing (iron & steel) dependent economy, the state is largely impacted by the fluctuations in these sectors. During the last decade, the mining industry was badly impacted by bans, new mining policy and change in steel and iron market scenario due to overall economic fluctuations. However, going forward, we expect as Jharkhand grows its economy stabilises overtime with magnitude of these cycles coming down.

5 FY26 Base year AADT and Traffic growth Analysis

Introduction

5.1 In this section, we present our approach, assumptions, and estimates for base year AADT and background traffic growth for each vehicle category on the Asset.

5.2 Traffic growth is commonly related to a variety of macro-economic and industry- or commodity-specific factors (hereafter referred to as 'traffic growth drivers'). These growth drivers are typically identified from the results of the OD data analysis and the site visits that help us appreciate the nature of traffic movement – 'what' travels 'where' and 'why'.

5.3 While comprehensive historical data on the asset is not available, we have access to six years of records. Despite some inconsistencies, this dataset provides a reasonable foundation for analysis. As a result, statistical methods to estimate background growth relationships could not be applied. Instead, we conducted a benchmarking exercise, supported by trip length and origin-destination (OD) analysis, to derive elasticity estimates. These are discussed in detail below.

FY26 Base year AADT estimates

5.4 The base year is the year on which long-term background forecast growth rates are applied to derive year-wise average annual daily traffic (AADT) estimates for forecast years. This is therefore an important aspect of our forecasting approach as traffic and ultimately revenue forecasts for future years are built on top of the base year traffic estimate. We have used FY26 as the base year for AADT estimates for the forecast years.

5.5 As described previously in Chapter 3; to establish the base year (FY26) traffic position, we utilized information from various sources – including from the Client and our context knowledge, to assess a reasonable demand on the corridor.

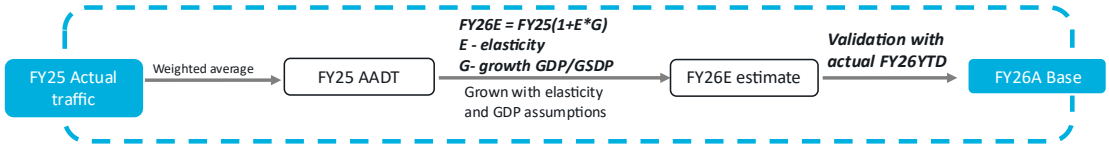
Methodology

5.6 The base traffic for FY26 has been estimated utilizing the actual 12 months of FY25. The weighted average of the actual FY25 traffic (April to March) was taken to arrive at annual FY25 AADT. Using elasticity-based growth assumptions GSDP or GDP we arrived at estimated FY26 (FY26E).

5.7 The monthly profile of the FY26E AADT was then compared to the actual traffic observed in the six months (April 2025 to September 2025) of FY26 (FY26YTD). The Adopted FY26 AADT (FY26A) is derived by making necessary adjustments to FY25E to reflect the outturn traffic in FY26YTD (adjusted for seasonality).

5.8 The methodology is represented using the below schematic:

Figure 5.1: FY25 Base Estimation methodology



Source: Steer Analysis

5.9 The two key inputs to estimate the base year FY26 traffic are FY25 traffic and seasonality correction factor (SCF).

Seasonal Correction Factors

5.10 Traffic on any Asset varies on a month-on-month level. Such variations maybe due to monsoons (typically Jul to Sept) or due to festivals in the region. For e.g. It is observed that typically the truck traffic during the first half of the financial year (April-September) is generally lower than the annual average, mainly because of peak summer season followed by monsoons affecting the freight movement patterns in large parts of the country in the July-September period. In addition to these there may be other seasonal variations specific to the Asset.

5.11 To normalise for these variations across the year to provide an AADT estimate, Seasonality Correction Factors (SCF) are used. SCFs are estimated to convert the monthly traffic numbers to an AADT level while accounting for seasonal variation due to local/national festivals, weather changes and/or temporary external impacts. These are typically estimated using historical data for each plaza and vehicle category over multiple years. An SCF >1 means that the traffic for the month is lower than the annual average and vice-versa.

5.12 Historical traffic data was available for all toll vehicle categories starting October 2020 up-to January 2025. Therefore, in absence of longer-term historical data for the Asset where FY21 and FY22 are COVID-19 impacted years, we assume FY24 and FY25 to be the normal year which is considered for FY26 base year estimation.

5.13 Table 5.1 presents the FY24 and FY25 average SCF used to estimate the AADT for the Asset's Toll Plaza:

Table 5.1: SCF Values for TP1 Pundag

Vehicle Category	Apr	May	Jun	Jul	Aug	Sep	Oct	Nov	Dec	Jan	Feb	Mar
CJV	1.04	1.02	0.97	1.08	1.12	1.13	1.08	0.96	0.92	0.98	0.88	0.95
LCV	0.85	1.30	0.96	1.05	1.09	1.07	1.03	1.04	0.93	0.96	1.09	0.92
Bus	1.09	1.10	1.03	1.04	1.15	1.07	1.01	0.92	0.90	1.02	0.89	0.89
2A	1.06	0.98	1.04	1.04	1.02	1.01	1.03	1.09	1.04	1.08	0.87	0.90
3A	1.01	1.01	1.02	1.05	1.14	1.11	1.02	1.00	0.94	0.97	0.89	0.93
MAV	1.08	1.09	1.07	1.10	1.09	1.07	1.04	0.99	0.92	0.92	0.88	0.90

Source: Steer analysis based on FY24 and FY25 data

Adopted base estimates

6.1 Based on the above methodology and inputs, the adopted base for the Asset has been shown below:

Table 5.2: Adopted base estimates: TP1 Pundag

	FY25	FY26YTD	FY26A	FY26A vs FY25
CJV	10,928	11,949	12,551	14.5%
LCV	363	390	386	6.4%
Bus	797	896	964	20.8%
2A	1,023	1,026	1,041	2.4%
3A	555	553	580	0.6%
MAV	2,557	2,687	2,894	14.0%
OSV	2	2	2	-
Total	**16,224**	**17,503**	**18,417**	**13.5%**
PCUs	**28,245**	**30,099**	**31,805**	**12.6%**

Source: Steer analysis: FY25 actual full year, FY26YTD includes 6 months of FY26, FY26A is adopted base for FY26.

5.14 As seen from Table 5.2, there is estimated to be a 12.5% PCU growth in the adopted FY26 base (FY26A) over FY25. All vehicle categories showcase healthy growth over FY25.

5.15 In the case of LCV and Bus we observe a change in the categorization of minibuses. Prior to FY25 the classification was based on "Gross Vehicle Weight" which has been changed to passenger-based system resulting in tolling of minibuses into the bus category.

5.16 The continued high growth in both PCU and across vehicle categories is driven by temporary traffic shift to the Asset post Jun'23 with the construction on Ormanjhi-Gola-Bokaro section of NH 320. However, we believe this shift is temporary and not a part of the Asset's traffic hence, necessary adjustments in forecast and segmentation are made as reflected later in this report.

Estimation of background elasticities

Overview

5.17 For brownfield Asset, where sufficient historical traffic evolution is available, it is common practice to use regression model analysis to determine the relationship, expressed as elasticity, between traffic growth and key socioeconomic drivers. This relationship is then applied to assumptions of future socio-economic evolution to estimate future traffic growth.

5.18 As for the Asset under consideration, a consistent historical trend was not available. Therefore, we undertook a benchmark to estimate our forecast elasticities, Sources used included our understanding of the Asset, the elasticities used during the bid for TOT3 package by the client and the subsequent lender study that was undertaken by the Client. We have also undertaken a regional benchmarking against Asset having similar traffic profiles, which give us reasonable confidence the relationships proposed.

5.19 In terms of selection of growth drivers for vehicle types, in general we have assumed state GDP as the key driving factor for the passenger traffic given this traffic is generally driven by the local economies of the cities and state containing the Asset. The heavier commercial vehicles generally ply long-distance, and the underlying growth is governed by the general economies of several states or nation as whole.

5.20 The below table presents the growth drivers identified to model the forecast background traffic growth rates.

Table 5.3: Identified growth drivers to model traffic growth

Vehicle type	GDP India	GSDP Jharkhand
Car		100%
LCV		100%
Bus		100%
2A	100%	
3A	100%	
MAV	100%	

Source: Steer

5.21 Further to developing estimates for FY25 AADT, the Asset has operational history between FY22 and FY25, proving us four years of traffic growth on the Asset. The table below summarises the volume growth across each of the vehicle categories. For this comparison we have normalised the FY22 AADT for COVID19 by adopting seasonally corrected H2FY22 as the FY22 normalised (FY22N), as can be seen in Table 5.4 below

Table 5.4: Passenger and Commercial growth with normalised FY22

	FY22N	FY23	FY24	FY25	FY26A	FY22N-26 CAGR
CJV	9,618	8,935	9,879	10,928	12,551	6.9%
LCV	511	445	488	363	386	(6.8%)
Bus	570	583	594	797	964	14.0%
2A	629	681	845	1,023	1,041	13.4%
3A	460	480	529	555	580	6.0%
MAV	1,639	1,690	1,950	2,557	2,894	15.3%
OSV	1	2	2	2	2	-
Total	**13,427**	**12,814**	**14,287**	**16,224**	**18,417**	**8.2%**
PCUs	**21,545**	**21,209**	**23,876**	**28,245**	**31,805**	**10.2%**
Passenger	10,187	9,518	10,472	11,725	13,514	7.3%
Commercial	2,728	2,850	3,324	4,135	4,515	13.4%

Source: Steer Analysis; Note; Passenger includes CJV and Bus traffic whereas Commercial includes 2A/3A/MAV traffic

5.22 Asset is growing at 10% from FY22N to FY26 at the PCU level, whereas commercial and passenger is growing at a CAGR of 13.4% and 7.3% respectively. Passenger traffic, which includes CJV and buses, is projected based on the state's GSDP, as the growth is driven by the regional local economy. Meanwhile, commercial traffic (2A/3A/MAV) is growing in relation to GDP, as the Asset lies on the NH20 corridor, which primarily facilitates north-south movement between Bihar and southern West Bengal and south. Any growth observed on the Asset is influenced by regions along this route.

5.23 The sections below detail out the reasoning for selection of respective growth driver(s) for each vehicle category.

5.24 It must be understood that, in recent historical traffic performance across national highway corridors, a notable trend has emerged: there is a discernible shift in axle preference towards 2As and MAVs, resulting in a dampening effect on the growth of 3As. This trend is mirrored in the Assets FY24 and FY25 performance as well. Consequent of these evolving axle preferences, it has been assumed that the relationship between 3As and GDP will be relatively muted, whereas 2As and MAVs are expected to grow more closely in line with the country's GDP.

Table 5.5: Elasticity Recommendations for the Asset

Vehicle Category	Proposed	Growth Driver	Comments
CJV	1.0	Jharkhand GSDP	The cars predominantly commute between Ranchi, Ramgarh, Hazaribagh and other local destinations along the Asset. With the increase in urbanisation and trip generators along the Asset, cars are expected to grow faster in the near future, therefore we have assumed a 1 relationship to GSDP for cars.
Mini LCV	0.6	Jharkhand GSDP	As discussed in chapter 3, the trip lengths for Mini LCV and LCV category (up to 70%) are predominantly short distance <300Km and caters to local demand. Hence, elasticity of 0.6 is assumed which is higher than LCV's.
Buses	0.5	Jharkhand GSDP	Buses are local and interstate, around 85% of the buses have one end of their trip in Jharkhand, while 10% of trip have one end of their trip in Bihar. It seems that buses currently are serving local intercity demand. As these cities grow, the buses are also expected to respond to the increasing demand however only at a 0.3 relationship to GSDP.
LCV	0.4	Jharkhand GSDP	As discussed in chapter 3, the trip lengths of LCV and 2A category (up to 70%) are predominantly short distance <300Km. Which confirms the understanding that the movements cater to local demand. Considering the above observations, and our experience across other toll roads in the region, we believe that elasticities of 0.4 and 0.7 with respect to state GSDP and GDP for LCV and 2As resp. are considered reasonable.
2A	0.7	GDP India	
3A	0.3	GDP India	The Asset observes traffic between Haryana, Rajasthan, Jamshedpur, as well as the Bokaro Steel Plant. 55% of all MAVs cover >300 Kms, and ~30% cover >1000 Kms journeys. The long-distance character, in addition to the proximity of steel plants catering to nation-wide demand shape the critical link between the Asset and the national economy. We assume this relationship to influence a healthy growth profile for traffic on the Asset in the future as well.
MAV	0.9	GDP India

6 Forecasts: Network overlays and forecasts

Introduction

6.1 Following the discussion on our forecast of background growth rates in the previous chapter, this chapter first covers the potential network impacts on traffic growth on the Asset. Thereafter, we present our assumptions around toll segmentation, trip factors and evolution of toll rates for the forecast period which are used to forecast revenues as derived from forecast traffic. In the final section, this chapter summarises traffic growth rates for the forecast years.

Analysis of potential network/developmental impacts

6.2 The section below details the impacts which we believe would affect traffic on the Asset during the concession period. As discussed in earlier Chapters, to assess the impacts on the Asset, whether positive or negative, we have studied developments (alternate roads, feeder roads and regulatory) in the surrounding road network.

Four laning of NH320

6.3 The alternate route NH320 for Dhanbad-Bokaro-Ranchi trips, passing via Ormanjhi and Gola is currently undergoing upgradation to 4 lanes. This stretch is being upgraded in two packages with construction starting in late June 2023 with a 24-month duration of work. Given the ongoing construction on the highway, there has been a ban on heavy commercial vehicles using the road, which has led to a proportion of the traffic to divert to the Asset Road. This diverted traffic is expected to return to the alternate road when the construction activity is completed, and the ban is lifted.[22]

6.4 Basis the conversations with the toll plaza manager and secondary research, the construction of Gola – Oramanjhi stretch is expected to be completed by Jun'25. However, the remaining stretch of the NH320 i.e Gola – Bokaro is expected to be completed by Dec'25. Given this impact we expect a large share of the additional traffic to shift back to NH320 starting FY27, with full impact realising by FY28.

6.5 The following table shows the extent of the impact of the completion of four laning on NH320.

[22] ttps://www.livehindustan.com/jharkhand/bokaro/story-villagers-protest-nh-320-road-construction-in-lepo-mauja-demand-underpass-201741001945578.html

Varanasi Kolkata Expressway

6.6 The NHAI is currently building a greenfield 4/6 lane access-controlled expressway between Varanasi and Kolkata with a spur to Kharagpur. So far 13 packages for the Asset in states of Uttar Pradesh, Bihar and Jharkhand have been awarded. The above-mentioned packages were awarded in March 2023. The expressway section in Jharkhand covers 203km across four districts, costing around Rs 10,000 crore. Designed for speeds of 120 km/hour, it includes measures like wildlife underpasses and interchanges. This expressway will intersect with the Asset at Bongabar, north of Ramgarh. It is expected to have some impact on the Asset once complete, as it can act as a feeder route providing access to Ranchi and Hazaribagh from the west and east respectively. Its impact is illustrated in the below table.

Source: Steer analysis

6 laning LOS improvement

6.7 As per the concession agreement as soon as the Asset hits 40,000 PCU's the Asset is eligible for capacity augmentation. The PCU level need to be maintained above the 40,000 levels for three consecutive years, and two years will be earmarked for DPR preparation. After that a three-year period is factored in for construction, during which the Year one of construction toll rates will be maintained at 75% and will remain flat at 75% for the duration of construction. After the construction is over the toll rates will be calculated as normal, as they should have been in that year.

6.8 On the Asset, it is expected based on our forecasts that traffic volumes will go beyond the 40,000 PCUs mark in FY35, thus breaching the Level of Service requirements set out in the concession agreement. We expect the level of service on the Asset to improve post capacity augmentation by FY43. To calculate this impact, we have employed a GJC based approach.

6.9 A comparison of generalised journey costs (GJC) provides how different elements of cost and time affect traffic. This comparison was done for both light and heavy vehicles. Lower GJCs correspond to higher induced traffic. Based on Steer's studies and research in India, we have found that for every 1% reduction in the GJCs, the traffic increases by a factor of 0.3. We then applied the difference of GJCs to the elasticity of 0.3 to get net influence on the traffic.

6.10 The improvement in GJC is translated into the impact on that share of local + IAOI OD movements using a linear inverse relationship. Therefore, the impact of improvement in level of service is applied on the corresponding shares of traffic, which were extracted from OD data.

6.11 The table below shows the extent of the LOS impact and the expected timelines of the impact on the Asset.

Table 6.3: Impact of 6 laning LOS improvement

Revenue forecasting assumptions

6.12 To forecast the revenues for a particular financial year, the traffic forecast for each vehicle type is converted into tickets sold, which is then multiplied with the corresponding toll rate, which grows over the years as defined in the Concession Agreement. While "trip factors" provide the conversion factor to the former, i.e., traffic (trips) to tickets sold, "toll segmentation" provides the latter i.e., the breakup of trips paying each ticket type. This section discusses assumptions related to trip factors, toll segmentation and toll rates for the forecast period.

Toll segmentation

6.13 The Ministry of Road Transport & Highways has finalized a compensation formula for existing toll concessionaires to offset revenue loss from the Annual Pass scheme for non-commercial vehicles.[23]

6.14 Across multiple assets, the number of passes sold has observed to be rising on a day-to-day basis, indicating an early adoption among frequent users since its introduction on 15th August 2025 till 30th September 2025, and a corresponding decline in other ticket categories mainly in the single and return categories. The evolution of proportion of users using the annual pass up to September 2025 is presented below:

	15th to 31st Aug	1st to 15th Sept	16th to 30th Sept
% CJV using Annual pass	5%	9%	11%

6.15 CJV Segmentation for FY26 has been developed using the pre annual pass segmentation till 14th August 2025, and daily Annual Pass transaction data from 15th August 2025 till 30th September 2025. Post September 2025, a gradual ramp up is assumed such that they form a large portion of the CJV trips by the end of FY26. This corresponds to a reduction in a proportionate decrease in single and return trips. For FY27 and beyond, we have assumed the share of annual pass trips to be in line with that observed at the end of March 2026, by when we believe the distribution of ticket categories in CJVs should stabilise.

6.16 In FY26, the share of CJVs using the Annual Pass is projected at **10%** (on an annual basis) with a March 2026 estimate of around **24**%, which from FY27, expected to stabilize at March'26 levels.

Table 6.4: Toll segmentation for FY26 onwards

Ticket type	CJV FY26	CJV FY27	Mini LCV	LCV	Bus	2A	3A	MAV
Single	25%	20%	29%	42%	8%	64%	67%	86%
Return	47%	37%	53%	51%	91%	34%	30%	14%

Annual Pass	10%	24%	-	-	-	-	-	-

Source: Steer analysis of Client TMS data; ticket segmentation for all vehicle categories other than CJVs are from FY26 onwards

6.17 The Annual pass compensation is separately calculated using the formula prescribed by NHAI in the same circular. Following Table 6.5 presents the Annual pass compensation computed for the toll plaza.

Table 6.5: Annual pass compensation for CJVs (in Crore)

Toll Plaza	FY26	FY28	FY33	FY38	FY43	FY51
Pundag	4.5	12.1	21.1	35.6	60.3	130.5

Source: Steer Analysis

Trip factors

6.18 Trip factors are used to calculate the revenue for the trips made on passes such as return, local personal, monthly passes. The trip factors assumed are based on the latest FY26YTD data available and listed in the table below:

Table 6.6: Trip factors at TP1 Pundag

Forecast	CJV/ Mini LCV	LCV	Bus	2A	3A	MAV
Single	1	1	1	1	1	1
Return	2	2	2	2	2	2
Monthly	14	46	50	50	45	45
Local commercial	1	17	1	1	1	1
Local Personal	20	-	-	-	-	-

Source: Steer analysis of Client TMS data

Toll evolution

6.19 Based on the concession agreement and the gazetted toll notification, we understand that base toll rates increase every year (revision month is April) based on WPI-linked inflation. These are rounded up to the nearest five to estimate the final toll rate charged to users.

6.20 We have used actual toll rates from the FY26 toll notifications and FY26 WPI to validate the modelling of future toll evolution. Increase in WPI was calculated based on the

Client's WPI forecasts, as shown in the table below. These forecasts provided by the Client expect the Indian WPI to grow at an average of 4.2% between FY25-FY51. The WPI forecasts available from other independent forecasting agencies may vary from this assumption and could be lower or higher than that provided by the client.

Table 6.7: WPI growth forecast assumptions

Financial year	WPI growth (%)
FY26	2.57%
FY27	2.4%
FY28	5.0%
FY29	5.1%
FY30	4.9%
FY31	4.4%
FY32 onwards	4.1%

Source: Client inputs used for WPI FY27 onwards.

Revenue reconciliation

6.21 As part of validating the data provided by the Client, as well as our assumptions around toll calculations, we have reconciled the actual reported revenue on a daily level for the Asset. To reconcile we have used the FY26YTD segmentation, FY26YTD AADT and compared it with the reported revenue for the year. The exercise was undertaken at an annual level. The comparison, as shown in the table below, depicts the modelled revenue and the reported revenue and the difference between the two is within 0.1%, this validates the assumptions around segmentation and trip factors used for estimating forecasting revenue.

Table 6.8: FY25 Revenue Reconciliation AADC (INR lakhs/daily)

Modelled	Reported	Delta
33.88	33.9	(0.01%)

Source: Steer comparison between modelled and reported revenue

Traffic and Revenue forecasts

6.22 Based on the traffic and revenue-related forecast assumptions discussed above, we have modelled the traffic and revenue forecasts for the forecast period for the Asset. The table below presents the AADT/PCU and revenue forecast growth rates and CAGRs on this Asset. Further, Appendix B presents the AADT and revenues for the forecast period.

Table 6.9: Final traffic forecast for TP1 Pundag

Source: Steer analysis

6.23 As presented in the tables above, traffic CAGRs (PCUs) for the traffic forecast (with impacts) on the Asset over the concession period is around 4.4% and corresponding revenue CAGR is around 9%. This growth is majorly driven by both CJVs and MAVs, as discussed in the historical section, this Asset connects major urban settlements of Hazaribagh, Ramgarh and Ranchi and because of which CJVs on the Asset are expected to grow with increasing per capita income levels of the region and are expected to grow at a healthy rate for a longer period, given the low car ownership levels in the state. While for the strong growth of the MAVs can be attributed to the growing industrial landscape in the vicinity of the Asset which includes steel plants, power plants and mining activities.

Target revenues and modification of concession period

6.24 As per the concession agreement, the target revenue should be 15.80 Cr for the month of March 2030 first calculation of target revenue and 38.02 Cr for the month of March 2040 for the second calculation of target revenue. The traffic sampling will be undertaken for a continuous period of 7 days during anytime within 15 days prior to the date on the specified year, previous year and following year. The average thereof will be deemed as 'actual revenue.'

6.25 If the target revenue falls short or exceeds by 20% and 30% for extensions 1 and 2 respectively, the concession period shall be deemed to be modified using the laid-out conditions in the concession agreement. The table below presents the summary of the analysis.

Table 6.13: Target Revenues for Extension 1

Asset	Target Month	Target Revenue	Estimated Revenue			Average Revenue	Variation (%)
		INR Cr	2029	2030	2031		
HR	Mar-30	15.80	15.00	16.53	18.20	16.58	4.9%

Source: Steer analysis

Table 6.14: Target Revenues for Extension 2

Asset	Target Month	Target Revenue	Estimated Revenue			Average Revenue	Variation (%)
		INR Cr	2039	2040	2041		
HR	Mar-40	38.02	28.84	30.25	31.72	30.27	(20.4%)

Source: Steer analysis

6.26 We have used the average AADT forecast for target year, previous year and following year as a proxy for 'actual traffic.' We have forecast seasonality of March month to adjust for seasonal trends and arrive at March traffic from AADT traffic, which is then segmented according to the forecast toll segmentation and trip factors and multiplied with respective estimated toll rates to get to a monthly revenue collection.

6.27 As seen from the table above, the difference lies within the 20% and 30% thresholds, no modification of concession period is expected on the Asset.

Upside and Downside cases

Upside and Downside scenario assumptions

6.28 We have developed our base case scenario considering a balanced view on the risks associated with input assumptions around GDP growth and traffic growth elasticities. There is always a risk that the outturn values of these inputs will vary as compared to the assumptions taken due to exogenous impacts, e.g. GDP growth could be influenced both positively and negatively by the impact of monsoons, export-import balances, political changes etc.

6.29 Similarly, traffic growth elasticities could be influenced by increased efficiencies achieved by technology, large shifts in commodity prices globally, changes in local manufacturing practices. However, at this stage we consider that the base case represents a central case scenario given the risks of variation of input assumptions.

6.30 To account for the possible variations in the growth drivers, we are also presenting an Upside (optimistic) and a Downside (pessimistic) scenario. These scenarios are defined by the following variations from the base assumptions:

Table 6.15: Summary of Macro-economic Assumptions for upside and downside cases

Input	Upside	Downside
Macro Assumptions		
GDP/GSDP	+1% every year	-1% every year
WPI	+1% every year	-1% every year
Elasticities	+ 10%	- 10%

Source: Steer analysis

6.31 Further, network developments are highly dependent on governmental directions, policies, legal and financial measure which might result in early or delayed completion of developments. Therefore, we have included an Upside (optimistic) and a Downside (pessimistic) case. However, at this stage, we consider that the base case represents a central case scenario given the risks of variation of input assumptions.

Impacts-Upside Case

6.32 The upside case impacts included in forecasts are summarised in below.

Table 6.16: Summary of impacts on the Assets

Development	Year of impact	Change in impact w.r.t base case	Magnitude of impact
6 laning LOS improvement	FY40	+25% of base case	CJV: 2.9%

Development	Year of impact	Change in impact w.r.t base case	Magnitude of impact
			LCV: 2.5% 2A: 2.0% 3A: 1.7% MAV: 1.1%

Varanasi Kolkata Expressway	FY28* (25%) FY30 – Full Impact		CJV: 0.75% 2A: 0.75% MAV: 0.75%

Source: Steer analysis; * Same as base case timeline

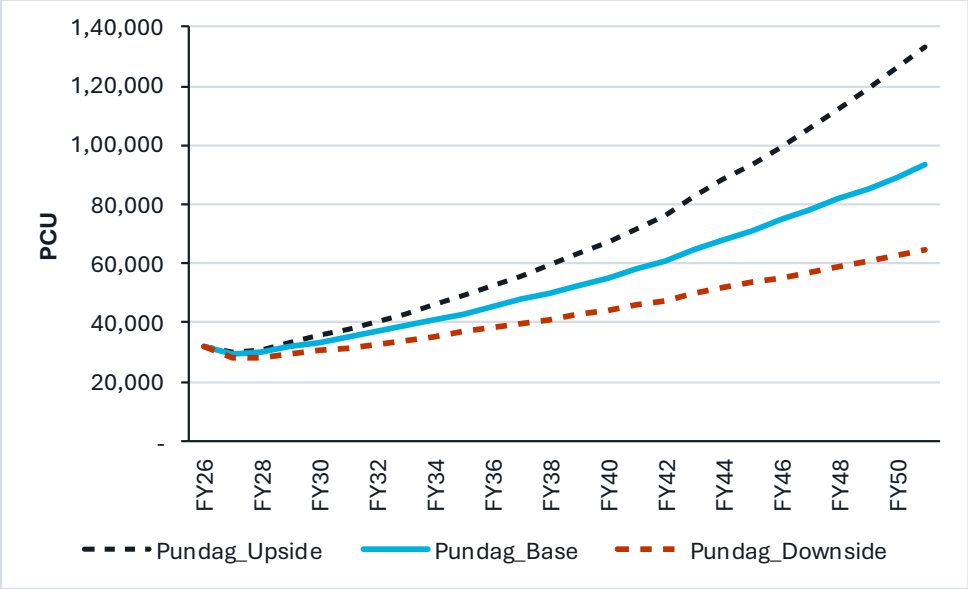
6.34 Based on the above assumptions for upside and downside scenarios, the following table summarizes the upside potential and downside risks associated with the PCU and the revenue for Pundag toll plaza at the end of the concession i.e. FY51.

Table 6.18: Upside potential and Downside PCU scenario – FY51

Toll Plaza	Upside Potential	Downside Risk
Pundag	43.1%	(30.3%)

Source: Steer Analysis of client data

Figure 6.2: Long term PCU forecasts for Pundag TP including upside and downside scenario



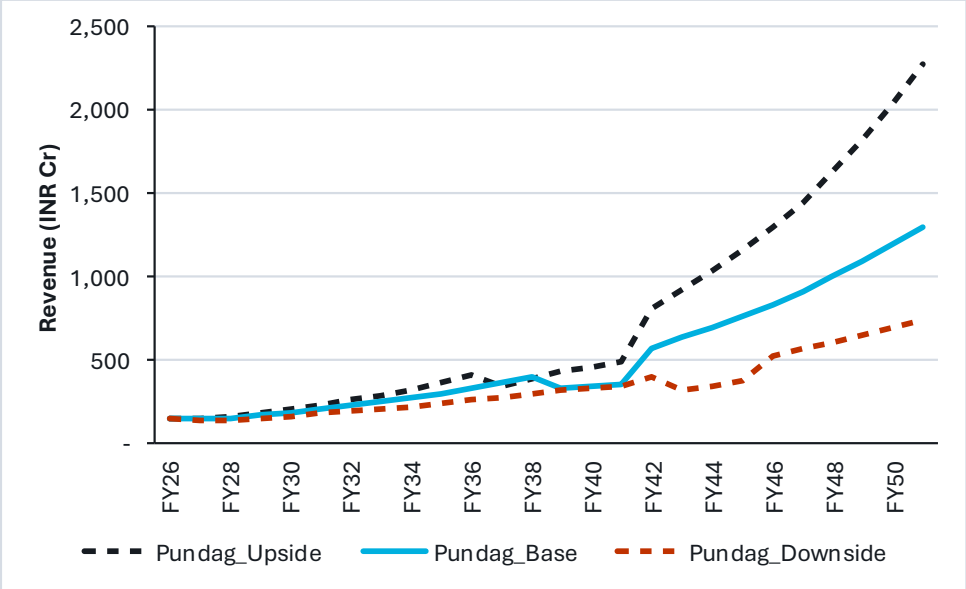
Source: Steer Analysis

Table 6.19: Upside potential and Downside Revenue scenario – FY51

Toll Plaza	Upside Potential	Downside Risk
Pundag	75.2%	(42.9%)

Source: Steer Analysis of client data

Figure 6.3: Long term Revenue forecasts for Pundag TP including upside and downside scenario



Source: Steer Analysis

6.35 Revenue projections exhibit variability in both the upside and downside cases, driven by fluctuations in macro-economic factors such as WPI, GDP/GSDP, elasticities and the network impacts.

Summary outlook

6.36 Passenger movement on the Asset is largely local in nature, connecting the cities of Ranchi to Patratu, Ramgarh, Hazaribagh over the short distance and northern regions of Delhi NCR, Uttar Pradesh, Patna, Gaya and Barhi to Jamshedpur, Rourkela, and further southern cities. Cars, the dominating vehicle category on the Asset, are expected to see a healthy growth on the Asset following the overall behavioural shift of users away from public transport.

6.37 Groceries, agricultural and manufacturing goods being transported form a part of essential commodities and are expected to show a healthy growth in the future years as well. Since the Asset is located in mineral and steel rich state of Jharkhand with numerous mines in the vicinity, the Asset is bound to grow with the growth of industrial sector as well as the overall growth of the country.

6.38 The strategic importance and geographic location of this Asset, connecting the key movement between north India and Bihar to the Jharkhand, Odisha, and West Bengal, is expected to continue driving a healthy traffic growth rate in the forecast years.

6.39 The MAV traffic on the Asset is largely influenced by the mineral industries along its alignment, which also contributes to the overall stability of MAV volumes across different time periods. Recent evidence from various industry players suggests a rebound in Steel production and consumption led by economic activity and urbanization which is expected to boost demand for steel in India to between 240-260 million metric tons by 2035. [24] [25] These factors support the growth prospects of the Steel related industry and traffic in the future. Beyond these natural growth factors, higher than usual growth was observed on Asset due to the work on the alternate NH320 as mentioned earlier.

6.40 Our findings and estimates in this report are based on our understanding from the site visit, analysis of primary data available both from surveys and the toll management system (both historical and current), macroeconomic assumptions prescribed by Client, feedback from Client meetings and secondary publicly available data. There can be both positive and negative risks associated with assumptions and the forecasts using them as summarised below.

6.41 Overall, we see a positive outlook for the region and the Asset, given that it serves major urban centres of Ranchi, Jamshedpur, Bokaro, Patna, Bhubaneswar, and Rourkela. The underlying growth drivers of the corridor are strong and are expected to deliver long term sustained growth driven by the industrial growth in the state backed by the potential of significant mining and mineral resources in the region.

Appendices

A Top 10 OD Pairs

A.1 B.1 Further to the OD analysis presented in Chapter 3 this appendix presents the top 10 OD pairs at each toll plaza. Please see this data for both CJVs and MAVs and OSVs combined below

TP1 Pundag

Table A.1: CJV top 10 OD pair shares at TP1 Pundag

	OD Pair	Share
1.	Ranchi-Ramgarh	34%
2.	Hazaribagh-Ranchi	24%
3.	Ranchi-Patna	10%
4.	Ormanjhi-Ramgarh	4%
5.	Ranchi-Bokaro	3%
6.	Ranchi-Kodarma	2%
7.	Ranchi-Dhanbad	2%
8.	Ranchi-Gola	2%
9.	Ranchi-Giridih	1%
10.	Ranchi-Chatra	1%

Table A.2: MAV and OSV top 10 OD pair shares at TP1 Pundag

	OD Pair	Share
1.	Ranchi-Patna	8%
2.	Ranchi-Ramgarh	4%
3.	Ranchi-Uttar Pradesh	4%
4.	Hazaribagh-Ranchi	3%
5.	Uttar Pradesh-Odisha	3%
6.	Ranchi-Bokaro	3%
7.	Patna-Odisha	3%
8.	Patna-Jamshedpur	3%
9.	Ranchi-Dhanbad	2%
10.	Jamshedpur-Uttar Pradesh	2%

B Data Collection Exercise

B.1 In order to validate and inform various inputs used in our forecasting, we undertook primary data collection on the Asset. OD survey data was collected on behalf of the Client, TVC surveys were commissioned by Steer with a third party. OD data collection typically involves manual data entry by enumerators based on oral surveys with road users crossing toll plazas. TVC data collection involves video-graphic capture of traffic passing crossing the toll plazas, followed by manual counting.

7-day TVC Count

Table B.1: TVC counts at TP1

Date	CJV	Mini LCV	LCV	Bus	2 Axle	3 Axle	MAV	Total

Disclaimer

This report has been produced for the sole benefit of Cube Highways Pvt. Ltd. This Report (the "Report") is confidential and disclosed only for information purposes, and it may not be relied upon by any party other than the Client or a Party to a Reliance Letter, and Steer: a) makes no warranty, expressed or implied, with respect to the use of any information or methods disclosed in this Report; and b) assumes no liability with respect to the use of any information or methods disclosed in this document. Any such party by its acceptance or use of this Report releases Steer from any liability for direct, indirect, consequential, or special loss or damage whether arising in contract, warranty, express or implied, tort or otherwise.

The Report is based on standard professional efforts, and information available to us at the time the review took place and is subject to time and budget constraints of the Report's scope of work. This Report, information and statements contained herein, are all based on third party data provided to us, or sourced by us, and Steer has not sought to establish the reliability of the data, except as specifically stated in the Report. Steer bears no responsibility for the results of any actions taken based on third-party data.

Certain forward-looking statements in the Report are estimates based on interpretations or assessments of information available at the time of writing. The Report is thus to be viewed as an assessment that is time-relevant, specifically referring to conditions at the time of the review. Steer undertakes no obligation to update the Report for any reason.

While the estimates contained in the Report are not precise forecasts, they do represent, in our view a reasonable expectation of the future, based on information we have been provided with or sourced. However, the estimates necessarily rely on numerous assumptions and judgements, and circumstances may occur over the timeframe of the project that go counter to these assumptions and judgements and that affect the project's realized revenues. Actual events may differ from those assumed, and events are subject to change. Therefore, Steer makes or provides no warranty, whether implied or otherwise, as to the accuracy of forward-looking information presented. Further, it is important to note that forecasts presented represent long-term growth profiles; the results for individual time periods may vary from forecasted values.

Traffic Consultant developed the relationships in the models used to produce the forecasts for the projects based on data available through September 2025. This report does not consider variations in traffic performance due to changing macro and force majeure events such (but not limited to) as global wars, economic uncertainty (high inflation, global recession), and changes in the regulatory environment. The situation remains dynamic and is subject to significant change in the short and medium term. In this challenging context, Traffic Consultant has produced base forecasts with a view on a possible scenario for the traffic forecasts. However, it is important to note that this is only one view, and there continues to remain uncertainty as to the short-term, intermediate, or prolonged effects of and responses to such macro-economic/force majeure events. As a result, no assurance can be provided by Traffic Consultant that the scenarios and assumptions Traffic Consultant has identified will prove to be accurate. Given the uncertainty inherent in this scenario, Traffic Consultant advises that all readers of the Report consider the Report in the context of their own assessment of the impact of such events.

TO THE FULLEST EXTENT PERMITTED BY APPLICABLE LAW, THE LIABILITY OF THE TRAFFIC CONSULTANT FOR ANY LOSS, DAMAGE, COST OR EXPENSE SUFFERED OR INCURRED BY ALL PERSONS OR ENTITIES AND FOR ALL CLAIMS RESPECTING ITS WORK PERFORMED IN CONNECTION WITH THE ISSUE OR THE REPORTS IS HEREBY LIMITED IN THE AGGREGATE TO THE AMOUNT OF FEES ACTUALLY PAID BY THE CLIENT TO THE TRAFFIC CONSULTANT IN RESPECT OF THE REPORTS AND CONNECTED SERVICES.

WADT	Weekly average daily traffic
YTD	Year to Date

1 Introduction

The assignment

1.1 The Cube Highways Fund Advisors Private Limited (the "Client") has commissioned Steer Davies Gleave India Private Limited ("Steer") for a traffic due diligence to be carried out on the Jhansi Lalitpur Tollway Road (hereafter called "Asset"). This report forms part of the annual fair market valuation (FMV) undertaken as part of the "Transit 10 project". This report presents a full update of the traffic and revenue forecasts based on recent network developments, actual traffic data available up to September 2025 and latest macro-economic assumptions.

1.2 The Asset Jhansi-Lalitpur consists of two toll road sections, each of which has a special purpose vehicle (SPV). For this report, we hereafter call the two SPVs together as a single Asset and the toll plazas on each section as TP1-2.

- Jhansi Lalitpur Tollways Limited: JLTL-: TP1 – Babina
- Jhansi Vigakhet Tollways Limited: JVTL-: TP2 - Vigakhet

1.3 Our scope of work for the traffic and revenue forecasting process includes:

Table 1-1: Scope of work and sources of data

Scope of work	Data source
• Review of historical Traffic Management System (TMS) data, Vendor reports and documents	• Provided by client for the period between Oct'20 and Sept'25
• Historical analysis and forecasts for baseline growth, including; — Background growth, and — Seasonality trends	• Historical data provided by the Client and benchmarking using plazas in the vicinity or of similar nature of the Asset has been done wherever sufficient data was unavailable.
• Validation of revenue reported in FY26YTD	• TMS data provided by Client • Revenue reconciliation using toll plaza traffic and ticket type data to calculate revenue and reconciling it with toll plaza reported revenue
• Origin Destination (OD) analysis to understand growth drivers: — Zonal influence and Top OD pairs — Commodity distribution — Trip Length Distribution	• Origin Destination (OD) surveys undertaken by Steer. The surveys were undertaken in 2024 on TP1 and in 2021 at TP2.
• Analysis of upcoming network improvements and other	• Secondary research and our in-house experience of working in the vicinity of the Asset. Impact analysis to be conducted by

Scope of work	Data source
developments, that may have future impacts on traffic	Steer based on Generalised Journey Cost spreadsheet-based analysis
• Historical revenue analysis and forecasts for revenue estimation, including — Toll segmentation and trip factors, — Overloading shares	• Calculated from historical data provided by Client
• Final traffic growth forecasts including baseline growth rates and potential future impacts	• Elasticity based base growth and potential impacts from secondary research, Asset historical traffic performance and Steer's in-house experience of working on toll roads on the corridor
• Toll revenue estimation for the entire concession, including toll evolution	• Toll evolution based on latest toll notification published by National Highway Authority of India (NHAI); and latest Wholesale Price Index (WPI) trends as shared by the client

Our Approach

1.4 Our analysis follows well-established practices for forecasting ongoing traffic growth on an existing/brownfield Asset.

1.5 The analysis has focused on two sets of issues, namely:

- understanding the traffic that is currently using the Asset; and
- identifying how and why that traffic is likely to change in the future.

1.6 To understand the current traffic on the Asset, we have analysed traffic data from multiple independent sources as given below:

- Client-provided secondary data, including:
- TMS data from October 2020 to September 2025
- Concession agreement and toll notifications for FY25 and FY26
- Previous studies related to traffic and revenue
- Steer-commissioned OD survey on 30th January to 31st January 2024 and TVC survey from 29th January to 31st January 2024 on TP1 Babina toll plaza as a part of study in earlier commission to validate any change in the growth drivers and travel pattern. Similarly, as a part our earlier commission Steer-commissioned TVC counts on TP2 Vigakhet from 18th January to 24th January 2021 and OD survey from 19th January to 20th January 2021.
- We undertook revenue reconciliation for FY26YTD, by building up revenue from the traffic reported by each of the toll plaza and subsequently match it to the reported revenue for FY26YTD using the prevalent toll rates and reported segmentation/toll-frequencies for FY26, this is a key part of our analysis to validate the segmentation/toll-frequency assumptions and the Annual Average Daily Traffic (AADT) reported for each of the toll plaza.

1.7 The estimation of future traffic demand on the Asset was undertaken through:

- Estimating FY26 base year position. The FY25 AADT was calculated using the monthly traffic data for FY25. The annual FY25 AADT was then grown with elasticity linked GDP/GSDP growth to arrive at the FY26 expected traffic. To determine the adopted FY26, the expected FY26 traffic was validated against the six months of actual traffic (Apr-Sept) and necessary adjustments were made where required.
- Secondary research to understand plans for new developments and progress of ongoing developments on the Asset.
- Steer independent primary surveys and site visits to validate our network and contextual understanding.
- Developing a bespoke growth model for each Asset/plaza/toll class to forecast year-on-year traffic growth from FY26 to the end of concession period.
- Investigating the elasticity of historical traffic growth compared to state (GSDP) and national (GDP) growth. Where historical data is limited, we have benchmarked the Asset against our Steer knowledge base (e.g., similar Asset types in the same state or on the same corridor), to derive appropriate elasticities.
- Applying our elasticities to independent GDP forecasts as provided by client.
- Identifying and analysing the potential impacts of any relevant changes to the competitive position of each Asset – these include impacts of changes to road network including expressways and opening of competitive modes of travel.
- Identifying and analysing any other potential impacts to traffic and revenue on each Asset – these include axle load norms, axle shift for heavy goods, FASTag implementation.
- Considering changes in trends of segmentation over time and making suggestions for changes in exemptions in the future
- Preparing traffic and revenue forecast for the Asset for the complete length of the concession. We have developed a set of forecasting assumptions for three scenarios: a base case and upside and downside scenarios.

Contents of this report

1.8 The report has been divided into the following chapters, including Chapter 1 providing an introduction:

- Chapter 1 introduces the methodology and approach to undertake the traffic and revenue due diligence;
- Chapter 2 describes the key characteristics of the Asset and its surrounding road network, primarily based on site visits;
- Chapter 3 summarises the current and historical traffic on the Asset, including results from the TMS, TVC and OD analyses;
- Chapter 4 presents the socio-economic context of the corridor and region/state containing the Asset, along with our approach and results on estimating background traffic demand growth; and
- Chapter 5 presents our baseline year forecast and summarises our results on estimating background traffic demand growth
- Chapter 6 summarises our assessment of network impacts and presents concession traffic and revenue forecasts for the Asset along with the assumptions for upside and downside cases

2 The Asset

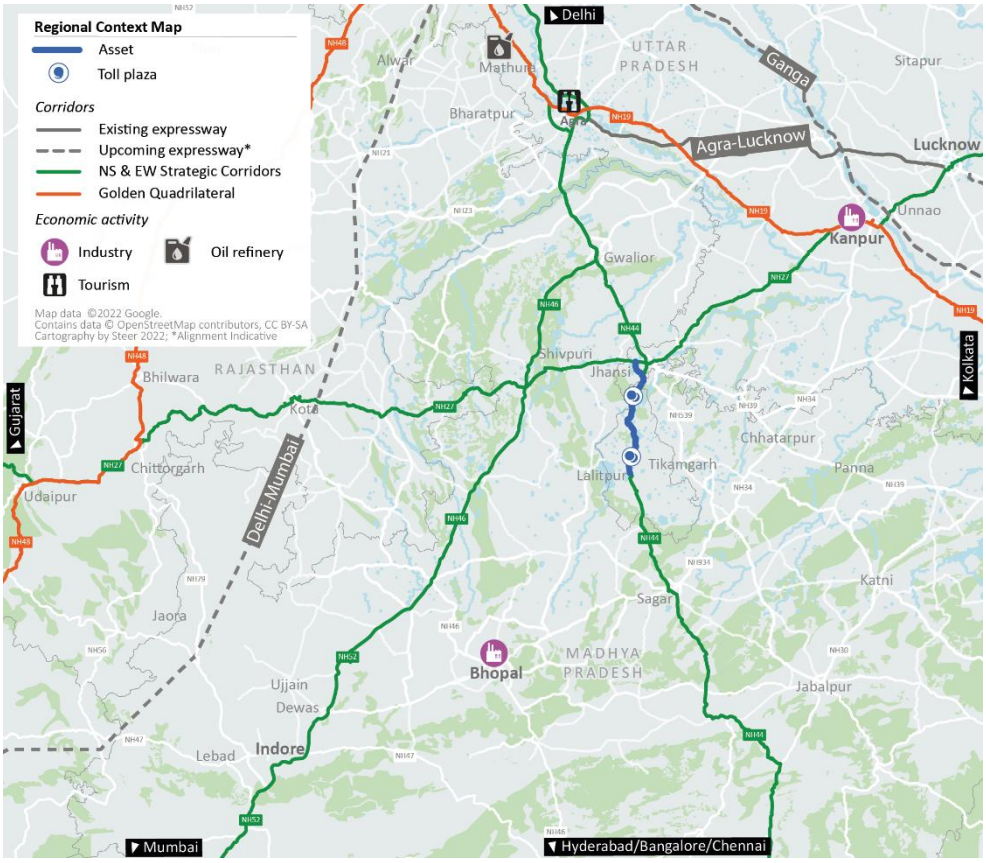
Introduction

2.1 This chapter provides a description of the Asset, based on both primary data (from site visits), and our understanding of the region and network surrounding the Asset. We cover the strategic network context, followed by key economic activities and network developments around the Asset.

Strategic network

2.2 The Asset is in the state of Uttar Pradesh, connecting Jhansi and Lalitpur, on the NH 44 (old NH 25 and 26). NH44 caters to the North- South movement between Jammu and Kashmir, and Kanyakumari, connecting major centres of economic activity such as Delhi, Nagpur, Hyderabad, Bangalore, and Chennai. The following figure shows the regional road network in which the Asset is located.

Figure 2-1: Location of Jhansi-Lalitpur and corresponding toll plazas



Source: Steer Cartography

2.3 The Asset primarily caters to two different types of strategic movements:

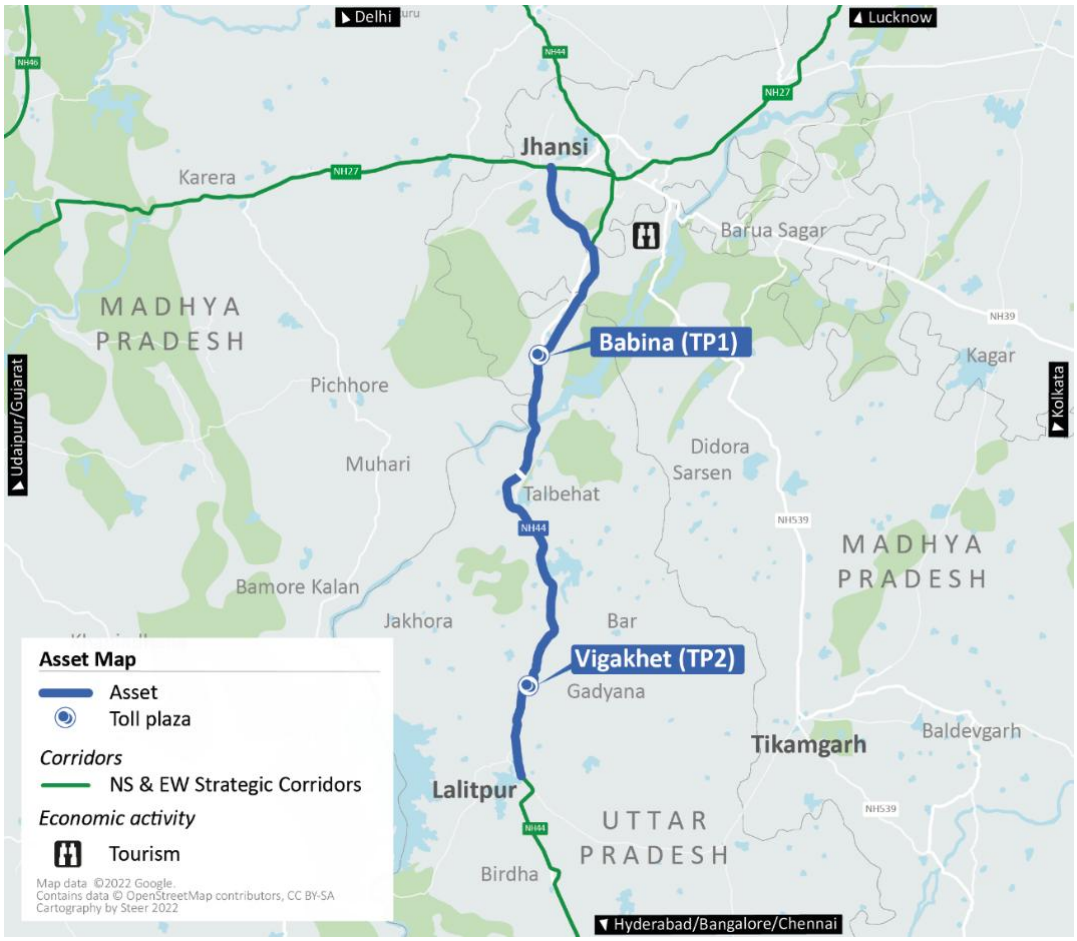
- **Short-distance trips** including leisure and business travel trips between some of the key tourist towns/cities around the Asset between Jhansi, Orchha, Talbehat, and Lalitpur.
- **Medium-distance and long-distance trips** by 3A and MAVs primarily between Delhi and north and Hyderabad/Bengaluru. The asset provides key link for the movement of goods between the states of Delhi, Haryana, Punjab in north India and Southern states of Telangana, Karnataka, Andhra Pradesh, and Tamil Nadu. Major long distance(>500kms) commodities include Automobile, Parcels, Manufacturing and Agri Commodities.

2.4 The Asset forms a 100.0 Km long contiguous section of toll roads which forms a part of NH 44 (old NH 25 and 26) in Uttar Pradesh. The following figure (Figure 2-2) provides a closer view of the Asset in the context of its immediate surrounding. Both the SPVs of the Asset are four-lane divided road with one toll plaza each namely,

- JLTL – TP1: Babina at km 32.100 and
- JVTL – TP2: Vigakhet at km 85.280.

2.5 TP1 Babina is near Jhansi whereas TP2 Vigakhet is near Lalitpur. The following figure provides a closer view of the Asset in the context of its immediate surroundings.

Figure 2-2: Asset context



Source: Steer cartography using OpenStreetMap data

Concession and tolling details

2.6 TP1- Babina on the Asset has been operational since November 2014 whereas TP2- Vigakhet has been operational since March 2012. The Client took over the operations of the Asset in October 2020. There are still 25 years left in the concession period which ends in FY51. Table 2-1 presents a summary of the concession.

Table 2-1: Summary of concession

Particulars	Details
State	Uttar Pradesh
Highway and lane configuration	NH 44 (old NH 25 and 26), 4-lane divided
Toll plaza	• SPV 1: TP1: Babina • SPV 2: TP2: Vigakhet
Length (km) as per concession agreement, applicable	• TP1: 49.70 km • TP2: 49.31 km
Commencement of operations	• TP1: November 2014 • TP2: March 2012
Operated by Client since	20th October 2020
Concession period	30 years
Last year of concession	2051

Source: Client data

2.7 Following pictures show typical cross section of the Asset and toll plazas.

Figure 2-3: Road cross section of the Asset

Source: Steer site visit

2.8 The toll rates for single category are shown in Table 2-2. The toll plazas have dedicated ETC/FASTag lanes for electronic tolling. Like the other National Highway plazas, the Asset has Single, Return, Local Commercial, Local Personal, Monthly, and Local Monthly tickets.

2.9 There is a difference in toll rates of both the toll plazas since the structure length and bypass length are shorter on TP2: Vigakhet toll plaza in comparison to TP1 Babina toll plaza.

2.10 Due to general elections in India from Apr-May'24 the toll rates on National highways across the country for next financial year were applicable Jun'24 onwards instead of Apr'24. For FY26 the toll rates changed from Apr'25.

Table 2-2: Single toll rates on the Asset (INR), applicable Apr 2025 to March 2026

Type of Vehicle	Single Journey Fee	
	TP1 Babina	TP2 Vigakhet
CJV	125	90
LCV	200	145
Bus/Truck	420	310
3A	460	335
MAV	660	485
OSV	800	590

Source: NHAI Revision of User fee Rate w.e.f 01.04.2025

Key economic activities

The Asset is situated in the state of Uttar Pradesh. Uttar Pradesh is the third largest economy and the most populous state in the country, accounting for 16% of India's total population which also makes its high consumer base a key factor that contributes to the GDP. Agriculture is the most important and the biggest sector in the state economy followed by the service sector comprising of travel, tourism, real estate, insurance, and the finance industry. State's real GSDP for 2023-24 was INR14.23 trillion, having grown at 5.7% CAGR between FY16 and FY24, contributing 8.2% to the national GDP.

Economic Activity Around Asset

2.11 The northern end of the Asset, Jhansi is a city of historical relevance in the Bundelkhand region. Being the only city with presence of both, East-West highway corridor (NH27) and North-South highway corridor (NH44), Jhansi has observed development in infrastructure and real estate sectors over the years. Jhansi is also one of six nodes identified as defence corridors where industries will be set up to meet the needs and requirements of the country's defence sector. A Defence Park is planned to be established in Jhansi for automobiles manufacturing for military, police modernization, forensics centres, aircraft/helicopter manufacturing/ assembling units, testing facilities for military equipment, drone manufacturing and testing facilities.

1. In October 2025, the Uttar Pradesh government announced multiple infrastructure and industrial initiatives in the Bundelkhand region, covering Jhansi and Lalitpur districts including three solar plants totalling 2,000 MW capacity, with Hinduja Group setting up a

600 MW plant in Jhansi and NTPC Green Energy developing a 600 MW plant in Lalitpur. The projects, worth ₹10,000 crore, are expected to be operational by December 2025, generating green energy.[1]

2.12 The UP State Industrial Development Authority is also developing a Bulk Drug Pharma Park over 1,472 acres with an anticipated investment of ₹12,000 crore and job creation for approximately 14,000 people. The park will feature advanced infrastructure and is expected to be operational within 2–2.5 years.[2]

2.13 Concrete and granite stone mines are present throughout the state and are used for construction. Stone crusher plants are present at Bijoli, 12 km from Jhansi along the Asset, which produce aggregate for construction. The same is transported to the rest of the state. Bijoli is also home to cement, bricks and pipes as well as machine parts industries.

2.14 There are two thermal power plants present near the Asset namely, Parichha Thermal Power Plant (near Jhansi) and Lalitpur Power Plant (near Lalitpur).

2.15 Diamond Cement Factory has a grinding unit at Jhansi where one of the raw materials, fly ash, is transported from Lalitpur power plant using the Asset.

2.16 Since the economy of Uttar Pradesh is mainly based on agriculture and around 65% of the population is dependent on agriculture, the Asset observes Agri-products as a key commodity transported. Agriculture related Pradeshik Co-operative Federation warehouse is also located near Vigakhet which is further expected to generate Agri-related traffic on the Asset.

2.17 Being a part of the long-distance strategic corridor of NH44, key commodities moving on the Asset include tomato, rice, potato, manufacturing products, parcels, and a small proportion of automobile traffic.

Alternate Routes

2.18 An alternate route between Jhansi and Sagar via Tikamgarh is also present and bypasses the toll plazas. The route is 32 km longer than the Asset route. This alternate is of an uneven width for the most part. The route is also closed during the rainy season as water flows over the low-level bridge near Orchha. Due to this reason, the route isn't preferred by general traffic and is not considered to be impacting the traffic on the Asset.

2.19 The National Highway Authority of India (NHAI) is building an ~1382km long greenfield expressway connecting Delhi and Mumbai. It is an 8-lane access-controlled route with 4 lanes in each direction connecting Delhi-Noida Direct (DND) Flyway in Delhi with the Jawaharlal Nehru Port Trust (JNPT) in Mumbai. A few sections of the greenfield expressway have been made operational with Sohna-Dausa-Lalsot section (Feb'23), Madhya Pradesh section (Sep'23), Vadodara-Bharuch section (Feb'24), Lalsot-Sawai-Madhopur section (Feb'24) and the Kota-Bundi Section (Dec'24) already being operationalised. The project is currently suffering from construction delays, mainly on the Gujarat stretch. The timeline for completion of the expressway has been revised several

[1] **Solar Plants in Bundelkand**

[2] **Pharma Plant in Lalitpur**

times and is now expected to be completed by 2027 as per reports[3]. It is key to note that while certain sections of the Rajasthan expressway lack direct connectivity, they are effectively linked via state highways.

2.20 Like the DME, the ~1,271 km long Surat-Solapur-Chennai Expressway will connect Surat and Chennai via Solapur, Kurnool, Kadapa, and Tirupati. Once the expressway is constructed, traffic coming from Delhi/ north and travelling to Kurnool/south will have the option to use DME till Indore followed by NH52 till Solapur followed by SCE (Surat Chennai Expressway) from Solapur to Kurnool and beyond. This new alternative will provide the option of using expressways for ~60% of the total journey distance and hence, a share of Delhi-Kurnool and south specifically Chennai bound traffic is expected to have an alternate route choice.

2.21 Further, DME provides a faster access to Indore and post which the users can reach Solapur via Dhule – Aurangabad. After Solapur, the route to reach Chennai can either be via Surat Solapur Chennai expressway.

2.22 Currently the existing sections between Indore and Hyderabad are getting widened from two lanes to four lanes as part of Indore Hyderabad Economic Corridor.

- The sector between Indore and Khandwa (164 Km) is getting upgraded as a part of brownfield expansion.
- The section between Khandwa and Akola (146 Km) is proposed to upgrade as a part of greenfield expansion (however very limited information is available on this greenfield development).
- The section between Akola and Hyderabad (NH161) is majorly four-laned.
- The 40 km long Kandi to Ramsanpalle section of NH161which was two laned has been recently inaugurated by Prime Minister in Mar'25 after it's completion of four laning[4].

2.23 Once the widening of the existing alignment is completed, the route via Indore, Akola, Nanded will provide an alternate route traveling between Madhya Pradesh/ North and Hyderabad/South.

2.24 Thus, the Indore-Hyderabad Economic Corridor will act in conjunction with the Delhi-Mumbai Expressway and the Surat-Chennai Expressway to form an alternate route to the Asset for North-South traffic. The detailed impact of this composite alternate is discussed in Chapter 6.

2.25 The 4 laning of Satna-Chitrakoot-Prayagraj section of NH30 is a lane augmentation project on the east of the Asset. It will have impact on traffic between Lucknow and north and Nagpur and south. There is no official information to suggest when this project may be completed. Reports online suggests the project is expected to start construction in 2025. Once the 4-laning is completed, this section will act as an alternate to our Asset for the traffic commuting between Lucknow - Nagpur.

---

3 Traffic Description

Introduction

3.1 This chapter outlines the current traffic and revenues on the Asset, as well as our analysis of origin-destination (OD) data and traffic count data. This covers data which was collected as a part of the study in the previous commission, as well as data provided by the Client.

3.2 Traffic demand data is generally collected and analysed to understand the volume and vehicle composition of demand currently using the Asset, while OD data is used to obtain a better understanding of travel patterns, trip lengths, trip purposes and areas of influence in the vicinity of the Asset, as well as the commodities being moved by goods vehicles. This analysis, combined with our understanding of the Asset (based on our site visits), enables us to identify the key drivers of demand on the Asset.

3.3 Actual toll plaza data is used as the basis from which the current/base year annual average daily traffic (AADT) is established. This data is typically provided by the Client and independently analysed and validated by us using traffic volume count (TVC) information.

PCU Factor assumption for reporting

3.4 The PCU values have been taken from 'IRC 64:1990- Guidelines for Capacity of Roads in Rural Areas'.[5] For MAV, based on the discussion with the Client, we have referred to the rigid and trailer splits in the latest TVC counts conducted in 2024 for calculating the effective PCU for MAVs. For rigid trailer trucks we have assumed a PCU factor of 3, whereas for trailer trucks we have assumed a PCU factor of 4.5. These factors have been used to arrive at the PCU values presented in the following sections.

Table 3-1: PCU factors

Vehicle Category	PCU Factor
CJV/ Mini LCV	1.0
LCV	1.5
Bus/2A	3.0
3A	3.0
MAV*	3.4
OSV	4.5

Source: Steer analysis and IRC64,1990, * Rigid-Trailer combined PCU

[5] IRC 64:1990- Guidelines for Capacity of Roads in Rural Areas

Historical trends

3.5 Table 3-2 illustrates the traffic data over the period of 5 years from October 2020 – September 2025 (provided by the Client) at a plaza level. There is lack of long-term historical data available on the Asset since tolling was started by the client only in October 2020 and both the available years of data, FY21 and FY22 were impacted by COVID-19 related restrictions. Therefore, starting FY23 traffic on the Asset has started to get normalised with normal travel patterns recorded FY24 onwards.

Table 3-2: Average Daily Traffic data of TP1 Babina

Vehicle category	FY21	FY22	FY23	FY24	FY25	FY26 YTD	CAGR FY23 -25
CJV	2,794	2,872	3,040	3,157	3,353	3,484	5.0%

Source: Steer analysis of Client data, (*12 days of data was available for Oct'20 FY26YTD consists of 6 months of data from Apr'25 to Sept'25; Tollable traffic excludes exemptions and violations

3.6 As per the reported data, it can be observed CJVs make up 40% of traffic in FY25 which can be attributed to short distance movement from Jhansi and surrounding region in proximity. Whereas 2A, 3A and MAV account for a total of nearly 55% of the traffic as the Asset is a part of the traditional North-South long-distance corridor and caters to many goods vehicles doing long distance North-South movement between Delhi/North and Nagpur/South.

3.7 3A category has largely growth at a 2% CAGR flat in the FY21-25 period. The reduction/stagnation in 3A volume is a result of the declining demand for 3A vehicles, which are being replaced by 2A and MAVs. MAVs offer higher tonnage capacity making them more cost-effective for transporters. While the increase in 2A volume reflects the growing preference for these vehicles due to favourable changes in the legal permissible loads for 2As and their suitability for e-commerce-related freight, particularly high-value, low-volume goods over medium to long distances. This is consistent with our discussion with various transporters and OEMs across the country who are favouring 2A and 5A vehicles for commodity movement due to better unit economics.

3.8 Based on the FY26YTD data provided by the client, movement of MAVs has declined by 9.4% compared to FY25. This reduction is primarily attributed to the diversion of north–south traffic onto the Delhi–Mumbai Expressway, as well as the rerouting of traffic from East Uttar Pradesh towards Nagpur and southern regions via NH30 (Rewa–Katni–Jabalpur–Nagpur), following the completion of the Katni Bypass in June 2025.

3.9 Generally the second half of the year is higher in volume terms for commercial vehicles hence the YTD performance is expected to improve for MAVs on a full year basis.

3.10 2A and 3A continues to be positive in FY26YTD as well signalling a strong demand generated by cities such as Nagpur, Bangalore, Chennai originating from Gwalior and North Indian states like Delhi NCR, Punjab and Haryana and vice-versa. Traffic volumes observed at Vigakhet toll plaza are presented below.

Table 3-4: Traffic level at TP2 Vigakhet

Vehicle category	FY21	FY22	FY23	FY24	FY25	FY26 YTD	CAGR FY23 -25
CJV	2,279	2,284	2,376	2,447	2,575	2,608	4.1%
LCV	233	201	222	243	303	320	16.8%

Source: Steer analysis of Client data, (*12 days of data was available for Oct'20). FY26YTD consists of 6 months of data from Apr'25 to Sept'25; Tollable traffic excludes exemptions and violations

3.11 Historically the traffic on TP2 as well has shown a healthy growth across categories with ~5.8% overall PCU growth for the period between FY23-FY25.

3.12 TP2 Vigakhet plaza lies south of Babina toll plaza and is a contiguous section. The traffic trends at both plazas are similar with similar seasonal impact as explained above. This is also validated with the toll plaza also reporting a very similar behaviour in the evolution of traffic since October 2020. There has been a growth in the 2A volume FY25 compared to FY24 due to increased category demand for long-distance movement. The tollable traffic at Vigakhet shows similar trend as the Babina Plaza.

3.13 Increase of approximately 11% has been observed in 2A vehicle traffic across both plazas, reflecting a broader trend along the corridor. Conversely, 3A vehicle growth has remained subdued, primarily attributed to an axle shift from 3A vehicles to MAVs.

Historical Revenue

3.14 In terms of revenue, CJVs contributes ~10% to the total revenue, while commercial traffic (2A, 3A and MAV) contribute ~86% in terms of revenue on Babina toll plaza with remaining shares by Bus and LCV.

3.15 Table 3-6 and Table 3-7 show the revenue by each vehicle type at the toll plaza at an annual level and at daily level.

Table 3-6: Total Revenue (in INR Cr) at TP1 Babina, and AADC (in INR Lakhs/day)

Year	CJV	LCV	Bus	2A	3A	MAV	OSV	Total	AADC	AADC %

FY26YTD	2.8	0.8	0.7	8.3	8.5	14.9	0.0	**36.1**	**19.6**	**3.0%**

Source: Steer analysis of Client data, (FY21* From Oct-20 (last 12 days) to Mar-21; AADC represents Average Annual Daily Collection; FY26YTD is data for 6 months from Apr'25 to Sept'25.

3.16 It can be inferred from the data that major contributor to the revenue on the Asset is the MAV category which has a share ranging ~45% of overall revenue across the Asset.

3.17 The Babina toll plaza reported an AADC of ~INR 27 Lakhs in FY25 as compared to Vigakhet toll plaza which reported an AADC of ~INR 19 lakhs. Both the plazas observed a ~10% increase in per day collection in FY25 which is mainly contributed by increased volume of LCV, 2A and MAV on the Asset. Since, both Asset carry similar traffic volumes, most of the revenue differences can be explained by the difference in toll rates charged, which in turn is due to the difference in tollable lengths.

3.18 The drop in AADC for FY26YTD can be attributed to drop in the MAV traffic which is the major contributor to the overall revenue at the asset.

Toll Frequencies

3.1 Toll frequency or segmentation is typically the share of each ticket category recorded for a particular vehicle type. This is based on the toll policy which forms a part of the concession agreement. Each vehicle category has different segmentation. As a part of historical analysis, we calculate the toll frequency for each vehicle category from the monthly data shared by the client. The most common ticket categories observed on a typical National Highway are: Single, Return, Monthly, Local and Exempt. Given the local nature of traffic, some toll plazas offer custom made local passes to attract the local commuters to opt for these passes instead of evading toll.

3.2 The following are the types of tickets being sold at the plazas of the Asset.

Table 3.8: Typical ticket types sold at NHAI plazas

Category	Description
Single	Allows the vehicle to cross the toll plaza once
Return	Allows for a return journey within a day with a 50% discount on the return trip.
Monthly Pass	Discounted single entry ticket for users who undertake multiple trips within a month can buy the monthly pass.
Local Personal	Discounted single entry pass only for private cars of residents within 20km radius of toll plaza
Local Commercial	50% discount on single trips for commercial vehicles registered in the local district. This pass allows single entry only
Exemptions	Officially exempted vehicles like ambulance, police cars, key political personnel etc.

3.3 Further, the toll plazas also record violations which are non-paying users, who are not officially allowed under exemptions category but are forced exemptions. For some Assets, the Exemption and violations are at time reported together.

3.4 Generally, over the period the shares of single/return/monthly tickets tend to stabilise within 2-3 years of Asset operations. Only in the cases where trip patterns are expected to

change significantly due to urban expansion is where we expect these shares to change over the period or due to some external events impacting the trip patterns.

3.5 Further, FY21 was impacted due to the mandatory implementation of FASTag as a mode of payment, where users were now paying via an online payment system instead of cash payments at the toll plaza. Additionally, in FY22 traffic and travel patterns were impacted by the second wave of COVID-19 in Q1 and Q2. With FY21 and FY22 being impacted these external events, the segmentation began to stabilise from FY23 onwards and reached steady state starting FY24

3.6 *Introduction of Annual pass for CJVs*

3.7 The National Highway Authority of India launched the "The FASTag Annual Pass" on August 15, 2025, a prepaid facility that allows private CJVs to travel across designated National Highway and National Expressway toll plazas. The annual pass is worth INR 3,000. The pass is valid for one year or 200 trips, whichever occurs first and is applicable only to private, non-commercial vehicles (Car/Jeep/Vans).

Since this pass has been introduced by NHAI, it is not valid on

- state governed toll plazas on highways
- state governed toll plazas expressways
- Parking areas or other non-NHAI tolling locations

3.8 The pass can be activated via the RajmargYatra app or the NHAI website, and links directly to an existing FASTag.

The Annual Pass aims to:

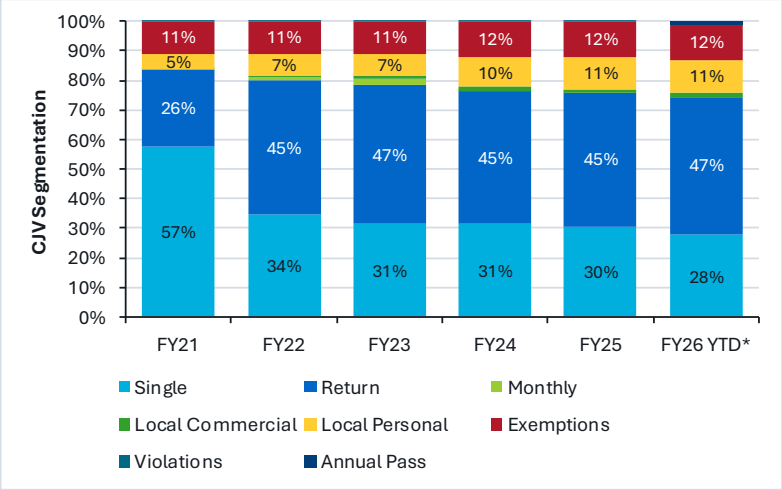
- Promote cashless and seamless travel on national highways.
- Reduce congestion and improve traffic flow at tolls
- Provide cost-effective travel for frequent users of NH/NE toll road

Share of traffic by payment type

3.19 Since the Asset is located closer to urban clusters, it caters to a considerable number of daily commuters. This local movement results in multiple CJV trips through the plaza, leading to a higher share of return tickets for CJVs. On TP1, the level of exemptions is influenced by the higher share of local traffic on the plaza.

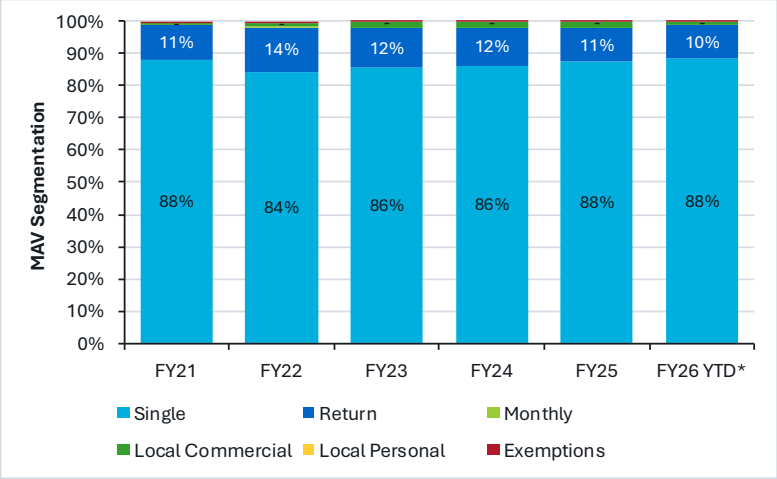
3.20 The CJV segmentation has decreased for single ticket type from FY22 to FY23 by approximately 3%, while the return ticket share increased by 2%. This minor shift can be attributed to the increasing adoption of FASTag by CJV users over the last three years. Post FY23, segmentation for CJVs has remained largely stable.

Figure 3-1: Ticket segmentation for CJV at TP1 Babina



Source: Steer analysis of Client data (FY21 has data for Oct-20 to Mar-21); FY26YTD is data for 5 months from Apr'24 to Aug'25

Figure 3-2: Ticket segmentation for MAV at TP1 Babina



Source: Steer analysis of Client data (FY21 has data for Oct-20 to Mar-21); FY26YTD is data for 6 months from Apr'25 to Sept'25

3.21 The trends observed in MAV segmentation for TP1 Babina are consistent between FY24 and FY26YTD. A considerable proportion of MAVs buying single tickets can be attributed to long-distance movement of traffic observed on the Asset. The same was verified from the OD data analysis with nearly 50% MAVs having trip lengths longer than 1,000kms and 50% MAVs having both ends of the trips out of Asset.

3.22 Table 3-9 presents data for FY26YTD (Apr'25 – Aug'25) segmentation for LCV, Bus, 2A and 3A category for Babina Toll Plaza:

Table 3-9: Ticket segmentation for LCV, Bus, 2A and 3A at TP1 Babina

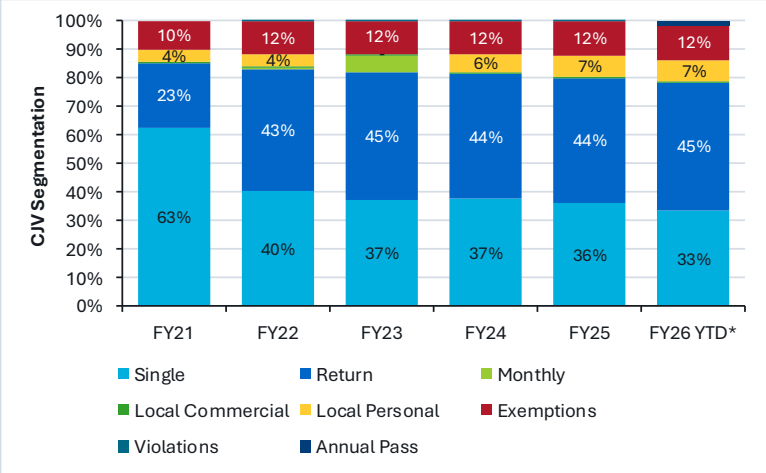
Ticket Category	LCV	Bus	2A	3A
Single	89%	34%	92%	96%
Return	10%	33%	6%	4%
Local commercial	0%	32%	0%	0%

Ticket Category	LCV	Bus	2A	3A
Exemption	1%	1%	2%	0%

Source: Steer analysis of Client data

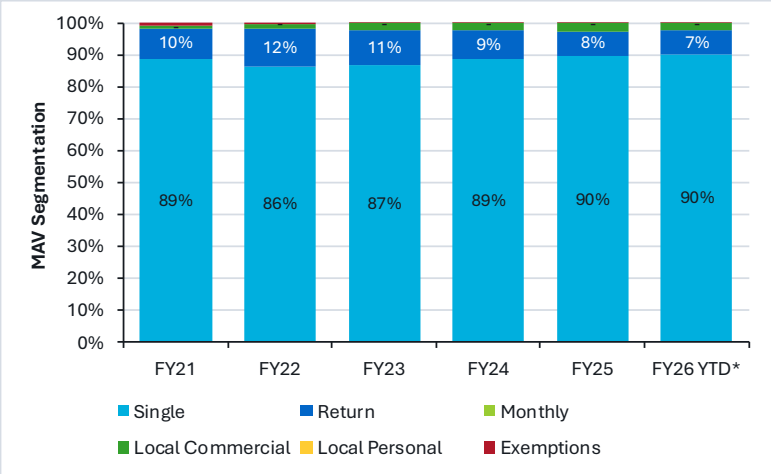
3.23 The segmentation for TP2, Vigakhet toll plaza is presented below:

Figure 3-3: Ticket segmentation for CJV at TP2 Vigakhet



Source: Steer analysis of Client data (FY21 has data for Oct-20 to Mar-21); FY26YTD is data for 5 months from Apr'25 to Aug'25

Figure 3-4: Ticket segmentation for MAV at TP2 Vigakhet



Source: Steer analysis of Client data (FY21 has data for Oct-20 to Mar-21); FY26YTD is data for 5 months from Apr'25 to Aug'25

3.24 Observations pertaining to ticket segmentation are similar on both toll plazas. The CJV segmentation shares have largely been consistent from FY23 and FY26YTD. On TP2 Vigakhet MAVs have exhibited similar trends when compared with previous years where single is dominant ticket category with more than ~85% share. These trips are primarily travelling between north and south India between Delhi NCR towards Bangalore and Chennai with trip lengths longer than 1,000kms.

3.25 Table 3-10 presents data for FY26YTD (Apr'25 – Sept'25) segmentation for LCV, Bus, 2A and 3A category for Vigakhet toll plaza:

Table 3-10: Ticket segmentation for LCV, Bus and 2A at TP2 Vigakhet

Ticket Category	LCV	Bus	2A	3A
Single	90%	39%	94%	96%
Return	9%	54%	4%	3%
Local commercial	1%	7%	0%	1%
Exemption	1%	0%	1%	0%

Source: Steer analysis of Client data

Data Collection exercise

3.26 As mentioned previously, to validate and inform various inputs used in our forecasting, we undertook primary data collection on the Asset in earlier commissions, comprising the surveys listed in the table below. OD data collection typically involves manual data entry by enumerators based on oral surveys with road users crossing toll plazas, which Steer also commissioned with a third party. TVC data collection involves video-graphic capture of traffic passing crossing the toll plazas, followed by manual counting.

Table 3-11: Data collection exercise

Toll Plaza	3/7-day videography-based TVC			1-day OD survey	
	Start date	End date	Time (hrs)	Start date	Start time
TP1 Babina	29 Jan 2024	31 Jan 2024	0000-2359	30 Jan 2024	0900 hours
TP2 Vigakhet	18 Jan 2021	24 Jan 2021	0000-2359	19 Jan 2021	0900 hours

Source: Steer analysis of TVC data

3.27 It should be noted that, in our experience, traffic on national highways shows variation across the week due to the economic activities surrounding each road. To derive a representative TVC count considering daily variation, three-day to seven-day traffic counts are generally recommended, and hence, to fully understand the impact of this weekly fluctuation on the Asset, we collected three and seven-day counts respectively at each toll plaza.

Key findings of the TVC data analysis

WADT estimates

3.28 Taking an average of the seven-day TVC counts (18th Jan – 24th Jan 2021, 0000-2359) at Vigakhet and three-day TVC count (29th Jan – 31st Jan 2024, 0000-2359) at Babina, we obtained the following average daily traffic (WADT) for each toll plaza. This WADT excludes non-tollable vehicles such as tractors, two-wheelers, bullock-carts, etc., but includes officially exempt vehicles such as police cars, ambulances, emergency response vehicles, government vehicles and other vehicle types officially allowed as 'exempted' under the concession agreement.

Table 3-12: WADT from TVC counts

Toll Plaza	CJV	Mini LCV	LCV	Bus	2A	3A	MAV	Total
TP1 Babina	3,238	623	390	151	1,118	1,140	1,731	**8,395**
TP2 Vigakhet	2,156	289	306	126	814	1,337	1,508	**6,536**

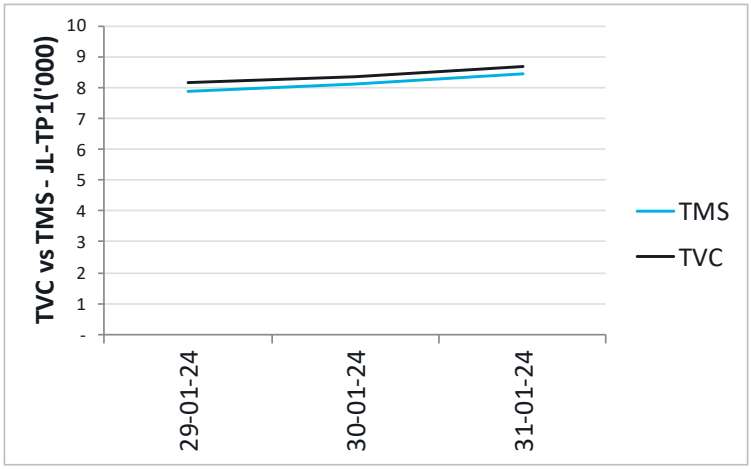
Source: Steer analysis of TVC data; Babina average is of 3 days and Vigakhet average is for 7 days of data

TVC v/s TMS analysis

3.29 As we use the TMS data to estimate the base year AADT, we have used our TVC data to validate the TMS data on those days, as provided by the Client.

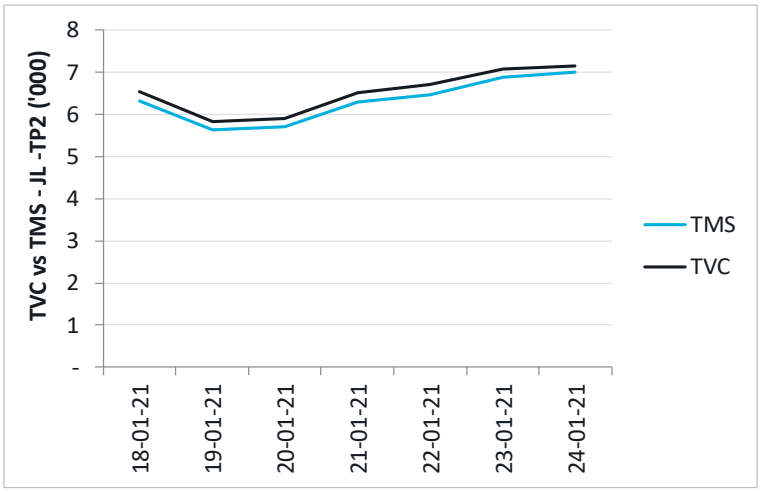
3.30 The following figures show the comparison between the daily traffic observed by TVC and TMS for the two toll plazas.

Figure 3-5: Comparison between TVC and TMS daily traffic data on TP1 Babina



Source: Steer analysis of TVC and Client TMS data

Figure 3-6: Comparison between TVC and TMS daily traffic data on TP2 Vigakhet

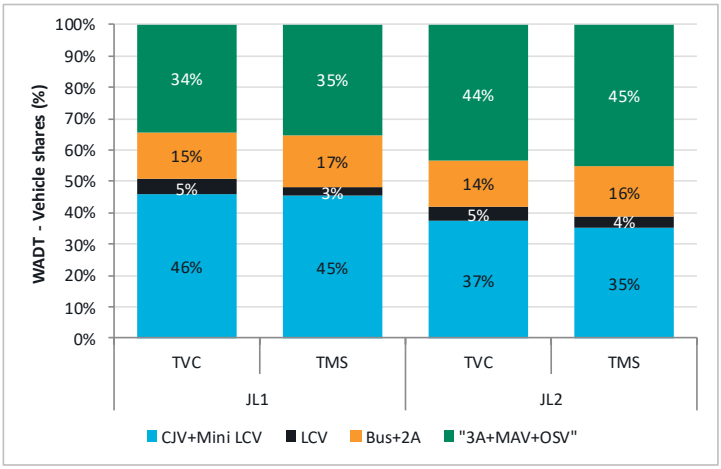


Source: Steer analysis of TVC and Client TMS data

3.31 Figure 3-7 compares the shares of vehicle types at both toll plazas observed by the TVC and TMS data. As can be seen, whilst the share of CJVs and 3A+MAV+OSV is marginally

higher in TMS compared to TVC, it is lower for bus/2A and LCV category. This difference can be attributed to common misclassification of vehicle categories.

Figure 3-7: Comparison between vehicle shares from TVC and TMS WADTs



Source: Steer analysis of TVC and Client TMS data

3.32 It is seen that on both the TP when the TVC and TMS are compared to each other, the major category of 3A and MAV taken together are within 1% on each day of the TVC. This suggests that the TMS is reliable and can be used to build further forecasts of the Asset.

Key findings of origin-destination analysis

Overview

3.33 Origin-destination (OD) analysis enables the understanding of the nature of traffic movement on the Asset. As mentioned previously, the OD analysis presented here has been based on the data collected on 30th-31st January 2024 at TP1 and 27th-28th January 2021 at TP2.

3.34 As part of our previous assignment, we have analysed the regional drivers of demand based on the following analyses:

- Zonal influence
- Commodity distribution
- Top OD pairs
- Trip length distribution

3.35 While zonal analysis and the list of top OD pairs help to understand 'where' people and goods travel, commodity distribution sheds light on 'what' goods get transported. Trip length distribution show 'how far' vehicles and people travel, and goods get transported. This set of analyses is generally used to estimate the key drivers of traffic and aid the making of informed forecasting assumptions around traffic demand elasticities, growth drivers and exogenous impacts.

Sample rates

3.36 Sample rates help understand the reliability of OD data. They are calculated by dividing OD samples captured by the traffic counts (based on the TMS data) during the same time period. The Table 3-13 below presents the sample rates for key vehicle type aggregations

at the toll plaza. We believe that the sample rates of the OD data are reasonable for the analysis required.

Table 3-13: Sample rates for OD data

Vehicle type	TP1 Babina	TP2 Vigakhet
Passenger (CJV+Bus)	18%	27%*
Goods (LCV+2A+3A+MAV)	62%	61%

Source: Steer analysis of OD data, *The surveys at TP2 took place during the COVID-19 pandemic due to which the vehicles were reluctant to stop and answer the enumerators which led to lower sample rate in passenger vehicles. While the surveys at TP1 took place during a spell of intense fog across north India due to which there was lower traffic appearing and sample collection.

Zone categories

3.37 To facilitate better interpretation of key regional drivers of traffic as determined by their OD zones, and influenced by various towns, cities, states, and regions in the vicinity of the Asset, we have aggregated zonal data as described in Table 3-14 below. The methodology behind this aggregation of zones may vary as per the characteristics displayed by the different Asset being studied.

Table 3-14: Zone aggregations for zonal influence analysis

Aggregate Zone	Description
Local	Local zones are those that fall on or very close to the Asset.
IAOI (Immediate Area of Influence)	IAOI zones are the locations which generate traffic and lie within approximately 75-150 km distance from the Asset.
Rest of Uttar Pradesh	Rest of the cities/Districts in the state that Asset lies in (other than Local/IAOI)
Madhya Pradesh	Madhya Pradesh state
Delhi	Delhi State, including New Delhi
North India	Uttarakhand, Haryana, Punjab, Jammu and Kashmir
West India	Rajasthan, Gujarat
Central India	Chhattisgarh
East and North-eastern India	West Bengal, Jharkhand, and Northeast Indian states
South India	Tamil Nadu, Karnataka, Kerala, Andhra Pradesh

Source: Steer analysis

Zonal influence

3.38 The zonal influence is the contribution of the zone or the zonal aggregation to trips by a vehicle type. This section presents the zonal influence at each toll plaza of each Asset, based on zonal aggregation listed in the previous sub-section. It should be noted that zonal influence is analysed on trip ends and not trips.[6]

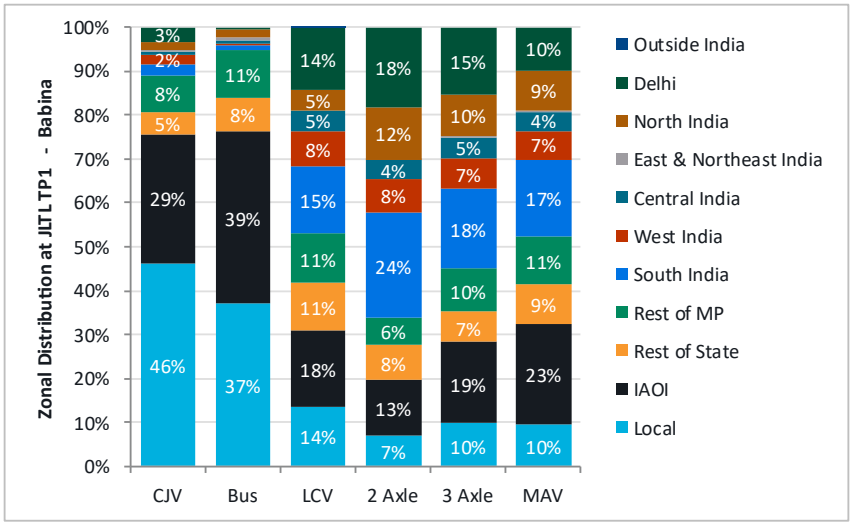
[6] For example, if out of 100 trips at a toll plaza on an Asset, 10 trips are between Hyderabad and Delhi and 90 trips are between Hyderabad and Chennai, then zonal influence of Hyderabad would

3.39 It can be seen from the figures below that CJV and Minibus/Bus categories are dominated by local and IAOI trips on both the toll plazas. The share of local trips for CJVs is more on TP1 as it is in close vicinity of Jhansi whereas Vigakhet is comparably distant from Lalitpur. Moreover, Babina itself is economically more developed when compared to Vigakhet. Similarly, since Lalitpur is near Madhya Pradesh, significant number of Madhya Pradesh trips also get added on TP2.

3.40 Since the Asset lies on the preferred route for traffic commuting between Delhi-NCR and Bangalore, the southern India zones and the Delhi zones have the highest and the second highest proportion respectively on both the toll plazas across all goods categories. The shares of other zones are comparable across all the categories. Since TP1 is near NH27 (East-West corridor), the share of Northern India trips is higher on TP1 than TP2. Similarly, since TP2 is near Madhya Pradesh which witnesses the higher share of Madhya Pradesh trips.

3.41 In the charts shown below, it will be noticed that TP1 and TP2 despite being adjoining, show slightly different influences for MAVs. With the proximity to TP1 to Army base camp in Babina for goods traffic and Jhansi for passenger traffic, the influence of local movement is higher on TP1 Babina. For this same reason, the share of Delhi/North bound trips on TP2 Vigakhet is higher around 28% than TP1 of 19%. Another reason which has affected the long-distance traffic results is the surveys undertaken on TP1 in 2024 was during January which was impacted due to dense fog situation. Therefore, resulting in affected long distance traffic movement.

Figure 3-8: Zonal influence at TP1 Babina

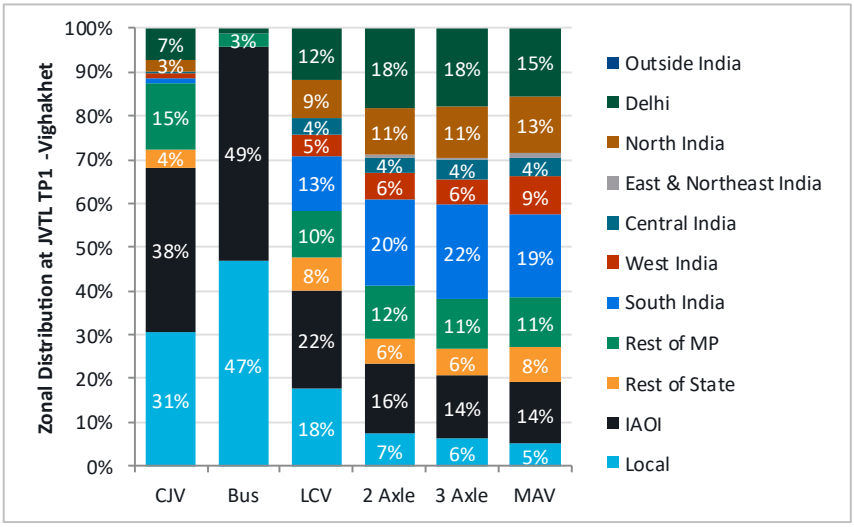


Source: Steer analysis of OD data

3.9 In comparison to our previous OD results, it was found that influence of local movement and trips have increased on TP1 Babina where the share of Rest of State and Internal trips increased by 14% for MAVs. In terms of commodity distribution, the Agriculture and Grocery share has decreased from 28% to 20%, while the Manufacturing share has also increased by 5% from 14% in 2024 OD results when compared to 2023.

be 50% since one end of all trips are at Hyderabad. Likewise, zonal influence of Delhi and Chennai would be 5% and 45%, respectively.

Figure 3-9: Zonal influence at TP2 Vigakhet



Source: Steer analysis of OD data

3.42 Given the strategic nature of the Asset, facilitating north-south movements via NH44 a, the zonal influence of this Asset is diverse. Significant zonal influence of Delhi-NCR, North India (UP, Haryana), South India (Tamil Nadu, and Karnataka) is observed for heavy vehicles (2A+3A+MAV).

3.43 Zones that are located within Uttar Pradesh, collectively contribute to 25-30% in case of 3A and MAV. The remaining 75% is a diverse mix of other zones, including Delhi, Haryana, Rajasthan, south India, Maharashtra, among others. The long-distance nature of this Asset is evident from ~25% share of zonal influence of South India in case of 2A/3A vehicles, followed by major shares of Delhi, Haryana, and Maharashtra.

Internal External analysis

3.44 Internal-External analysis helps in identifying the trips which have both the origin and destination on the Asset (Internal-Internal or I-I), any one end on the Asset (Internal-External or I-E), or neither end on the Asset i.e., through trips (External-External or E-E). 'Internal' zones are those that were analysed as 'local' in the zonal influence analysis, i.e., lying on the Asset, while 'External' zones are all other zones.

3.45 The figures below show the distribution of trips for MAV for both TP1: Babina and TP2: Vigakhet. Understandably, these reflect the observations seen in the zonal influence presented earlier, at a higher level of aggregation.

3.46 The internal-external distribution further validates the strategic nature of the asset, with 60% influence pertaining to zones that are external at both the plazas. This is further to the zonal distribution that showed that Local and Rest of the State had relatively less influence on the Asset, while aggregate of the remaining zones categorized as External exert the significant proportion of influence on the traffic. This validates that the long-distance nature of the Asset, facilitating long distance through movement—that is trips that originate and end outside of Uttar Pradesh, traversing via the Asset. However, there is a difference in the External-External share at Babina is 18% lower for MAV than at Vigakhet. The high share of external trips infers the presence of majorly through long

distance traffic on the Asset. The Asset is used by through traffic commuting between Uttar Pradesh/Delhi/northern state and southern states of Karnataka and Chennai.

Figure 3-10 Internal-external distribution at TP1 Babina

	Internal	Rest of State	External
External	22%	8%	37%
Rest of State	2%	1%	4%
Internal	14%	2%	10%

Commodity distribution

3.47 We have grouped various commodities into aggregate categories for ease of interpretation, as shown in the Table 3-15 below. The charts in the following sub-section present information in terms of aggregate commodity categories.

Table 3-15: Aggregate commodity categories

Commodity Description	Code	Combined codes used for charts
Agriculture Products / Cash crops (Wheat, Rice, Sugar cane,Maize etc.)	AGR	AGR
Cattle Food / Live Stock (sheep, ghoat, cow,cattle food etc)	LIV	

Commodity Description	Code	Combined codes used for charts
Perishable Items (Fruits, vegetables)	PER	GRO
Animal Products/Dairy/Eggs/Fish/Meat/Animals	DFM	
Groceries / Food items (Soap, Salt, Sugar, Pulses, Spices, Biscuits, bread,cool drinks, beer etc.)	GRO	
Building Material / Construction (Cement, Lime, Brick, fly ash, etc)	CNS	CNS
Sand/Clay	SND	
Stone (kota stone, marble, Granite, Aggregate stone etc.)	STN	
Ceramic	CRM	
Petroleum Products (Oil, LPG, CNG, etc.)	PET	PET
Chemicals / Fertilizers (Acids,Fertilizers etc.)	CHM	
Electrical/Manufacturing items (Electronic items, Medicine, Leather, Wine, Rubber/ Tyre, Plastics, Cloth, Paper etc.)	MAN	MAN
Raw Wood,Cork & Wood Products, Furn	WUD	
Machinery / Spare parts	MAC	
Automobiles (Finished products, auto parts, Car/bike manufacturing, New Chassis)	AUT	AUT
Basic / Fabricated Metals (Iron, Steel / Metal)	MET	MET
Mining Minerals (Coal, Gypsum, Cobalt etc.)	MIN	
Empty	EMT	EMT
Container	CTR	MSC
Miscellaneous (Parcel, Courier, House hold items etc.)	MSC	
Passengers	PAS	
Scrap	SCR	

3.48 The following figures present the commodity distribution for goods vehicles at the toll plaza at the total level and split by direction, towards Jhansi and towards Lalitpur.

3.49 As observed during our site visit, majority of the 2As and 3As at both the plazas were carrying miscellaneous commodities (parcels, couriers, household items). This is due to the fact the Asset connects Delhi-NCR to the Central India (Nagpur) and the e-commerce hub in Chennai, Bangalore, and Hyderabad. It must be noted that the trucks carrying such miscellaneous items are largely carrying e-commerce deliveries from various hubs.

3.50 Automobiles are another significant commodity, with over 10% share of MAV on both plazas. This is because there are automobile manufacturing hubs both north (Delhi NCR) and south (Chennai, Bangalore) of the Asset.

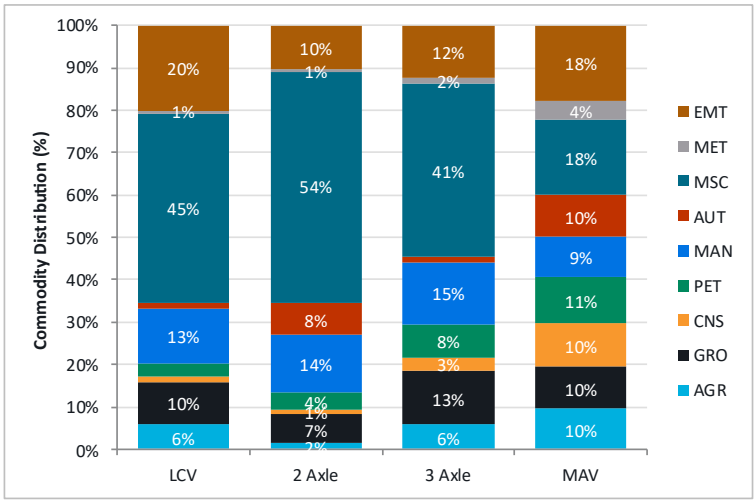
3.51 Manufactured items are the second most common commodity being transported using 3A and MAV trucks whereas automobiles are the second highest commodity of 2A. According to the OD analysis, manufactured items are transported using this route as it connects major hubs like Delhi-NCR, Chandigarh, Nagpur, Bhopal, Raipur, Bangalore, Hyderabad, and Kolkata.

3.52 Groceries also account for significant proportion of commodities transported on the Asset. It accounts for over 20% of the goods being carried on both the plazas. Since the

asset links cities such as Jhansi, Gwalior, Agra, Sagar and other key cities in Uttar Pradesh and Madhya Pradesh, these daily consumption items are observed in high proportion.

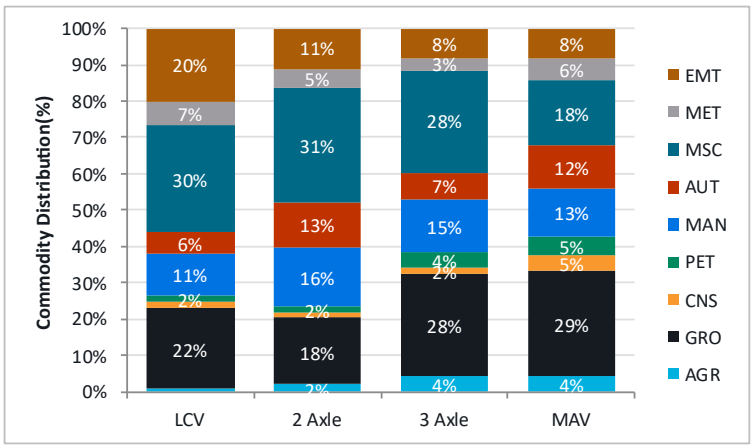
3.53 Commodities such as apples, wheat, potato, and mango are carried from northern states such as Uttar Pradesh, Punjab, Himachal Pradesh for consumption in southern states of Karnataka, Tamil Nadu and Telangana. Whereas commodities such as rice and banana are carried from southern cities of Bangalore, Puducherry, and Chennai for consumption in norther states of Delhi, Uttar Pradesh, Punjab.

Figure 3-12: Commodity distribution at TP1 Babina



Source: Steer analysis of OD data

Figure 3-13: Commodity distribution at TP2 Vigakhet



Source: Steer analysis of OD data

Trip length analysis

3.54 Trip-length distribution provides the distance-based profile of various vehicle types. This aids in validating assumptions around the share of macro-economic drivers, inputs from zonal influence and toll segmentation. For ease of interpretation, we have categorized distances into 5 groups – local (0-100km), short-distance (100-300 km), medium-distance (300-500 km), long-distance (500-1000 km) and very-long-distance (+1,000 km). The trip

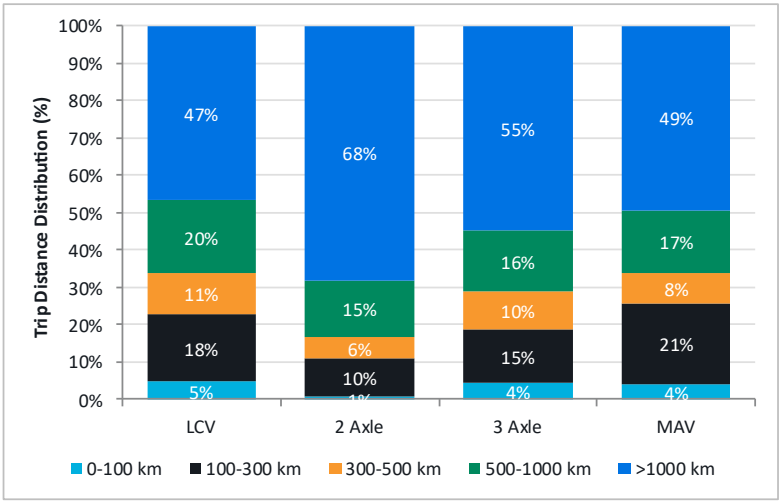
distances were derived as driving distances from Google Distance Matrix Tool based on zonal coordinates for OD pairs.[7]

3.55 As observed in Internal-External analysis, the Asset is majorly being used by through traffic for goods vehicle categories. The same is validated by the figures below as for 2A/3A/MAV trucks, trips which cover greater than 1000 km distance have the highest proportion on both the toll plazas. These trips are majorly between Delhi NCR/Punjab/Uttar Pradesh on one end and Nagpur, Hyderabad, Bangalore and Chennai on the other end.

3.56 As understood from the zonal distribution and commodities' distribution, that the strategic nature of this Asset serves long-distance north-south/west movements. Accordingly, over 60% of the trip distances of 2 Axle, 3 Axle and MAV are traveling very long-distance movement of over 1,000 km.

3.57 There is clear difference between the proportion of MAV travelling over 1000 km on both the plazas, with TP1 at 49% and TP2 at 60% respectively. This is because of the effect of the dense fog over north India which affected long distance traffic movement.

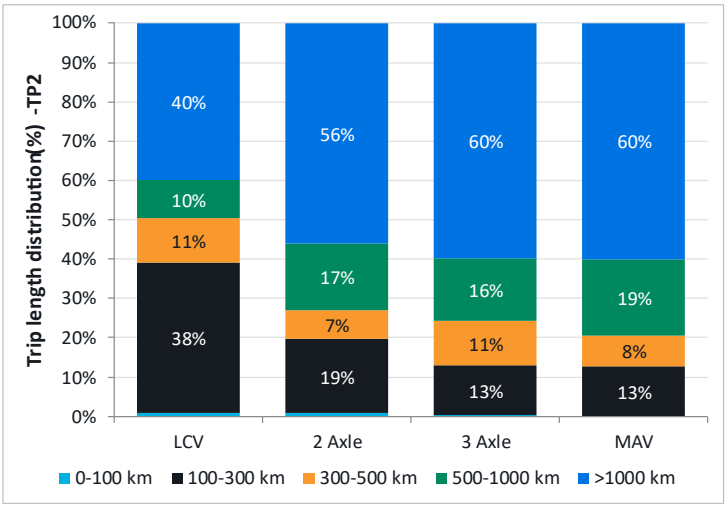
Figure 3.14: Trip distance distribution at TP1 Babina



Source: Steer analysis of OD data

[7] **Google Distance API is a tool that is available on a chargeable basis from Google Maps Platform. Link:** https://developers.google.com/maps/documentation/distance-matrix/start**. Travel distance and time information for driving/transit under various congestion scenarios can be extracted through this tool by Figure 3.using macro-enabled Excel, R, etc.**

Figure 3.15: Trip distance distribution at TP2 Vigakhet



Source: Steer analysis of OD data

Conclusions

3.58 Traffic on the Asset is dominated by CJVs which make up approximately 40% of the total composition on both the toll plazas. 3A and MAVs, collectively, make up around 40% of the total composition on both the toll plazas. Apart from the mentioned categories, both the toll plazas observe around 18% 2A, 2% Bus, and 4% LCV traffic. In terms of revenue, CJVs contribute around 10% to the total revenue, while commercial traffic (2A, 3A and MAV) contribute ~87% in terms of revenue.

3.59 For MAVs Single tickets have remained dominant, holding a share of over ~85% across years at both the plazas. The proportion of exemptions and local personal in CJV has remained constant ~10-12% and ~6-12% on both the plazas over the years. An analysis of LCV segmentation reveals an increasing share of single-ticket transactions by 1.8% and 1.4% at Babina and Vigakhet resp., suggesting a trend toward longer trip distances. The Asset observes almost negligible violations.

3.60 The TVC data shows minor variation on the TMS data, where at the total level of TVC is approximately 3% higher than the TMS data. However, the difference is negligible for the larger revenue generating categories (3A, MAV, and OSV combined), 0.4% at a total level.

3.61 The OD analysis found that in terms of zonal influence, both TP1 and TP2 observe high share of local and IAOI trips for CJV and bus categories. On the other hand, maximum trips for goods vehicles are originated/destined out of the state and hence both the toll plazas have average 26% local and IAOI trips only for MAVs vehicles. The key commodities transported on the Asset includes parcels, couriers, and manufactured products, which when combined, make up around 42% of the commodity share for MAV traffic on both the toll plazas. Automobiles are another category which contribute nearly 10% of MAV traffic.

3.62 When considering the internal and external distribution, it is observed that External/Through trips dominate for 3A and MAV categories suggesting rest of states as origin and destination of truck traffic. Since, majority of the traffic is attributed to external zones, it can be inferred that the traffic is greatly through in nature and the growth of traffic is directly proportional to the growth of other influencing state. The trip analysis

supports these findings, with 3A traffic having 55% and 60% share and MAV traffic having 49% and 60% share of trips ending post 1000 km distance on TP1 and TP2 respectively.

3.63 Overall, the Asset has benefitted from the strong traffic volumes observed on the NH44/7 corridor connecting Delhi in the north to cities like Nagpur, Hyderabad, Bangalore and Chennai in the central and southern region.

4 Socio economic context and traffic growth

Introduction

4.1 The growth of traffic on existing (brownfield) roads depends on, firstly, how fast the background travel demand grows (background growth); and secondly, how successful the roads are in attracting that traffic (traffic capture). Background travel demand is driven by the socio-economic conditions in the regions where the Asset are located and the country. These include:

- Changes in factors such as population, economic growth (regional and national) and industrial production; and
- Other local factors such as strategic port growth, and growth in local industries near the Asset.

4.2 In turn, the change in the relative competitive position of the Asset (and thus of the traffic capture they can achieve) derives from how the relative offer for the roads changes, i.e. the service offered, and the tolls charged on the project roads, in comparison to that on competing roads; and whether any competing road facilities are planned.

4.3 In this chapter, we have assessed the trends of the above growth drivers, as indicators of the socio-economic conditions in the regions surrounding the Asset.

Population growth

4.4 We have analysed the key socioeconomic drivers of the background traffic demand in the Uttar Pradesh state, where the Asset are located.

National level

4.5 Table 4-1 below shows that the total population in India has grown at a Compound Annual Growth Rate (CAGR) of 1.5% since 2000, decreasing over the years. The World Bank forecasts this growth to decrease to 0.6% CAGR by the 2030-45 period.

Table 4-1: CAGR of population in India

Years	CAGR		
	Total Population (m)	Rural Population (m)	Urban Population (m)
1970 – 1985]	2.3%	1.9%	3.8%
1985 – 2000	2.0%	1.7%	2.9%
2000 – 2015	1.5%	1.0%	2.6%

Years	CAGR		
	Total Population (m)	Rural Population (m)	Urban Population (m)
2015 – 2030*	1.0%	0.3%	2.3%
2030 – 2045*	0.6%	-0.3%	1.9%

Source: World Bank Data on Health Nutrition and Population Statistics, *forecast population growth.

State level

4.6 Table 4-2 shows the evolution of population in Utter Pradesh state compared to that of the country. Overall, as can be seen, the trend observed at the country level is also noticeable at the state level, namely, a move towards urban agglomeration with the growth in rural population being slower than that of urban population. Further, the state has grown at a higher rate than the country average, between 2012-2024.

Table 4-2: Population Growth in Uttar Pradesh and India (2012-2024)

State	2012 Population (m)	2024 Population (m)	CAGR (2012 – 2024)
Uttar Pradesh	201	237	**1.4%**
India	1,210	1,395	**1.2%**

Source: MoSPI Estimates

4.7 Due to the complexities of the patterns in which urbanisation takes place, and the very dynamic nature of local population migration (which are very difficult to forecast with accuracy), we do not use population growth as a proxy for understanding future travel demand growth on the Asset. It has been included in this section simply to provide a socio-economic context of the state/trends in the regions in which the Asset are located.

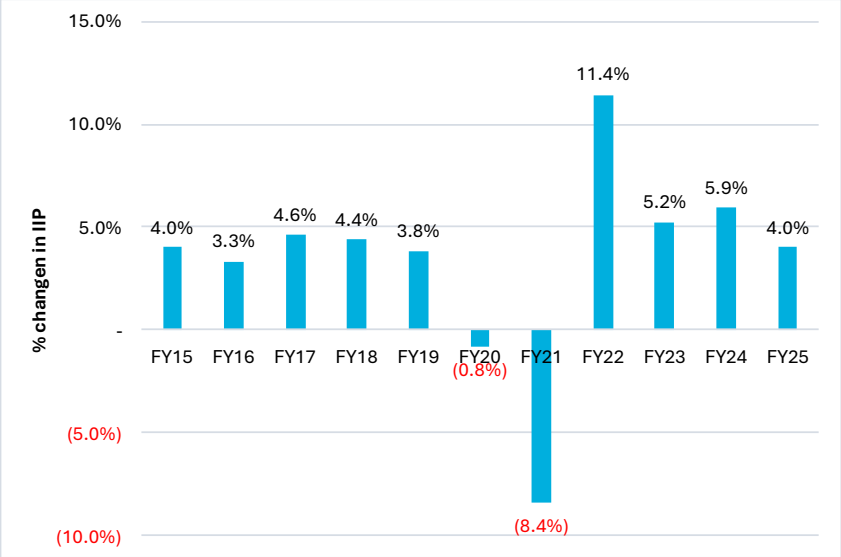
Economic Indicators

4.8 The Index of Industrial Production (IIP) is a composite indicator that measures the short-term changes in the volume of production for a basket of industrial products. The IIP data tracks the manufacturing activity in different sectors of an economy, with mining, manufacturing, and electricity being the three broad sectors constituting the IIP.

4.9 At an annual level, national IIP was growing at an average of 4% per year over the period FY15-19, before the country underwent a liquidity crisis and experienced an overall economic slowdown in FY20 (as presented in Figure 4.1 below). In the aftermath, IIP shrank by over 8% in FY21 due to a decline in economic activity in the wake of global lockdowns introduced to curb the Covid-19 pandemic. However, with the gradual opening up of economy post the pandemic, and recovery in consumption demand, industrial activity also recovered with time with IIP recording growth of 5% in FY23 and 6% in FY24.

4.10 The figure below shows that at an annual level, national IIP was growing at an average of 4% per year over the period FY15-19, before the country underwent a liquidity crisis and experienced an overall economic slowdown in FY20. In the aftermath, IIP shrank by over 8% in FY21 due to a decline in economic activity in the wake of global lockdowns introduced to curb the Covid-19 pandemic. Post the immediate recovery in FY22, IIP growth has since stabilised, with FY25 recording 4% growth over FY24.

Figure 4.1: Annual growth – Index of Industrial Production



Source: Steer analysis of MoSPI data

4.11 Since state-level IIP data is not as readily available as national level IIP, we have presented national IIP here to indicate nationwide activity in key industrial sectors like power, manufacturing, and mining, all of which influence long-distance commercial movements across the nation, and not unique to this asset. We however, do not use it to forecast future travel demand growth since long-term forecast for IIP is not available through official sources such as MOSPI, RBI or through multilateral organisations like WB, or the IMF.

Vehicle Ownership

4.12 Car ownership in India has traditionally been very low at 22 cars per 1000 individuals, compared to developed countries like the United States, which has approximately 980 cars per 1,000 individuals.[8] However this is slowly changing with the increasing per capita income levels. As can be seen in Figure 4.2 below, between 2007-17, the number of cars per 1,000 people more than doubled from 9 in 2007 to 22 in 2017 growing at a CAGR of approximately 11%. The corresponding ownership rates for urban cities like Delhi, Mumbai, Bengaluru, and Chennai are over 100 cars per 1,000 people[9] (GoI 2011; MoRTH 2012).

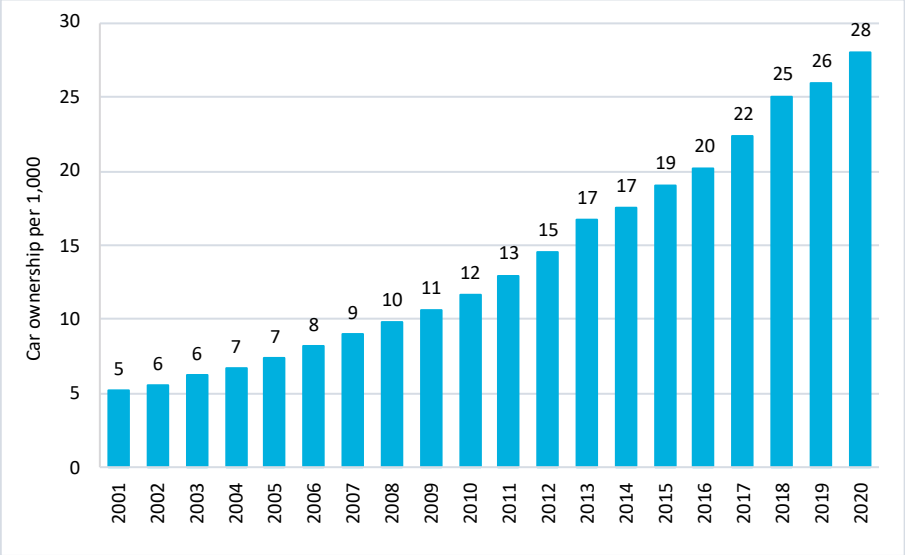
4.13 Overall, India still stands at a very nascent stage in the vehicle saturation curve, offering huge potential for growth going forward. As the income per capita of India and the region itself grow further, we expect car ownership levels to increase. As per the India Energy Outlook (2015), car ownership is projected to grow steeply to 175 cars per 1,000 population by 2040 in India.[10]

[8] India has 22 cars per 1,000 individuals

[9] Proliferation of Cars in Indian Cities

[10] https://www.gita.org.in/Attachments/Reports/IndiaEnergyOutlook_WEO2015.pdf

Figure 4.2: Car ownership in India per 1,000 population

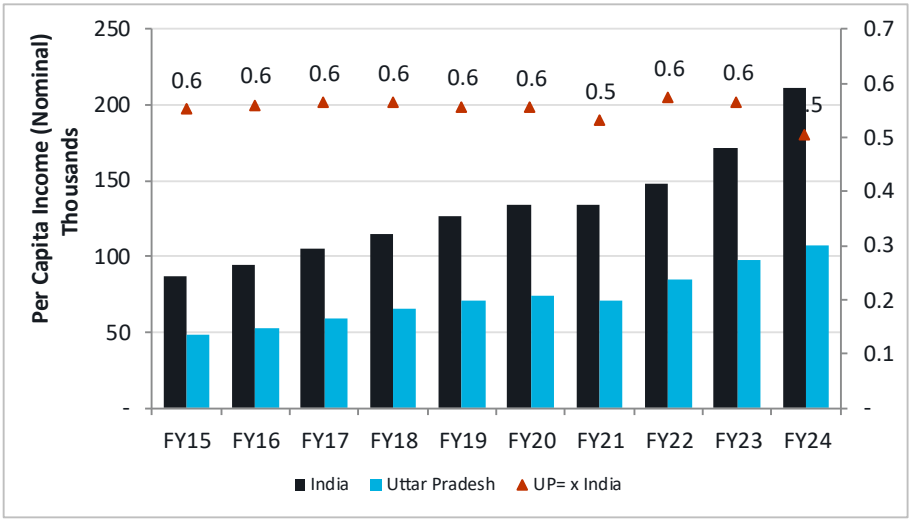


Source: International Energy Agency (IEA)

Per Capita Income (PCI)

4.14 The per capita income of the state where the Assets lies i.e., Uttar Pradesh is lower as compared to the national average. In dollar terms, PCI of just $1,000 per head indicates that the state is at a very early stage of consumption curve. Going forward, we therefore expect local consumption to be strong which would drive the growth in both passenger and commercial traffic.

Figure 4.3: Per capita income



Source: Steer Analysis of MoSPI data

4.15 However, given the difficulty in obtaining granular district level PCI data it is not advisable to use this as a growth driver. Also, the long-term forecast for PCI is not available we therefore refrain from using it to forecast traffic.

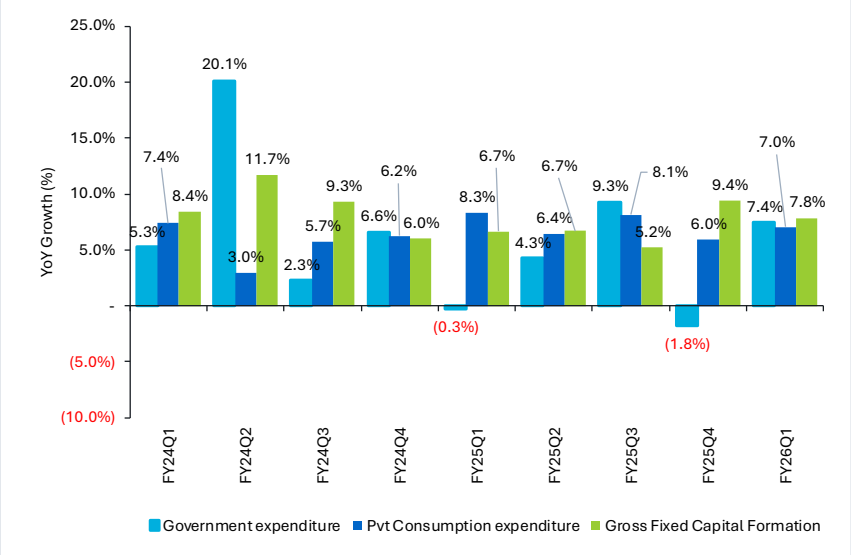
Economic growth

India's Performance

4.16 Despite a slowdown in the economy during H1FY25, the Indian economy has observed strong growth each quarter since FY25Q2, with the latest published estimates for FY26Q1 GDP at 7.8% over FY25Q1. This performance has been driven by strong growth in investment and consumption expenditures and higher consumer optimism for the year ahead[11].

4.17 The figure below, we present quarterly Y-o-Y growth in three major components of GDP – government expenditures, consumption expenditures, and business investment (gross fixed capital expenditure) over the past two years (FY24-FY26Q1).

Figure 4-4: Government final consumption expenditure



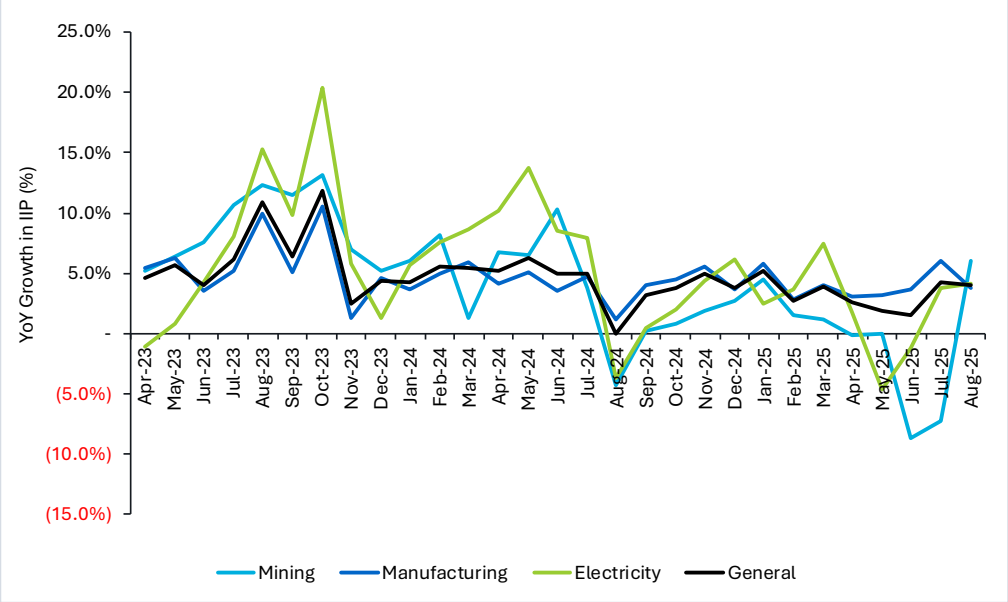
Source: Steer Analysis of MOSPI Data

4.18 While consumption and investment expenditures have continued to show consistent growth over the past two quarters, government expenditures observed a marginal decline in FY25Q4. In FY26Q1, government expenditures rebounded, recording 7.4% growth over FY25Q1 levels.

4.19 Performance across different types of industrial activities (such as Mining, Manufacturing, and Power Generation) directly impact freight movement and commercial traffic volume growth across the country, including on the Asset. In the figure below, we present growth trends in IIP – a measure that tracks the performance of the economy across these activities. As of FY26YTD (Apr-Aug '25), the Manufacturing sector continues to perform strongly, recording positive y-o-y growth since FY25Q3. While industrial activity across the two other sectors (i.e., Power Generation and Mining) dropped between May and Jun/Jul '25, they have since rebounded and show signs of continued growth going forward.

[11] Government of India, PIB Release Oct 1 '25

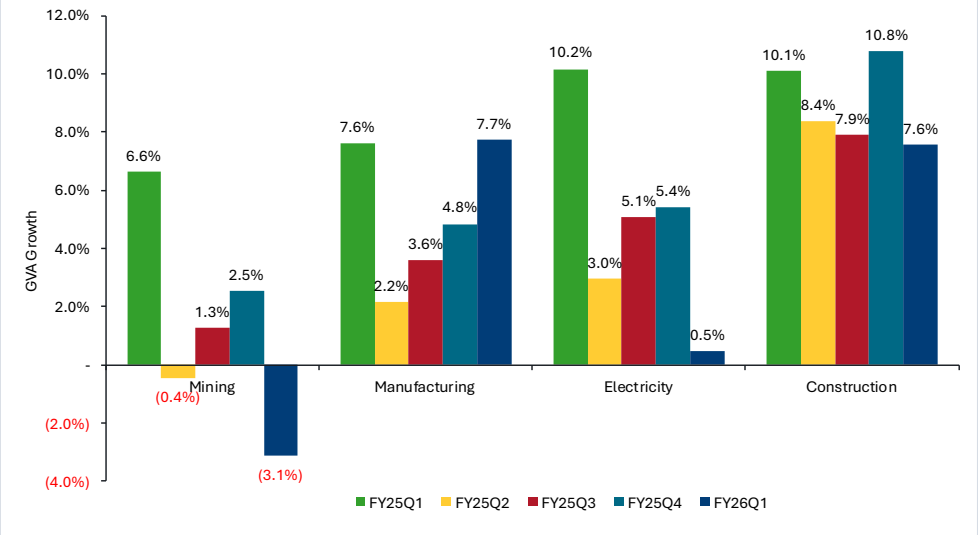
Figure 4-5: Month on Month IIP performance



Source: Steer Analysis of MOSPI Data

4.20 In addition to monthly trends in IIP, the figure below presents y-o-y growth of quarterly GVA in four industrial sectors - Mining (& Quarrying), Manufacturing, Electricity (and other Utilities), and Construction. While the Mining and Power sectors observed decline and muted growth in FY26Q1, the Manufacturing and Construction sectors experienced strong growth. While overall economic growth has remained resilient as of FY26YTD, performance across industries have varied, impacting economic growth across different regions and on the Asset as well.

Figure 4-6: Industrial components of GVA



Source: Steer Analysis of MOSPI Data

GDP and GSDP Growth

4.21 Over the period FY12-FY24, the Indian economic has grown at a CAGR of approx. 6% aided by growth in the tertiary sector which grew at a CAGR of approx. 6.9% over the same

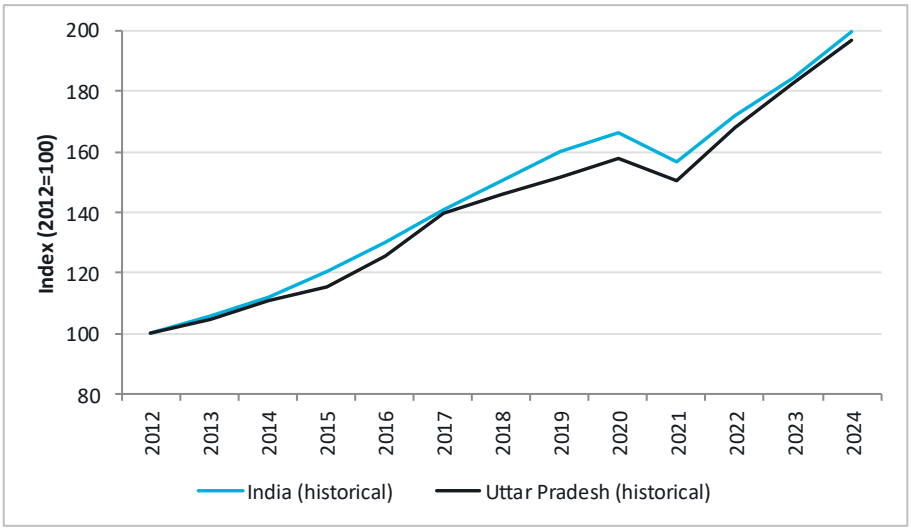
period. The economic growth of Uttar Pradesh (GSDP) has been slightly slower than the country overall. Uttar Pradesh's GSDP CAGR was 5.8% between FY12-24. Uttar Pradesh approximately contributes 8% to the India's GDP. In terms of per capita income, Uttar Pradesh's has lower per capita income than the country.

4.22 In terms of sectoral contribution to the state GDP, tertiary sector has the highest share (47%) followed by secondary (27%) and primary (24%), with the sectoral shares remaining stable over the last few years.

4.23 Uttar Pradesh is the most populous state in India with a population of ~237 million people. The state has a large pool of skilled, semi-skilled and unskilled labour. Uttar Pradesh is also considered the largest consumer base in the country. The tertiary sector has the highest sectoral contribution to the state GDP followed by the secondary and primary sectors. These shares have remained stable for the past decade.

4.24 The tourism and transport sector constitute a majority of the state's tertiary sector. Uttar Pradesh is considered a favoured tourist destination in India, with key tourist attractions being Agra, Varanasi, Mathura and Prayagraj. In 2023, the state contributed 16% share to national tourism pie which is second highest after Tamil Nadu12. The state holds third position in the country in foreign tourist arrivals with over 3.78 million[13]. Also, the state recorded a tourist footfall of 64.90 crore in 2024, a significant increase of over 17 crore from 2023 as per Union Ministry of Tourism[14]. Overall, Uttar Pradesh has 8.2% contribution to national GDP as per 2024 statistics.

Figure 4-7: Evolution of Uttar Pradesh's state GDP and national GDP



Source: Steer Analysis of MOSPI Data

4.25 In terms of secondary sector, the state has key industrial areas in Khurja (Ceramic); Moradabad (Metals); Meerut, Bareilly, Mirzapur and Lucknow (Handloom & Handicrafts);

[12] 'UP is 2nd biggest contributor to domestic tourism' | Lucknow News - Times of India (indiatimes.com)

[13] http://tourism.gov.in/sites/default/files/Other/India%20Tourism%20Statistics%20at%20a%20Glance%202019.pdf

[14] up-sees-65-crore-tourists-in-2024-over-17-crore-more-from-2023

and Kanpur and Noida (Leather and tannery). The state also has an oil refinery in Mathura, operated by Indian Oil Corporation.

4.26 Uttar Pradesh has very fertile Gangetic land with a large share of population dependent upon agriculture sector for the livelihood. The key primary industries in the state include food processing, crop production and horticulture. The state is mainly known for production of wheat, sugarcane, potato and mango.

4.27 The official historical GDP and GSDP data for India are released by the Ministry of Statistics and Program Implementation (MoSPI). The GDP forecasts for India are available from various reliable sources such as Oxford Economics and Consensus Economics[15], but state-specific GSDP forecasts are not published by any such sources. To derive state GSDP forecasts, we rely on past trends of the relationship between GDP and GSDP, and develop GSDP forecasts as a function of our assumed GDP forecasts[16].

4.28 For any indicator to be used as a growth driver to forecast traffic, a reliable source of historical and forecast data availability for that indicator is the key requirement. Of the key socioeconomic indicators discussed above, GDP was assessed to be the only growth driver for which reliable data is available both in terms of historical and forecast data. Therefore, to forecast traffic, we use GDP/GSDP as our key growth drivers.

Forecasts for growth drivers

4.29 Following the discussion in Chapter 2 on the nature of economic activity in the state of Uttar Pradesh, in this section, we describe the assumptions in relation to forecasts of the key macro-economic drivers of traffic growth. Particularly, we have based our forecast on GSDP using forecasts of GDP as provided by the Client.

National GDP

4.30 After the last period of economic slowdown in FY11-12, the country experienced an economic downturn again in late FY19 with FY20 having reported a GDP growth of 4% (relative to an average growth rate of 7% per year between FY13 and FY19). India's GDP growth declined as domestic investment and consumption demand were already under stress because of the liquidity crunch before Covid-19. Other factors that contributed to the economic slowdown included reduced growth rates in automobile sales and production, liquidity crunch in credit markets and rising number of Non-Performing Assets (NPAs) within the banking sector, as well as lower manufacturing production and lower rural consumption.[17]

4.31 The Covid19 outbreak had a significant impact on the Indian economy during the first two quarters of FY21 as government mandated lockdowns across the country effectively stalled economic activity and growth. The growth momentum eventually picked up in Q3 of FY21, with a sharp rebound in the economy in FY22 (GDP recorded 9.7% growth over

[15] **Consensus Economics - Economic Forecasts and Indicators**

[16] Assuming that the historical long-term relationship between GSDP and GDP sustains over the short-term, we project future growth in GSDP as a function of our GDP growth forecast. We taper the relationship of GSDP growth to converge to GDP growth gradually over the long-term.

[17] **Data | India's GDP was on a downward slope even before COVID-19 wreaked havoc - The Hindu** (September 2020)

FY21), and has since observed a consistent growth of 7.6% in FY23, 9.2% in FY24 and 6.5% in FY25 (as per the SAE) before slowing down over the past year due to several domestic and external factors.

4.32 Figure 4-8 below shows client provided GDP projections for India. The forecast provided by the Client expects the Indian GDP to grow at 6.5% between FY25-FY27[18] and gradually tapering down to 5.2% by FY51, end of concession. The India GDP growth forecast provided by the Client is broadly in line with other independent forecasts available from reliable sources such as IMF, World Bank and RBI[19] in the medium term.

Figure 4-8: GDP-GSDP forecast

[19] **Survey of Professional Forecasters on Macroeconomic Indicators – Results of the 93rd Round (April 2025)**

5 FY26 Base year AADT and Traffic growth Analysis

Introduction

5.1 In this section, we present our approach, assumptions, and estimates for base year AADT and background traffic growth for each vehicle category on the Asset.

5.2 Traffic growth is commonly related to a variety of macro-economic and industry- or commodity-specific factors (hereafter referred to as 'traffic growth drivers'). These growth drivers are typically identified from the results of the OD data analysis and the site visits that help us appreciate the nature of traffic movement – 'what' travels 'where' and 'why'.

5.3 In the absence of Historical data on the Asset, the option of running statistical method to estimate background growth relationships was not available, therefore we have undertaken a detailed benchmarking exercise, coupled with trip length and OD analysis to estimate the elasticities. These are discussed in detail below.

FY26 Base year AADT estimates

5.4 The base year is the year on which long-term background forecast growth rates are applied to derive year-wise average annual daily traffic (AADT) estimates for forecast years. This is therefore an important aspect of our forecasting approach as traffic and ultimately revenue forecasts for future years are built on top of the base year traffic estimate. We have used FY26 as the base year for AADT estimates for the forecast years.

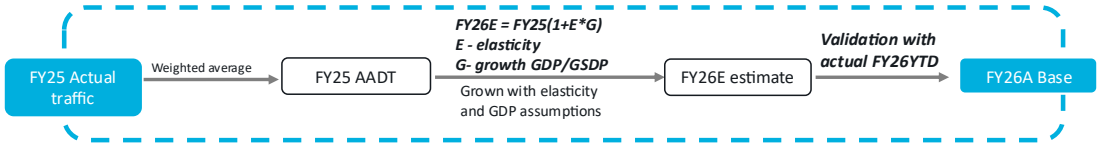
5.5 As described previously in Chapter 3, to establish the base year (FY26) traffic position, we utilised information from various sources – including from the Client and our context knowledge, to assess a reasonable demand on the corridor.

Methodology

5.6 The base traffic for FY26 has been estimated utilizing the actual 12 months of FY25. The weighted average of the actual FY25 traffic (April to March) was taken to arrive at annual FY25 AADT. Using elasticity-based growth assumptions GSDP or GDP we arrived at estimated FY26 (FY26E).

5.7 The monthly profile of the FY26E AADT was then compared to the actual traffic observed in the six months (April 2025 to September 2025) of FY26 (FY26YTD). The Adopted FY26 AADT (FY26A) is derived by making necessary adjustments to FY26E to reflect the outturn traffic in FY26YTD (adjusted for seasonality). The methodology is represented using the below schematic:

Figure 5-1: FY26 Base Estimation methodology



Source: Steer Analysis

5.8 The two key inputs to estimate the base year FY26 traffic are: FY25 traffic and seasonality correction factor (SCF).

Seasonal Correction Factors

5.9 Traffic on any Asset varies on a month-on-month level. Such variations maybe due to monsoons (typically Jul to Sept) or due to festivals in the region. For e.g. It is observed that typically the truck traffic during the first half of the financial year (April-September) is generally lower than the annual average, mainly because of peak summer season followed by monsoons affecting the freight movement patterns in large parts of the country in the July-September period. In addition to these there may be other seasonal variations specific to the Asset.

5.10 To normalise for these variations across the year to provide an AADT estimate, Seasonality Correction Factors (SCF) are used. SCFs are estimated to convert the monthly traffic numbers to an AADT level while accounting for seasonal variation due to local/national festivals, weather changes and/or temporary external impacts. These are typically estimated using historical data for each plaza and vehicle category over multiple years. An SCF >1 means that the traffic for the month is lower than the annual average and vice-versa.

5.11 Historical traffic data was available for all toll vehicle categories starting October 2020 up-to September 2025. Therefore, in absence of longer-term historical data for the Asset where FY21 and FY22 are COVID-19 impacted years, we assume FY23 onwards to be normal years, thus average FY23 to FY25 seasonality is considered for FY26 base year estimation for all the vehicle categories except for MAVs. For MAVs average FY23-FY24 SCF are used due to impacted traffic in Feb'25 and Mar'25.

5.12 Table 5-1 and Table 5-2 below present the average FY23-FY25 SCF used to estimate the AADT for both the toll plazas:

Table 5-1 SCF values for JL TP1

Vehicle Category	Apr	May	Jun	Jul	Aug	Sep	Oct	Nov	Dec	Jan	Feb	Mar
CJV	1.03	0.98	1.00	1.08	1.04	1.11	1.02	0.95	0.94	1.01	0.90	1.00

Adopted base estimates

5.13 Based on the above methodology and inputs, the adopted base for both toll plazas have been shown below:

Table 5-3: Adopted base estimates: JL TP1

	FY25	FY26YTD	FY26A	FY26A vs FY25
CJV	3,353	3,484	3,604	7.5%
LCV	311	328	336	7.9%
Bus	185	174	175	(5.6%)
2A	1,422	1,542	1,577	10.9%
3A	1,280	1,413	1,397	9.2%
MAV	2,010	1,823	1,910	(5.0%)
OSV	2	2	2	-
Total	**8,563**	**8,766**	**9,000**	**5.1%**
PCUs	**19,364**	**19,606**	**20,094**	**3.8%**

Source: Steer analysis; FY25 actual full year, FY26YTD includes 6 months of FY26, FY26A is adopted base for FY26

Table 5-4: Adopted base estimates: JL TP2

	FY25	FY26YTD	FY26A	FY26A vs FY25
CJV	2,575	2,608	2,698	4.8%
LCV	303	320	329	8.6%
Bus	168	158	158	(5.8%)
2A	1,379	1,492	1,531	11.1%
3A	1,305	1,409	1,395	6.9%
MAV	1,865	1,732	1,800	(3.5%)
OSV	2	1	2	
Total	**7,595**	**7,720**	**7,913**	**4.2%**
PCUs	**17,969**	**18,195**	**18,607**	**3.6%**

Source: Steer analysis; FY25 actual full year, FY26YTD includes 6 months of FY26, FY26A is adopted base for FY26

5.14 As can be seen from Table 5-3 and Table 5-4 above, the PCU growth for FY26A compared to FY25 is 4.1% on TP1 and 3.8% at TP2. This increase is mostly driven by 2A and LCV and reflects the recent rapid development of the 2A using the corridor. Demand produced by places like Nagpur, Hyderabad, Bangalore, and Chennai has been the key driver of growth on this corridor. The success of 2A and LCVs along the NH44 routes has contributed to their growth. Hence, increase of approximately ~12% has been observed in 2A vehicle traffic across both plazas, reflecting a broader trend along the corridor. Conversely, the MAV growth has remained subdued, primarily attributed to traffic shift to Delhi Mumbai Expressway and the NH-30.

Estimation of background elasticities

Overview

5.15 For brownfield Asset, where sufficient historical traffic evolution is available, it is common practice to use regression model analysis to determine the relationship, expressed as elasticity, between traffic growth and key socioeconomic drivers. This relationship is then applied to assumptions of future socio-economic evolution to estimate future traffic growth.

5.16 As for the Asset under consideration, a historical trend was not available since the Asset started tolling by the client in Oct-2020 and both FY21 and FY22 have been affected by Covid19 related disruptions. Therefore, we undertook a benchmarking exercise in order to estimate our forecast elasticities, Sources used included historical vehicle wise traffic growth on the Asset, outputs from the analysis of the OD data (refer chapter 3 for Commodity and trip length analysis) collected on the toll plaza. We have also undertaken a regional benchmarking against Asset having similar traffic profiles, which give us reasonable confidence the relationships proposed.

5.17 In terms of selection of growth drivers for vehicle types, in general we have assumed state GSDP as the key driving factor for the passenger traffic given this traffic is generally driven by the local economies of the cities and state containing the Asset. The heavier commercial vehicles generally ply long-distance, and the underlying growth is governed by the general economies of several states or nation as whole.

5.18 Given the nascent stage of India's logistics sector, characterized by a highly fragmented trucking industry (95% of operators owning fewer than five trucks) and low car ownership rates (30-35 per 1000 people), the forecast elasticities are projected to remain constant throughout the concession period. This assumption is grounded in historical trends and a long-term perspective on regional and national growth, suggesting market maturity is still several years away.

5.19 Table 5-5 below presents the growth drivers identified to model the forecast background traffic growth rates.

Table 5-5: Identified growth drivers to model traffic growth

Vehicle type	GDP India	GSDP Uttar Pradesh
Car		100%
LCV		100%
Bus		100%

Vehicle type	GDP India	GSDP Uttar Pradesh
2A	100%	
3A	100%	
MAV	100%	

Source: Steer Analysis

5.20 Further to developing estimates for FY25 AADT, the Asset has operational history between FY22 and FY25, proving us three years of traffic growth on the Asset. Table 5.6and Table 5.7 below summarise the volume growth across each of the vehicle categories. For this comparison we have normalised the FY22 AADT for COVID19 by adopting seasonally corrected H2FY22 as the FY22 normalised (FY22N).

Table 5.6: Passenger and Commercial growth with normalised FY22 – JL TP1

Vehicle type	FY22N	FY23	FY24	FY25	FY26A	FY22N-26 CAGR
CJV	2,872	3,040	3,157	3,353	3,604	5.8%
LCV	220	236	253	311	336	11.1%
Bus	163	167	191	185	175	1.8%
2A	969	1,123	1,226	1,422	1,577	13.0%
3A	1,248	1,313	1,325	1,280	1,397	2.9%
MAV	1,611	1,761	1,818	2,010	1,910	4.3%
OSV	2	1	2	2	2	-
Total	**7,085**	**7,641**	**7,971**	**8,563**	**9,000**	**6.2%**
PCUs	**15,861**	**17,232**	**17,987**	**19,364**	**20,094**	**6.1%**
Passenger	3,034	3,207	3,348	3,538	3,779	5.6%
Commercial	3,828	4,197	4,369	4,712	4,884	6.3%

Source: Steer Analysis; Note; Passenger includes CJV and LCV traffic whereas Commercial includes LCV/2A/3A/MAV traffic

Table 5.7: Passenger and Commercial growth with normalised FY22 – JL TP2

Vehicle type	FY22N	FY23	FY24	FY25	FY26A	FY22N-26 CAGR
CJV	2,284	2,376	2,447	2,575	2,698	4.3%
LCV	201	222	243	303	329	13.1%
Bus	148	148	176	168	158	1.6%
2A	929	1,073	1,178	1,379	1,531	13.3%
3A	1,230	1,301	1,310	1,305	1,395	3.2%
MAV	1,541	1,689	1,713	1,865	1,800	3.9%
OSV	2	1	1	2	1	-
Total	**6,335**	**6,811**	**7,068**	**7,595**	**7,913**	**5.7%**
PCUs	**14,787**	**16,058**	**16,670**	**17,969**	**18,607**	**5.9%**
Passenger	2,432	2,525	2,623	2,743	2,856	4.1%
Commercial	3,700	4,063	4,201	4,548	4,726	6.3%

Source: Steer Analysis; Note; Passenger includes CJV and LCV traffic whereas Commercial includes LCV/2A/3A/MAV traffic

5.21 Babina toll plaza is growing at 6.0% from FY22N to FY26 at the PCU level, whereas Vigakhet is growing at 5.9%. Passenger traffic, which includes CJV and buses, is projected based on the state's GSDP, as the growth is driven by the regional local economy. Meanwhile, commercial traffic (2A/3A/MAV) is growing in relation to GDP, as the Asset lies on the NH44 corridor, which primarily facilitates north-south movement between Delhi and north and Chennai and south. Any growth observed on the Asset is influenced by regions along this north-south route.

5.22 The sections below detail out the reasoning for selection of respective growth driver(s) for each vehicle category.

5.23 It must be understood that, in recent historical traffic performance across national highway corridors, a notable trend has emerged: there is a discernible shift in axle preference towards 2As and MAVs, resulting in a dampening effect on the growth of 3As. This trend is mirrored in the Assets FY24 and FY25 performance as well. Consequent of these evolving axle preferences, it has been assumed that the relationship between 3As and GDP will be relatively muted, whereas 2As and MAVs are expected to grow more closely in line with the country's GDP.

Table 5-8: Elasticity recommendations for the Asset (both sections)

Vehicle Category	Proposed	Growth Driver	Comments
CJV	1.0	Uttar Pradesh GSDP	CJV traffic is predominantly catering to the local demand of towns of Jhansi and Lalitpur. Generally, we would expect that in fast-growing economies, car traffic growth rates are in line with growth in GSDP/GDP i.e., suggesting elasticities at or just above 1.0.
Mini LCV	0.6	Uttar Pradesh GSDP	Mini LCV traffic is predominantly catering to the local demand of towns of Jhansi and Lalitpur. Historical growth observed is similar to LCVs on all plazas hence the same elasticity is assumed as LCVs.
Buses	0.4	Uttar Pradesh GSDP	Buses tend to grow as the intercity connections improves. With Uttar Pradesh being a large state, buses tend to play an important role linking key cities in the state. A large majority of trips are within 100-300 km.
LCV	0.5	Uttar Pradesh GSDP	As discussed in chapter 3, the trip lengths of LCV and 2A category (up to 72%) are predominantly long-distance trips. The origins and destinations are similar to those of 3A and MAVs on the Asset. These trucks are special trucks which carry commodities such as courier/parcel, and automobile and ancillary parts as well. In addition to long distance movement, they also made short distance local trips feeding into the local demand generated by the cities nearby. Therefore, considering the above observations, and our experience across other toll roads in the region, we believe that elasticities of 0.5 for LCV with respect to state GSDP are considered reasonable.
2A	0.9 tapered to 0.8 by FY35	GDP India	2A/3A/MAV are primarily long-distance traffic carrying a healthy mix of commodities. Agriculture products and groceries are the key commodities moving on the Asset. However, this Asset is becoming a key link between Delhi,

Vehicle Category	Proposed	Growth Driver	Comments
3A	0.3	GDP India	Nagpur, Bangalore and Chennai forming part of the strategic NH7/44 corridor. Trip lengths for almost 55% of the MAV are more than 1000km, signifying long distance nature of the traffic. Therefore, a relation of 1 to GDP is considered reasonable for MAV. We believe 3A to grow slower as compared to MAV as there is an increasing preference to use MAVs for long-distance movements.
MAV	1.0	GDP India

.

6 Forecast: Network overlays and forecasts

Introduction

6.1 Following the discussion on our forecast of background growth rates in the previous chapter, this chapter first covers the potential network impacts on traffic growth on the Asset. Thereafter, we present our assumptions around toll segmentation, trip factors and evolution of toll rates for the forecast period which are used to forecast revenues as derived from forecast traffic. In the final section, this chapter summarises traffic growth rates for the forecast years.

Analysis of potential network/developmental impacts

6.2 The section below details the impacts which we believe would affect traffic on the Asset during the concession period. As discussed in earlier Chapters, to assess the impacts on the Asset, whether positive or negative, we have studied developments (alternate roads, feeder roads and regulatory) in the surrounding road network.

Impact of DME and Surat Solapur Chennai on Delhi- Chennai traffic

6.3 The National Highway Authority of India (NHAI) is building 1350km long greenfield expressway connecting Delhi and Mumbai. It is an 8-lane access-controlled route with 4 lanes in each direction connecting Delhi-Noida Direct (DND) Flyway in Delhi with the Jawaharlal Nehru Port Trust (JNPT) in Mumbai. At 1350km long, it will drastically reduce travel length and times from Delhi to Mumbai. With this alignment, it is expected that once it's completed, the Delhi-Mumbai Expressway could attract long-distance traffic from the north including Delhi/North of Delhi regions and going that is presently using the asset.

6.4 As mentioned in Chapter 2, a few sections of the greenfield expressway have been made operational with Sohna-Dausa-Lalsot section (Feb'23), Madhya Pradesh section (Sep'23), Vadodara-Bharuch section (Feb'24), Lalsot-Sawai-Madhopur section (Feb'24) and the Kota-Bundi Section (Dec'24) already being operationalised. The project is currently suffering from construction delays, mainly on the Gujarat stretch. The timeline for completion of the expressway has been revised several times and is now expected to be completed by 2027 as per reports. It is key to note that while certain sections of the Rajasthan expressway lack direct connectivity, they are effectively linked via state highways.

Figure 6.1: Alternate Route via Delhi Mumbai Expressway and Surat Solapur Chennai

Source: Steer Cartography

6.5 Further, the existing alignment between Indore and Hyderabad is currently being upgraded to 4 lanes throughout. Once the widening of the existing alignment is completed, the route via Indore, Khandwa, Muktainagar, Akola, Nanded will provide an alternate route traveling between Madhya Pradesh/ North and Hyderabad/South. An alternate route of this mentioned OD pairs already exists via NH52. The widening of the section will improve the LOS of the existing alternate route.

6.6 There are currently two key options for north south traffic movement between Delhi/north and Kurnool/south via:

- using NH19/NH44 via Delhi-Agra-Gwalior-Sagar-Nagpur-Hyderabad-asset-Kurnool-Karnataka/Chennai
- using NE4/NH52/SCE via Delhi-Lalsot-Indore-Dhule-Aurangabad-Solapur-Kurnool-Karnataka/Chennai.

6.7 Currently, the traffic is using NH44 corridor as it is cheaper and shorter for north-south travel. The proposed upgrades on NH52 coupled with upcoming Delhi-Mumbai Expressway (DME) and Surat-Solapur-Chennai Expressway (SCE) will improve the alternate route's overall attractiveness as long-distance corridor for traffic moving north and south. For this expressway 2 out of 13 packages have been awarded and rest are under bidding[20].

6.8 The users travelling from Delhi/north to Kurnool/south will have the option to divert to DME at Delhi instead of taking NH44/NH52. The users can then exit from DME at Indore where they can travel till Solapur on an upgraded 4-lane highway (NH52). At Solapur, the users can divert on the upcoming SCE to reach Chennai. Hence, the route via DME-NH52-SCE, which will be a mix of expressways and upgraded NH, will act as a competing route for the Asset.

6.9 The In-scope trips considered include movements between

- Delhi and north India including states of Haryana, Punjab, and
- parts of Tamil Nadu such as Chennai and Puducherry.

6.10 The benefits will also be most valued by long distance users which can make end to end movements as compared to those users with intermittent destinations. Given the novelty of the expressway and its expected impacts on a fragmented logistics market, we have assumed that 50% of impact will be realised within the first year of its completion whereas the 100% will occur in FY32 when the SCE becomes operationalised.

Table 6-1: Impact of DME and SCE for TP1

Vehicle category	FY27	FY32 onwards
Staging	*50%*	*100%*
2A	(5.3%)	(12.0%)
3A	(5.1%)	(11.5%)
MAV	(2.7%)	(6.1%)

Source: Steer analysis, 90% impact will be applicable from FY32, while impact will be applicable in a phased manner from FY27.

Table 6-2: Impact of DME and SCE for TP2

Vehicle category	FY27	FY32 onwards
Staging	*50%*	*100%*
2A	(5.5%)	(12.3%)
3A	(5.1%)	(11.6%)
MAV	(2.9%)	(6.4%)

Source: Steer analysis, 90% impact will be applicable from FY32, while impact will be applicable in a phased manner from FY27.

6.11 We expect such shifts to take place over course of time once the benefits of the expressway are fully visible and could be influenced by three factors:

[20] https://infrainfohub.com/surat-chennai-expressway-route-map-cost-progress-and-latest-updates/

- the last and first mile connectivity; and
- roadside facilities typically seen along the national highway network such as truck stops, rest/refresh areas, affordable food/drink facilities; and
- fuel and repair shops coming up along the expressway network.

Revenue forecasting assumptions

6.12 To forecast the revenues for a particular financial year, the traffic forecast for each vehicle type is converted into tickets sold, which is then multiplied with the corresponding toll rate, which grows over the years as defined in the Concession Agreement. While "trip factors" provide the conversion factor to the former, i.e., traffic (total trips) to tickets sold, "toll segmentation" provides the latter i.e., the breakup of trips paying each ticket type. This section discusses assumptions related to trip factors, toll segmentation and toll rates for the forecast period.

Toll segmentation

6.13 The Ministry of Road Transport & Highways has finalized a compensation formula for existing toll concessionaires to offset revenue loss from the Annual Pass scheme for non-commercial vehicles. To access the document, refer to the following link.

6.14 Across multiple assets, the number of passes sold has observed to be rising on a day-to-day basis, indicating an early adoption among frequent users since its introduction on 15th August 2025 till 30th September 2025, and a corresponding decline in other ticket categories mainly in the single and return categories. The evolution of proportion of users using the annual pass up to September 2025 is presented below:

%CJV using Annual pass	15th to 31st Aug	1st to 15th Sept	16th to 30th Sept
TP1 Babina	12.7%	20.8%	23.8%
TP2 Vigakhet	14.2%	21.2%	24.2%

6.15 CJV Segmentation for FY26 has been developed using the pre annual pass segmentation till 14th August 2025, and daily Annual Pass transaction data from 15th August 2025 till 30th September 2025. Post September 2025, a gradual ramp up is assumed such that they form a large portion of the CJV trips by the end of FY26. This corresponds to a reduction in a proportionate decrease in single and return trips. For FY27 and beyond, we have assumed the share of annual pass trips to be in line with that observed at the end of March 2026, by when we believe the distribution of ticket categories in CJVs should stabilise.

6.16 For Babina, In FY26, the share of CJVs using the Annual Pass is projected at **18%** (on a full year basis), ramping upto 37% by March 26, which is expected to be the baseline adoption for FY27, for TP2 Vigakhet this is expected to be 19% for FY26 and 39% by March 26.

6.17 For other vehicle categories we have analysed the historical TMS data split by ticket categories, to understand trends, as shown in Chapter 3. For the traffic and revenue forecast, FY26YTD (Apr- Aug) as discussed in the earlier sections, can be considered a normal period.

Table 6-3: Segmentation for forecast years, TP1 Babina

Ticket type	CJV FY26	CJV FY27	Mini LCV	Bus	LCV	2A	3A	MAV
Single	21%	14%	28%	34%	89%	92%	96%	88%
Return	36%	24%	47%	33%	10%	6%	4%	10%
Monthly	-	-	-	-	-	-	0%	0%

6.18 The Annual pass compensation is separately calculated using the formula prescribed by NHAI in the same circular. Following Table 6.6 presents the Annual pass compensation computed for the toll plaza.

Table 6.5: Annual pass compensation for CJVs (in Crore)

Toll Plaza	FY26	FY28	FY33	FY38	FY43	FY51
Babina	2.1	5.5	9.2	15.1	25.0	54.0
Vigakhet	1.2	3.3	5.5	9.0	14.9	32.2

6.19 Source: Steer Analysis

Trip factors

6.20 Trip factors are used to calculate the revenue for the trips made on passes such as return, local personal, monthly passes. The trip factors assumed are based on the latest FY23 data available and listed in the tables below:

Table 6-6: Trip factors at TP1 Babina

Forecast	CJV/Mini LCV	LCV	Bus	2A	3A	MAV
Single	1	1	1	1	1	1
Return	2	2	2	2	2	2
Monthly	45	45	7	45	45	50
Local commercial/Annual Pass	1	1	1	1	1	1
Local Personal	22	-	-	-	-	-

Monthly	45	45	50	45	45	45
Local commercial/Annual Pass	1	1	1	1	1	1
Local Personal	17	-	-	-	-	-

Source: steer analysis of Client TMS data

Toll evolution

6.21 Based on the concession agreement and the gazetted toll notification, we understand that base toll rates increase every year (revision month is April) based on WPI-linked inflation. These are rounded up to the nearest five to estimate the final toll rate charged to users.

6.22 We have used actual toll rates from the FY25 toll notifications and FY26 WPI to validate the modelling of future toll evolution. Increase in WPI was calculated based on the Client's WPI forecasts, as shown in the table below. These forecasts provided by the Client expect the Indian WPI to grow at an average of 4.2% between FY25-FY51. The WPI forecasts available from other independent forecasting agencies may vary from this assumption and could be lower or higher than that provided by the client.

Table 6-8: WPI growth forecast assumptions

Financial year	WPI growth (%)
FY26	2.57%
FY27	2.4%
FY28	5.0%
FY29	5.1%
FY30	4.9%

FY31	4.4%
FY32 onwards	4.1%

Source: Client inputs used for WPI FY27 onwards.

Revenue reconciliation

6.23 As part of validating the data provided by the Client, as well as our assumptions around toll calculations, we have reconciled the actual reported revenue on a monthly level for the Asset. To reconcile we have used the FY26YTD (April 2025 to August 2025) segmentation, FY26YTD AADT and compared it with the reported revenue at the AADC (Annual Average Daily Collection) for the year. The exercise was undertaken at an annual level. The comparison, as shown in Table 6-9 and Table 6-10 below, depicts the modelled revenue vs the reported revenue difference, and the difference lies within 0.5% for both, this gives us the confidence in the assumptions around segmentation and trip factors for future forecast purposes.

Table 6-9: Revenue reconciliation summary TP Babina at AADC level (INR lakhs)

Modelled	Reported	Delta

Traffic and Revenue forecasts

6.24 Based on the traffic and revenue-related forecast assumptions discussed above, we have modelled the traffic and revenue forecasts for the forecast period for the Asset. The tables below present the AADT/PCU and revenue forecast growth rates and CAGRs on this Asset. Further, Appendix B presents the AADT and revenues for the forecast period.

Table 6-11: Forecast traffic for TP1 Babina

Vehicle Type	FY26	FY28	FY33	FY38	FY43	FY51
CJV	3,105	3,509	4,673	6,212	8,156	12,287

Target revenues and modification of concession period

6.26 As per the concession agreement, the target revenue for TP1 and TP2 should be 7.9 Cr and 5.3 Cr for the month of March 2030 first calculation of target revenue and 18.9Cr and 12.8Cr for the month of March 2040 for the second calculation of target revenue. The traffic sampling will be undertaken for a continuous period of 7 days during anytime within 15 days prior to the date on the specified year, previous year and following year. The average thereof will be deemed as 'actual revenue.' If the target revenue for any section falls short or exceeds by 2.5%, the concession period shall be deemed to be modified using the laid-out conditions in the concession agreement. Table 6.19 and Table 6.20 below presents the summary of the analysis.

Table 6.19: Target Revenues for Extension 1

Asset	Target Month	Target Revenue	Estimated Revenue			Average Revenue	Variation (%)
		Cr	2029	2030	2031		
JL TP1	Mar-30	7.87	12.27	13.54	14.79	13.53	72.0%
JL TP2	Mar-30	5.28	8.52	9.40	10.25	9.39	77.8%

Source: Steer analysis

Table 6.20: Target Revenues for Extension 2

Asset	Target Month	Target Revenue	Estimated Revenue			Average Revenue	Variation (%)
		Cr	2039	2040	2041		
JL TP1	Mar-40	18.89	29.52	32.28	35.44	32.41	71.6%
JL TP2	Mar-40	12.81	20.37	22.29	24.46	22.37	74.7%

Source: Steer analysis

6.27 We have used the average AADT forecast for target year, previous year and following year as a proxy for 'actual traffic.' We have forecast seasonality of March month to adjust for seasonal trends and arrive at March traffic from AADT traffic, which is then segmented according to the forecast toll segmentation and trip factors and multiplied with respective estimated toll rates to get to a monthly revenue collection.

6.28 As seen from the tables above, the difference between actual and targeted revenue lies above the permitted 2.5% excess, a renegotiation of the length of the concession agreement is expected. As per the concession agreement, for every 1% excess target revenue, the concession period shall be decreased by 1.5%, with a capping at 20%. Therefore, for the excess traffic on these toll plazas, the concession period, originally 30 years, is expected to be decreased by 5 years from FY51, potentially reducing the last date of concession to FY45.

Upside and Downside cases

Upside and Downside scenario assumptions

6.29 We have developed our base case scenario considering a balanced view on the risks associated with input assumptions around GDP growth and traffic growth elasticities. There is always a risk that the outturn values of these inputs will vary as compared to the assumptions taken due to exogenous impacts, e.g. GDP growth could be influenced both positively and negatively by the impact of monsoons, export-import balances, political changes etc.

6.30 Similarly, traffic growth elasticities could be influenced by increased efficiencies achieved by technology, large shifts in commodity prices globally, changes in local manufacturing practices. However, at this stage we consider that the base case represents a central case scenario given the risks of variation of input assumptions.

6.31 To account for the possible variations in the growth drivers, we are also presenting an Upside (optimistic) and a Downside (pessimistic) scenario. These scenarios are defined by the following variations from the base assumptions:

Table 6.21: Summary of Macro-economic Assumptions for upside and downside cases

Input	Upside	Downside
Macro Assumptions		
GDP/GSDP	+1% every year	-1% every year
WPI	+1% every year	-1% every year
Elasticities	+ 10%	- 10%

Source: Steer analysis

6.32 Further, network developments are highly dependent on governmental directions, policies, legal and financial measure which might result in early or delayed completion of developments. Therefore, we have included an Upside (optimistic) and a Downside (pessimistic) case. However, at this stage, we consider that the base case represents a central case scenario given the risks of variation of input assumptions.

Impacts-Upside Case

6.33 The upside case impacts included in forecasts are summarised in below.

Table 6.22: Summary of impacts on the Assets

Development	Year of impact	Change in impact w.r.t base case	Magnitude of impact	
			TP Babina	TP Vigakhet
Impact of DME and Surat Solapur Chennai on Delhi- Chennai traffic	FY27*; (40% impact) FY32 - full impact	+25% of base case	2A: (10.0%) 3A: (9.6%) MAV: (5.0%)	2A: (10.3%) 3A: (9.6%) MAV: (5.4%)

Source: Steer analysis; *Same as the base case timeline

Impacts-Downside Case

6.34 The downside case impacts included in forecasts are summarised in below.

Table 6.23: Summary of impacts on the Assets

Development	Year of impact	Change in impact w.r.t base case	Magnitude of impact	
			TP Babina	TP Vigakhet
Impact of DME and Surat Solapur Chennai on Delhi-Chennai traffic	FY27*; (40% impact) FY32 - full impact	-25% of base case	2A: (16.6%) 3A: (16.0%) MAV: (8.4%)	2A: (17.1%) 3A: (16.1%) MAV: (8.9%)

Source: Steer analysis; *Same as the base case timeline

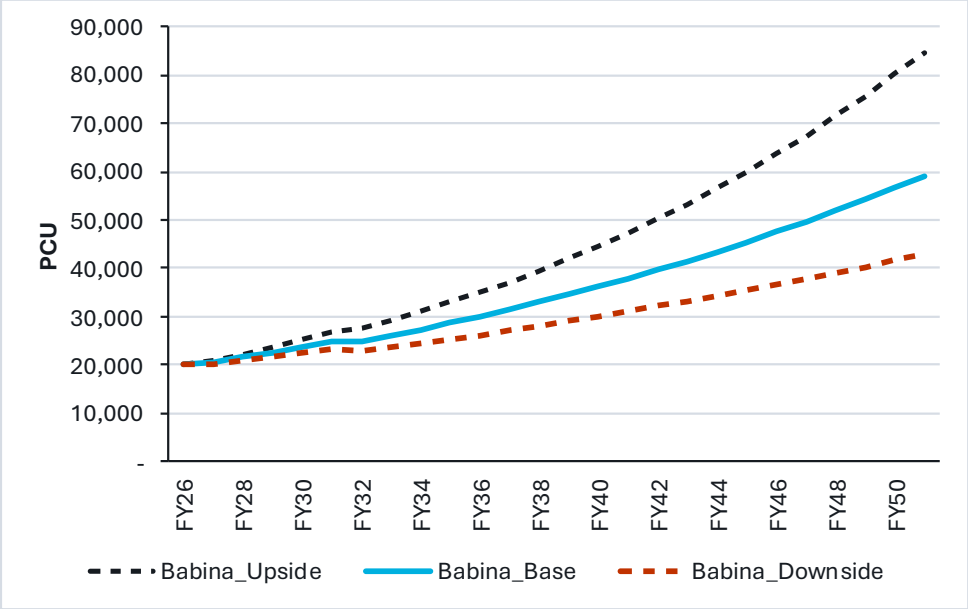
6.35 Based on the above assumptions for upside and downside scenarios, the following table summarizes the upside potential and downside risks associated with the PCU and the revenue for Babina and Vighkhet toll plazas at the end of the concession i.e. FY51.

Table 6.24: Upside potential and Downside PCU scenario – FY51

Toll Plaza	Upside Potential	Downside Risk
Babina	43.7%	(27.4%)
Vighakhet	43.5%	(27.3%)

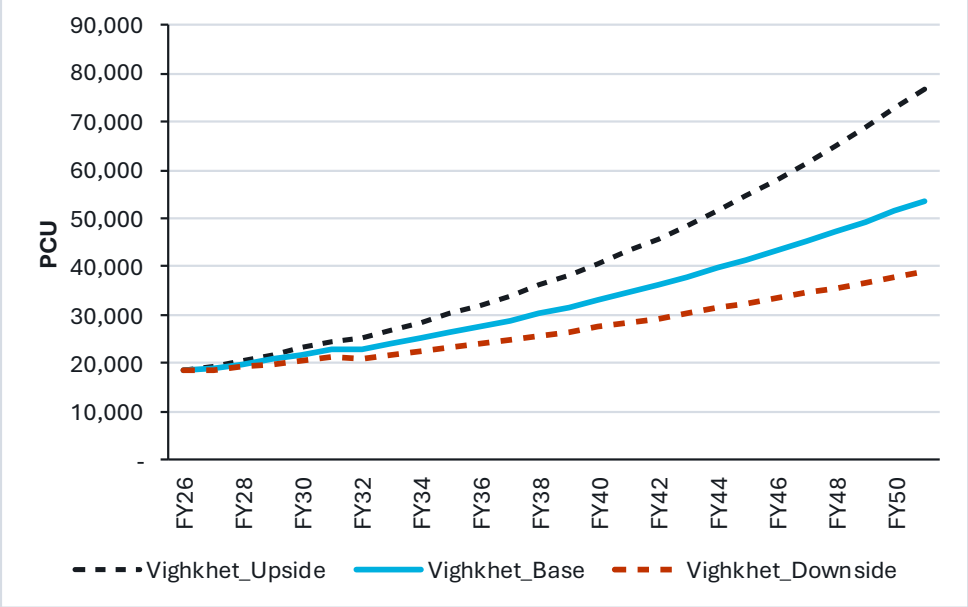
Source: Steer Analysis

Figure 6.2: Long term PCU forecasts for Babina TP including upside and downside scenario



Source: Steer Analysis

Figure 6.3: Long term PCU forecasts for Vighkhet TP including upside and downside scenario



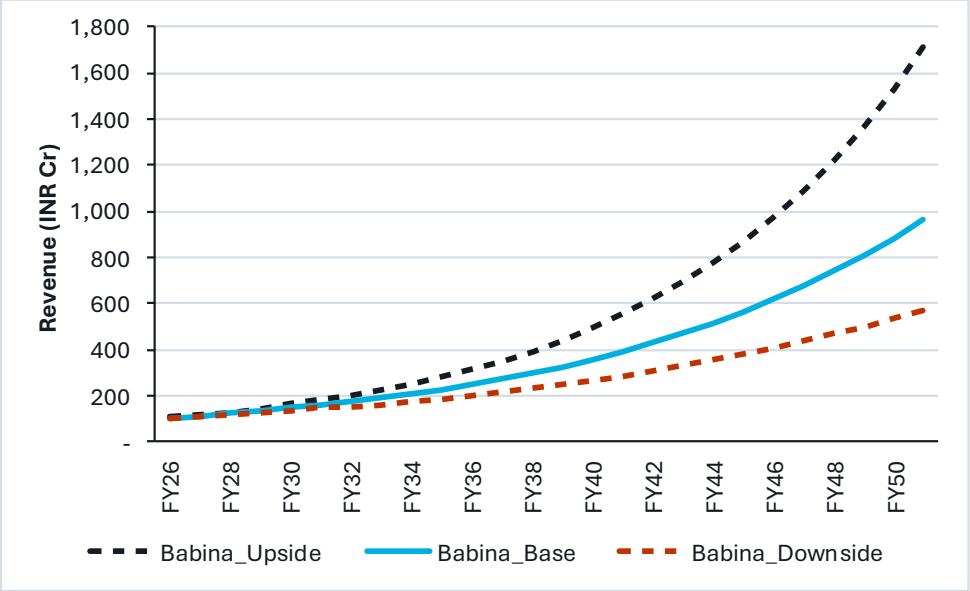
Source: Steer Analysis

Table 6.25: Upside potential and Downside Revenue scenario – FY51

Toll Plaza	Upside Potential	Downside Risk
Babina	77.4%	(40.5%)
Vighakhet	77.1%	(40.6%)

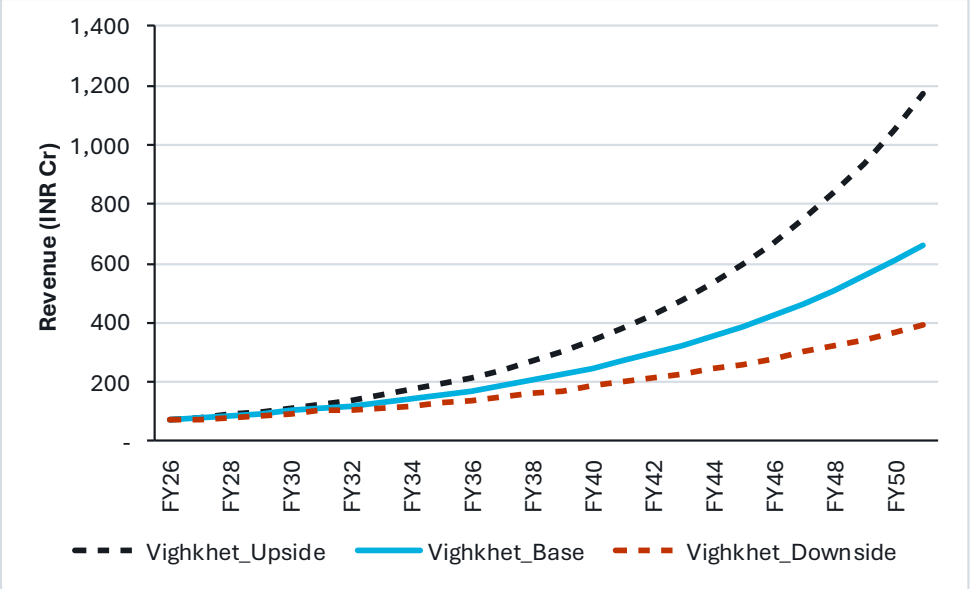
Source: Steer Analysis

Figure 6.4: Long term Revenue forecasts for Babina TP including upside and downside scenario



Source: Steer Analysis

Figure 6.5: Long term Revenue forecasts for Vighkhet TP including upside and downside scenario



Source: Steer Analysis

6.36 Revenue projections exhibit variability in both the upside and downside cases, driven by fluctuations in macro-economic factors such as WPI, GDP/GSDP, elasticities and the network impacts.

Summary outlook

6.37 Passenger movement on the Asset is largely local in nature, connecting the cities of Jhansi to Lalitpur over the short distance and northern cities of Kanpur and Lucknow to Sagar and Nagpur. Cars are expected to see a healthy growth on the Asset following the overall growth in income level and growth in the economy.

6.38 The biggest advantage for this Asset lies in its geographic location and strategic context, connecting the key movement between north India to the southern states of Madhya Pradesh, Karnataka, Telangana and Tamil Nadu. The overall network has been recently upgraded and provides a seamless connectivity for users. This is also demonstrated by the fact that almost 80% of truck users on this Asset cover distances of more than 500km.

6.39 Delhi Mumbai Expressway and Solapur Chennai Expressway is a key risk that has been identified which will impact the traffic on the corridor. As discussed in this chapter, a phased approach is taken to access the impact of DME, with 50% of estimated traffic loss in the first year of operation and the complete impact in the subsequent years.

6.40 Overall, we see a positive outlook for the region and the Asset, given that it caters to long distance movement to/from Chennai, Bangalore, Hyderabad etc to Delhi NCR. The underlying growth drivers of the corridor are strong and are expected to deliver long term sustained growth.

6.41 Our findings and estimates in this report are based on our understanding from the site visit, analysis of primary data available both from surveys and the toll management system (both historical and current), macroeconomic assumptions prescribed by Client, feedback from Client meetings and secondary publicly available data. There can be both positive and negative risks associated with assumptions and the forecasts using them as summarised below.

Appendices

A. Top 10 OD Pairs

6.42 Further to the OD analysis presented in Chapter 3, this appendix presents the top 10 OD pairs at each toll plaza. The tables below showcase data for both CJVs as well as MAVs and OSVs combined.

TP1 Babina

Table A.1: CJV top 10 OD pair shares at TP1 Babina

	OD Pair	Share
1.	Lalitpur-Karera	29%

B. Data collection exercise

6.43 In order to validate and inform various inputs used in our forecasting, we undertook primary data collection on the Asset. OD survey data was collected on behalf of the Client, TVC surveys were commissioned by Steer with a third party. OD data collection typically involves manual data entry by enumerators based on oral surveys with road users crossing toll plazas. TVC data collection involves video-graphic capture of traffic passing crossing the toll plazas, followed by manual counting.

3/7-day TVC counts

Table B.1: TVC counts at TP1

Date	CJV	Mini LCV	LCV	Bus	2 Axle	3 Axle	MAV	OSV	Total

C. Detailed forecasts

6.44 Further to the summary of forecasts presented in Chapter 6, this appendix presents detailed forecasts.

Traffic forecasts

6.45 This section presents the detailed traffic forecasts for the forecast period until FY51, year of expected close of the concession. The following two tables show the traffic growth rates and AADT, respectively.

Table C.1: Forecasts for (background + impacts) traffic – TP1 Babina

	CJV	Mini LCV	Bus	LCV	2A	3A	MAV	OSV	Total	PCU
FY26	3,105	499	175	336	1,577	1,397	1,910	2	9,000	20,094

Disclaimer

This report has been produced for the sole benefit of Cube Highways Pte. Ltd ("the Client"). The report may only be relied upon by Approved Addressees in accordance with the terms of our engagement letter. This Report (the "Report") is confidential and disclosed only for information purposes, and it may not be relied upon by any party other than the Client or a Party to a Reliance Letter, and Steer: a) makes no warranty, expressed or implied, with respect to the use of any information or methods disclosed in this Report; and b) assumes no liability with respect to the use of any information or methods disclosed in this document. Any such party by its acceptance or use of this Report releases Steer from any liability for direct, indirect, consequential, or special loss or damage whether arising in contract, warranty, express or implied, tort or otherwise.

The Report is based on standard professional efforts, and information available to us at the time the review took place and is subject to time and budget constraints of the Report's scope of work. This Report, information and statements contained herein, are all based on third party data provided to us, or sourced by us, and Steer has not sought to establish the reliability of the data, except as specifically stated in the Report. Steer bears no responsibility for the results of any actions taken on the basis of third-party data. Certain forward-looking statements in the Report are estimates based on interpretations or assessments of information available at the time of writing. The Report is thus to be viewed as an assessment that is time-relevant, specifically referring to conditions at the time of the review. Steer undertakes no obligation to update the Report for any reason. While the estimates contained in the Report are not precise forecasts, they do represent, in our view a reasonable expectation of the future, based on information we have been provided with or sourced. However, the estimates necessarily rely on numerous assumptions and judgements, and circumstances may occur over the timeframe of the project that go counter to these assumptions and judgements and that affect the project's realized revenues. Actual events may differ from those assumed, and events are subject to change. Therefore, Steer makes or provides no warranty, whether implied or otherwise, as to the accuracy of forward-looking information presented. Further, it is important to note that forecasts presented represent long term growth profiles; the results for individual time periods may vary from forecasted values.

Traffic Consultant developed the relationships in the models used to produce the forecasts for the projects based on data available through September 2025. This report does not consider variations in traffic performance due to changing macro and force majeure events such (but not limited to) as global wars, economic uncertainty (high inflation, global recession), and changes in the regulatory environment. The situation remains dynamic and is subject to significant change in the short and medium term. In this challenging context, Traffic Consultant has produced base forecasts with a view on a possible scenario for the traffic forecasts. However, it is important to note that this is only one view, and there continues to remain uncertainty as to the short-term, intermediate or prolonged effects of and responses to such macro-economic/force majeure events. As a result, no assurance can be provided by Traffic Consultant that the scenarios and assumptions Traffic Consultant has identified will prove to be accurate. Given the uncertainty inherent in this scenario, Traffic Consultant advises that all readers of the Report consider the Report in the context of their own assessment of the impact of such events.

TO THE FULLEST EXTENT PERMITTED BY APPLICABLE LAW, THE LIABILITY OF THE TRAFFIC CONSULTANT FOR ANY LOSS, DAMAGE, COST OR EXPENSE SUFFERED OR INCURRED BY ALL PERSONS OR ENTITIES AND FOR ALL CLAIMS RESPECTING ITS WORK PERFORMED IN CONNECTION WITH THE ISSUE OR THE REPORTS IS HEREBY LIMITED IN THE AGGREGATE TO THE AMOUNT OF FEES ACTUALLY PAID BY THE CLIENT TO THE TRAFFIC CONSULTANT IN RESPECT OF THE REPORTS AND CONNECTED SERVICES.

YTD	Year to Date

1 Introduction

The assignment

1.1 The Cube Highways Fund Advisors Private Limited (the "Client") has commissioned Steer Davies Gleave India Private Limited ("Steer") for a traffic due diligence to be carried out on the Jaipur Mahua Toll Road (hereafter called "Asset"). This report forms part of the annual fair market valuation (FMV) undertaken as part of the "Transit 10 project". This report presents an update of the traffic and revenue forecasts based on actual traffic data available up to September 2025 and latest macro-economic, and network assumptions.

1.2 The Asset Jaipur-Mahua consists of a single stretch of toll road with two toll plazas. For the purpose of this report, we hereafter call the toll plazas present on the Asset as TP1 and TP2 respectively.

- TP1 – Sikandra
- TP2 – Rajadhok

1.3 Our scope of work for the traffic and revenue forecasting process includes:

Table 1.1: Scope of work and sources of data

Scope of work	Data source
• Review of historical Traffic Management System (TMS) data, Origin-Destination (OD) data, Vendor reports and documents	• Provided by client for the period between April 2009 and September 2025 for TP1 and September 2010 and September 2025 in case of TP2
• Historical analysis and forecasts for baseline growth, including; — Background growth, — Seasonality	• Historical toll plaza data provided by Client
• Validation of Revenue reported in FY26YTD	• TMS data provided by Client. • Revenue reconciliation using toll plaza traffic and ticket type data to calculate revenue and reconciling it with toll plaza reported revenue.
• Origin Destination (OD) analysis to understand growth drivers: — Zonal influence and Top OD pairs — Commodity distribution — Trip length distribution	• Origin Destination (OD) surveys undertaken by Steer on Rajadhok in Jan'25 and on Sikandra in June 2023 under previous study.
• Analysis of upcoming network improvements and other developments, that may have future impacts on traffic	• Secondary research and our in-house experience of working in the vicinity of the Asset. Impact analysis to be conducted by

Scope of work	Data source
	Steer based on Generalised Journey Cost spreadsheet-based analysis
• Historical revenue analysis and forecasts for revenue estimation, including — Toll segmentation and trip factors, — Overloading shares	• Calculated from historical data provided by Client
• Final traffic growth forecasts including baseline growth rates and potential future impacts	• Elasticity based base growth and potential impacts from secondary research and Steer's in-house experience of working in the vicinity of the Asset
• Toll revenue estimation for the entire concession including toll evolution	• Toll evolution based on toll notification published by National Highway Authority of India (NHAI); and Gross Domestic Product (GDP) & Wholesale Price Index (WPI) trends as shared by the client

Our approach

1.4 The approach employed by Steer in the preparation of these forecasts was developed to take advantage of existing knowledge of the Asset and available data from various sources made available by the Client as well as publicly sourced. It follows well-established practices for forecasting ongoing traffic growth on an existing/brownfield Asset.

1.5 The analysis focused on two sets of issues, namely:

- understanding the traffic that is currently using the Asset; and
- identifying how and why that traffic is likely to change in the future.

1.6 To understand the current traffic on the Asset, we have analysed traffic data from multiple independent sources:

- Client-provided secondary data, including:
  - TMS data starting from FY09 up to September 2025
  - Concession agreement and toll notifications for FY25 and FY26
  - Previous studies related to traffic and revenue
  - Steer-commissioned OD surveys on the two plazas of the Asset to validate any change in growth drivers and travel patterns. The latest survey on TP1 was conducted on 26th June 2023 and on TP2 on 22nd Jan'25.
  - Steer-commissioned a 4-day TVC counts on TP1 Sikandra from 26th June to 29th June 2023 in the previous study in 2023 and a 3-day TVC counts on TP2 Rajadhok from 22nd Jan'25to 24th Jan'25.
- We undertook revenue reconciliation for FY26YTD, by building up revenue from the traffic reported by each of the toll plaza and subsequently match it to the reported revenue for FY26YTD using the prevalent toll rates and reported segmentation/toll-frequencies for FY26YTD, this is a key part of our analysis to validate the segmentation/toll-frequency assumptions and the Annual Average Daily Traffic (AADT) reported for each of the toll plaza.

1.7 The estimation of future traffic demand on the Asset was undertaken through:

- Estimating FY26 base year position. The FY25 AADT was calculated using the monthly traffic data for FY25. The annual FY25 AADT was then grown with elasticity linked GDP/GSDP growth to arrive at the FY26 expected traffic. To determine the adopted FY26, the expected FY26 traffic was validated against the six months of actual traffic (Apr-Sep) and necessary adjustments were made where required.
- Secondary research to understand plans for new developments and progress of ongoing developments on the Asset.
- Steer independent primary surveys and site visits to validate our network and contextual understanding.
- Developing a bespoke growth model for each Asset/plaza/toll class to forecast year-on-year traffic growth from FY26 to the end of concession period.
- Investigating the elasticity of historical traffic growth compared to state (GSDP) and national (GDP) growth. Where historical data is limited, we have benchmarked the Asset against our Steer knowledge base (e.g., similar Asset types in the same state or on the same corridor), to derive appropriate elasticities.
- Applying our elasticities to independent GDP forecasts as provided by client.
- Identifying and analysing the potential impacts of any relevant changes to the competitive position of each Asset – these include impacts of changes to road network including expressways and opening of competitive modes of travel.
- Identifying and analysing any other potential impacts to traffic and revenue on each Asset – these include axle load norms, axle shift for heavy goods.
- Considering changes in trends of segmentation over time and making suggestions for changes in exemptions in the future
- Preparing traffic and revenue forecast for the Asset for the complete length of concession. The analysis here includes the specific impacts of network, or other exogenous factors specific to the Asset. We have developed a set of forecasting assumptions for three scenarios: a base case and upside and downside scenarios.

Contents of this report

1.8 The report has been divided into the following chapters, including Chapter 1 providing an introduction:

- Chapter 1 introduces the methodology and approach to undertake the traffic and revenue due diligence;
- Chapter 2 describes the key characteristics of the Asset and its surrounding road network, primarily based on site visits;
- Chapter 3 summarises the current and historical traffic on the Asset, including results from the TMS, TVC and OD analysis;
- Chapter 4 presents the socio-economic context of the corridor and region/state containing the Asset, along with our approach and results on estimating background traffic demand growth; and
- Chapter 5 presents our baseline year forecast and summarises our results on estimating background traffic demand growth
- Chapter 6 summarises our assessment of network impacts and presents concession traffic and revenue forecasts for the Asset along with the assumptions for upside and downside cases.

2 The Asset

Introduction

2.1 This chapter provides a description of the Asset, based on concession agreement, site observations, our understanding of the region and network surrounding the Asset. We cover the strategic network context, followed by key economic activities and network developments around the Asset.

Strategic network

2.2 The Asset is situated in the state of Rajasthan, connecting the state capital Jaipur to Mahua on the east, near the border of Rajasthan with Uttar Pradesh (UP). The Asset carries considerable passenger volumes between the three nodes of India's Golden Triangle - Delhi, Jaipur and Agra engaged in tourism and related activities. Figure 2.1 shows the regional road network in which the Asset is located.

Figure 2.1: Asset location in the regional network context

Source: Steer cartography using OpenStreetMap data

2.3 This Asset primarily caters to three types of strategic movements:

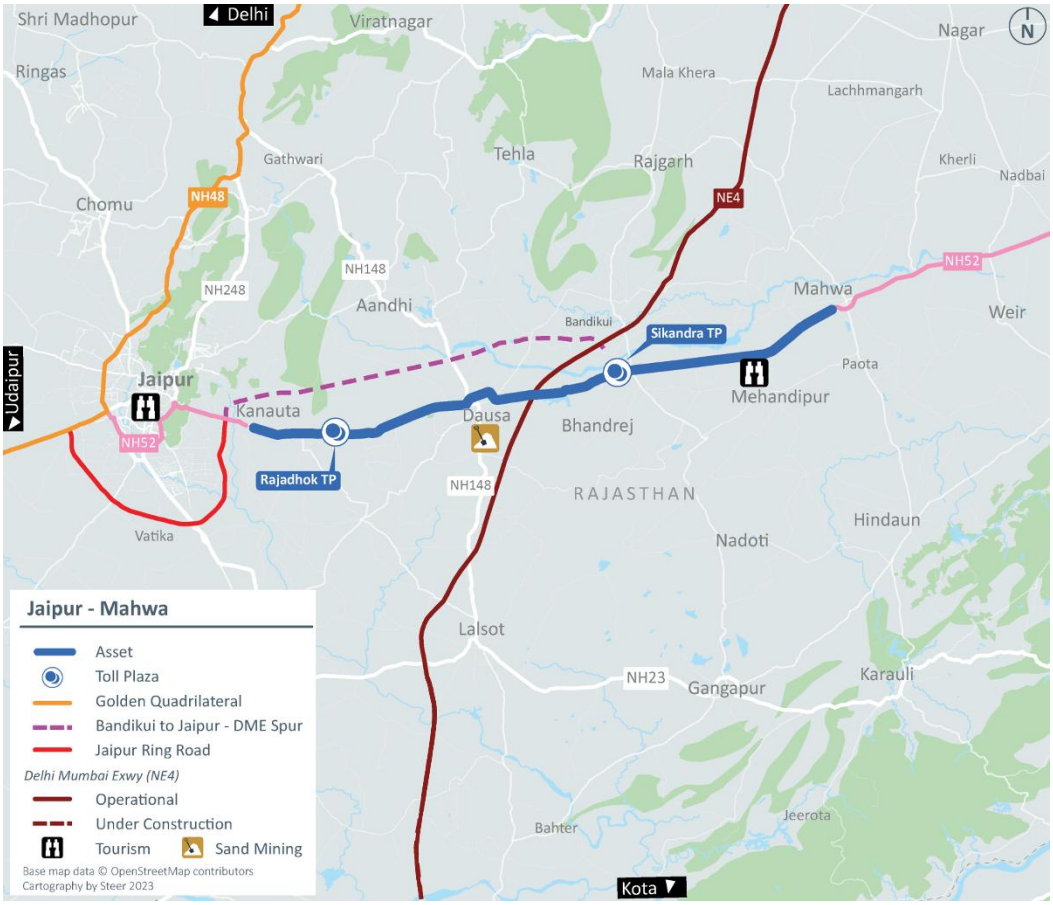
Short-distance trips including tourism and leisure trips between some of the key tourist destinations in India. Such trips are mostly comprising of CJVs which are either local or run between key tourist locations of Agra and Bharatpur at one end and Jaipur on the other.

Medium-distance trips between Rajasthan and Uttar Pradesh connect marble and sandstone processing sites of Rajasthan to its consumption sites in Uttar Pradesh. The Asset also transports significant number of manufactured products across the states of UP and Rajasthan.

Long-distance trips between Gujarat and southern Rajasthan, and UP/East India connects ports and industries of western India to major consumption and production centres in North India.

2.4 The Asset is a 109.09-km toll road which forms a part of the NH 21 (Jaipur – Agra – Bareilly) in Rajasthan and Uttar Pradesh. It is a four-lane Asset with two toll plazas, namely, Sikandra (TP1) at Km 156.6 (closer to Mahua) and Rajadhok (TP2) at Km 204.7 (closer to Jaipur). Figure 2.2 provides a closer view of the Asset in the context of its immediate surroundings and location of toll plazas.

Figure 2.2: Asset context



Source: Steer cartography using OpenStreetMap data

Concession and tolling details

2.5 The toll plazas on the Asset have been operational since April (TP1) and September (TP2) 2009 and the Client took over its operations in May 2015. There are 7 years left in the concession period which ends in FY31. Table 2.1 table presents a summary of the concession.

Table 2.1: Summary of concession

Particulars	Details
State	Rajasthan
Highway and lane configuration	NH 21 four lane
Toll plazas	• TP1: Sikandra • TP2: Rajadhok
Length (km) as per concession agreement, applicable	• TP1: 54.73 km • TP2: 54.36 km
Commencement of operations	• TP1: April 2009 • TP2: September 2009
Operated by Client since	May 2015
Concession period	25 years
Last year of concession	FY32

Source: Client data

2.6 The figure below shows a typical cross-section of the Asset and its toll plazas.

Figure 2.3: Toll plazas on the Asset

Source: Steer site visit

2.7 The tolls on the Asset are collected for following vehicle categories with rates as shown in Table 2.2. The toll plazas have dedicated ETC/FASTag lanes for electronic tolling.

Table 2.2: Single toll rates on the Asset (INR), applicable in FY26

Type of Vehicle	Single Journey Fee	
	TP1 Sikandra	TP2 Rajadhok
CJV	80	80
LCV	140	140
Bus/Truck	285	280
3A/MAV	455	450
HCM/EME/OSV	455	450

Source: NHAI Revision of User fee Rate w.e.f 01.07.2025

2.8 The Asset currently issues tickets including single, local commercial, monthly, and local personal under NHAI concession. There are no return tickets issued on either of the two toll plazas, but TP2 Rajadhok plaza issues local passes. The local personal ticket category is a discounted single-entry pass issued to trips originating within 10kms of the Asset. Whereas local commercial is another single-entry discounted pass issued at the Asset Plaza to commercial vehicles registered within the Asset district. Further, detailed information on this have been provided in Chapter 3 of the report.

Key economic activities

2.9 Rajasthan is the largest state in India by area, sharing borders with five major states- Uttar Pradesh, Haryana, Punjab, Madhya Pradesh and Gujarat. It is rich in natural resources particularly minerals and produces about 57 different minerals.[1] Predominantly an agrarian economy and a major producer of grains, oilseeds and edible oil, the recent

[1] http://www.mines.rajasthan.gov.in/dmgcms/page?menuName=YzCjPSj/AU7RGgRfpUoY5A==#:~:text=Rajasthan%20is%20the%20richest%20state,zinc%20ores%2C%20selenite%20and%20wollastonite.

times has seen a high rise in the service sector growth wherein the sector contributed to 45% to state's GSDP in 2024-25 followed by agriculture at 30% and industries at 25%.[2]

Urban centres, business and tourism

2.10 The state of Rajasthan and its bordering cities in UP (e.g. Agra and Mathura) are known for their tourist destinations. This contributes significantly to high passenger traffic volumes both within cities and on highways. The Bharatpur area with the Keoladeo Ghana National Park is a major attraction for tourists, known for its birds. The capital city of Jaipur, located on one end of the Asset, is a thriving urban city which is the main centre of administration, governance, culture, education, business, and service sector in the state. It is a prominent tourism destination contributing majorly to the flourishing hospitality industry in the state. This reflects in considerable passenger volumes between the three nodes of India's Golden Triangle - Delhi, Jaipur and Agra – observed on the Asset engaged in tourism and related activities. In recent times, the city has also emerged as a promising hub for global outsourcing and IT industry. Jaipur's strategic location on the golden quadrilateral connects it with major industrial, agricultural, and cultural centres of Chennai, Kolkata, Delhi, and Mumbai.

Marble, cement, and sand

2.11 The State is also a leading producer of Masonry stone with around 136.1 million tonnes of production in FY24.[3] Places like Kishangarh, Kota and Dausa produce stone and sand, apart from being a hub of major marble processing centres, with a history of supplying marble to the rest of India.

2.12 Rajasthan accounts for 70 per cent of the country's stone production. There are 4,920 mining leases in the state[4]. Rajasthan produces 90 percent of the marble and sandstone in the country. In terms of Granite, in FY24 Rajasthan produced more than 10.4 million tonnes compared to 9.3 million tonnes in FY23[5]. This is due to the increased export demand from countries like US, China and Europe.

2.13 Sandmining in India has long faced issues of corruption involving local mafias and a lack of proper implementation of mining policies by the government. In November FY18, when Supreme Court order ruled the requirement of environmental clearances for all sand mines, including those less than five hectares of size, there was a reported drop in traffic carrying construction-related commodities on the Asset, particularly sand. However, in 2020, following the implementation of the Major and Minor Mineral Policy, the mining industry in the state was regularized by imposing a ban on illegal mining activities. Additionally, sand mining leases were reduced to two years, with an improved replenishment cycle. The policy also mandated the use of 25% M-Sand (manufactured sand) as an alternative to riverbed sand for construction activities in Rajasthan.

2.14 After the policy implementation, the combination of reduced legalized sand mining, award of leases, and increasing demand for construction material for local activities led

[2]MoSPI data

[3]**Minor mineral production in Rajasthan**

[4] **70% of stone production in India comes from Rajasthan: RIICO Chairman (knnindia.co.in)**

[5] **Granite production in Rajasthan**

to a continued demand for sand and other construction materials in the region. In terms of lease tenure related to this commodity within the Rajasthan mining policy:

- Sand mining leases- 2 years (re-award of new leases after 2 years): Additionally, to reduce illegal mining and allow for the full replenishment cycle of rivers in the region, the state government has reduced the validity of sand mining leases from the existing five years to two years.
- Aggregate mining leases- 5 years (re-award of new leases after 5 years)

2.15 While the main sand mining policy came in 2020, a revised version is issued in 2024. in which the Rajasthan government introduced the Rajasthan Mineral Policy 2024 and the M-Sand Policy 2024 to address illegal mining and promote sustainable practices. To strengthen enforcement, 27 monitoring teams were deployed across the state. Therefore, there is no ban on sandmining/construction material mining; however illegal mining is prohibited.

Alternate Routes

2.16 For long-distance trips connecting Gujarat and southern Rajasthan to Uttar Pradesh and other eastward states, there is an alternative route along NH 27 that joins Udaipur and Kanpur via Chittorgarh-Kota-Jhansi. Majority of travel patterns are already well established and the choice between using NH27 vs. NH48 and the Asset for east-west movements has been established over a number of years. However, for a small proportion of traffic on NH27; the route via the Asset is expected to become more attractive as the key feeders of the Asset improve.

2.17 In Chapter 6, we have discussed how the completion of southern bypass of Agra Ring Road improves the relative level of service on the Asset corridor and has a positive impact. The traffic impact of Jaipur Ring Road is already part of the current volumes appearing on the Asset and no further adjustments have been made to the traffic forecasts.

2.18 The Dausa-Lalsot corridor connects to the Asset between the two toll plazas. It acts as a feeder to the Asset. As For medium-distance trips between southern Rajasthan and east of Dausa, there is an alternate road that bypasses TP2 Rajadhok through the Tonk-Lalsot-Dausa connection. This corridor is operational since 2021 with a positive impact of increasing traffic on Sikandra plaza of the Asset with a slight traffic dip on Rajadhok plaza. This traffic started appearing on the Asset in FY23 volumes and no further adjustments have been made to the traffics.

Delhi-Mumbai Expressway

2.19 The Delhi-Mumbai Expressway is a 1290-KM long greenfield expressway that has been developed to provide an improved 8-lane route to long-distance traffic between North/Western India to Mumbai. The competing movements which may choose to take the DME are as follows:

1. Traffic originating near Lalsot destined to Alwar
   i. Vehicles making trips between Lalsot and Alwar, which earlier made the trip via Dausa – Sikandra – Mahwa – Laxmangarh – Alwar, now has an alternative available in the form of the DME which provides direct connectivity from Lalsot – Dausa – Alwar via NE4.
2. Traffic originating near Lalsot destined to Faridabad/North

i. Trips originating near Lalsot destined to regions in Faridabad/north including Delhi, Ghaziabad, Gurugram, which earlier made the trip via Dausa – Sikandra – Bharatpur – Mathura via SH33 – Faridabad, will now have an alternative route available.
ii. The alternative route will materialise as a conjunction of the DME and the Faridabad bypass. It will provide connectivity from Dausa – NE4 – Faridabad bypass at Kaligaon.
iii. By virtue of the route being supplemented by the Faridabad bypass, traffic destined to Delhi and north will get access to smoother passage by being able to avoid entering the city altogether.

2.20 The section of DME between Delhi and Lalsot (Rajasthan) was made operational on 14th Feb 2023, the section in Madhya Pradesh passing through Ratlam was made operational in June 2023. The sections until Surat are expected to be made operational by Mar'25, and the remaining sections are expected to be completed by end-FY26. Commencement of operations of the Delhi-Sohna-Dausa-Lalsot section has already been materialising it's influence on the Asset. The potential shift of traffic that was expected on this stretch has already been witnessed on TP1 Sikandra in goods vehicles. The NE4 in conjunction with the Faridabad bypass now provides a better alternative to vehicles moving between Lalsot, Jaipur, Faridabad, Delhi, Gurugram, etc. However, Sikandra has seen an increase in CJV volume due to the presence of famous temples near Sikandra, therefore CJV traffic from DME is crossing the Sikandra plaza to visit the popular pilgrimage destination Shri Khatu Shayam Temple and Mehendipur Balaji Temple.

2.21 The alignment of the DME and the Bandikui spur has led to a traffic dropping on TP2 Rajadhok, since the spur acts as an effective alternate route for vehicles travelling to/from Jaipur using the DME, thereby bypassing the Delhi-Jaipur NH48 section to reach Jaipur directly.

2.22 In absence of an official update on the construction status of DME, based on the publicly available information, the section wise update on the Delhi Mumbai Expressway section is given below:

Table 2.3: Section Wise Delhi Mumbai Expressway status

S. No	Section	Length (in km)	Sub-Section	State	Status	Expected Data of Completion
1	Delhi-Faridabad-KMP	59	Faridabad-KMP	Delhi, Haryana	Operational	Opened Nov'24
2	Sohna-KMP-Vadodara	844	Sohna – Sawai Moadhopur	Haryana	Operational	Opened Sept'23
			Sawai-Madhopur-Jhalawar	Sawai-Madhopur-Jhalawar	Under Construction	Expected end of FY26 (75-90%

S. No	Section	Length (in km)	Sub-Section	State	Status	Expected Data of Completion
						construction completed)[67]
			Jhalawar-Timarwani	Jhalawar-Timarwani	Operational	Opened Sept'23
			Timarwani-Vadodara	Madhya Pradesh, Gujarat	Under Construction	Expected Dec 2025 (75-80% construction completed)[8]
3	Vadodara – Virar	354	Vadodara-Bharuch	Gujarat	Operational	Opened Feb'24
			Bharuch-Virar	Gujarat, Maharashtra	Under Construction	Expected October 2025 (50-60% construction completed)[9]
4	Virar- JNPT	92	Virar- JNPT	Maharashtra	Under Construction	Expected FY28
Spur Development						
5	Jaipur – Bandikui Expressway	67	Jaipur – Bandikui	Rajasthan	Operational	Operational since July 2025

2.23 No major micro-diversions through local roads were observed close to the toll plazas.

3 Traffic description

Introduction

3.1 This chapter outlines the historical and current traffic and revenues on the Asset, as well as our analysis of origin-destination (OD) data and traffic volume count (TVC) data. This includes data collected as a part of this study and previous studies of this Asset, as well as data provided by the Client.

3.2 Traffic data is generally collected and analysed to understand the volume and vehicle composition of traffic currently using the Asset, while OD data is used to obtain a better understanding of commodity movements, travel patterns, trip lengths, trip purposes and areas of influence in the vicinity of the Asset as well as the commodities being moved by the goods vehicle. This analysis, combined with our understanding of the Asset (based on our site visits), enables us to identify the key drivers of demand on the Asset.

3.3 Actual toll plaza data is used as the basis from which the current/base year annual average daily traffic (AADT) is established. This data is typically provided by the Client and independently analysed and validated by us using traffic volume count (TVC) information.

PCU factors considered for reporting

3.4 The PCU values have been taken from 'IRC 64:1990- Guidelines for Capacity of Roads in Rural Areas'. For MAV, based on the discussion with the Client, we have referred to the rigid and trailer splits in the latest TVC counts conducted in 2023 for calculating the effective PCU for MAVs. For rigid trailer trucks we have assumed a PCU factor of 3, whereas for trailer trucks we have assumed a PCU factor of 4.5. These factors have been used to arrive at the PCU values presented in the following sections.

Table 3.1: PCU factors

Vehicle Category	PCU Factor
CJV	1.0
Mini LCV	1.0
LCV	1.5
Bus/2A/3A	3.0
MAV	4.06
OSV	4.5

Source: Steer analysis and IRC64,1990

Historical trends

3.5 The following table presents the historical variation in traffic volume at both the Asset plazas, in terms of total AADT, vehicle shares and yearly volume growth. TP1 Sikandra

started operation in April FY10 while TP2 started September FY11. The table below shows the traffic evolution on TP1 and TP2 of recent years FY16-26YTD.

Table 3.2: Historical evolution in AADT by vehicle class at TP1 – Sikandra

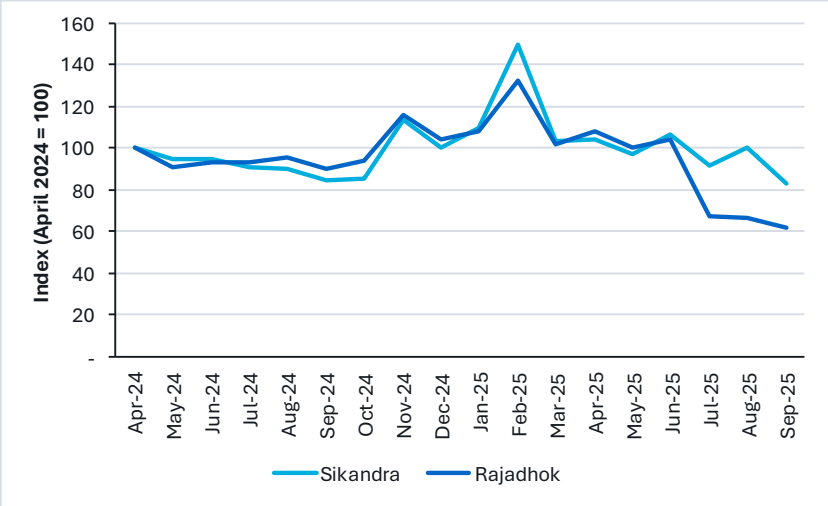
Figure 3.1: Passenger Traffic trends on the Asset in FY25 and FY26YTD



Source: Steer analysis of Client data

3.6 On the Asset, a slowdown was observed between FY19 and FY20, driven by a combination of factors:

- Completion of large construction activities in the vicinity (Agra-Lucknow expressway) – negative traffic impact due to construction
- Construction activity on a key feeder route (Dausa-Lalsot) - traffic loss due to construction
- Construction of Jaipur ring road - negative traffic impact due to construction
- Revision in axle load norms and economic slowdown - observed over seven quarters starting FY19 up to Q3 FY20 resulting a negative impact on Asset's traffic

3.7 In terms of vehicle composition, CJVs are biggest contributor on the Asset with a share of over 60% on TP1 and 70% on TP2 since FY16 except for a slight dip in FY21 due to COVID-19. Traffic growth on TP2 Rajadhok plaza of this Asset has been stronger than TP1, primarily due to its proximity to Jaipur and is driven by the rapid car growth influenced by the urban characteristic of Jaipur which generates heavy daily passenger trips.

3.8 Additionally, there's notable rise in car volumes during Jan'25, as seen in Figure 3.1 above, driven by increased travel to the 2025 Maha Kumbh Mela in Prayagraj [10]. As a result, passenger traffic on the Asset witnessed a substantial increase in pilgrim-related volumes during Jan 2025 on both toll plazas

3.9 However, since FY23 traffic volumes have increased significantly on TP2 Rajadhok especially in CJV category resulting from operationalisation of DME till Lalsot in Feb'23 which led to a notable increase in traffic on the Asset till July '25.

3.10 On JMTL, 2A and Buses have the same toll rates (INR 275 and INR 280 for a single ticket at TP1 and TP2 respectively in FY26) and so do 3A and MAV (INR 455 and INR 450 for TP1 and TP2 respectively for a single ticket in FY26).

3.11 On Sikandra, this growth is primarily attributed to the increase in CJV volume due to the presence of famous temples near the toll plaza. Consequently, CJV traffic from the DME is crossing the Sikandra Plaza to visit popular pilgrimage destinations such as Shri Khatu Shyam Temple and Mehandipur Balaji Temple. Additionally, there has been a decline in MAV traffic from FY23 onwards due to the diversion of Alwar-bound traffic coming from Jaipur and west, earlier used to cross both Rajadhok and Sikandra toll plazas, but it now takes the DME route, crossing only the Rajadhok toll plaza, resulting in a loss.

3.12 Rajadhok, on the other hand, recorded a healthy growth across all vehicle categories. With DME now becoming operational between Sohna and Dausa in Feb'23, the Rajadhok plaza has observed incremental traffic which is influenced by regions such as Jaipur, Ajmer, Kishangarah and parts of Gujarat. In FY26YTD, Rajadhok saw a 13.6% drop in traffic in PCU terms from FY25. This is attributable to the opening of the Bandikui spur. The spur provides an effective alternate route for traffic travelling between Jaipur and Delhi NCR via the DME.

3.13 Overall on the Asset level, CJV witnessed a nine-year traffic growth of 2.3% from FY16-25 at TP1 and 5.3% at TP2 respectively. It is mostly driven by increased tourism activity in Rajasthan and re-opening of tourist places which increased daily CJV trips where TP1 witnessed higher growth due to its proximity to popular pilgrimage destinations in close vicinity to the Asset. TP2 is expected to witness a drop in traffic from FY26 onwards due to diversion of traffic from Rajadhok to the Bandikui spur from July 2025.

3.14 LCVs on the Asset have observed a negative variance between FY16 and FY25. This trend could be attributed to the misclassification of Mini LCVs, LCVs, Buses and 2As prior to the implementation of FASTag.

3.15 Although 2A and Buses share the same toll rate, the current TMS reports them as separate categories. In contrast, 3A and MAV are combined into a single category. However, post FASTag implementation there has been a reclassification of Buses and 2As

[10] **The Maha Kumbh Mela, held once every 144 years, is regarded as a once-in-a-lifetime spiritual event, significantly influencing regional traffic patterns.**

which are now tolled basis their vehicle mapping. To accurately assess the historical growth of these categories and adjust for any discrepancies due to this reclassification, we have combined the 2A and Bus categories for our analysis.

3.16 To further validate individual growth of each category (Bus/2A/3A/MAV), we conducted independent counts at various points in time to ensure the true representation of individual volumes for the asset. The results of the split are presented in the 'Key findings of the TVC data analysis' section of Chapter 3 of the report. Therefore, the split that we have derived from our counts is the split we are using in our projection to forecast the growth of each individual category for this Asset.

Historical Revenue

3.17 Table 3.6 presents the reported historical revenue of the Asset.

Table 3.6: Historical revenue collection (in INR crores) and AADC (in INR Lakh) :

		FY16	FY17	FY18	FY19	FY20	FY21	FY22	FY23	FY24	FY25	FY26 YTD	CAGR (FY16-25)
TP1	Total	66.1	64.0	78.7	74.2	79.1	77.3	94.9	109.0	114.0	120.5	60.4	-
	AADC	18.1	17.5	21.5	20.3	21.6	21.2	25.9	29.9	31.1	33.0	32.8	6.9%
TP2	Total	56.2	53.3	63.9	62.5	64.4	61.1	74.2	89.0	120.8	132.7	58.2	-
	AADC	15.4	14.6	17.5	17.1	17.6	16.7	20.3	24.4	33.0	36.3	31.6	10.0%

Source: Steer analysis of the Client data. *FY26YTD includes six months revenue till Sep-25.

3.18 The Asset has demonstrated a strong compound annual growth rate (CAGR) of 8.4% from FY16 to FY25, with the YoY growth in FY23 and FY24 surpassing the YoY revenue growth of both FY22 and FY21. This growth can be attributed to various factors, including increased traffic volumes resulting from network enhancements including operationalisation of DME till Lalsot in Feb'23 which led to positive traffic increase. Positive tick in revenue prior FY23 is due to post-pandemic recovery, as discussed earlier. Particularly noteworthy is the positive traffic impact observed on TP2 Rajadhok post the opening of DME in FY23.

3.19 Furthermore, an increase in overloading revenue has contributed to higher revenue receipts from FY22 onwards. In FY25, the daily overloading collection at Rajadhok is INR 0.61 lakhs, while at Sikandra, it stands at INR 0.87 lakhs.

Toll Frequencies

3.20 Table below shows the toll segmentation assumed for the period of forecast. The following are the types of tickets being sold at the plazas of the Asset.

Table 3.7: Typical ticket types sold at NHAI plazas

Category	Description
Single	Allows the vehicle to cross the toll plaza once
Local Personal	Discounted single entry pass only for private cars of residents within 10km radius of toll plaza

Category	Description
Local Commercial	50% discount on single trips for commercial vehicles registered in the local district. This pass allows single entry only
Exemptions	Officially exempted vehicles like ambulance, police cars, key political personnel etc.

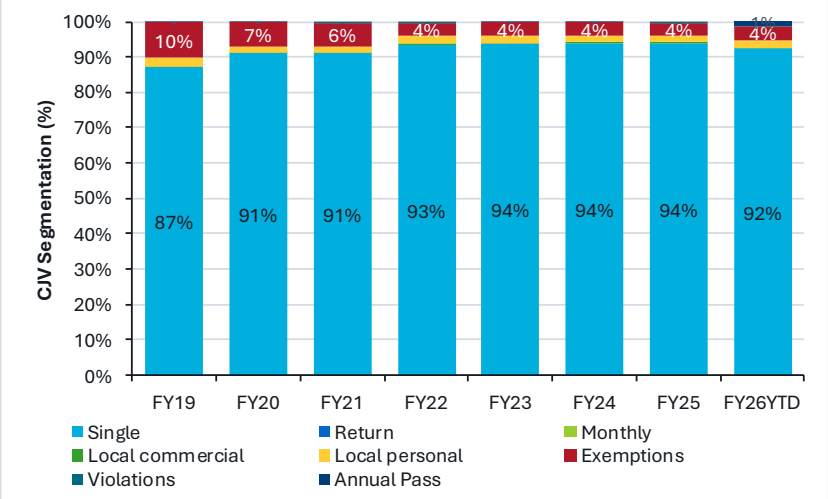
3.21 In addition to the above ticket categories, a special category pass of "Monthly" is also being sold on Rajadhok plaza the Asset for CJV and LCV vehicle category. Under this, the user is charged 1/3rd the fee of Single ticket applicable on the plaza for 50 allowed trips.

Traffic Segmentation

3.22 FY22 was impacted by 2nd wave of COVID-19 in Q1 and Q2 of FY22. Hence, during this period, travel patterns were also disrupted, with more shorter trips being undertaken since several states implemented state entry barriers, resulting in an increase in the proportion of short distance trips. With FY21 and FY22 being Covid-19 impacted, it is observed that traffic patterns have begun to return to their previous segmentation levels. Moreover, the segmentation has stabilised from FY23 following the decision to make FASTag mandatory for all vehicle categories in February 2021. The resultant segmentation, therefore, has been assumed as the forecast segmentation as well.

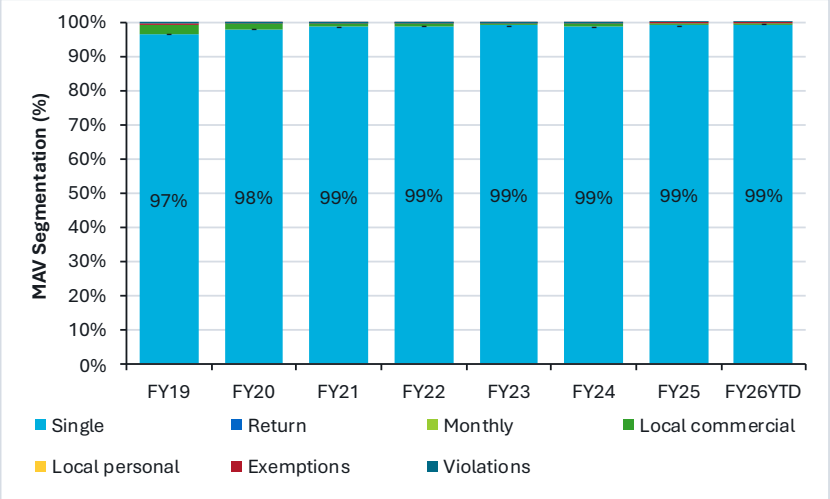
3.23 Figure 3.2 through Figure 3.5 below present the toll segmentation for the historical years FY19- FY26 YTD at TP1 Sikandra and TP2 Rajadhok for CJVs and MAVs. Table 3.8 through Table 3.13 below present the same for all other vehicle categories.

Figure 3.2 Ticket-segmentation for CJV at TP1 Sikandra



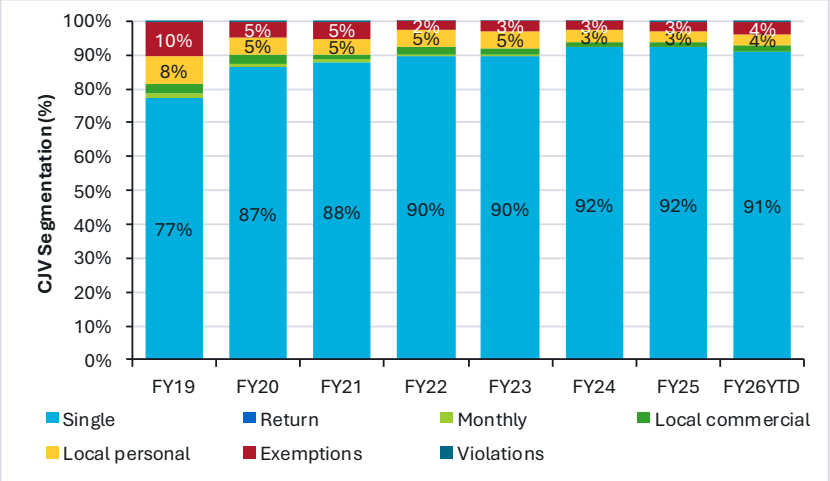
Source: Steer analysis of the Client data, FY26 YTD includes 5 months of data from Apr-Aug'25

Figure 3.3 Ticket-segmentation for MAV at TP1 Sikandra



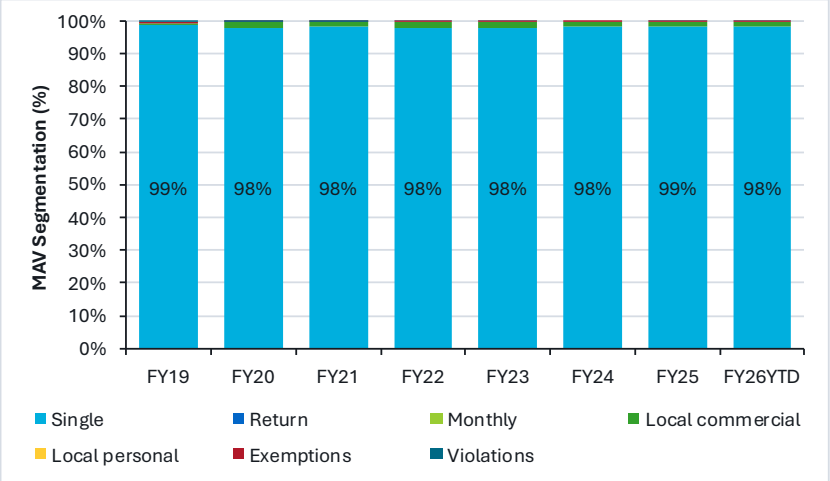
Source: Steer analysis of the Client data, FY26 YTD includes 5 months of data from Apr-Aug'25

Figure 3.4 Ticket-segmentation for CJV at TP2 Rajadhok



Source: Steer analysis of the Client data, FY26 YTD includes 5 months of data from Apr-Aug'25

Figure 3.5: Ticket-segmentation for MAV at TP2 Rajadhok



Source: Steer analysis of the Client data, FY26 YTD includes 5 months of data from Apr-Aug'25

3.24 The traffic segmentation charts indicate that the pattern observed in FY26YTD remains broadly consistent with previous years. As illustrated in the Figure 3.2 and Figure 3.4, in FY26YTD, the share of single-ticket transactions for CJVs at TP1 is ~92%, while at TP2, it stands at approximately 91%. This clearly establishes "Single" as the predominant ticket category issued for CJVs at the Asset plaza. It is important to note that the Asset does not offer a return ticket option, which explains the disproportionately high proportion of single-ticket transactions in the toll segmentation. Furthermore, CJVs operating on the Asset typically undertake short- to medium-distance trips, generally within a 300 km radius, as reflected in the OD analysis Figure 3.16 and Figure 3.17 below. A significant proportion of these CJV trips originate from locations beyond 10 km of the Asset, rendering them ineligible for a discounted local pass. This aligns with the nature of the Asset, which functions as a key tourism-driven corridor attracting passengers from surrounding regions. However, with the introduction of annual pass, a section of the single traffic is expected to shift to annual pass trips. This is explained further in Chapter 5.

3.25 Most MAVs at both TP1 and TP2 are observed to have high shares of single tickets with the share of MAVs buying single tickets, reaching as high as 99% at TP1 and 98% at TP2 in FY26YTD in line with previous years. This reflects the long-distance and through nature of heavy truck movement on the Asset. The high share of single ticket type is due to other tickets such as return and monthly being not available as per the toll notification. As expected, there is a negligible share of violations for MAVs.

3.26 From above figures it is observed that for CJVs there has been a steady decline in the number of exemptions reported on the Asset starting FY16 towards FY25YTD from 10% to 4% at TP1 and 10% to 3% at TP2. This decline is also attributed to the local nature of the Asset and its proximity to the tourist city of Jaipur, which experiences heavy daily traffic movement.

Table 3.8: Historical ticket segmentation at TP1 Sikandra (LCVs)

	FY19	FY20	FY21	FY22	FY23	FY24	FY25	FY26YTD

Overloading

3.27 The Asset being a part of NHAI concession follows the NHAI Overloading policy released in 2016 which bans the overloading of commercial vehicle on any NHAI toll plaza. In case of non-compliance, overloaded vehicles on the Asset are charged twice the toll fee they would otherwise pay for a Single ticket at the toll plaza.

3.28 The plaza currently charges overloading under single and local commercial category. These shares are determined using the total single journey traffic and total local commercial traffic. Table 3.14 shows the share of overloaded vehicles until FY25YTD paying twice the Single journey toll fee on each toll plaza.

Table 3.14: Overloading shares for FY19, FY20, FY22, FY23 and FY24

Data collection and validation

Overview

3.29 As mentioned previously, in order to validate and inform various inputs used in our forecasting, we undertook primary data collection on the Asset, comprising the surveys listed in Table 3.15 below. OD survey data was collected on behalf of the Client, TVC surveys were commissioned by Steer with a third party. OD data collection typically involves manual data entry by enumerators based on oral surveys with road users crossing toll plazas, which Steer also commissioned with a third party. TVC data collection involves video-graphic capture of traffic passing crossing the toll plazas, followed by manual counting.

Table 3.15: Data collection schedule

TP	**4-day videography-based TVC**			**1-day OD survey**	
	Start date	**End date**	**Time (hrs)**	**Start date**	**State time**
TP1 Sikandra	26th June 2023	29th June 2023	0000-2359	26th June 2023	0800 hours
TP2 Rajadhok	22nd January 2025	24th January 2025	0000-2359	22nd January 2025	0800 hours

Source: Steer analysis

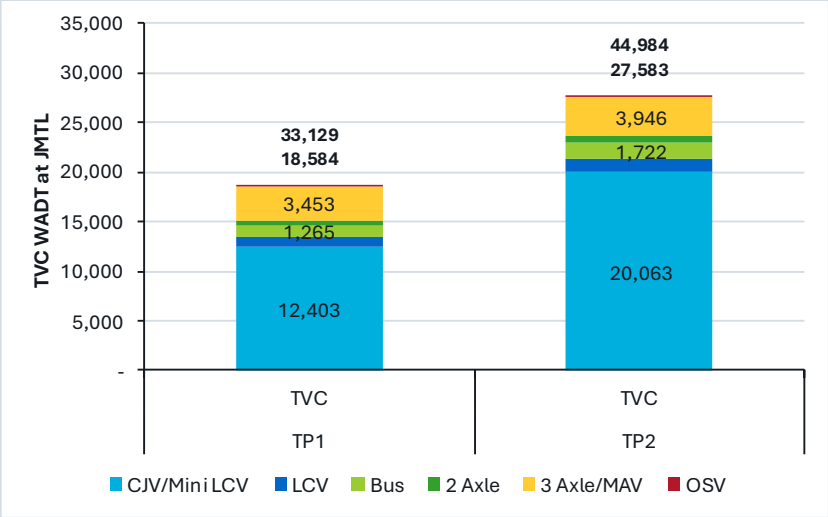
3.30 It should be noted that, in our experience, traffic on national highways shows variation across the week due to the economic activities surrounding each road. To derive a representative TVC count considering daily variation, three-day to seven-day traffic counts are generally recommended, and hence, in order to fully understand the impact of this weekly fluctuation on the Asset, we collected four-day counts at each toll plaza.

Key findings of the TVC data analysis

WADT estimates

3.31 Taking an average of the three-day TVC counts (26th June – 29th June 2023, 0000-2359 hours) at TP1 and at TP2 (22nd Jan – 24th Jan 2025, 0000-2359 hours), we obtained the following weekly average daily traffic (WADT) for each toll plaza. This WADT excludes non-toll able vehicles such as tractors, two-wheelers, bullock-carts, etc., but includes officially exempt vehicles such as police cars, ambulances, emergency response vehicles, government vehicles and other vehicle types officially allowed as 'exempted' under the concession agreement.

Figure 3.6 WADT at TP1 and TP2



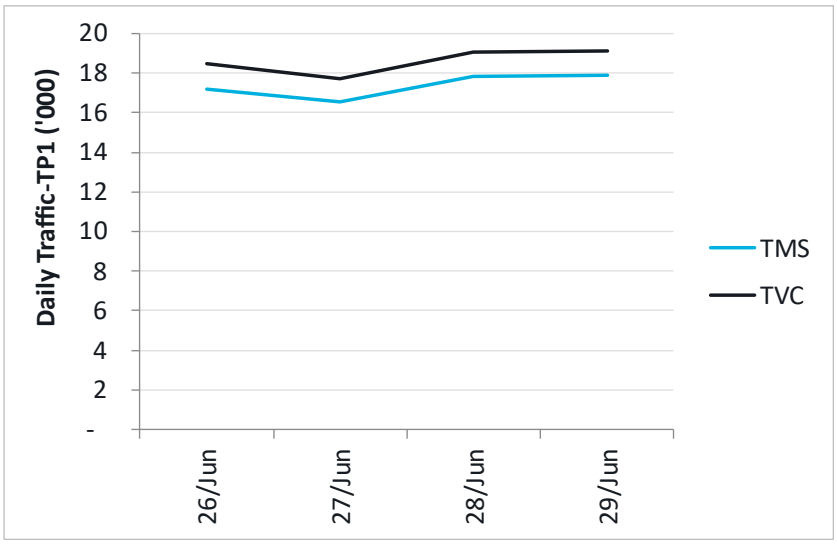
Source: Steer analysis of TVC data

TVC v/s TMS analysis

3.32 As we use the TMS data to estimate the base year AADT, we have used our TVC data to validate the TMS data on those particular days, as provided by the Client.

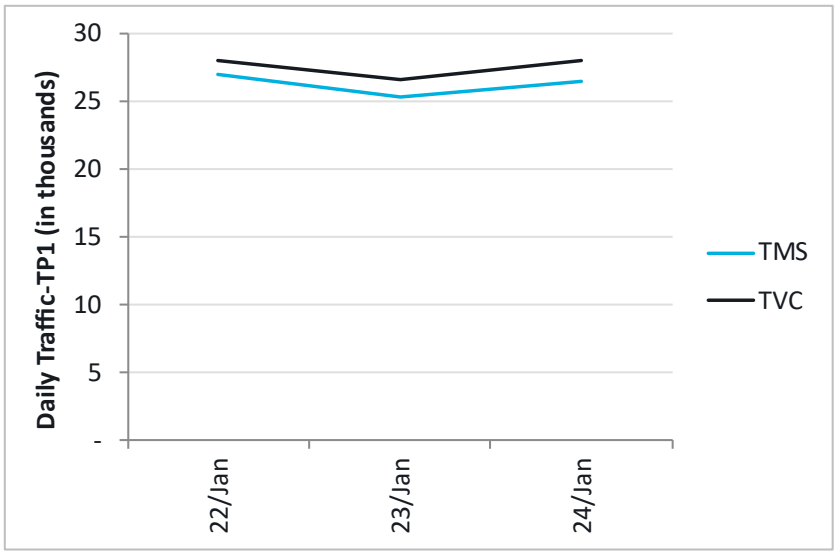
3.33 The following figures show the comparison between the daily traffic observed by TVC and TMS for the two toll plazas. As shown in Figure 3.7 and Figure 3.8 below, the TVC and TMS overall are within the acceptable range of variation. The vehicle category which is causing this variation is CJV which is attributable to a small proportion of local users who are not being captured by the TMS.

Figure 3.7 Comparison between TVC and TMS daily traffic data on TP1 Sikandra



Source: Steer analysis of TVC and Client TMS data

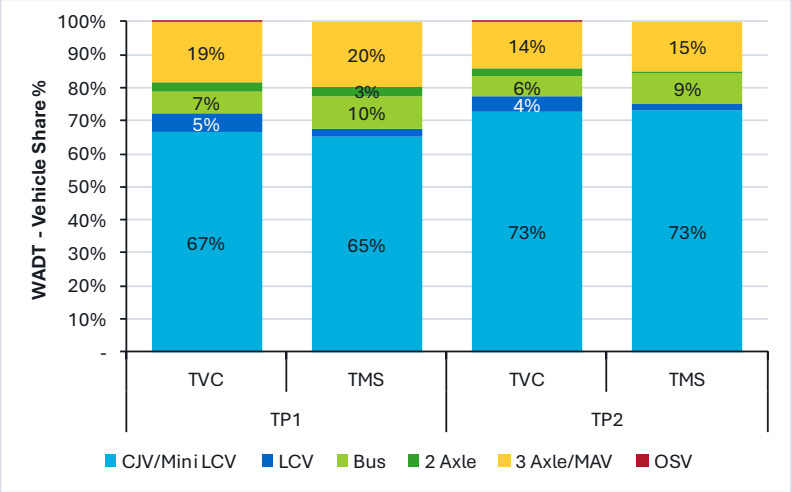
Figure 3.8: Comparison between TVC and TMS daily traffic data on TP2 Rajadhok



Source: Steer analysis of TVC and Client TMS data

3.34 The Figure 3.9 below compares the shares of vehicle types at both toll plazas observed by the TVC and TMS data. However, this difference varies across different vehicle categories. As can be seen, whilst the share of CJVs is higher for TVC compared to TMS, it is vice-versa for other vehicle categories. This difference can be attributed to common misclassification of vehicle categories.

Figure 3.9 Comparison between vehicle shares from TVC and TMS WADTs



Source: Steer analysis of TVC and Client TMS data

Table 3.16: TVC TMS Comparison

	TVC	TMS	Delta
CJV	20,063	19,202	4.5%
LCV	1,232	542	127.4%
Bus/2A	2336	2527	8.2%
3A/MAV	3,946	3,990	(1.1%)
Total	**27,583**	**26,261**	**5.0%**

Source: Steer analysis

3.35 Considering the smaller variation between the TVC and TMS data for the largest revenue generator 3A+MAVs, and an overall match in the traffic volumes, TVC-TMS analysis gives us the confidence that the base year traffic calculated using the Client data forms a reliable base year traffic estimate.

3.36 As mentioned earlier, the current TMS reports 2A and Bus as separate categories. However, for comparison purposes, their volumes are being combined, as ETC single-ticket 2A volumes have declined since March 2024, while Bus volumes have increased in a manner that suggests potential misclassification. This misclassification is evident from the Table 3.16 above, which highlights discrepancies in the TMS data for Buses and 2A.

3.37 Therefore, the split that we have derived from our counts is the split we are using in our projection to forecast the growth of each individual category for this Asset.

Key findings of origin-destination analysis

Overview

3.38 Origin-destination (OD) analysis enables the understanding of the nature of traffic movement on the Asset. The OD analysis presented here is based on data collected on behalf of the Client in June 2023 at TP1 and January 2025 at TP2. More recent OD survey

on TP1 was not undertaken as it has a long operational history and we did not believe material changes in these patterns would have occurred during this period.

3.39 We have analysed the regional drivers of demand based on the following analyses:

- Zonal influence
- Commodity distribution
- Top OD pairs
- Trip length distribution

3.40 While zonal analysis and the list of top OD pairs help to understand 'where' people and goods travel, commodity distribution sheds light on 'what' goods get transported on this Asset. Trip length distribution shows 'how far' vehicles and people travel, and goods get transported. This set of analysis is used to estimate key drivers of traffic and aid in making informed forecasting assumptions related to traffic demand elasticities, growth drivers and exogenous impacts.

Sample rates

3.41 Sample rates help understand the reliability of OD data. They are calculated by dividing OD samples captured by the traffic counts (based on the TMS data) during the same period. Table 3.17 below presents the sample rates for key vehicle type aggregations at both toll plazas. We believe that the sample rates of the OD data are reasonable for the analysis required and that the high sample rate for goods traffic at TP1 could be due to Mini LCV-CJV related difference in classification in the TMS data.

Table 3.17: Sample rates for OD data

Traffic type	TP1	TP2
Passenger (CJV+Bus)	19%	16%
Goods (LCV+2A+3A+MAV)	72%	57%

Source: Steer analysis of OD data

Zone categories

3.42 To facilitate better understanding of key regional traffic drivers as determined by their OD zones, and influenced by various towns, cities, states and regions in the vicinity of the Asset, we have aggregated zonal data as described in Table 3.18 below. The methodology behind this aggregation of zones may vary as per the characteristics displayed by the different Assets being studied.

Table 3.18: Zone aggregations for zonal influence analysis

Aggregate Zone	Description
Local	Local zones are those that fall on or very close to the Asset.
IAOI (Immediate Area of Influence)	IAOI zones are the locations which generate traffic and lie within approximately 75-150 km distance from the Asset.
Rest of Rajasthan	Rest of the cities/Districts in the state that Asset lies in (other than Local/IAOI)
Rest of Uttar Pradesh	Uttar Pradesh excluding parts of Uttar Pradesh which are a part of IAOI
Rest of North India	Uttarakhand, Haryana, Punjab, Jammu and Kashmir
Central NCR	Delhi State, including New Delhi
Gujarat & Maharashtra	Gujarat and Maharashtra (including Mumbai)

Central India	Madhya Pradesh, Chhattisgarh
South India	Tamil Nadu, Karnataka, Kerala, Andhra Pradesh
East & Northeast India	West Bengal, Orissa, Jharkhand and Northeast Indian states
Outside India	Nepal, Bhutan, Bangladesh

Zonal influence

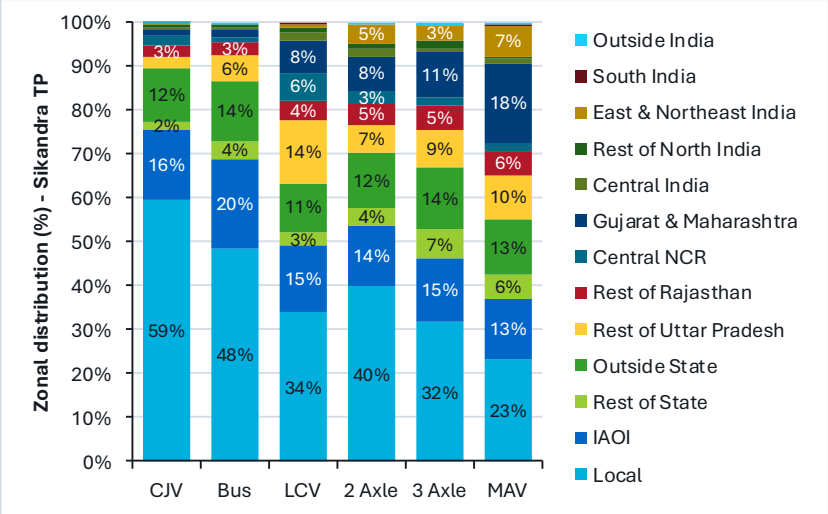
3.43 The zonal influence is the contribution of the zone or the zonal aggregation to trips by a vehicle type. This section presents the zonal influence at each toll plaza of each Asset, based on zonal aggregation listed in the previous sub-section. it should be noted that zonal influence is analysed based on trip ends and not trips.

3.44 From Figure 3.10 and Figure 3.11 below, it can be seen that the local category (trip ends lying on the Asset) has one of the highest shares across vehicle types. TP2 Rajadhok has a higher share of local trips with 41% for MAV to 78% for CJV, whereas TP1 Sikandra has only 23% local MAV trips and 59% local CJV trips. TP2 is closer to Jaipur and hence the toll plaza is surrounded by an area of high urban population density, resulting in a higher local influence at the plaza.

3.45 High zonal influence from Gujarat/Maharashtra and Uttar Pradesh is observed in 2A, 3A and MAVs. TP1 and TP2 have 10% and 18% trips to or from UP and 18% and 18% to or from Gujarat for their MAVs.

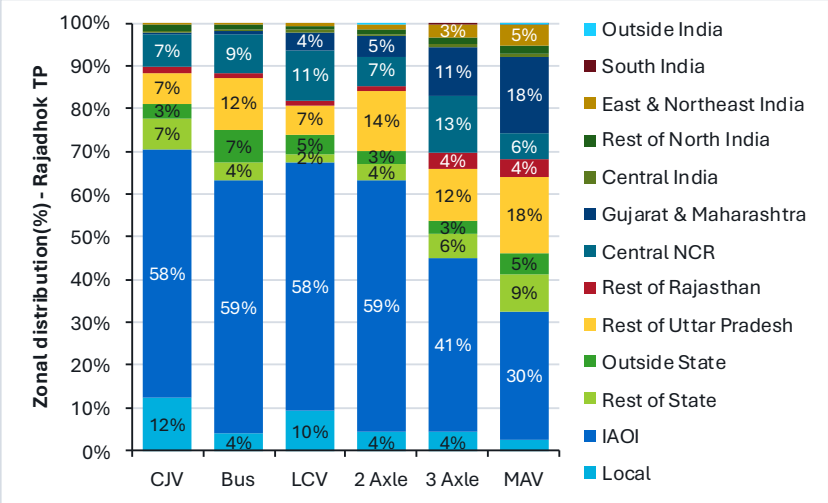
3.46 With DME becoming operational between Sohna and Dausa, the Rajadhok plaza has observed 6% of the Central NCR MAV traffic whereas Sikandra observes 2% of the Central NCR MAV traffic.

Figure 3.10 Zonal influence at TP1 Sikandra



Source: Steer analysis of OD data

Figure 3.11 Zonal influence at TP2 Rajadhok



Source: Steer analysis of OD data

Internal External analysis

3.47 Internal-External analysis helps in identifying the trips which have both the origin and destination on or near the Asset i.e. local/IAOI zones (Internal-Internal or I-I), any one end on the Asset (Internal-External or I-E), or neither end on the Asset i.e. through trips (External-External or E-E). RoS here represents areas within the state which are neither local nor IAOI. 'Internal' zones are those that were analysed as 'local' and 'IAOI' in the zonal influence analysis, i.e. lying on the Asset, while 'External' zones are areas lying outside the state.

3.48 Figure 3.12 and Figure 3.13 below show the distribution of trips based on these categories. Understandably, these reflect the observations seen in the zonal influence presented earlier, at a higher level of aggregation.

3.49 We see that TP1 and TP2 has about 30% and 31% of E-E trips for MAVs. As discussed earlier in Chapter 2, this is partly due to TP1 having a higher share of long-distance traffic that joins the Asset through Dausa. These are strategic movements moving between western and eastern regions in the immediate vicinity of the corridor, e.g. North Gujarat-Wester Uttar Pradesh, and therefore prefer using the Asset due to the connectivity it offers to these regions.

3.50 Overall, at a PCU level this analysis shows that the share of E-E trips is less than 10% (averaged across both toll plazas) which is consistent with commodity analysis and confirms that the key growth driver are local economic centres of Jaipur, Agra, Bharatpur, Alwar as well as regional feeders of Dausa-Lalsot. This also confirm that a vast majority of the traffic is 'sticky' to the Asset.

Figure 3.12 Internal-external distribution at TP1 Sikandra

	Internal	Rest of State	External
External	16%	7%	30%
Rest of State	4%	0%	8%
Internal	18%	4%	14%

Figure 3.13 Internal-external distribution at TP2 Rajadhok

	Internal	Rest of State	External
External	15%	5%	31%
Rest of State	5%	0%	13%
Internal	14%	3%	14%

Source: Steer analysis of OD data

3.51 Furthermore, in Chapter 6 we present the impacts analysis which gives an estimation of captive traffic. The non-captive traffic is a minority share, with the impacts being insignificant for all but the impact of Delhi-Mumbai expressway on TP2 Rajadhok.

Commodity distribution

3.52 We have grouped various commodities into aggregate categories for ease of interpretation, as shown in Table 3.19 below. The charts in the following sub-section present information in terms of aggregate commodity categories.

Table 3.19: Aggregate commodity categories

Commodity Description	Code	Combined codes used for charts
Agriculture Products / Cash crops (Wheat, Rice, Sugar cane,Maize etc.)	AGR	**AGR**

Cattle Food / Live Stock (sheep, ghoat, cow,cattle food etc)	LIV	
Perishable Items (Fruits, vegetables)	PER	**GRO**
Animal Products/Dairy/Eggs/Fish/Meat/Animals	DFM	
Groceries / Food items (Soap, Salt, Sugar, Pulses, Spices, Biscuits, bread, cool drinks, beer etc.)	GRO	
Building Material / Construction (Cement, Lime, Brick, fly ash, etc)	CNS	**CNS**
Sand/Clay	SND	
Stone (kota stone, marble, Granite, Aggregate stone etc.)	STN	
Ceramic	CRM	
Petroleum Products (Oil, LPG, CNG, etc.)	PET	**PET**
Chemicals / Fertilizers (Acids, Fertilizers etc.)	CHM	
Electrical/Manufacturing items (Electronic items, medicine, Leather, Wine, Rubber/ Tyre, Plastics, Cloth, Paper etc.)	MAN	**MAN**
Raw Wood, Cork & Wood Products, Furn	WUD	
Machinery / Spare parts	MAC	
Automobiles (Finished products, auto parts, Car/bike manufacturing, New Chassis)	AUT	**AUT**
Basic / Fabricated Metals (Iron, Steel / Metal)	MET	**MET**
Mining Minerals (Coal, Gypsum, Cobalt etc.)	MIN	
Empty	EMT	**EMT**
Container	CTR	**MSC**
Miscellaneous (Parcel, Courier, Household items etc.)	MSC

Scrap	SCR	

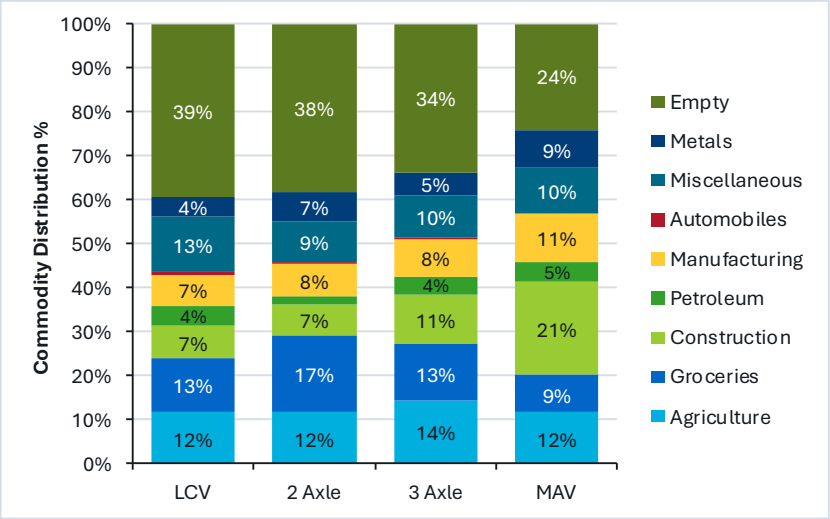
Source: Steer analysis

3.53 Figure 3.14 and Figure 3.15 present the commodity distribution for goods vehicles at the two toll plazas, at the total level as well as split by direction, towards Jaipur and Agra. As observed during our site visit, the figures below indicate that agricultural products make up about 30% of commodity share across the two toll plazas. MAVs also carry a significant share of a variety of manufactured goods between Udaipur and Gujarat at one end and Uttar Pradesh, Bihar and the rest of eastern India at the other end. Construction goods have 25% and 24% share respectively at TP1 and TP2, which includes marble being transported from Rajasthan and Gujarat towards Uttar Pradesh, Bihar, Odisha etc. Agricultural produce is mostly transported within the state of Rajasthan and manufactured products have Rajasthan, Uttar Pradesh and Delhi NCR as the top origins or destinations.

3.54 Looking by direction, a greater share of vehicles also travels empty towards Jaipur, than those travelling in the opposite direction towards Agra. Also, agricultural and grocery

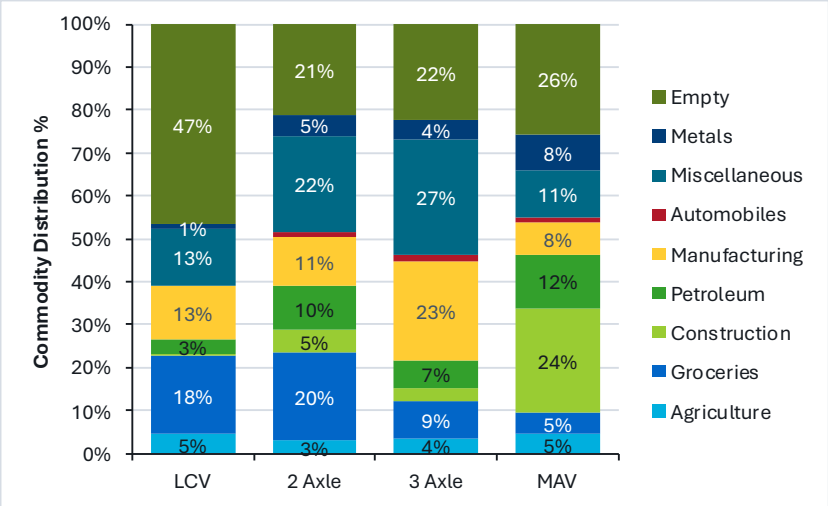
products make up a significant commodity shares for vehicles travelling towards Jaipur, then those travelling towards Agra. However, other commodity groups hold a greater commodity share in the direction towards Agra as compared to Jaipur, including stone, construction and petroleum products. The above is true for both TP1 and TP2.

Figure 3.14 Commodity distribution at TP1 Sikandra (Both directions)



Source: Steer analysis of OD data

Figure 3.15 Commodity distribution at TP2 Rajadhok (Both directions)



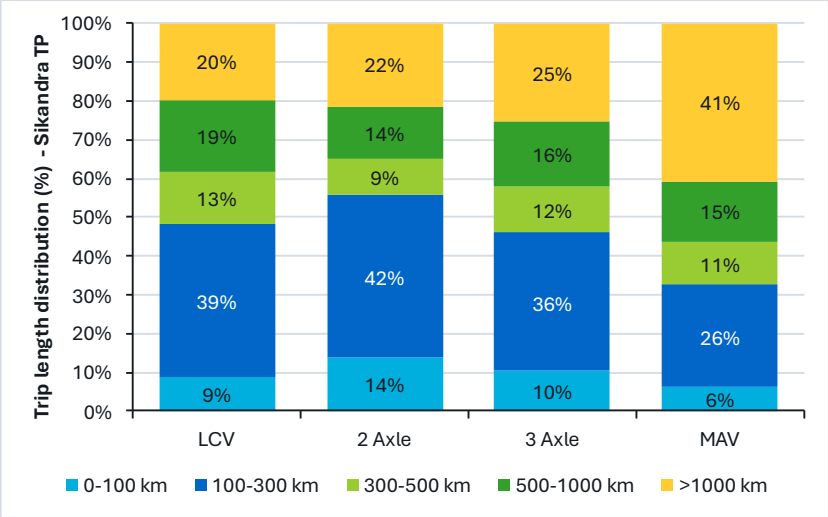
Source: Steer analysis of OD data

Trip length analysis

3.55 Trip-length distribution provides the distance-based profile of various vehicle categories. This aids in validating assumptions around the share of macro-economic drivers, inputs from zonal influence and toll segmentation. For ease of interpretation, we have categorised distances into 5 groups – local (0-100km), short-distance (100-300 km), medium-distance (300-500 km), long-distance (500-1000 km) and very-long-distance

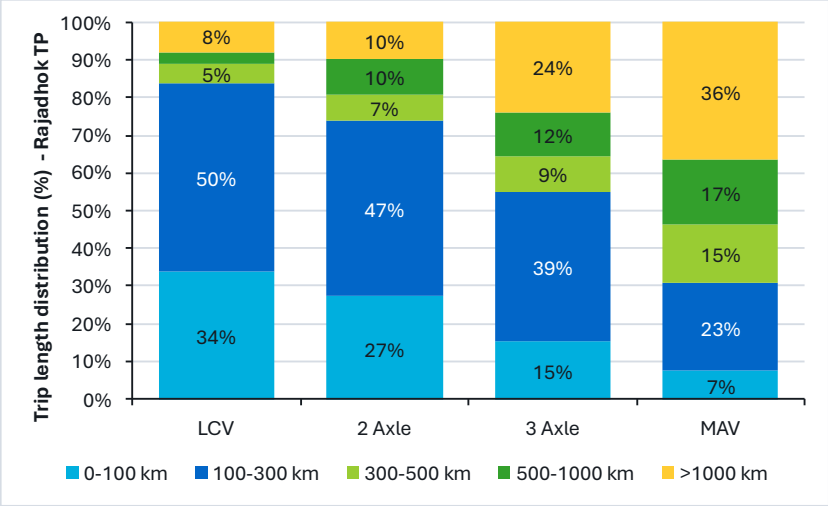
(+1,000 km). The trip distances were derived as driving distances from Google Distance Matrix Tool based on zonal coordinates for OD pairs.[11]

Figure 3.16 Trip length distribution TP1 Sikandra



Source: Steer analysis of OD data

Figure 3.17 Trip length distribution TP2 Rajadhok



Source: Steer analysis of OD data

3.56 As observed in above figures and the internal-external analysis, TP2 has a large share of local and short-medium-distance trips (up to 300 km), ranging from 31% for MAVs to 84% for LCVs, this share is lower at TP1 Sikandra, ranging from 29% for MAVs to 43% for LCVs .

3.57 In terms of long-distance and very-long-distance trips more than 500 km long, CJVs understandably do not have a significant proportion, as has been seen across other

[11] Google Distance API is a tool that is available on a chargeable basis from Google Maps Platform. Link: **https://developers.google.com/maps/documentation/distance-matrix/start**. Travel distance and time information for driving/transit under various congestion scenarios can be extracted through this tool by using macro-enabled Excel, R, etc.

Assets around the country. As expected, MAVs show a much higher share, up to 56% at TP1 and 51% at TP2 due to long distance movements between western and eastern India. 2A vehicles at TP2 have 20% share of trips being greater than 500 km.

Conclusions

3.58 In summary, in FY26YTD the Asset has witnessed an AADT of 17,667 at TP1 Sikandra and an AADT of 21,043 at TP2 Rajadhok. Looking at the vehicle shares of this Asset, the dominant vehicle class is CJV, holding 62% of vehicle share at TP1 and 74% at TP2. Further, MAVs at TP1 has a higher share (22% compared to 15% at TP2). Shares of other vehicle category volumes are consistent between the two toll plazas. Traffic has shown significant recovery starting FY22 when the Dausa-Lalsot section and Jaipur Ring Road was commissioned resulting in improved connectivity to Delhi and South.

3.59 Rajadhok's traffic in PCU terms reduced by 13.4% between FY25 and FY26YTD due to the opening of Bandikui spur in July 2025, leading to traffic diversion to Delhi Mumbai Expressway away from Rajadhok.

3.60 Passenger traffic has seen a significant growth in the month of Jan'25 on both TP1 and TP2 due to the 2025 Maha Kumbh Mela. Necessary adjustment to downturn this additional temporary gain in traffic observed in Q4 for FY25 due to Maha Kumbh mela has been made in the forecast to reflect the true nature of future traffic on the Asset.

3.61 The TVC counts does show variation on the TMS, at the total level TMS is 6% lower than TVC at TP1, and 5% lower than TVC at TP2, primarily attributable to local CJV users. However, the differences are smaller for the larger revenue generating categories (3A, MAV and OSV combined), 1% and -4% at TP1 and TP2 respectively, which gives us confidence in the data moving forward.

3.62 The OD analysis found that in terms of zonal influence, TP2 had a higher share of local trips compared to TP1, which is explained by TP2's proximity to Jaipur and a higher urban population density. CJV and Bus traffic driven with origins and destinations at both ends of the Asset corridor is seen to be driven by the urban population and tourism related drivers. The key commodities transported on the Asset on 3A/MAV trucks include agricultural products, which make up around 30% of the commodity share at both plazas. Stone also holds a respectable share, at 9% and 13% at TP1 and TP2 respectively. Majority of the traffic is sticky to the Asset with only 8% being external-external in PCU terms which is using the Asset as it offers excellent connectivity to the regions in the immediate vicinity of the corridor.

3.63 The overall characteristic of the Asset is strategic is nature connecting several key urban and economic activity centres of Jaipur, Agra, Bharatpur in immediate vicinity with wider generators and attractors of south Rajasthan, Gujarat, Maharashtra to Uttar Pradesh and Delhi NCR also being connected by the Asset. Urban population and tourism linked growth is seen as an added advantage for CJV and Bus traffic.

4 Socio Economic Context

Introduction

4.1 The growth of traffic on existing (brownfield) roads depends on, firstly, how fast the background travel demand grows (background growth); and secondly, how successful the Asset is in attracting that traffic (traffic capture). Background travel demand is driven by the socio-economic conditions of the region where the Asset is located and conditions on a national scale. These include:

Changes in factors such as population, economic growth (regional and national) and industrial production; and
Other local factors such as strategic port growth, and growth in local industries near the Assets.

4.2 In turn, the change in the competitive position of the Asset (and thus of the traffic capture it will achieve) derives from how the service offered and the prices charged on the Asset change in comparison to competing roads; and whether any new competing road facilities are available.

4.3 In this chapter, we assess the socio-economic indicators relevant to traffic growth on the Asset.

Population growth

4.4 We have analysed the key socioeconomic drivers of the background traffic demand in the state of Rajasthan where the Asset is located.

National Level

4.5 The total population in India has grown at a Compound Annual Growth Rate (CAGR) of 1.5% since 2000, decreasing over the years, as shown in Table 4.1 below. The World Bank forecasts this growth to decrease to 0.6% CAGR by the 2030-45 period.

Table 4.1: CAGR of population in India

Years	CAGR		
	Total Population (m)	Rural Population (m)	Urban Population (m)
1970 - 1985	2.3%	1.9%	3.8%
1985 - 2000	2.0%	1.7%	2.9%
2000 - 2015	1.5%	1.0%	2.6%
2015 – 2030*	1.0%	0.3%	2.3%
2030 – 2045*	0.6%	-0.3%	1.9%

Source: World Bank Data on Health Nutrition and Population Statistics, *forecast population growth

State Level

4.6 As Table 4.2 shows, the populations of Rajasthan has grown at a faster pace compared to that of India, between FY12 and FY24. As of FY24, accounts for 5.8% f India's population

4.7 Table 4.2 shows the evolution of population in the state of Rajasthan (containing the Asset), compared to that of the country.

4.8 As Table 4.2 shows, the populations of Rajasthan has grown at a faster pace compared to that of India, between FY12 and FY24. As of FY24, accounts for 5.8% f India's population

Table 4.2: Population Growth in Rajasthan and India (2012-2024)

State	2012 Population (m)	2024 Population (m)	CAGR (2012 – 2024)
Rajasthan	69.1	82.4	1.4%
India	1,210	1,395	1.2%

Source: MoSPI estimates

4.9 Due to the complexities of patterns of urbanisation, and the very dynamic nature of local population migration (which are very difficult to forecast with accuracy), we do not use population growth as a proxy for understanding future travel demand growth on the Asset. It has been included in this section simply to provide the underlying socio-economic context of the state/trends in the regions in which the Asset is located.

Economic Indicators

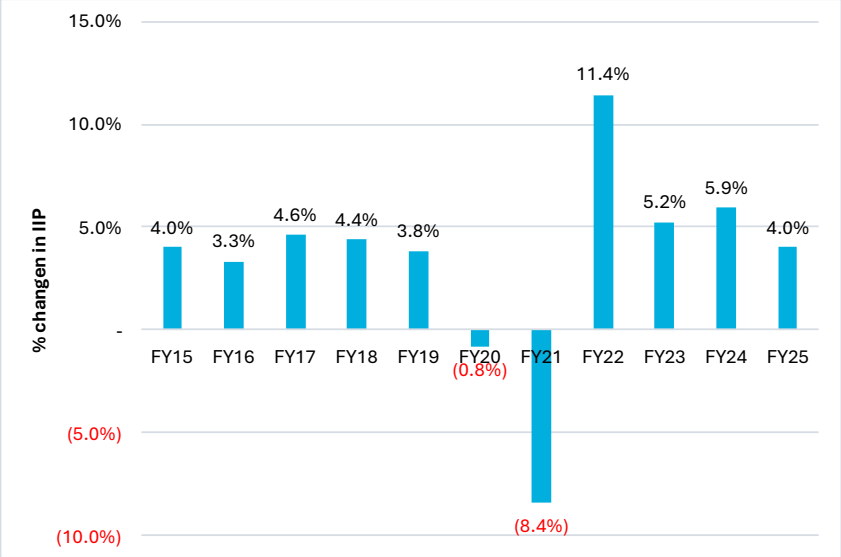
Industrial Production

4.10 The Index of Industrial Production (IIP) is a composite indicator that measures the short-term changes in the volume of production for a basket of industrial products. The IIP data tracks the manufacturing activity in different sectors of an economy, with mining, manufacturing, and electricity being the three broad sectors constituting the IIP.

4.11 At an annual level, national IIP was growing at an average of 4% per year over the period FY15-19, before the country underwent a liquidity crisis and experienced an overall economic slowdown in FY20 (as presented in Figure 4.1 below). In the aftermath, IIP shrank by over 8% in FY21 due to a decline in economic activity in the wake of global lockdowns introduced to curb the Covid-19 pandemic. However, with the gradual opening up of economy post the pandemic, and recovery in consumption demand, industrial activity also recovered with time with IIP recording growth of 5% in FY23 and 6% in FY24.

4.12 The figure below shows that at an annual level, national IIP was growing at an average of 4% per year over the period FY15-19, before the country underwent a liquidity crisis and experienced an overall economic slowdown in FY20. In the aftermath, IIP shrank by over 8% in FY21 due to a decline in economic activity in the wake of global lockdowns introduced to curb the Covid-19 pandemic. Post the immediate recovery in FY22, IIP growth has since stabilised, with FY25 recording 4% growth over FY24.

Figure 4.1: Annual growth – Index of Industrial Production



Source: Steer analysis of MoSPI data

4.13 Since state-level IIP data is not as readily available as national level IIP, we have presented national IIP here to indicate nationwide activity in key industrial sectors like power, manufacturing, and mining, all of which influence long-distance commercial movements across the nation, and not unique to this asset. We however, do not use it to forecast future travel demand growth since long-term forecast for IIP is not available through official sources such as MOSPI, RBI or through multilateral organisations like WB, or the IMF.

Vehicle Ownership

4.14 Car ownership in India has traditionally been very low at 22 cars per 1000 individuals, compared to developed countries like the United States, which has approximately 980 cars per 1,000 individuals.[12] However this is slowly changing with the increasing per capita income levels. As can be seen in Figure 4.2 below, between 2007-17, the number of cars per 1,000 people more than doubled from 9 in 2007 to 22 in 2017 growing at a CAGR of approximately 11%. The corresponding ownership rates for urban cities like Delhi, Mumbai, Bengaluru, and Chennai are over 100 cars per 1,000 people[13] (GoI 2011; MoRTH 2012).

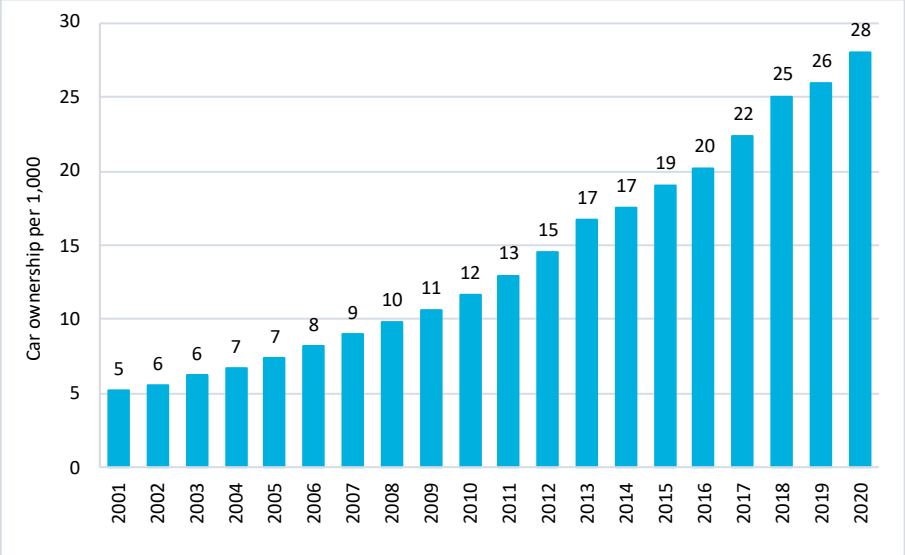
4.15 Overall, India still stands at a very nascent stage in the vehicle saturation curve, offering huge potential for growth going forward. As the income per capita of India and the region itself grow further, we expect car ownership levels to increase. As per the India Energy Outlook (2015), car ownership is projected to grow steeply to 175 cars per 1,000 population by 2040 in India.[14]

[12] India has 22 cars per 1,000 individuals

[13] Proliferation of Cars in Indian Cities

[14] https://www.gita.org.in/Attachments/Reports/IndiaEnergyOutlook_WEO2015.pdf

Figure 4.2: Car ownership in India per 1,000 population

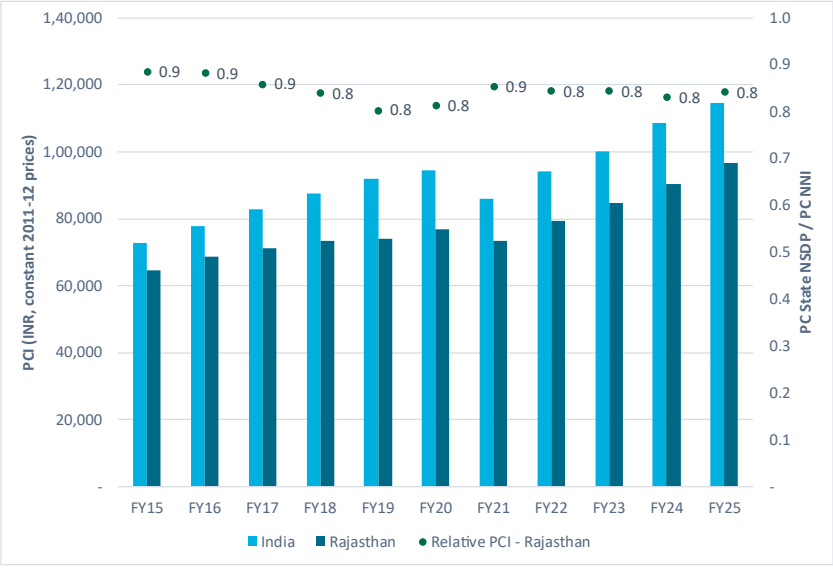


Source: International Energy Agency (IEA)

Per Capita Income (PCI)

4.16 The per capita income of the state where the Asset lies (i.e., Rajasthan) has historically varied slightly below the national average, trending at 80-90% of the national per capita income over the period FY15-FY25. While the statewide per capita income has remained below the national average, incomes near and around the Asset are higher given its proximity to Jaipur city (the state's capital). In recent years (FY22-FY25), Rajasthan recorded higher per capita income growth than observed pre-COVID (FY12-FY19) owing to strong consumption growth in the state. Going forward, we expect strong local consumption demand to drive growth in both passenger and commercial traffic.

Figure 4.3: Relative Per Capita Income (FY15-FY25)



Source: Steer analysis of MoSPI data

4.17 However, given the difficulty in obtaining granular district level PCI data it is not advisable to use this as a growth driver. Also, the long-term forecast for PCI is not available we therefore refrain from using it to forecast traffic.

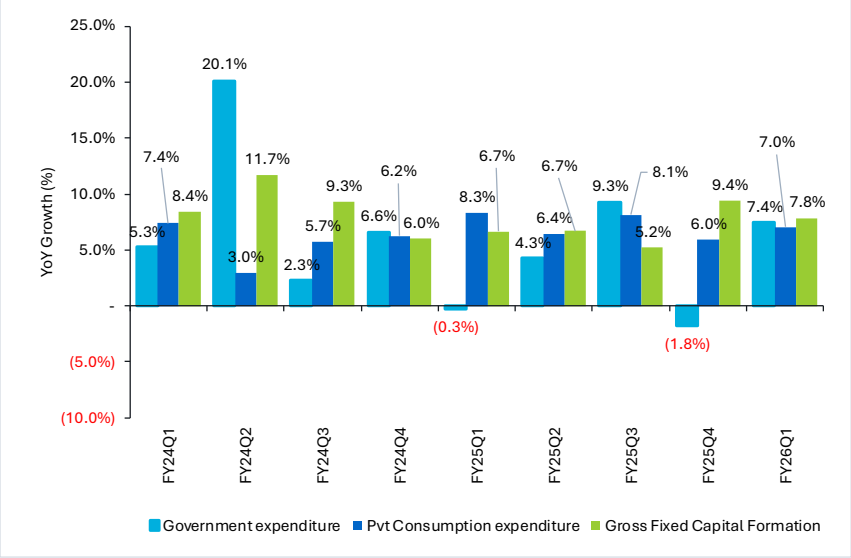
Economic growth

India's Performance

4.18 Despite a slowdown in the economy during H1FY25, the Indian economy has observed strong growth each quarter since FY25Q2, with the latest published estimates for FY26Q1 GDP at 7.8% over FY25Q1. This performance has been driven by strong growth in investment and consumption expenditures and higher consumer optimism for the year ahead[15].

4.19 The figure below, we present quarterly Y-o-Y growth in three major components of GDP – government expenditures, consumption expenditures, and business investment (gross fixed capital expenditure) over the past two years (FY24-FY26Q1).

Figure 4-4: Private and Government Consumption and Business Investment Expenditures



Source: Steer Analysis of MOSPI Data

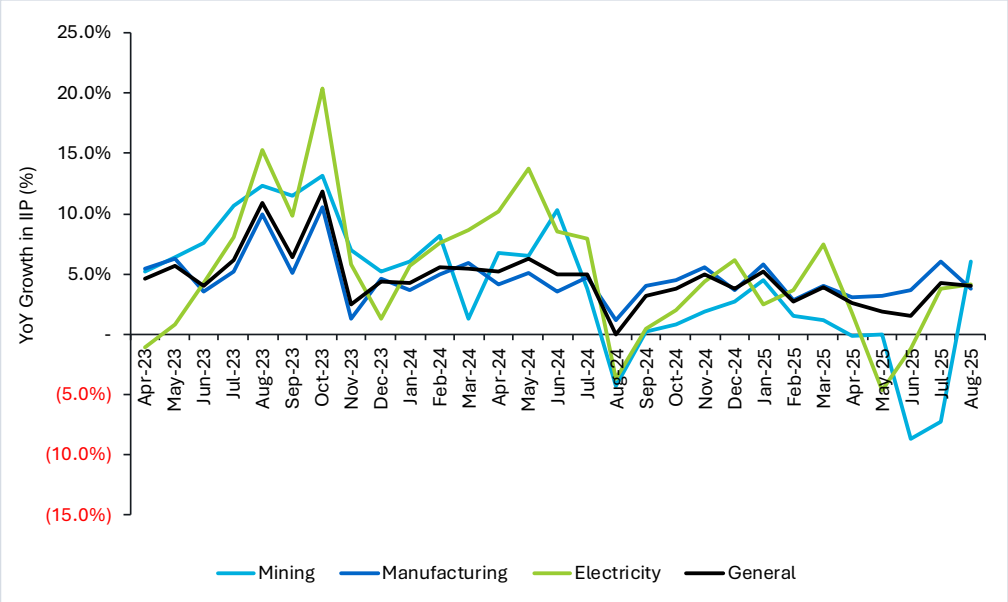
4.20 While consumption and investment expenditures have continued to show consistent growth over the past two quarters, government expenditures observed a marginal decline in FY25Q4. In FY26Q1, government expenditures rebounded, recording 7.4% growth over FY25Q1 levels.

4.21 Performance across different types of industrial activities (such as Mining, Manufacturing, and Power Generation) directly impact freight movement and commercial traffic volume growth across the country, including on the Asset. In the figure below, we present growth trends in IIP – a measure that tracks the performance of the economy across these activities. As of FY26YTD (Apr-Aug '25), the Manufacturing sector continues to perform strongly, recording positive y-o-y growth since FY25Q3. While industrial activity across the

[15] Government of India, PIB Release Oct 1 '25

two other sectors (i.e., Power Generation and Mining) dropped between May and Jun/Jul '25, they have since rebounded and show signs of continued growth going forward.

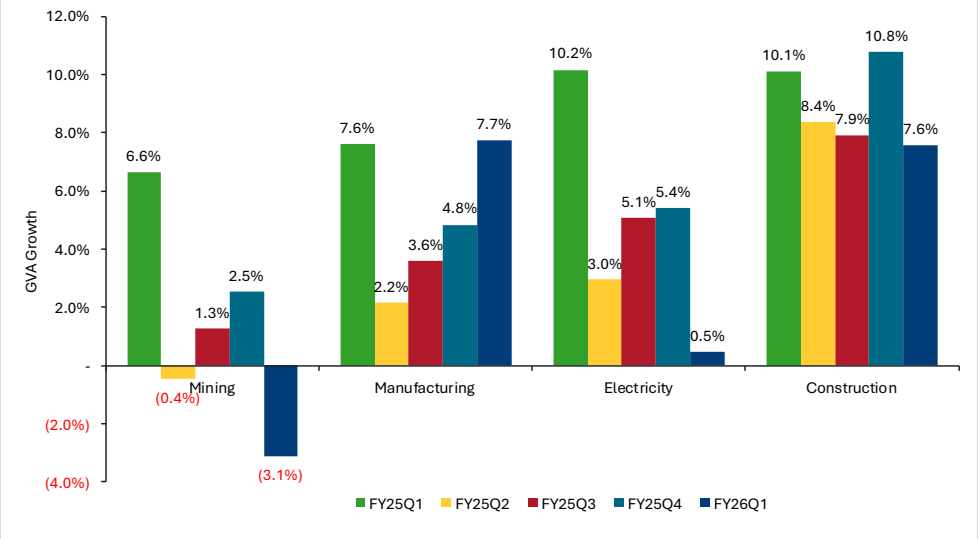
Figure 4-5: Month on Month IIP performance



Source: Steer Analysis of MOSPI Data

4.22 In addition to monthly trends in IIP, the figure below presents y-o-y growth of quarterly GVA in four industrial sectors - Mining (& Quarrying), Manufacturing, Electricity (and other Utilities), and Construction. While the Mining and Power sectors observed decline and muted growth in FY26Q1, the Manufacturing and Construction sectors experienced strong growth. While overall economic growth has remained resilient as of FY26YTD, performance across industries have varied, impacting economic growth across different regions and on the Asset as well.

Figure 4-6: Industrial components of GVA



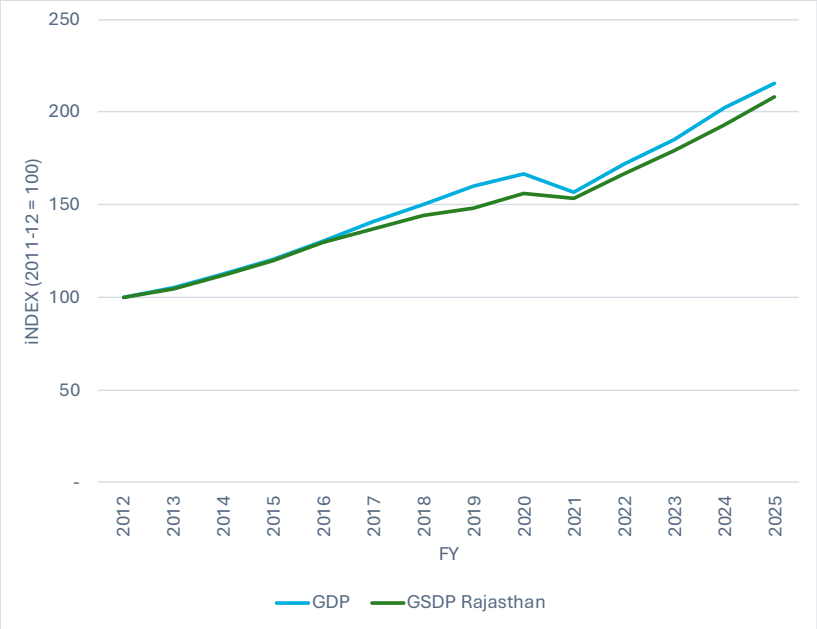
Source: Steer Analysis of MOSPI Data

GDP and GSDP Growth

4.23 Over the period FY12-FY25, the Indian economic has grown at a CAGR of approx. 6% aided by growth in the tertiary sector which grew at a CAGR of approx. 6.9% over the same period. The economic growth of Rajasthan (state GSDP) has been somewhat slower than the country overall for the past 5 years but it seems to have caught up with the national rate since the COVID19 pandemic. [16]

4.24 The Asset Jaipur - Mahua, lies in the state of Rajasthan. The state contributes approximately 5% to India's GDP. Figure 4.7 illustrates the evolution of India and Rajasthan GDP.

Figure 4.7: Evolution of Rajasthan's state GDP and national GDP, FY12-25



Source: Ministry of Statistics and Program Implementation (MoSPI)

Economic activity in the state

4.25 Rajasthan, the largest (area-wise) state in India, is in the north-western part of the country. In terms of sectoral contribution to the state GDP, tertiary sector has the highest share followed by primary and secondary, with the shares remaining stable during the last six years (i.e., 2019-2025).

4.26 The tourism and transport sector constitutes a major share of state's tertiary sector, accounting for roughly 15% of the state's economy as of 2024[17]. Rajasthan is considered a favoured tourist destination in India, with key tourist destinations being Jaipur, Jodhpur, Jaisalmer, Bharatpur and Udaipur. In 2018, the state attracted over 50 million domestic

[16] GSDP is the Gross State Domestic Product i.e., the GDP equivalent for a particular state, it is the final value of goods and services produced by a particular state

[17] Rajasthan Tourism sector

tourist arrivals in the country whereas, in terms of foreign tourist arrivals it holds fifth position in the country with over 1.7 million[18] tourist visiting state every year.

4.27 In terms of secondary sector, the state has key industrial areas in Kishangarh (marble); Manesar (automobile), Pali and Jodhpur (textiles), Chittorgarh -Neemuch (cement), Kota (stone). Rajasthan is one of the largest minerals producing state in India and is the sole producer of lead and zinc ores in India. The state has one of the largest limestone reserves, making it a hub for cement industries. In terms of agricultural produce, the state is largely known for its production of wheat, cotton, cereals and pulses.

Forecasts for growth drivers

4.28 Following the discussion in Chapter 4 on the nature of economic activity in the state of Rajasthan, in this section, we describe the assumptions in relation to forecasts of the key macro-economic drivers of traffic growth. Particularly, we have based our forecast on GSDP using forecasts of GDP as provided by the Client.

National GDP

4.29 After the last period of economic slowdown in FY11-12, the country experienced an economic downturn again in late FY19 with FY20 having reported a GDP growth of 4% (relative to an average growth rate of 7% per year between FY13 and FY19). India's GDP growth declined as domestic investment and consumption demand were already under stress because of the liquidity crunch before Covid-19. Other factors that contributed to the economic slowdown included reduced growth rates in automobile sales and production, liquidity crunch in credit markets and rising number of Non-Performing Assets (NPAs) within the banking sector, as well as lower manufacturing production and lower rural consumption.[19]

4.30 The Covid19 outbreak had a significant impact on the Indian economy during the first two quarters of FY21 as government mandated lockdowns across the country effectively stalled economic activity and growth. The growth momentum eventually picked up in Q3 of FY21, with a sharp rebound in the economy in FY22 (GDP recorded 9.7% growth over FY21) and has since observed a consistent growth of 7.6% in FY23, 9.2% in FY24 and 6.5% in FY25 before slowing down over the past year due to several domestic and external factors.

4.31 Figure 4.8 below shows client provided GDP projections for India. The forecast provided by the Client expects the India GDP to grow at 6.5% between FY25-FY27 and gradually tapering down to 4.1% by FY32, end of concession. The India GDP growth forecast provided by the Client is broadly in line with other independent forecasts available from reliable sources such as IMF, World Bank and RBI[20] in the medium term.

[18] http://tourism.gov.in/sites/default/files/Other/India%20Tourism%20Statistics%20at%20a%20Glance%202019.pdf

[19] **Data | India's GDP was on a downward slope even before COVID-19 wreaked havoc - The Hindu** (September 2020)

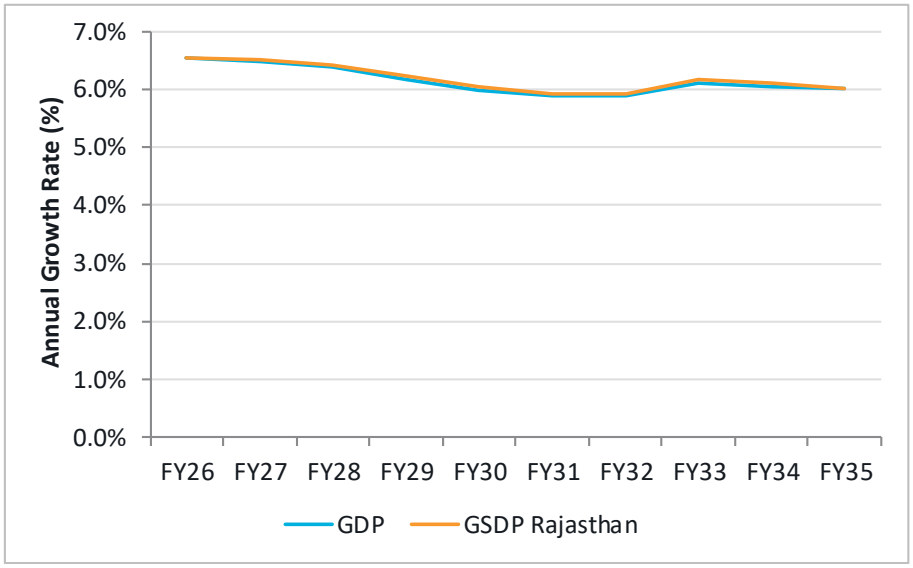
[20] **Survey of Professional Forecasters on Macroeconomic Indicators – Results of the 93rd Round (April 2025)**

4.32 Over the near term, Rajasthan's GSDP growth assumes to continue outpacing the national GDP throughout the concession period. We believe this is a realistic position based on the current and future development plans of local and state governments.

4.33 There are significant investments expected to take place as part of the state's plan and Rajasthan is expected to receive a significant proportion of these investments, given its leading position in industrial investments. Higher than expected GSDP growth rate across the concession period could be achieved if such investments were realised as they are expected to give an additional boost to Rajasthan's state economy.

4.34 In the long term, we believe that as other smaller state economies of India catch up with the national economic growth, the gap between growth rates of larger state economies, such as Gujarat, Maharashtra and Karnataka, and the national GDP growth rate will start reducing.

Figure 4.8: GDP-GSDP forecast



Source: GDP forecast provided Client, GSDP based on Steer analysis

5 FY26 Base year AADT and Traffic growth analysis

Introduction

5.1 In this chapter, we present our approach, assumptions, and results for base (or background) traffic growth for each vehicle category on the Asset.

5.2 Traffic growth is commonly related to a variety of macro-economic and industry- or commodity-specific factors (hereafter referred to as 'traffic growth drivers'). These growth drivers are typically identified from the results of the OD data analysis and the site visits that help us appreciate the nature of traffic movement – 'what' travels 'where' and 'why'. To understand the historical traffic trends in relation to these growth drivers, we carry out regression analysis to determine the historical relationship between traffic belonging to each major vehicle category and its macroeconomic growth driver at each toll plaza. The traffic demand is the dependent variable while the one or more identified growth drivers are the independent or explanatory variables.

5.3 Typically, passenger and light commercial vehicles like cars, buses, LCVs and 2-axle trucks grow in line with the GSDP of the state where the toll road is located. Heavy vehicle traffic like 3-axle trucks and MAVs grow in line with the national GDP. This is because most light vehicles tend to travel shorter distances within the state, whereas a significant proportion of heavy vehicles carry commodities for long-distances across the country. These commodities also tend to be part of industry ecosystems whose demand-supply relationships are scattered across the country and therefore relate more with GDP growth.

FY26 Base year AADT estimates

5.4 The base year is the year on which long-term background forecast growth rates are applied to derive year-wise average annual daily traffic (AADT) estimates for forecast years. This is therefore an important aspect of our forecasting approach as traffic and ultimately revenue forecasts for future years are built on top of the base year traffic estimate. We have used FY26 as the base year for AADT estimates for the forecast years.

5.5 As described previously in Chapter 3, to establish the base year (FY26) traffic position, we utilised information from various sources – including from the Client and our context knowledge, to assess a reasonable demand on the corridor.

Methodology

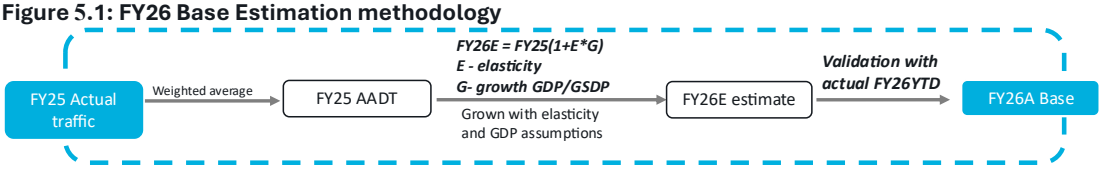
5.6 The base traffic for FY25 has been estimated utilizing the normal months of FY25. The weighted average of the actual FY25 traffic (April to March) was taken to arrive at annual

FY25 AADT. Using elasticity-based growth assumptions GSDP or GDP we arrived at estimated FY26 (FY26E).

5.7 The monthly profile of the FY26E AADT was then compared to the actual traffic observed in the six months (April to September) of FY26 (FY26YTD). The Adopted AADT FY26A is calculated by adjusting FY26E to match FY26YTD outturn traffic, accounting for seasonality.

5.8 The methodology is represented using the below schematic:

Figure 5.1: FY26 Base Estimation methodology



Source: Steer Analysis

5.9 The two key inputs to estimate the base year FY26 traffic are FY25 traffic and seasonality correction factor (SCF).

Seasonal Correction Factors

5.10 Traffic on any Asset varies on a month-on-month level. Such variations maybe due to monsoons (typically Jul to Sept) or due to festivals in the region. For e.g. It is observed that typically the truck traffic during the first half of the financial year (April-September) is generally lower than the annual average, mainly because of peak summer season followed by monsoons affecting the freight movement patterns in large parts of the country in the July-September period. In addition to these there may be other seasonal variations specific to the Asset.

5.11 In order to normalise for these variations across the year to provide an AADT estimate, Seasonality Correction Factors (SCF) are used. SCFs are estimated to convert the monthly traffic numbers to an AADT level while accounting for seasonal variation due to local/national festivals, weather changes and/or temporary external impacts. These are typically estimated using historical data for each plaza and vehicle category over multiple years. An SCF >1 means that the traffic for the month is lower than the annual average and vice-versa.

5.12 To achieve this, we studied the seasonality between monthly average daily traffic (MADT) – We have analysed the seasonality trends between monthly average daily traffic (MADT) and AADT for data during the historical years of tolling (as described in Chapter 3), excluding the years that were impacted by specific events. This averaged seasonality trend is then applied to the monthly traffic to obtain AADT as mentioned in the previous sections.

5.13 Table 5.1 and Table 5.2 present the assumptions in SCF used to estimate the AADT:

Table 5.1: Seasonality correction factors for TP1 Sikandra

Adopted FY26 base estimates

6.1 Based on the above methodology and inputs, the adopted base for toll plaza has been shown below:

Table 5.3: Adopted base estimates: TP1 Sikandra

	FY25	FY26YTD	FY26A	FY26A vs FY25
CJV	11,580	11,138	11,607	0.2%
LCV	364	328	344	(5.7%)
Bus/2A	2,353	2,353	2,438	3.6%
3A/MAV	3,933	3,847	4,067	3.4%
Total	**18,230**	**17,667**	**18,456**	**1.2%**
PCUs	**34,694**	**33,859**	**35,473**	**2.2%**

Table 5.4: Adopted base estimates: TP2 Rajadhok

	FY25	FY26YTD	FY26A	FY26A vs FY25
CJV	18,299	15,280	14,565	(20.4%)
LCV	484	410	403	(16.7%)
Bus/2A	2,418	2,263	2,235	(7.6%)
3A/MAV	3,553	3,091	3,130	(11.9%)
Total	**24,753**	**21,043**	**20,333**	**(17.9%)**
PCUs	**40,373**	**34,946**	**34,293**	**(15.1%)**

Source: Steer analysis; FY25 actual full year, FY26YTD includes 6 months (Apr-Sep) of FY26, FY26A is adopted base for FY26

5.14 As we can see from Table 5.3 and Table 5.4, FY26A AADT estimates are 6.8% higher and 12.1% lower than FY25 AADT for TP1 Sikandra and TP2 Rajadhok respectively. Rajadhok's adopted base traffic in FY26 is lower than FY25 as the diversion of traffic from the Asset to Bandikui spur of the Delhi Mumbai expressway towards Jaipur.

5.15 Sikandra's CJV volume in FY26 is expected to remain at FY25 levels in in FY26 as FY25 witnessed high traffic on account of the Mahakumbh resulting in an one-time increase in volumes on both Sikandra and Rajadhok toll plaza .

5.16 We have combined Bus and 2A volumes for our base estimation because as mentioned before, TMS reports discrepancies in the data. Therefore, the split that we have derived from our counts is the split we are using in our projection to forecast the growth of each individual category for this Asset.

Estimation of background elasticities

5.17 Elasticities, in the case of traffic growth are the relationships between traffic and growth drivers. Multiplied with forecasts of growth drivers like GDP or GSDP, they provide the forecasts of background traffic growth rates.

5.18 The below table presents the growth drivers identified to model the forecast background traffic growth rates.

Table 5.5: Identified growth drivers to model traffic growth at Asset level

Vehicle type	GDP India	GSDP Rajasthan
Car		100%
LCV		100%
Bus		100%
2A	100%	
3A	100%	
MAV	100%	

Source: Steer analysis of Client data

5.19 The TMS data for the Asset reports 3A and MAV together where Bus and 2A reported separately, hence splits were required to understand the 3A and MAV growth pattern. For this Asset Car, Bus and LCV do more regional movement as validate from OD trip length and zonal analysis hence the growth of this vehicle category is more influenced by Rajasthan GSDP. Whereas 2A, 3A and MAV carry heavy commodities like construction material and agricultural products from Rajasthan across states and internationally hence more linked to GDP growth.

5.20 For the purpose of regression analysis we have considered the period of FY16-25. FY16 and before were chequered period for the Asset with combination of illegal mining and overloading ban. The commercial traffic did not witness significant negative impact on volumes except for first nation-wide lockdown in March and April 2021. Hence we have considered FY21 and FY22 for the regression analysis.

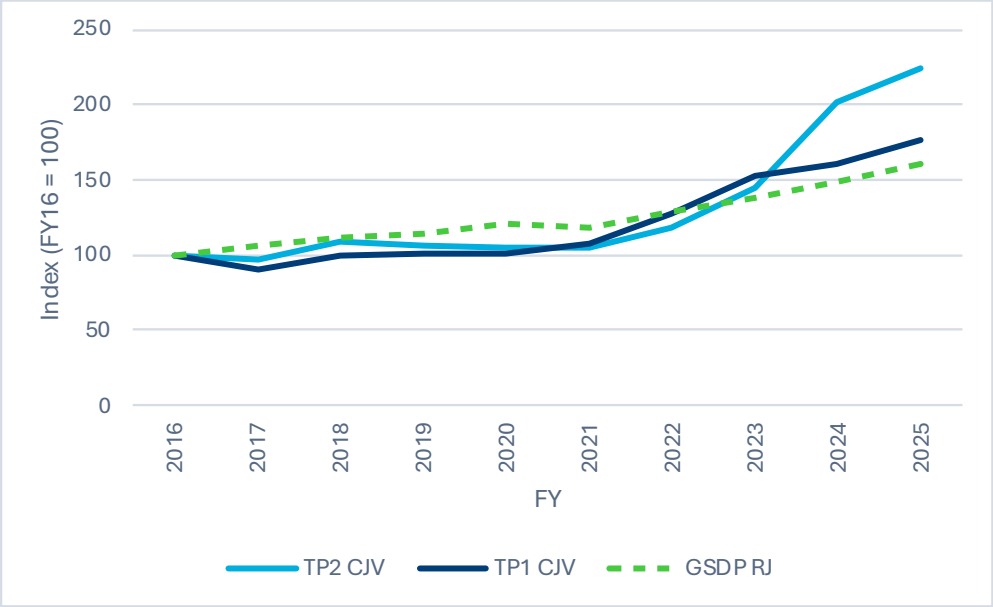
5.21 In recent historical traffic performance across national highway corridors, a notable trend has emerged: there is a noticeable shift in axle preference towards 2As and MAVs, resulting in a dampening effect on the growth of 3As. This trend is mirrored in the Assets FY23 and FY24 performance as well, which has been discussed in detail in the

subsequent sections. As a consequence of these evolving axle preferences, it has been assumed that the relationship between 3As and GDP will be relatively muted, whereas 2As and MAVs are expected to grow more closely in line with the country's GDP.

CJV

5.22 It was observed from the OD data, that CJVs primarily cater to regional movements between Jaipur, Bharatpur, Agra and other towns lying in the vicinity of the Asset. We have therefore assumed Rajasthan GSDP to be the growth driver for modelling growth of CJV traffic. Figure 5.2 shows the relationship between indexed values of CJV traffic and Rajasthan GSDP at TP1 Sikandra and TP2 Rajadhok. CJV traffic on TP1 has shown 6% growth from FY16-24 while for the same period TP2 recorded 9%.

Figure 5.2: Relationship between CJV traffic and Rajasthan GSDP



Source: Steer analysis of Client TMS data and publicly available GSDP data

5.23 Generally, we would expect that in fast-growing economies with relatively low car ownership levels, car traffic growth rates are often in line with or are slightly higher than growth in GSDP/GDP (i.e. suggesting elasticities just above 1.0). Further, the opening of the Delhi Mumbai section upto Lalsot has had a significant impact on Car traffic on the corridor on both toll plazas adding additional impetus to car growth. This has also increased the influence of tourism related movement on the Asset, due to the significant volumes contributed by DME onto the corridor and hence it is expected that car growth will remain robust on the Asset. In addition there is an expected increase in car ownership proportion of overall population as the economy grows.

5.24 Taking note of the positive outlook for passenger traffic on the tourism-driven Asset we have assumed a forecast background elasticity of 1.10 with respect to Rajasthan GSDP for CJV at both the toll plazas.

LCV, Bus, 2A

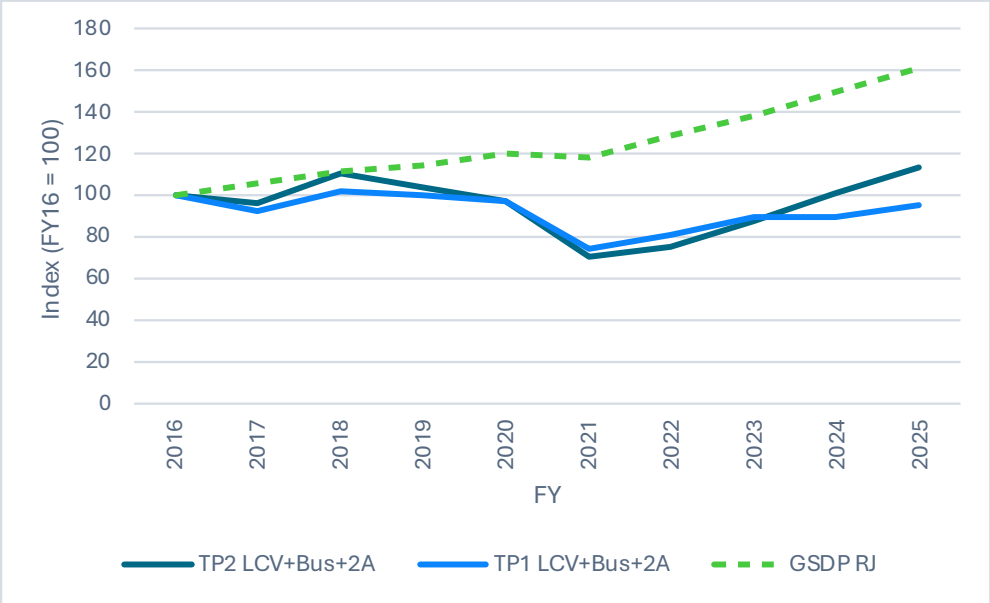
5.25 As discussed in the OD data analysis, LCV, Buses, and 2As are employed for more regional travels within the state - Rajasthan in this example - than heavier vehicles such as 3A and MAV. More than 80% of LCVs and Buses, and 70% of 2As, complete their

journey in Rajasthan. As a result, we assumed that the Rajasthan GSDP would be a better growth driver to predict the increase in Bus+LCV traffic. Figure 5.3 below depicts the link between the indexed values of combined Bus+LCV traffic and Rajasthan's GSDP.

5.26 In many sections of the country, bus growth is entirely supply-driven, with new buses purchased and deployed by the government at varying intervals. According to our experience across the country, buses on inter-urban and tourism corridors have elasticities ranging from 0.4 to 0.6 in relation to the GSDP. We estimated an elasticity of 0.5 with regard to GSDP Rajasthan based on the regression results and benchmarks.

5.27 Between 2016 and 2024, the growth rate of Bus+2A+LCV remained flat. During this time period, it was noticed that disaggregate traffic for LCVs rose slower than traffic for Buses and 2As. This could be attributable to a variety of factors, one of which is the reclassification of LCVs and 2As, which has been seen as a prevalent tendency across the country's toll highways. However, beginning in 2022, the combined volume of Bus+LCV+2A has began to show indications of recovery, as shown in the graph below.

Figure 5.3: Relationship between Bus+LCV+2A combined traffic and Rajasthan GSDP



Source: Steer analysis of Client TMS data and publicly available GSDP data

5.28 Based on the results of the regression, analysis of historical trends on the Asset, as well as our previous experience on benchmark Assets the elasticity assumption for LCVs is 0.3 on both TPs, and for Bus which have witnessed relatively stronger growth is 0.5 for both toll plazas. 2A have benefited from increase in Courier/Parcel movement and continued on a positive growth profile over the last 3-4 years and are expected to have an 0.8 elasticity to GDP.

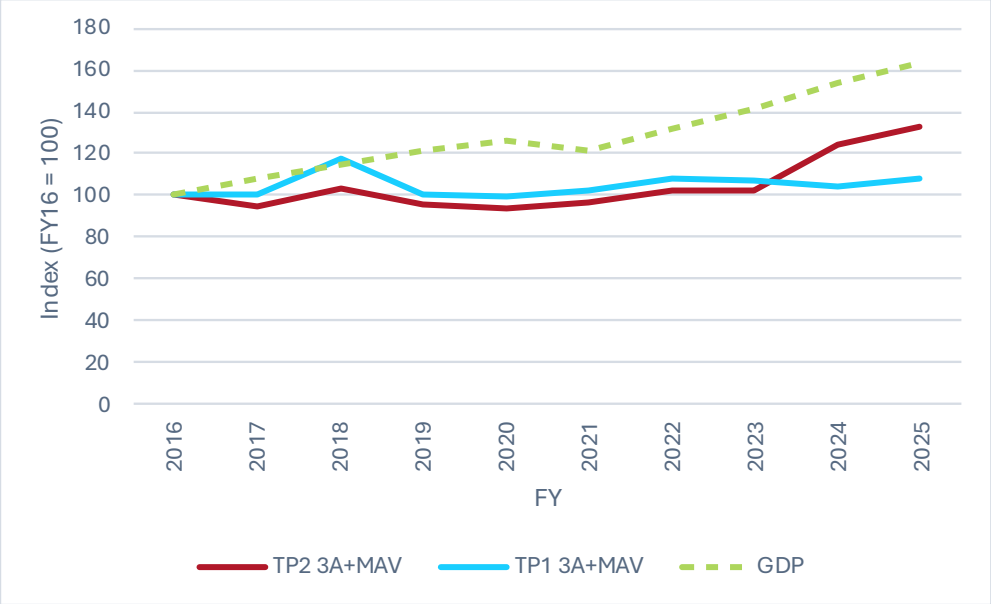
3A/MAV Trucks

5.29 In comparison to lighter vehicles such as LCV and 2A, 3A and MAV have more national or long-distance movements that span multiple states. Given that manufacturing-related commodities tend to dominate commodity distribution, resulting in traffic growth in 3A and MAV vehicle categories to be dependent on industry demand-supply ecosystems spread across the country, we have assumed GDP as the growth driver to model traffic

growth in 3A and MAV vehicle categories. Figure 5.4 below depicts the relationship between the indexed values of 3A+MAV combined traffic and India's GDP.

5.30 Historically, 3A+MAV combined traffic grew positively in the FY16-18 period at 8.2% at TP1 Sikandra and 1.4% at TP2, before losing volumes in FY19 and FY20.

Figure 5.4: Relationship between 3A+MAV combined traffic and India GDP:



Source: Steer analysis of Client TMS data and publicly available GDP data

5.31 Major reasons associated with this slower growth is implementation of stringent sand mining policy 2020 in Rajasthan which reduced the illegal sand mining and associated 3A and MAV traffic (FY18-FY20) in the region. Completion of Jaipur Ring Road improving access of regions beyond Jaipur. Opening of DME, which resulted in higher 3A and MAV traffic on Rajadhok plaza, whereas the Sikandra plaza lost commercial traffic which as destined to Alwar which earlier used to cross the Sikandra plaza but now diverts via DME. Between FY23 and FY25 the Asset registered negative 2% 3A+MAV growth on Sikandra and 21% on Rajadhok. Since DME is now operational for more than 12 months now, we expect very minimal loss on Sikandra and return of normal traffic growth on Rajadhok plaza.

5.32 The Asset reports 3A+MAV combined, in our experience of other toll roads, 3As to grow slower than MAVs due to an increasing preference seen for MAVs instead of 3As for long-distance movements. This is because MAVs have higher load capacity which generate economies of scale resulting in lower costs. However, it is unlikely that 3A trucks will disappear from the market completely as there are best suited for certain commodities or movements.

5.33 Based on the above points, we have assumed elasticities of 0.40 and 0.85 for 3A and MAV trucks respectively, with respect to India GDP growth.

Forecasts for background elasticities

5.34 Table 5.6 presents a summary of the results of the regression analysis carried out on historical toll plaza data and the macroeconomic (GDP/GDSP) growth, along with the assumed forecast elasticities for background traffic growth.

5.35 The forecast elasticities are assumed to remain constant over the concession period as the logistics sector in still in early stages of development in India (95% of trucks still owned by operators owning less than 5 trucks). Car ownership levels are still around 30-35 per 1000 people, and it is likely to take a few years before the market reaches maturity. These trends are based on a long-term understanding of historical relationships and an overall outlook on the growth of the region and the country.

Table 5.6: Derived implied elasticities and assumed forecast elasticities for background growth

Vehicle type	Growth driver	History		Forecast	
		Derived elasticity	Period Considered (Without Dummy)	Assumed forecast elasticity	Evolution of elasticity
TP1 Sikandra					
Car	GSDP Rajasthan	1.20	FY16-25	1.10	No change
LCV*	GSDP Rajasthan	(0.10) *(LCV+2A+Bus)*	FY16-25	0.30	No change
Bus*	GSDP Rajasthan		FY16-25	0.50	No change
2A*	GDP		FY16-25	0.80	No change
3A*	GDP	0.15 (3A+MAV)	FY16-25	0.20	No change
MAV*	GDP			0.85	No change
TP2 Rajadhok					
Car	GSDP Rajasthan	1.73	FY16-25	1.10	No change
LCV*	GSDP Rajasthan	0.25 *(LCV+2A+Bus)*	FY16-25	0.30	No change
Bus*	GSDP Rajasthan		FY16-25	0.50	No change

6 Forecasts: Network overlays and forecasts

Introduction

6.1 Following the discussion on estimated and assumed forecast background growth rates in the previous chapter, this chapter first deals with the forecasting assumptions around base year AADT and potential impacts on traffic growth on the Asset. Thereafter, we present our assumptions around toll segmentation, trip factors and growth of toll rates for the forecast period which have been used to forecast revenues as derived from forecast traffic. This chapter summarises traffic growth rates for the forecast years.

6.2 All traffic is presented as AADT for vehicle category at each plaza, for financial years (April-March). All revenue is presented in INR (nominal terms). Though FY32 is the last year of concession, we have developed our forecasts until FY32 for the Client's reference.

Analysis of potential network/developmental impacts

Summary of alternate routes and planned changes

6.3 This section details the impacts which we believe would affect traffic on the Asset during the concession period. As discussed in previous chapters, to assess the impacts on the Asset, whether positive or negative, we have studied developments (alternate roads, feeder roads and regulatory) in the surrounding road network.

6.4 We have estimated impacts of potential network changes and developments around the Asset. These are indicated in Table 6.1.

Table 6.1: List of network/other developments

	Development	Route affected	Year of completion	Impact (+/-)	Plaza
1.	Completion of pending sections on Agra Ring Road	Asset route: Bhilwara/Udaipur-Jaipur-Asset-Agra-Kanpur Alternate route: Bhilwara/Udaipur-Chittorgarh-Kota-Jhansi-Kanpur	FY27	+ve	TP1 & TP2
2.	Completion of construction of Delhi-Mumbai Expressway	Asset route: Delhi-Dausa+Dausa-Kota+Dausa-Godhra	FY26 (however, FY27 is	-ve	TP2

	Development	Route affected	Year of completion	Impact (+/-)	Plaza
		Alternate route: Jaipur-Delhi via DME Spur	expected to see a further diversion)		
3	Completion of Agra-Gwalior Construction		FY27	+ve	TP1 & TP2

Source: Steer analysis.

6.5 The map below shows the immediate road network surrounding the Asset.

Figure 6.1: Alternate routes and Asset route shown against the regional network context

Source: Steer analysis and cartography

Impact assessment for network/other developments

6.6 As seen in the previous sub-section, the assessed impacts primarily fall into either the category of road network developments or development in other modes of transport. Under network developments, changes in the road network could be either brownfield (upgrade to existing road) or greenfield (development of new road). We typically assess impacts of the changes in costs and travel time on routes in these networks using binary logit models that compare generalised journey costs (GJC) between Asset and alternate routes. However, each impact is dealt individually in its own network or industry context.

6.7 'Summary of impact assessments' below include a narrative of each of the improvements, and impacts associated from each of these on our traffic forecasts. Please note that all traffic volumes for impacts were estimated, and impact rates were applied on FY25 AADT.

Diversion due to the Delhi-Mumbai Expressway

6.8 The Delhi-Mumbai Expressway is a greenfield expressway being developed to provide an improved level of service to long-distance traffic between North and Western India, compared to the existing network of national highways that are already operating at high levels of utilisation. Though the Asset currently does not directly serve north-south movement (e.g., Delhi-Jaipur and Jaipur-Gujarat) as the NH8 directly provides connectivity to them, the Delhi-Lalsot section of the expressway has been operationalized since Q4 FY23 which provides faster and unhindered connectivity through an interchange with the Asset near Dausa at km-169. As illustrated in the alternate route map, the diverted traffic through the expressway would pass only through TP2 Rajadhok.

6.9 We have considered the following three types of north-south movements for this impact:

- **Delhi-Jaipur**: These movements currently use the NH8 via Neemrana. The route through the proposed expressway via Dausa provides a competitive alternate with high time savings and good end-to-end connectivity, despite higher toll rates.
- **Gujarat and southern Gujarat-Jaipur**: These movements currently use the NH8 via Kishangarh. The route through proposed expressway via Dausa does not provide a competitive alternate given the Chittorgarh-Kota non-expressway section slows down the journey.
- **Southern Rajasthan-Jaipur**: These movements currently use the NH8 via Kishangarh. The route through the proposed expressway via Dausa provides a competitive alternate with high time savings and good end-to-end connectivity, despite higher toll rates.

6.10 Key sections of the expressway are already open to traffic, including the Sohna–Dausa–Lalsot segment (inaugurated February 2023), the Madhya Pradesh section (opened September 2023), the Vadodara–Bharuch segment (opened February 2024), and the Kota–Bundi section (opened December 2024). Additionally, the 67-km Bandikui to Jaipur Ring Road spur is anticipated to become operational end of 2025. Despite these advancements, the overall project has faced delays due to factors such as slow contractor progress, land acquisition challenges, and force majeure events, particularly affecting a 140-km stretch between Surat and the Gujarat-Maharashtra border.

6.11 A 67-KM Spur of DME between Jaipur and Dausa known as Badnikui spur has been discussed, and its construction contract was awarded in Mar'22. This has been open to the public from July 2025 and is expected to lead to a further decline in traffic on Rajadhok as it provides a faster alternate route. While FY26A base traffic of Rajadhok accounts for the expected decline in the forecast months of FY26 (October 2025 to March 2026), FY27 is likely to see a further decline over FY26 as the impact did not fully play out in FY26. We have accordingly assumed a further decline in traffic from FY27. Since the Bandikui spur allows traffic to bypass Rajadhok and not Sikandra, the magnitude of the impact at Rajadhok is larger.

Table 6.2: Impact due to completion of Delhi-Mumbai Expressway Spur, TP1 Sikandra

Vehicle type	FY27 onwards

2A	(0.4%)
3A	(0.4%)
MAV	(0.3%)

LCV	(6.0%)
Bus	(2.9%)
2A	(2.9%)
3A	(4.9%)
MAV	(4.9%)

Source: Steer analysis

Diversion due to completion of pending sections on the Agra Ring Road

6.12 As shown in Figure 6.1**Error! Reference source not found.** above, the Asset is part of a long-distance east-west corridor connecting southern Rajasthan (Udaipur, Bhilwara, Chittorgarh), Uttar Pradesh (Kanpur, Lucknow) and the east. While the route using the Asset passes through Jaipur (NH8), Jaipur-Mahua-Asset and Agra, the alternate route passes through NH27 via Kota and Jhansi. Currently, movements through Agra are limited due to the incomplete Agra ring road and congestion inside Agra city on NH19. Completion of the pending section of the Agra Ring Road is expected to improve connectivity for long-distance traffic which will allow them to bypass Agra city and provide direct access to Agra Lucknow expressway, thereby significantly improving the access for traffic destined to Kanpur/Lucknow and east.

6.13 Based on our Generalised Journey Cost (GJC) based diversion analysis from the strategic route discussed above, we believe the upgrade to Agra Ring Road will result in a partial positive impact on the Asset route in FY27, and full impact from FY28 onwards, as summarised in the table below.

Table 6.4: Impact due to completion of pending section on Agra Ring Road, TP1 Sikandra

Vehicle type	FY27	FY28 onwards
Staging	*80%*	*100%*
LCV	0.3%	0.4%
2A	1.5%	1.8%
3A	2.5%	3.1%
MAV	3.8%	4.8%

LCV	0.2%	0.2%
2A	1.3%	1.6%
3A	2.1%	2.7%
MAV	2.7%	3.3%

Source: Steer analysis of OD data, Client TMS data and publicly available information

Completion of Agra-Gwalior Construction

6.14 Additional construction material required for the Agra-Gwalior Expressway will be transported through the JMTL Asset, which will further increase MAV traffic from FY26 onwards. However, we assume that this impact will taper off by FY29, as the expressway construction is expected to be completed by then. The phasing of the impact will see partial impact in FY27, and 100% of the impact playing out in FY28.

Table 6.6: Completion of Agra-Gwalior Construction

Impact	TP1 Sikandra		TP2 Rajadhok	
	FY27	FY28	FY27	FY28
MAV	1.4%	1.4%	1.2%	1.5%

Revenue forecasting assumptions

6.16 To forecast the revenues for a particular year, the traffic forecast for each vehicle type is converted into tickets sold, which is then multiplied with the corresponding toll rate, which grows over the years as defined in the Concession Agreement. While “trip factors” provide the conversion factor to the former, i.e., traffic (trips) to tickets sold, “toll segmentation” provides the latter i.e. the breakup of trips paying each ticket type. This section discusses assumptions related to trip factors, toll segmentation and toll rates for the forecasts.

Trip factors

6.17 Trip factors are used to calculate the revenue for the trips made on passes such as return, local personal, monthly passes. The trip factors assumed are based on the latest FY25 data available and listed in the table below:

Table 6.8: Trip factors at TP1 Sikandra

Forecast	CJV/Mini LCV	LCV	Bus	2A	3A/MAV
Single	1	1	1	1	1
Return	2	2	2	2	2
Monthly	45	45	45	45	45
Local commercial	1	1	1	1	1
Local Personal	1	1	1	1	1

Table 6.9: Trip factors at TP2 Rajadhok

Forecast	CJV/Mini LCV	LCV	Bus	2A	3A/MAV
Single	1	1	1	1	1
Return	2	2	2	2	2
Monthly	45	45	45	45	45
Local commercial	1	1	1	1	1
Local Personal	1	1	1	1	1

Source: Steer analysis of Client TMS data

Toll segmentation and trip factors

6.18 As discussed in Chapter 3, segmentation trends have largely been stabilising over the years, with FY26 (shown in the following Table 6.11and Table 6.12) indicating the recent performance of the Asset. Table 6.11 and Table 6.12 below provide the toll segmentation assumed for the period of forecast. For the traffic and revenue forecast, FY26YTD (Apr-

Aug) as discussed in the earlier sections, can be considered a normal period. Therefore, we believe the FY26YTD segmentation is representative of the travel patterns on the Asset and the same has been assumed for forecast years as well. Across multiple assets, the number of passes sold has observed to be rising on a day-to-day basis, indicating an early adoption among frequent users since its introduction on 15th August 2025 till 30th September 2025, and a corresponding decline in other ticket categories mainly in the single and return categories. The evolution of proportion of users using the annual pass up to September 2025 is presented below:

Table 6.10: Annual pass adoption between 15th August and 30th September 2025

	15th to 31st Aug	1st to 15th Sept	16th to 30th Sept
Sikandra	11.0%	17.0%	19.3%
Rajadhok	10.5%	15.7%	18.0%

Source: Steer analysis of TMS data

6.19 CJV Segmentation for FY26 has been developed using the pre annual pass segmentation till 14th August 2025, and daily Annual Pass transaction data from 15th August 2025 till 30th September 2025. Post September 2025, a gradual ramp up is assumed such that they form a large portion of the CJV trips by the end of FY26. This corresponds to a reduction in a proportionate decrease in single and return trips. For FY27 and beyond, we have assumed the share of annual pass trips to be in line with that observed at the end of March 2026, by when we believe the distribution of ticket categories in CJVs should stabilise.

6.20 In FY26, the share of CJVs using the Annual Pass on Sikandra is projected at 14% (on an annual basis) with a March 2026 estimate of around 28%, which from FY27, expected to stabilize at March 2026 levels. On Rajadhok, the share of CJVs using annual pass is projected at 13% (on an annual basis) with March 2026 estimated to be around 27%, which from FY27 is expected to stabilize at March 2026 levels.

6.21 For other vehicle categories we have analysed the historical TMS data split by ticket categories, to understand trends, as shown in Chapter 3. For the traffic and revenue forecast, FY26YTD (Apr- Aug) as discussed in the earlier sections, can be considered a normal period.

6.22 The tables below summarise the forecast segmentation assumptions for each of the toll plazas.

Table 6.11: Forecast toll segmentation, FY26 onwards- TP1 Sikandra

Ticket type	CJV (FY26)	CJV (FY27)	Mini LCV	LCV	Bus	2A	3A/MAV
Single	79.6%	65.4%	93.5%	96.9%	98.8%	98.8%	99.4%

Overloading

6.23 Overloaded vehicles on the Asset are charged twice the toll fee they would otherwise pay for a Single ticket at the toll plaza. We have considered FY25 actual overloading shares and assumed that they would continue in the forecast years. Table 6.13 shows the assumptions for share of overloaded Single journey vehicles that are considered to pay twice the Single journey toll fee due to overloading.

Table 6.13: Overloading assumptions for forecast years FY26 onwards

Vehicle type	Single	Local Commercial
TP1 Sikandra

Toll evolution

6.24 Based on the concession agreement and the gazetted toll notification, we understand that base toll rates increase every year (revision month is July) based on WPI-linked inflation. These are rounded up to the nearest five to estimate the final toll rate charged to users.

6.25 We have used actual toll rates from the FY26 toll notifications and latest print WPI for the month of March'25[21] for FY26 to validate the modelling of future toll evolution. Increase in WPI was calculated based on the Client's WPI forecasts, as shown in Table 6.14 below. The upward trend in inflation is expected to continue in the medium term, before gradually tapering to 4.1% by FY32 when the concession period ends.

6.26 These WPI forecasts provided by the Client. The WPI forecasts available from other independent forecasting agencies may vary from this assumption and could be lower or higher than that provided by the Client.

Table 6.14: WPI growth forecast assumptions

Financial year	WPI growth (%)
FY26	2.57%
FY27	2.4%
FY28	5.0%
FY29	5.1%
FY30	4.9%
FY31	4.4%
FY32	4.1%

Source: FY27 onwards WPI print as per client inputs

Revenue reconciliation

6.27 As part of validating the data provided by the Client, as well as our assumptions around toll calculations, we have reconciled the actual reported revenue against the modelled revenue. For the Asset we have reconciled daily level reported revenue for FY26YTD with the modelled revenue based on FY26YTD MADT and forecast assumptions on toll segmentation, trip factors and toll rates.

6.28 The comparison, as shown in Table 6.15 below, shows that modelled revenue overall is within a variation of 0.2-0.3% on average from the reported revenue. This gives us confidence that the revenues estimated using the traffic data in our forecasts are accurately representing the revenues being reported from the Asset.

[21] **Latest release WPI**

Table 6.15: Revenue reconciliation for FY26YTD

Toll Plaza	Steer modelled daily revenue (INR lakhs)	Reported daily revenue (INR lakhs)	Difference (%)
TP1 Sikandra	32.8	32.7	0.2%
TP2 Rajadhok	32.7	32.6	0.3%

Traffic and Revenue forecasts

6.29 Based on the traffic and revenue-related forecast assumptions discussed above, we have modelled the traffic and revenue for the forecast period for the Asset. The table below presents the AADT/PCU and revenue forecast growth rates and CAGRs on this Asset. Further, Appendix C presents the AADT and revenues for the forecast period.

Table 6.16: Traffic forecasts (with impacts) forecast for TP1 Sikandra

Upside and Downside cases

Upside and Downside scenario assumptions

6.31 We have developed our base case scenario considering a balanced view on the risks associated with input assumptions around GDP growth and traffic growth elasticities. There is always a risk that the outturn values of these inputs will vary as compared to the assumptions taken due to exogenous impacts, e.g. GDP growth could be influenced both positively and negatively by the impact of monsoons, export-import balances, political changes etc.

6.32 Similarly, traffic growth elasticities could be influenced by increased efficiencies achieved by technology, large shifts in commodity prices globally, changes in local manufacturing practices. However, at this stage we consider that the base case represents a central case scenario given the risks of variation of input assumptions.

6.33 To account for the possible variations in the growth drivers, we are also presenting an Upside (optimistic) and a Downside (pessimistic) scenario. These scenarios are defined by the following variations from the base assumptions:

Table 6.24: Summary of Macro-economic Assumptions for upside and downside cases

Input	Upside	Downside
Macro Assumptions		
GDP/GSDP	+1% every year	-1% every year
WPI	+1% every year	-1% every year
Elasticities	+ 10%	- 10%

Source: Steer analysis

6.34 Further, network developments are highly dependent on governmental directions, policies, legal and financial measure which might result in early or delayed completion of developments. Therefore, we have included an Upside (optimistic) and a Downside (pessimistic) case. However, at this stage, we consider that the base case represents a central case scenario given the risks of variation of input assumptions.

Impacts-Upside Case

6.35 The upside case impacts included in forecasts are summarised in below.

Table 6.25: Summary of impacts on the Assets

Development	Year of impact	Change in impact w.r.t base case	Magnitude of impact	
			TP1 Sikandra	TP2 Rajadhok
Completion of pending sections on Agra Ring Road	FY27*	+25% of base case	Same as Base Case	Same as Base Case
Completion of construction of Delhi-Mumbai Expressway	FY27*		Same as Base Case	Same as Base Case
Completion of Agra-Gwalior Construction	FY27*		MAV: 1.8%	MAV: 1.9%
Bandikui Spur	FY27			No Change

Summary outlook

6.38 Passenger traffic on the Asset is driven by local movements connecting key urban centers of Jaipur, Agra, Alwar, and Bharatpur. Tourism and leisure travel between Jaipur at one end and Bharatpur and Agra at the other also contributes to passenger and bus movements, as the Asset is part of the Golden Triangle corridor (Delhi NCR, Agra, Jaipur). Even though the recent pandemic impacted passenger and tourism-related traffic, the trend of increased use of personal vehicles has led to a good recovery of car traffic in recent months. TP2 Rajadhok has shown stronger traffic growth, especially in the CJV category, due to its proximity to Jaipur and the operationalization of the DME spur to Lalsot in February 2023 and until Sawai Madhopur in September 2024, enhancing connectivity to Delhi. However, with the new 67-km Bandikui to Jaipur Ring Road spur (part of the DME) opening in July 2025 this incremental traffic for TP2 has diverted to the spur (as can be seen in the FY26YTD traffic at Rajadhok), as the new link offers a faster and shorter route between Delhi and Jaipur.

6.39 Goods traffic is driven by agricultural commodities, construction-related traffic including stone and sand, apart from a good spread of consumption-related commodities meeting urban demand. The completion of large-scale construction activity in the vicinity of the Asset, combined with limited sand movement and network developments like the construction of the Delhi Mumbai Expressway, had temporarily caused a slowdown in the Asset's traffic growth. These effects have largely receded in recent years. As the economic recovery gathers pace, the Asset is expected to see traffic growth aligned with the historical trends observed in the long term. The strong recovery in recent months has shown underlying strength in the traffic growth drivers along the Asset corridor, which is expected to continue driving growth. Heavy vehicles (3A/MAV) primarily cater to long-distance movements between western and eastern India.

6.40 Our findings and estimates in this report are based on our understanding from the site visit, analysis of primary data available both from surveys (including OD surveys from June 2023 at TP1 and January 2025 at TP2) and the toll management system (both historical and current, up to January 2025), macroeconomic assumptions prescribed by the Client, feedback from Client meetings, and secondary publicly available data. There can be both positive and negative risks associated with assumptions and the forecasts using them as summarized.

6.41 Overall, we see a positive outlook for the region and the Asset, given that it serves major urban centers of Jaipur, Agra, Bharatpur, Alwar, and Delhi NCR. It is also the primary route on the tourism corridor connecting Jaipur with Bharatpur and Agra. The underlying growth drivers of the corridor are strong and are expected to deliver long-term sustained growth.

Appendices

A Developments in sandmining

A.1 This appendix provides a chronological account of developments – policy, regulatory and judicial – in sandmining applicable across India and particularly in Rajasthan. Please note that this list is not exhaustive and is meant to gain a high-level understanding of the issues surrounding sandmining that affect movement of sand on the Asset.

Table A.1: History of policy and regulatory changes, and court judgements affecting sandmining

Event	Timeline
National	
Recommendations of MoEF core group	2010
SC ruling - Orders MoEF to formulate guidelines for sustainable sand - mining	Feb FY12
MoEFCC Sustainable Sand Mining Management Guidelines - Calls for site-specific surveys by district administration - Environmental clearance mandatory for all sand mines - DEAC and DEIAA committees for less than 5-hectare mines Stop of mining during monsoon months (June-September)	Mar FY16
Amendment of EIA Notification 2006 - EI clearance mandatory for all small-scale sand mines Treat cluster mines within 500 m as single mine	May FY17
SC ban on sandmining; prohibits 82 large sandmining lease holders	Nov FY18
SC refuses to remove ban	Jan, Aug FY19
Rajasthan	
Mining policy	2015
NGT: Even existing licence holders need to get environmental clearance	Jan FY15
Not clear if manufactured sand can meet demand and quality needs	FY19
"Mining ban give rise to sand mafia"	Oct FY19
SC stays Rajasthan HC order that allowed sandmining at mines with issued LoIs	May FY20
Manufactured sand policy being considered and licences for small plots being allowed	Sept FY19, Jul FY20
Replenishment study of sand mines to be taken up	Aug FY20
Rajasthan HC asks PS (RJ) to issue compounding fee on vehicle – apply consistent approach	Sept FY20
Rajasthan M-sand policy announced	2020
Revised M-sand policy and 27 monitoring teams deployed across the state	2024

D Data collection exercise

D.1 To validate and inform various inputs used in our forecasting, we undertook primary data collection on the Asset. OD survey data was collected on behalf of the Client, TVC surveys were commissioned by Steer with a third party. OD data collection typically involves manual data entry by enumerators based on oral surveys with road users crossing toll plazas. TVC data collection involves video-graphic capture of traffic passing crossing the toll plazas, followed by manual counting.

7 days TVC count

Table D.1: 7-day TVC counts at TP1 Sikandra

Date	Toll Plaza	Source	CJV	Mini LCV	LCV	Bus	2 Axle	3 Axle	MAV	OSV	Total

Disclaimer

This report has been produced for the sole benefit of Cube Highways Pte. Ltd. This Report (the "Report") is confidential and disclosed only for information purposes, and it may not be relied upon by any party other than the Client or a Party to a Reliance Letter, and Steer: a) makes no warranty, expressed or implied, with respect to the use of any information or methods disclosed in this Report; and b) assumes no liability with respect to the use of any information or methods disclosed in this document. Any such party by its acceptance or use of this Report releases Steer from any liability for direct, indirect, consequential, or special loss or damage whether arising in contract, warranty, express or implied, tort or otherwise.

The Report is based on standard professional efforts, and information available to us at the time the review took place and is subject to time and budget constraints of the Report's scope of work. This Report, information and statements contained herein, are all based on third party data provided to us, or sourced by us, and Steer has not sought to establish the reliability of the data, except as specifically stated in the Report. Steer bears no responsibility for the results of any actions taken on the basis of third-party data.

Certain forward-looking statements in the Report are estimates based on interpretations or assessments of information available at the time of writing. The Report is thus to be viewed as an assessment that is time-relevant, specifically referring to conditions at the time of the review. Steer undertakes no obligation to update the Report for any reason.

While the estimates contained in the Report are not precise forecasts, they do represent, in our view a reasonable expectation of the future, based on information we have been provided with or sourced. However, the estimates necessarily rely on numerous assumptions and judgements, and circumstances may occur over the timeframe of the project that go counter to these assumptions and judgements and that affect the project's realized revenues. Actual events may differ from those assumed, and events are subject to change. Therefore, Steer makes or provides no warranty, whether implied or otherwise, as to the accuracy of forward-looking information presented. Further, it is important to note that forecasts presented represent long term growth profiles; the results for individual time periods may vary from forecasted values.

Traffic Consultant developed the relationships in the models used to produce the forecasts for the projects based on data available through September 2025. This report does not consider variations in traffic performance due to changing macro and force majeure events such (but not limited to) as global wars, economic uncertainty (high inflation, global recession), and changes in the regulatory environment. The situation remains dynamic and is subject to significant change in the short and medium term. In this challenging context, Traffic Consultant has produced base forecasts with a view on a possible scenario for the traffic forecasts. However, it is important to note that this is only one view, and there continues to remain uncertainty as to the short-term, intermediate or prolonged effects of and responses to such macro-economic/force majeure events. As a result, no assurance can be provided by Traffic Consultant that the scenarios and assumptions Traffic Consultant has identified will prove to be accurate. Given the uncertainty inherent in this scenario, Traffic Consultant advises that all readers of the Report consider the Report in the context of their own assessment of the impact of such events.

TO THE FULLEST EXTENT PERMITTED BY APPLICABLE LAW, THE LIABILITY OF THE TRAFFIC CONSULTANT FOR ANY LOSS, DAMAGE, COST OR EXPENSE SUFFERED OR INCURRED BY ALL PERSONS OR ENTITIES AND FOR ALL CLAIMS RESPECTING ITS WORK PERFORMED IN CONNECTION WITH THE ISSUE OR THE REPORTS IS HEREBY LIMITED IN THE AGGREGATE TO THE AMOUNT OF FEES ACTUALLY PAID BY THE CLIENT TO THE TRAFFIC CONSULTANT IN RESPECT OF THE REPORTS AND CONNECTED SERVICES.

Glossary Items

Acronym	Meaning
2A/ Truck	2 Axle/ Truck
3A	3 Axle
AADT	Annual Average Daily Traffic
BOT	Build Operate Transfer
CAGR	Compound Annual Growth Rate
CJV	Cars / Jeeps / Vans
COD	Commercial Operations Date
DPR	Detailed Project Report
ETC	Electronic Toll Collection, also referred to as FASTag

NSDP	National State Domestic Production
OD	Origin Destination
OSV	Oversized vehicles
PCU	Passenger Car Unit; it is a measure of standard vehicle unit to convert all vehicle classes to a single unit by using PCU factors to compute total traffic on an Asset.
Q1	Quarter 1 of financial year, from April to June
Q2	Quarter 2 of financial year, from July to September
Q3	Quarter 3 of financial year, from October to December
Q4	Quarter 4 of financial year, from January to March
RNP	Registered Number Plate
SCF	Seasonality Correction Factor

Acronym	Meaning
SH	State Highway
T&R	Traffic and Revenue
TMS	Traffic Management System
TVC	Traffic Volume Count
WADT	Weekly average daily traffic
YTD	Year to Date

1 Introduction

The assignment

1.1 The Cube Highways Fund Advisors Private Limited (the "Client") has commissioned Steer Davies Gleave India Private Limited ("Steer") for a traffic due diligence to be carried out on the Walayar-Vadakkencherry Expressway Private Limited (hereafter called the "Asset"). This report forms part of the annual fair market valuation (FMV) undertaken as part of the "Transit 10 project". This report presents an update of the traffic and revenue forecasts based on primary surveys undertaken in 2023 and 2024, and actual traffic data available up to September 2025 and latest macro-economic assumptions.

1.2 The Asset consists of a 53.5 km single toll road section of the NH544 between Walayar and Vadakkencherry in Kerala, with a single toll plaza (hereafter, referred to as "TP1" or "Pampampallam") located west of Palakkad and east of the Kerala-TN state border.

1.3 Our scope of work for the traffic and revenue forecasting process includes:

Table 1.1: Scope of work and sources of data

Scope of work	Data source
Review of historical Traffic Management System (TMS) data, Vendor reports and documents	Provided by client for the period between May 2015 and September 2025
Historical analysis and forecasts for baseline growth, including; — Background growth, and — Seasonality trends	Historical data provided by the Client and benchmarking using plazas in the vicinity or of similar nature of the Asset has been done wherever sufficient data was unavailable.
Validation of revenue reported in FY25YTD	TMS data provided by Client Revenue reconciliation using toll plaza traffic and ticket type data to calculate revenue and reconciling it with toll plaza reported revenue
Origin Destination (OD) analysis to understand growth drivers: — Zonal influence and Top OD pairs — Commodity distribution — Trip length distribution	Origin Destination (OD) surveys undertaken by Steer in 2024
Analysis of upcoming network improvements and other developments, that may have future impacts on traffic	Secondary research and our in-house experience of working in the vicinity of the Asset. Impact analysis to be conducted by Steer based on Generalised Journey Cost spreadsheet-based analysis
Historical revenue analysis and forecasts for revenue estimation, including — Toll segmentation and trip factors,	Calculated from historical data provided by Client

— Overloading shares	
Final traffic growth forecasts including baseline growth rates and potential future impacts	Elasticity based base growth and potential impacts from secondary research, Asset historical traffic performance and Steer's in-house experience of working on toll roads on the corridor Gross Domestic Product (GDP) forecast assumptions provided by Client
Toll revenue estimation for the entire concession, including toll evolution	Toll evolution based on latest toll notification published by National Highway Authority of India (NHAI) and latest actual Wholesale Price Index (WPI) trends as shared by the Client. Assumptions of WPI forecasts and future tolling length changes provided by Client Revenues estimated as a product of traffic forecasts and toll evolution

Our approach

1.4 Our approach follows well-established practices for forecasting ongoing traffic growth on an existing/brownfield Asset. The analysis is focused on two sets of issues, namely:

Understanding the traffic that is currently using the Asset; and
Identifying how and why that traffic is likely to change in the future.

1.5 To understand the current traffic on the Asset, we have analysed traffic data from multiple independent sources:

- Client-provided secondary data, including:
- TMS data from May 2015 to September 2025
- Concession agreement and toll notifications for FY25 and FY26
- Previous studies related to traffic and revenue
- Steer-commissioned OD survey on 6th February 2024 at Pampampallam toll plaza to validate any change in growth drivers and travel patterns.
- Steer-commissioned TVC survey from 28th June to 30th June 2023 at Pampampallam plaza.
- We undertook revenue reconciliation for FY26YTD (April 2025 to August 2025) by building up revenue from the traffic reported by the toll plaza and subsequently matching it to the reported revenue for FY26YTD using the prevailing toll rates and reported segmentation/toll-frequencies for FY26YTD. This is a key part of our analysis to validate our future segmentation/toll-frequency assumptions and the Annual Average Daily Traffic (AADT) reported for the toll plaza.

1.6 The estimation of future traffic demand on the Asset was undertaken through:

- Estimating FY26 base year position. The FY25 AADT was calculated using the monthly traffic data for FY25. The annual FY25 AADT was then grown with elasticity linked GDP/GSDP growth to arrive at the FY26 expected traffic. To determine the adopted FY26, the expected FY26 traffic was validated against six months of actual traffic (April-September 2025) and necessary adjustments were made where required.
- Secondary research to understand plans for new developments and progress of ongoing developments on the Asset.
- Steer independent primary surveys and site visits to validate our network and contextual understanding.
- Developing a bespoke growth model to forecast year-on-year traffic growth from FY26 to the end of concession period.
- Investigating the elasticity of historical traffic growth compared to state (GSDP) and national (GDP) growth. Where historical data is limited, we have benchmarked the Asset against our Steer knowledge base (e.g., similar Asset types in the same state or on the same corridor), to derive appropriate elasticities.
- Applying our elasticities to independent GDP forecasts as provided by Client.
- Identifying and analysing the potential impacts of any relevant changes to the competitive position of each Asset – these include impacts of changes to road network including expressways and opening of competitive modes of travel.
- Identifying and analysing any other potential impacts to traffic and revenue on each Asset – these include axle load norms, axle shift for heavy goods, FASTag implementation.
- Considering changes in trends of segmentation over time and making suggestions for changes in exemptions in the future.
- Preparing traffic and revenue forecasts for the Asset for the complete length of concession. The analysis here includes the specific impacts of network or other exogenous factors specific to the Asset. We have developed a set of forecasting assumptions for three scenarios: a base case and upside and downside scenarios.

Contents of this report

1.7 The report has been divided into the following chapters:

1. Chapter 1 introduces the methodology and approach to undertake the traffic and revenue due diligence;
2. Chapter 2 describes the key characteristics of the Asset and its surrounding road network, primarily based on site visits;
3. Chapter 3 summarises the current and historical traffic trends on the Asset, including results from the TMS, TVC and OD analysis;
4. Chapter 4 presents the socio-economic context of India, the corridor and region/state containing the Asset, along with our approach and results on estimating background along with our key forecasting assumptions,
5. Chapter 5 presents our baseline year forecast and summarises our results on estimating background traffic demand growth
6. Chapter 6 summarises our assessment of network impacts and presents concession traffic and revenue forecasts for the Asset along with the assumptions for upside and downside cases.

2 The Asset

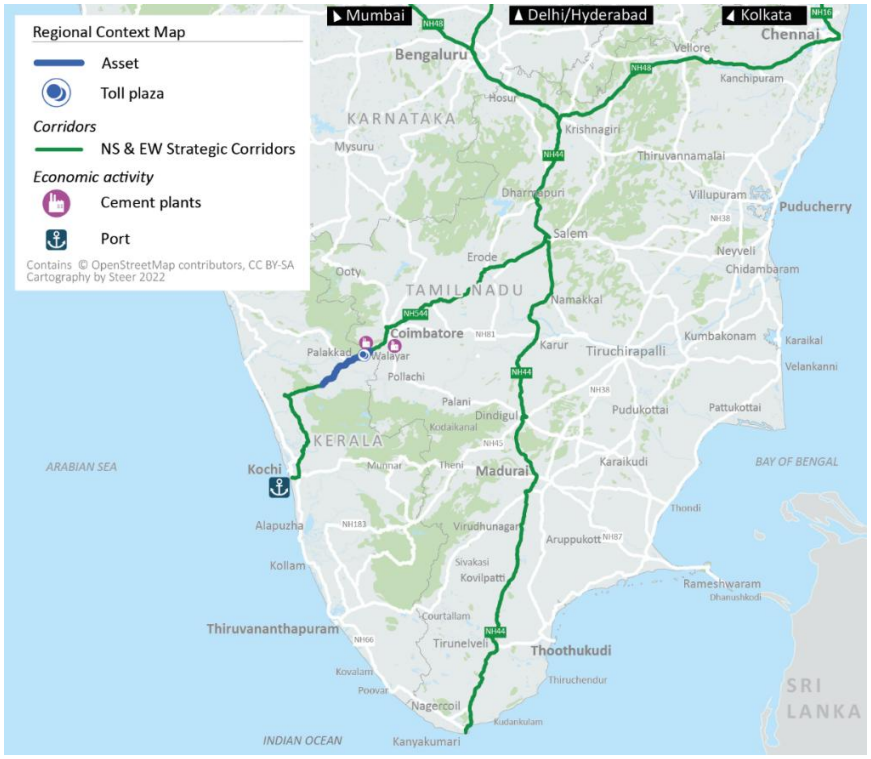
Introduction

2.1 This chapter provides a description of the Asset, based on both primary data (from site visits), and our understanding of the region and network surrounding the Asset. We cover the Asset's strategic network context, followed by key economic activities and network developments around the Asset.

Strategic network

2.2 The Asset is situated in the state of Kerala, connecting Walayar, a town located on the Tamil Nadu-Kerala border and Vadakkancherry, a town in the Palakkad district of Kerala. The Asset is a section of the strategic NH544 which itself is a spur of the NH44 running that runs north-south across the country (Srinagar-Kanyakumari). The section where the Asset is located serves as a key entry point for Kerala from its eastern end, through Palakkad, which is a stretch of low-lying passes between the mountain ranges of the Nilgiris and the Western Ghats. Figure 2-1 below shows the regional road network in which the Asset is located.

Figure 2-1: Asset location in the regional network context



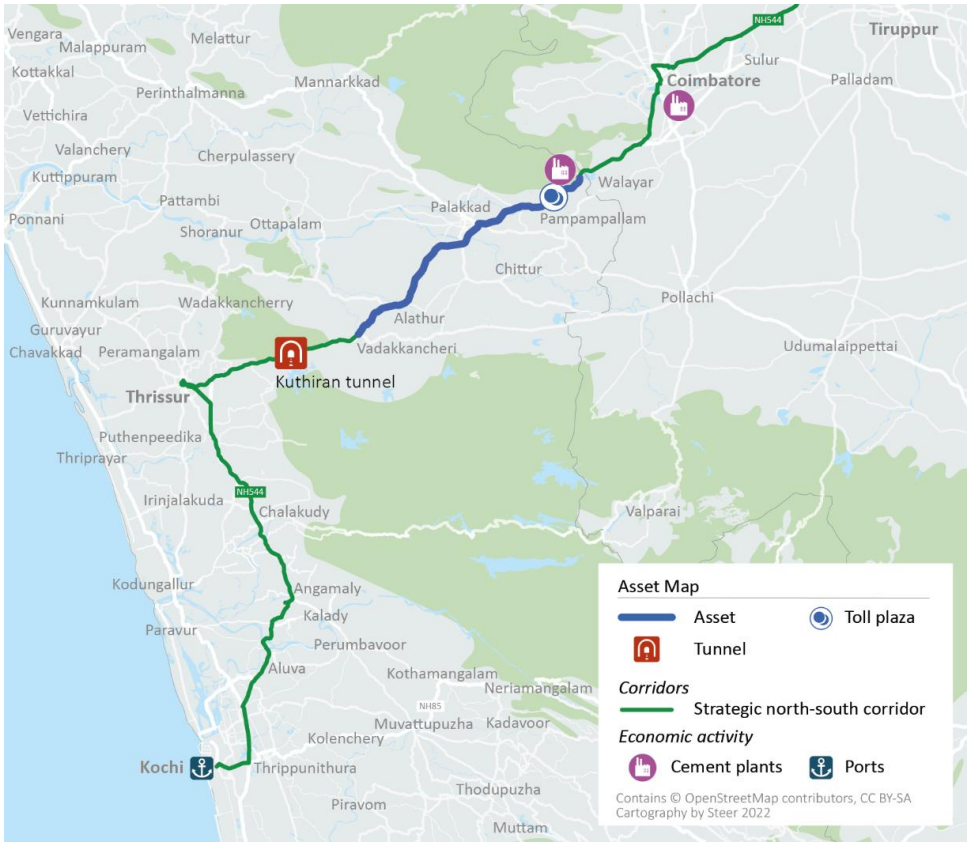
Source: Steer cartography using OpenStreetMap data

2.3 This Asset primarily caters to three different types of strategic movements:

- **Short-distance trips** undertaken largely by passenger vehicles for work/business trips wherein the movement is predominantly local in nature, between Walayar and other areas in the Palakkad district.
- **Medium-distance trips** made by both passenger and goods vehicles covering places such as Ernakulam/Kochi in Kerala, to Erode and Salem in Tamil Nadu.
- **Long-distance trips** predominantly by MAVs catering to Kerala's demand for consumption goods and cement, from areas lying outside the state such as Chennai, Bangalore, Vijayawada, and the rest of the country.

2.4 The Asset is a 53.5 km toll road which forms a part of the NH544, a key highway connecting Salem in Tamil Nadu to Kochi in Kerala. It is a four-lane road with one toll plaza, namely, Pampampallam Hamlet (Pampampallam) at km 189.4 (closer to Walayar). Figure 2-2 below provides a closer view of the Asset in the context of its immediate surroundings.

Figure 2-2: Asset context



Source: Steer cartography using OpenStreetMap data

Concession and tolling details

2.5 The toll plaza on the Asset has been operational since May 2015, and the Client took over its operations on 29th September 2020. There are 13 years remaining in the concession period which ends in FY38. Table 2.1 below presents a summary of the concession.

Table 2.1: Summary of concession

	Particulars
State	Kerala
Highway and lane configuration	NH544; 4-laned
Toll plazas	TP1: Pampampallam
Length (km) as per concession agreement, applicable	TP1: 53.5 km
Commencement of operations	May 2015
Operated by Client since	29th September 2020
Concession period	22 years
Last year of concession	FY38

Source: Client data

2.6 Figure 2-3 below shows a typical cross-section of the Asset and its toll plazas.

Figure 2-3: Typical cross-sections and toll plazas on the Asset

Source: Steer site visit

2.7 Tolls on the Asset are collected as shown in Table 2.2 below. The toll plazas have dedicated ETC/FASTag lanes for electronic tolling. Toll rates applicable for FY26 are provided in the following table.

Table 2.2: Single toll rates on the Asset (INR), applicable April 2025 to March 2026

Type of Vehicle	Single Journey Fee
CJV	80
LCV	130
Bus/2A	275
3A/MAV	430
OSV	525

Source: NHAI Revision of User fee Rate w.e.f 01.04.2025

2.8 Apart from single tickets, the typical NHAI ticket categories like return, monthly, local personal and local commercial passes are also available on the Asset.

Key economic activities

Tourism

2.9 Kerala, one of the two south Indian states forming the southern tip of the Indian peninsula (the other state being Tamil Nadu), and commonly called as "God's Own Country", is known for its largely consumption-based and tourism-centred economy. It is known as the 'Land of Spices' and is a leading producer of pepper, cardamom, and rubber. Other items such as coffee, rice, coconut, tea, cashew, and spices also make up for a share in the state's agricultural output which is distributed to various parts of the country.

2.10 Its rich culture and natural landscape have put the state on the world map as a major tourist destination wherein this sector contributes to 10% to the state GSDP[1]. The city of Thrissur which lies along the strategic north-south corridor (see Figure 2-2: Asset context) is a key tourist destination in the state and is a seat of culture hosting significant festivals.[2]

2.11 Kerala's image as a prime tourist destination is evident by the fact that it attracted 22.3 million tourists in CY 2024, marking a substantial increase of 21% from the pre-pandemic period[3]. The state government has announced the K-Homes project in the 2025-26 budget to increase accommodation for tourists – this is expected to take the state's tourism sector to new heights.[4]

2.12 Given Kerala has very limited entry points from the rest of the country, the Asset forms an integral part of the NH544 east-west corridor and is the only four laned national highway that provides connectivity and a point of entry into the state from Tamil Nadu. Some of the major settlements along the Asset include Walayar, Kanjikode, Palakkad, Alathur and

[1] ECONOMIC REVIEW 2017 | State Planning Board, Thiruvananthapuram, Kerala, India

[2] Major festivals include Attukal Pongala (February), Eid al-Fitr (March), Eid al-Adha (June) and Onam (August-September)

[3] As per the Ministry for Tourism and Public Works, Government of Kerala

[4] Kerala attracts over 2.22 crore tourists in 2024 - tourismindiaonline.com

Vadakkancherry whereas long-distance traffic on the road serves cities in other states such as Coimbatore, Salem, Bangalore, and Chennai.

Cement and Construction

2.13 The construction industry contributes a significant share of Kerala's overall state GSVA, at approximately 14% of the state GSDP as of FY24.The industry has also grown consistently over the last ten years, at roughly 3.5% per year between FY14 and FY24 [5]. This consistent growth has been driven by the continued push towards construction projects in Kerela, such as - the widening of NH66[6], other infrastructure such as construction of the Lulu Mall in Kottayam [7]and the construction of Government Medical College, Idukki [8].

2.14 The Kerela Infrastructure Investment Fund Board (KIIFB) has been established by the Government of Kerala to mobilize funds for infrastructure development. Major projects that have been taken up by the KIIFB include a Petrochemical and Pharma Park in Kochi & a Coastal and Hill Highway, connecting different cities within Kerala [9]

2.15 The state of Kerala is also rich with mineral deposits; there were around 643 active quarries and 1,433 active mineral depots within the state as of September 2023[10]. A majority of these units deal with the extraction and processing of granite deposits to cater to construction demand. A considerable number of crushers are present south of the Asset. In additional to stone quarries within the state, construction material is also sourced from the state of Tamil Nadu via Coimbatore. Currently, most of the construction material in Kerala is sourced from mines in Tamil Nadu, particularly in Coimbatore.

2.16 Walayar, part of the Palakkad district in Kerala and situated on one end of the Asset is a small industrial town at the state border between Kerala and Coimbatore, Tamil Nadu. It is home to the state-owned Malabar Cements Limited (MCL) which is the one of the state's largest public sector undertakings (PSU) in cement production, with a production capacity of 6.6 lakh MT per annum.[11]

2.17 The cement produced by MCL caters to 6-8% of the requirement for the whole of Kerala. Future plans include raising the market share to 25% and augmenting the capacity from 0.66 to 0.8 MMTA (million metric tonne per annum) along with an addition of 1 MTA grinding facility and modernisation of the mill at the Walayar plant.[11]

2.18 Kanjikode, situated in the middle of the Asset, is one of the largest industrial areas in Kerala. It is home to the manufacturing base for companies such as Bharat Earth Movers, Pepsico, PPS Steel Pvt. Ltd, Marico, United Breweries and Empee Distilleries.

[9] **KERALA INFRASTRUCTURE INVESTMENT FUND BOARD**

[10] **DMG Dashboard (kerala.gov.in)**

[11] **Malabar Cements**

2.19 While construction of Lulu Mall in Kottayam has been completed in December 2024, the widening of NH66 and construction of GMC, Idukki has been largely completed, thereby causing a drop in construction traffic on the Asset.

2.20 Due to a combination of demand and supply-side disruptions, the movement of construction material from Tamil Nadu into Kerala has significantly reduced. This decline is largely attributed to regulatory and logistical challenges, including the imposition of a mineral-bearing land tax of ₹90/tonne on crushed stone by Tamil Nadu's mining department in April 2025, which triggered strikes by quarry and lorry associations in Coimbatore. Although the strikes were short-lived, the tax remains in force, discouraging outbound quarry traffic. On the Kerala side, material shortages have been exacerbated by border permit issues, as noted in March 2025 reports. In response, Kerala has granted preliminary consent for 885 new quarries—a 160% increase—indicating a strategic push towards self-sufficiency. We expect these dynamics to stabilise over the next year, after which the movement of construction vehicles between Tamil Nadu and Kerala should increase, bringing some traffic volumes back to the Asset.

Refinery

2.21 Kochi Refinery operated by the Bharat Petroleum Corporation Limited (BPCL), the country's second-biggest fuel retailer, lies within the region of influence of the Asset and produces all fuel-based refinery products - benzene, sulphur, white spirit for the domestic market, and fuel oil for exports.

2.22 BPCL plans to expand the capacity of the Kochi refinery from 15.5 million tons per year (tpy) to 18 million tpy by 2028, as a part of wider expansion plans.[12] This expansion includes upgrading to produce higher-value products and integrating petrochemical facilities, including producing more niche petrochemicals[13]

Ports

2.23 Kerala has a coastline of approximately 590km. The state also has 20 ports (2 major and 18 minor ports), with Kochi port being the largest freight handling port.[14]

2.24 The Asset is located ~110 km from the Kochi port and caters to port-bound traffic. The key commodities handled at the port include petroleum products, crude oil, chemicals, foodgrains, and containers. As per FY24 figures, Kochi which is the largest commercial port in Kerela handled around 36 million metric tonnes of cargo. The port handled all major categories of cargo including liquid bulk, dry bulk, break and containers.

2.25 The historical cargo handling performance of the port till FY25 is presented in Table 2.3 below. The traffic handled at the port has grown at a healthy 6.1% CAGR between FY16 – FY25.

3 Traffic description

Introduction

3.1 This chapter presents historical and current traffic and revenue trends on the Asset, as well as our analysis of origin-destination (OD) survey data and traffic count data. This covers data which was collected as a part of this study and in previous studies, as well as data provided by the Client.

3.2 Traffic demand data is generally collected and analysed to understand the volume and vehicle composition of traffic currently using an Asset, while OD data is used to obtain a better understanding of travel patterns, trip lengths, trip purposes, and areas of influence in the vicinity of the Asset, as well as the commodities being moved by the goods vehicles via the Asset. This analysis, combined with our understanding of the Asset (based on our site visits), enables us to identify the key drivers of demand on the Asset.

3.3 Actual toll plaza data is used as the basis from which the current/base year annual average daily traffic (AADT) is established. This data is provided by the Client and independently analysed and validated by us using traffic volume count (TVC) information.

PCU Factor assumption

3.4 The PCU values considered in Table 3.1 below are as per IRC64 1990[15]. Based on discussions with the Client, for reporting purposes, we have referred to the Rigid and Trailer truck splits in the TVC counts for calculating the effective PCU for MAV trucks. For Rigid trailer trucks we have assumed a PCU factor of 3, whereas for Trailer trucks we have assumed a PCU factor of 4.5 as defined in IRC64 1990[16]

Table 3.1: PCU factors

Vehicle Category	PCU Factor
CJV	1.0
LCV	1.5
Bus/2A/3A	3.0
MAV	3.6
OSV	4.5

Source: Steer analysis and IRC64,1990

[15] IRC 064: Guidelines for Capacity of Roads in Rural Areas

[16] On this Asset, we have 3A/MAV combined volumes. However, for PCU calculations, to maintain consistency, we have used the shares derived from the latest TVC on the Asset (conducted in Jun 2023)

Historical trends

3.5 Table 3.2 and Table 3.3 below present historical total traffic, and historical tollable traffic volumes (by each vehicle category) observed at TP Pampampallam between FY18 and FY25 (respectively). FY26YTD volumes were calculated using actual traffic data available for the period April 2025 through September 2025.

Table 3.2: Historical evolution in AADT by vehicle class at TP Pampampallam

	FY18	FY19	FY20	FY21	FY22	FY23	FY24	FY25	FY26 YTD	FY18 - FY25 (CAGR %)
Car	9,188	9,743	10,672	6,658	7,971	12,985	14,190	14,974	16,128	7.2%

Source: Steer analysis of the Client data; FY26YTD consists of data from Apr'25 to Sep'25; Tollable traffic excludes exemptions and violations

3.6 Historically, CJVs have accounted for the highest share of total traffic observed on the Asset; as of FY26YTD, they accounted for 67% of total traffic on the Asset. This is consistent with expectations, given the Asset's proximity to the major urban centres of Walayar and Palakkad, where there exists high demand for passenger transportation to school or work, and for tourism-related, and medical services. Overall, CJV traffic has observed annual growth of about CAGR of 7.6% between FY18 and FY25, relative to

Kerala's GSDP growth of 4.1% per year over the same period. This trend has continued in FY26 as well, with a 10% increase in FY26 YTD.

3.7 Trucks on the Asset largely cater to construction demand within the state of Kerala as well as consumption demand arising from local and regional activity centres within the state. Key commodities on the Asset comprise stone and cement which are carried by heavy goods vehicles (3A/MAV). The stone movement happens round the year, with lower movement observed in June and July due to heavy rains. Between FY18 and FY25, MAV traffic grew at an average 6.6% per year, while construction GVA in the state grew at 4.2% per year over the same period.

3.8 As of FY26YTD, 3A and MAV volumes on the Asset observed a decline of 6% over FY25 levels. This is mainly due to reduced movement of construction material into Kerala from Tamil Nadu post border-cess introduction in Tamil Nadu in October 2022[17] as well as a crackdown on illegal stone and sand mining in Tamil Nadu in recent years[18], effectively reducing the supply of construction materials available to transport to Kerala. In April 2025, the mining department of Tamil Nadu had also introduced a mineral-bearing land tax of INR 90/tonne on crushed stone[19]. This corresponded with the mining and geology department of Kerala granting permission for 885 quarries in Kerala[20].

3.9 As a result, the demand for aggregate and construction material from Tamil Nadu's quarries has reduced along with an increase in supply of the same from Kerala. This is expected to impact stone-carrying traffic on the Asset. Given the historical demand of construction material in kerela; it is expected that the ongoing issue of reduced supply from Tamil Nadu is expected to improve over the next 12-18 months,

3.10 Bus traffic at Pampampallam toll plaza has grown at a 1.9% CAGR, between FY18 and FY24. Buses have experienced a rebound post the pandemic-impacted years of FY21 and FY22, due to the region's resurgence in tourism post-pandemic. As per data from Kerala's Department of Tourism, approximately 70% of the tourists frequenting popular destinations were from the state itself, as of CY 2024.[21] with additional influence from people in the nearby states of Tamil Nadu, Karnataka, Andhra Pradesh and Telangana.

3.11 Bus traffic plying on the Asset grew by 166% in FY23 and a further 11% in FY24, highlighting the post-COVID recovery. Between FY18 and FY25, buses have grown at a CAGR of 2.3%, with recovery continuing at a steady pace.

3.12 Tollable traffic on the Asset has shown marginally faster growth than observed for total traffic. The observed CAGR of tollable PCU for FY18-25 is 8.2 % which is higher than the growth observed for PCU at total (tollable + non-tollable) level of 6.5%.

3.13 Table 3.4 below present total revenue (in INR Lakhs) by each vehicle category at TP1 Pampampallam plaza over the period FY21 through FY25YTD. It can be noticed that the AADC has grown year on year with the FY25YTD AADC being 1.3% higher than that in

[17] **Vehicles coming to TN can now pay permit fees, road tax online**

[18] **ED in letter to TN DGP says sand mining happening in massive scale, demands action**

[19] **Owners of quarries, crusher units and trucks begin indefinite strike in TN**

[20] **Mining and Geology dept grants permission for 885 quarries in Kerala**

[21] **Keralites account for 69% of domestic tourist footfall in State - The Hindu**

FY24. This is in line with the increase in traffic as well as the revision in toll rates post-elections in June 2024.

Table 3.4: Total revenue (INR Cr) and AADC (in INR Lakhs) at TP1 Pampampallam

Year	Total revenue (INR Cr)	*AADC (INR lakhs)	AADC Growth (%)
FY21	41.2	11.3	
FY22	65.6	18.0	**59.3%**
FY23	96.6	26.5	**47.0%**
FY24	106.8	29.2	**10.2%**
FY25	109.3	29.9	**2.7%**
FY26YTD	48.7	26.6	**-**

Source: Client data *AADC represents Average Annual Daily Collection and FY26YTD represents data for 6 months (April 2025-September 2025);

Toll Frequencies

3.14 Toll frequency or segmentation is typically the share of each ticket category recorded for a particular vehicle type. This is based on the toll policy that is part of the Asset concession agreement. As a part of our historical data analysis, we calculate the toll frequency for each vehicle category from the monthly data shared by the Client. The most common ticket categories observed on a typical National Highway concession are: Single, Return, Monthly, Local and Exempt. Given the local nature of traffic, some toll plazas offer custom made local passes to attract the local commuters to opt for these category passes instead of evading toll.

3.15 Understanding the toll frequency gives insights into the nature of traffic plying on the Asset. CJVs generally have higher shares of return passes or local monthly passes because they travel for short to medium distances, while heavy trucks mostly have single tickets since they travel longer distances. Toll roads catering to short distance local traffic generally observe high shares of return tickets or other local monthly passes, while the other roads that cater to strategic long-distance traffic generally observe higher shares of single ticket traffic.

3.16 Table 3.5 below summarize the types of tickets being sold at TP Pampampallam.

Table 3.5: Typical ticket types sold at TP Pampampallam

Category	Description
Single	Allows the vehicle to cross the toll plaza once
Return	Allows the vehicle to cross the plaza twice in a day at discounted rates.
Monthly Pass	Discounted single ticket pass users issued at toll plaza for users who intend to undertake multiple single trips within a month. 50 trips are given at a discounted rate
Local Personal	Discounted single entry pass only for private cars of residents within 20km radius of toll plaza
Local Commercial	50% discount on single trips for commercial vehicles registered in the local district. This pass allows single entry only
Exemptions	Officially exempted vehicles like ambulance, police cars, key political personnel etc.

3.17 In addition to the above ticket categories, toll plazas generally also record violations, which are non-paying users, and who are not officially allowed under the exemptions category but are forced exemptions. For the Asset, the segmentation discussed below reports Exemptions and violations together.

3.18 As a general pattern, the shares of single/return/monthly tickets tend to stabilise within 2-3 years of the commencement of Asset operations. Only in the cases where trip patterns are expected to change significantly due to urban expansion is where we expect these shares to change over the period or due to some external events impacting the trip patterns. During FY21 and FY22 however, two key events impacted traffic patterns throughout the country: COVID-19 and government mandated FASTag implementation.

Introduction of Annual pass for CJVs

3.19 The National Highway Authority of India launched the "The FASTag Annual Pass" on August 15, 2025, a prepaid facility that allows private CJVs to travel across designated National Highway and National Expressway toll plazas. The annual pass is worth INR 3,000. The pass is valid for one year or 200 trips, whichever occurs first and is applicable only to private, non-commercial vehicles (Car/Jeep/Vans).

Since this pass has been introduced by NHAI, it is not valid on

- state governed toll plazas on highways
- state governed toll plazas expressways
- Parking areas or other non-NHAI tolling locations

3.20 The pass can be activated via the RajmargYatra app or the NHAI website, and links directly to an existing FASTag. The Annual Pass aims to:

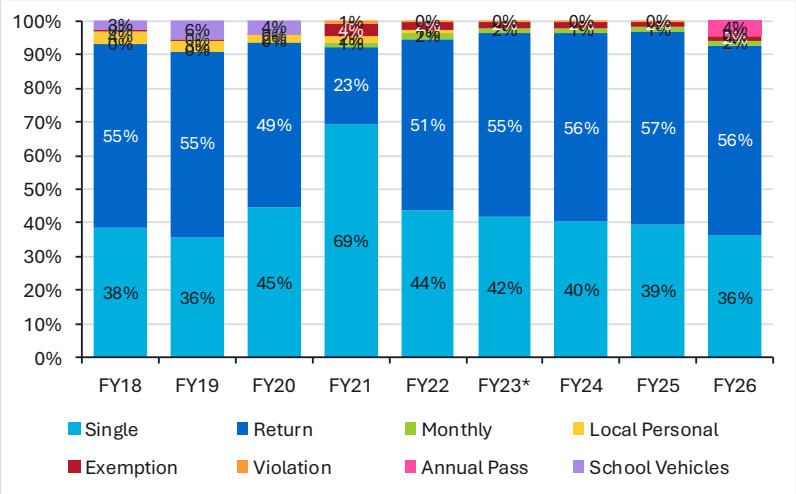
- Promote cashless and seamless travel on national highways.
- Reduce congestion and improve traffic flow at tolls

Share of traffic by payment type

3.21 In FY21, there was a change in ticket patterns across most toll roads in the country (including the Asset) due to the mandatory implementation of FASTag as a mode of payment for road users, as well as changes in travel behaviours induced by lockdowns due to the Covid-19 pandemic. As trip patterns stabilised from the mandatory implementation of FASTag, FY22 was further impacted by the 2nd wave of Covid-19 in Q1 and Q2, resulting in an extended period of travel disruption, where the share of shorter distance trips increased as several states implemented state entry barriers.

3.22 Figure 3-1 and Figure 3-2 below show ticket segmentation for CJV and MAV categories from FY18 to FY26YTD.

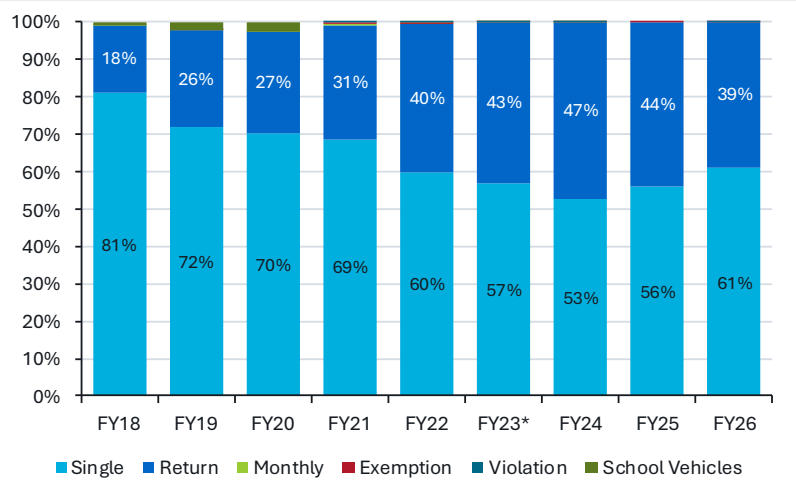
Figure 3-1: Ticket-segmentation for CJV at TP Pampampallam



Source: Steer analysis of the Client data; FY26YTD contains data from Apr-Aug'25; issuance of annual passes commenced from 15 August 2025

3.23 Over the historical period (except FY20-22 when Covid-19 and FASTag implementation resulted in changes to travel behavior), "Return" tickets formed the majority of CJV trips on the Asset, accounting for roughly 55-57% of the total every year. This is due to proximity of the Asset to densely populated centres such as Palakkad, Walayar, and Coimbatore.

Figure 3-2: Ticket-segmentation for MAV at TP Pampampallam



Source: Steer analysis of the Client data; FY26YTD is from Apr'25 to Aug'25

3.24 For MAVs, single journey tickets decreased from 69% to 53% between FY21 and FY24 and has risen to 61% as of FY26YTD. Over the same period, return journey tickets increased from 31% to 39%. This trend is due to various events in the state of Kerala:

- The closure of quarries after the expiration of permits in January 2024 [22]and illegal quarries being shut down by the Ministry of Environment and Forests (MoEF) in

[22] 300 quarries in state to be shut; Challenges for construction sector in Kerala

November 2024 has led to the setting-up of various dumping yards near Palakkad.[23] These dumping yards observe a high share of movement from areas like Coimbatore, which has also influenced the return share increasing year-on-year for MAVs on the Asset. Similar movement from Coimbatore is also observed for construction purposes, which caters to demand on alternate routes from our Asset.

- With the increasing ETC penetration, the share of return traffic has increased as the traffic which returns within 24-hour is eligible for return ticket automatically.

3.25 Table 3.6 below presents the FY26YTD (April to September) segmentation for LCV, Bus and 2A category.

Table 3.6: Ticket-segmentation for LV, Bus, 2A and 3A Categories at TP Pampampallam

Ticket Category	LCV	Bus	2A	3A
Single	35.5%	42.9%	56.5%	60.9%
Return	55.0%	28.9%	43.3%	39.1%
Monthly	9.2%	27.5%	0.0%	0.0%
Local Personal	0.0%	0.0%	0.0%	0.0%
Violations	0.0%	0.0%	0.0%	0.0%
Exemptions	0.3%	0.4%	0.2%	0.1%

Source: Steer analysis of the Client data

Data Collection exercise

3.26 To validate and inform various inputs used in our forecasting, we undertook primary data collection on the Assets, comprising the surveys listed in Table 3.7 below. OD survey data was collected on behalf of the Client, TVC surveys were commissioned by Steer with a third party. OD data collection typically involves manual data entry by enumerators based on oral surveys with road users crossing toll plazas, which Steer also commissioned with a third party. TVC data collection involves video-graphic capture of traffic passing crossing the toll plazas, followed by manual counting.

Table 3.7: Data collection schedule

3-day videography-based TVC			1-day OD survey			
Start date	End date	Time (hrs)	Start date	Start Time	End Date	End Time
28th Jun 2023	30th Jun 2023	0000-2359	6th Feb 2024	0900 hours	7th Feb 2024	0900 hours

Source: Steer analysis

3.27 It should be noted that, in our experience, traffic on national highways shows variation across the week due to the economic activities surrounding each road. To derive a representative TVC count considering daily variation, three-day to seven-day traffic

[23] MoEF Cracks Down on Illegal Quarries in Kerala with New EC Guidelines | Kochi News - Times of India

counts are generally recommended, and hence, to fully understand the impact of this weekly fluctuation on the Asset, we collected three-day counts at the toll plaza.

Key findings of the TVC data analysis

WADT estimates

3.28 Taking an average of the 4-day TVC counts (28th Jun – 30th Jun 2023, 0000-2359), we obtained the following average daily traffic (ADT). This ADT excludes non-tollable vehicles such as tractors, two-wheelers, bullock-carts, etc., but includes officially exempt vehicles such as police cars, ambulances, emergency response vehicles, government vehicles and other vehicle types officially allowed as 'exempted' under the concession agreement.

Table 3.8: ADT at TP Pampampallam

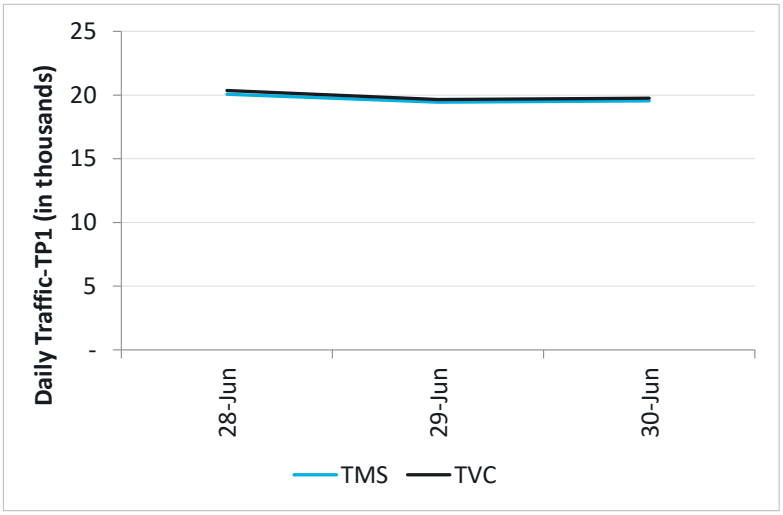
Toll Plaza	CJV	Mini LCV	LCV	Bus	2 Axle	3 Axle	MAV	OSV	Total
TP1 Pampampallam	11,180	1,447	2,368	934	1,183	555	2,252	3	**19,921**

Source: Steer analysis of TVC data

TVC v/s TMS analysis

3.29 As we use the TMS data to estimate the base year AADT, we have used our TVC data to validate the TMS data on those particular days, as provided by the Client. The following figures show the comparison between the daily traffic observed by TVC and TMS for the toll plaza.

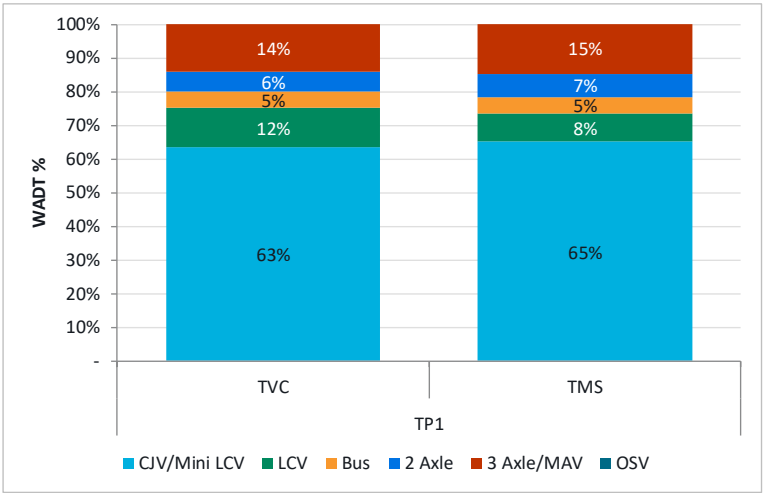
Figure 3-3: Comparison between TVC and TMS daily traffic data on TP Pampampallam



Source: Steer analysis of TVC and Client TMS data

3.30 As can be seen from Figure 3-3 above, the difference between daily traffic from both sources is minimal. Figure 3-4 below compares the shares of vehicle types at both toll plazas observed by the TVC and TMS data. In terms of individual vehicle categories as well, the difference is minimal (1-3%) which could be attributed to common misclassification of vehicle categories between CJV, Mini LCV, LCV and 2A.

Figure 3-4: Comparison between vehicle shares from TVC and TMS WADTs



Source: Steer analysis of TVC and Client TMS data

3.31 Considering the smaller variation between the TVC and TMS data for the largest revenue generators-CJV and 3A+MAVs, and an overall good fit in the traffic volumes, TVC-TMS analysis gives us the confidence that the base year traffic calculated using the Client data forms a reliable base year traffic estimate.

Key findings of the origin-destination analysis

Overview

3.32 Origin-destination (OD) analysis enables the understanding of the nature of traffic movement on the Asset. We have analysed the regional drivers of demand based on the following analysis:

- Zonal influence
- Commodity distribution
- Top OD pairs
- Trip length distribution

3.33 While zonal analysis and the list of top OD pairs help to understand 'where' people and goods travel, commodity distribution sheds light on 'what' goods get transported on this Asset. Trip length distribution shows 'how far' vehicles and people travel, and goods get transported. This set of analyses is used to estimate key drivers of traffic and aid in making informed forecasting assumptions related to traffic demand elasticities, growth drivers and exogenous impacts.

Sample rates

3.34 Sample rates help understand the reliability of OD data. They are calculated by dividing OD samples by the TVC count observed on the same date for each vehicle category at the toll plaza. Table 3.9 below presents the sample rates for key vehicle type aggregations at the toll plaza. We believe that the sample rates of the OD data are reasonable for the analysis required.

Table 3.9: Sample rates for OD data

Vehicle type	TP Pampampallam
Passenger (CJV+Bus)	28%
Goods (LCV+2A+3A+MAV+OSV)	53%

Source: Steer analysis of OD data

3.35 Low sample rates for passenger vehicles are due to short stop times at the toll plaza post implementation of FASTag where the queuing at plazas have decreased and time to record survey responses, especially for private vehicles (CJVs) have also reduced.

Zone Categories

3.36 To facilitate better interpretation of key regional drivers of traffic as determined by their OD zones, and influenced by various towns, cities, states, and regions in the vicinity of the Asset, we have aggregated zonal data as described Table 3.10 below. The methodology behind this aggregation of zones may vary as per the characteristics displayed by the different Assets being studied.

Table 3.10: Zone aggregations for zonal influence analysis

Aggregate Zone	Description
Local	Local zones are those that fall on or very close to the Asset.
IAOI (Immediate Area of Influence)	IAOI zones are the locations which generate traffic and lie within approximately 75-150 km distance from the Asset.
Rest of State (RoS)	Rest of the cities/Districts in the state that Asset lies in (other than Local/IAOI)
Tamil Nadu	Parts of Tamil Nadu not belonging to local or IAOI aggregations
Karnataka	Karnataka
North India	Uttarakhand, Uttar Pradesh, Rajasthan, Delhi, Haryana, Punjab, Jammu and Kashmir
Central India	Madhya Pradesh, Chhattisgarh
West India	Gujarat, Maharashtra, Goa
Rest of South India	South Indian states other than Kerala, Karnataka, and Tamil Nadu
East & Northeast India	West Bengal, Bihar, Orissa, Jharkhand, and Northeast Indian states

Source: Steer analysis

Zonal influence

3.37 The zonal influence is the contribution of the zone or the zonal aggregation to trips on the Asset for a given vehicle type. This section presents the zonal influence of these zones/zone aggregates on the Asset as retrieved from the OD survey data, and as based on zonal aggregation list presented in Table 3.10 above. [24] It should be noted that zonal

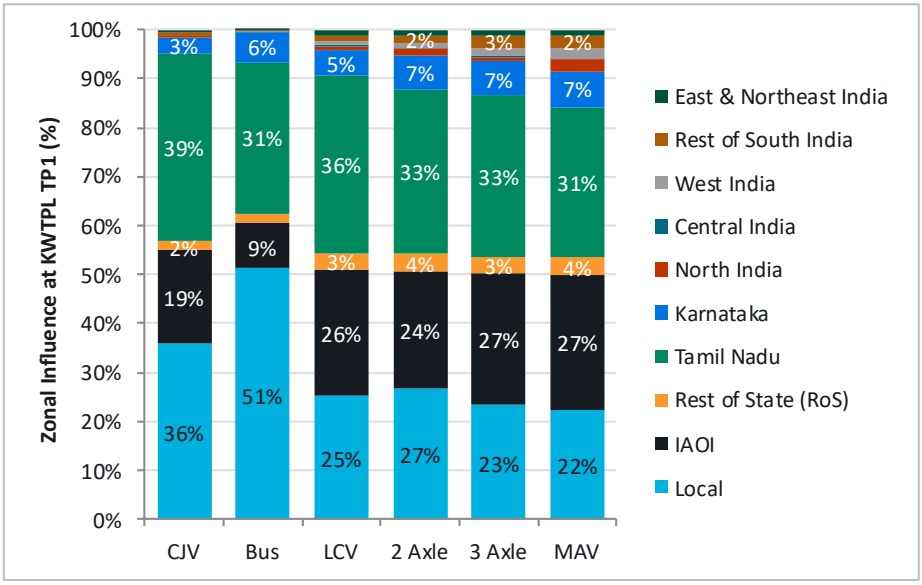
[24] For example, if out of 100 trips at a toll plaza on an Asset, 10 trips are between Hyderabad and Delhi and 90 trips are between Hyderabad and Chennai, then zonal influence of Hyderabad would be 50% since one end of all trips are at Hyderabad. Likewise, zonal influence of Delhi and Chennai would be 5% and 45%, respectively.

influence is analysed on trip ends and not trips. The zonal Influence analysis outputs are presented in Figure 3-5 below.

3.38 As the Asset is located on the border of Kerala and Tamil Nadu and serves as the gateway to the former, we see a large proportion of trips across all vehicle categories influenced by locations in Kerala. There is a higher share of local trips for the passenger vehicles wherein more than 50% of the influence for CJVs is from local and IAOI zones such as Walayar, Coimbatore, Thrissur and other areas in Palakkad district. This analysis is in line with our understanding during the site visit wherein heavy influence of the surrounding local areas was observed on passenger traffic volumes. Light goods traffic is significantly influenced by local and IAOI areas such as Coimbatore, Thrissur and Annur whereas the heavy goods traffic had a relatively greater influence of medium distant locations like Rest of South India and Karnataka. As the number of axles increase the influence of local areas on traffic volumes on the Asset decrease.

3.39 Outside Kerala, areas in Tamil Nadu such as Salem, Chennai, Thanjavur and Erode contribute to both light and heavy goods traffic on the Asset, followed by Bangalore in Karnataka. Supporting this analysis, the top OD pairs analysis (see Top 10 OD Pairs) shows that the majority of passenger trips originate and end in local and IAOI areas whereas for goods traffic, the rest of the state and areas outside the state such as Ernakulam, Bangalore and Salem feature in the top OD pairs list.

Figure 3-5: Zonal influence at TP Pampampallam



Source: Steer analysis of OD data

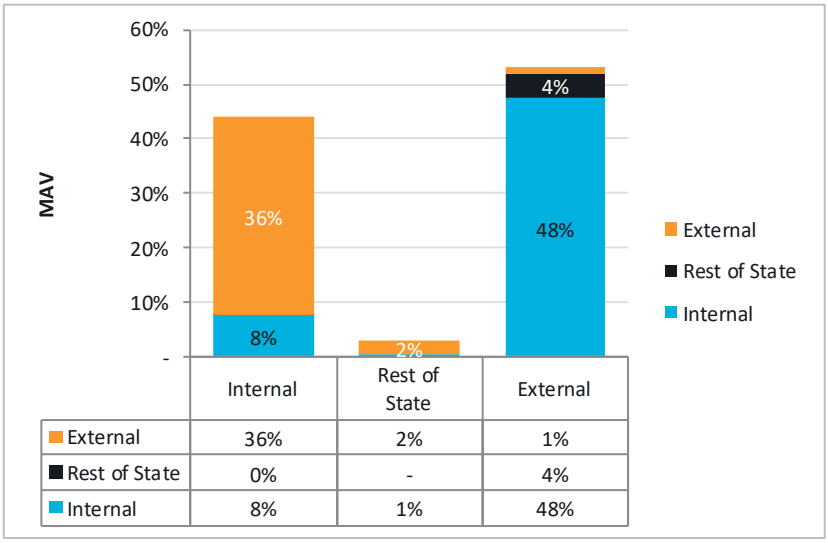
Internal External analysis

3.40 Internal-External analysis helps in identifying the trips which have both an origin and destination on or near the Asset i.e., local/IAOI zones (Internal-Internal or I-I), any one end on the Asset (Internal-External or I-E), or neither end on the Asset i.e., through trips (External-External or E-E). RoS here represents areas within the state which are neither local nor IAOI. 'Internal' zones are those that were analysed as 'local' and 'IAOI' in the zonal influence analysis, i.e., lying on the Asset, while 'External' zones are areas lying outside the state.

3.41 Figure 3-6 below shows the distribution of trips based on the categories described above. The results from the I-E analysis support our observations from the zonal influence analysis presented above, but at a higher level of aggregation. The following observations can be made from the I-E analysis:

1. Overall, a significant share (36%) of the MAVs originates from external areas and end their trips in Kerala which could be attributed to Kerala's dependency on other states for meeting its consumption demand. Similarly, 48% of the MAV traffic has its origin within the Local areas and are destined for places in external areas such as Tamil Nadu and Karnataka.
2. External to external movement accounts for a small share of overall MAV traffic on the Asset, highlighting that the Asset is primarily used by the vehicles which have one end in the state, with minimal through movement.

Figure 3-6: Internal-external distribution at TP Pampampallam



Source: Steer analysis of OD data

Commodity distribution

3.42 We have grouped various commodities into aggregate categories for ease of interpretation, as shown in Table 3.11 below. Figure 3-7 below presents the outputs of the commodity distribution analysis at the aggregated commodity categories.

Table 3.11: Aggregate commodity categories

Commodity Description	Code	Combined codes used for charts
Agriculture Products / Cash crops (Wheat, Rice, Sugar cane, Maize etc.)	AGR	AGR
Cattle Food / Live Stock (sheep, goat, cow, cattle food etc)	LIV	
Perishable Items (Fruits, vegetables)	PER	GRO
Animal Products/Dairy/Eggs/Fish/Meat/Animals	DFM	
Groceries / Food items (Soap, Salt, Sugar, Pulses, Spices, Biscuits, bread, cold drinks, beer etc.)	GRO	

Commodity Description	Code	Combined codes used for charts
Building Material / Construction (Cement, Lime, Brick, fly ash, etc)	CNS	CNS
Sand/Clay	SND	
Stone (kota stone, marble, Granite, Aggregate stone etc.)	STN	
Ceramic	CRM	
Petroleum Products (Oil, LPG, CNG, etc.)	PET	PET
Chemicals / Fertilizers (Acids, Fertilizers etc.)	CHM	
Electrical/Manufacturing items (Electronic items, Medicine, Leather, Wine, Rubber/ Tyre, Plastics, Cloth, Paper etc.)	MAN	MAN
Raw Wood, Cork & Wood Products, Furn	WUD	
Machinery / Spare parts	MAC	
Automobiles (Finished products, auto parts, Car/bike manufacturing, New Chassis)	AUT	AUT
Basic / Fabricated Metals (Iron, Steel / Metal)	MET	MET

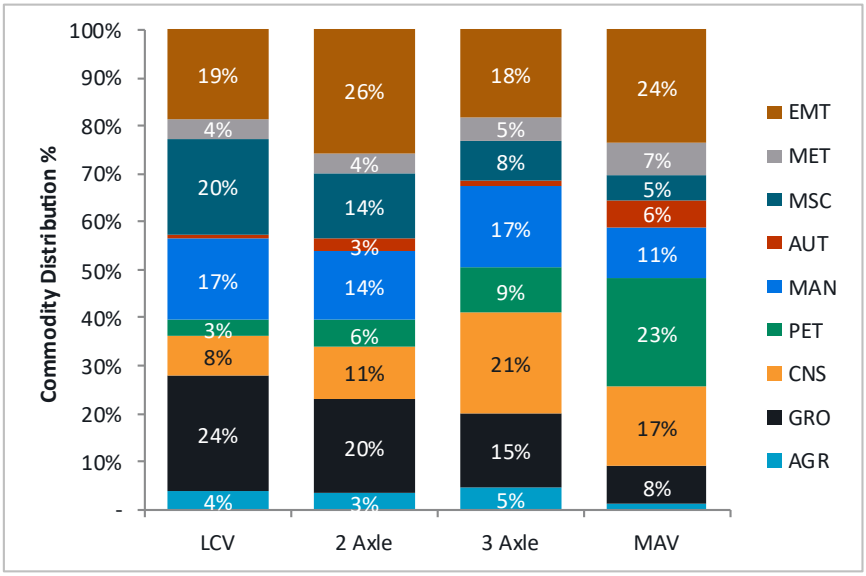
Scrap	SCR	

Source: Steer Analysis

3.43 With the ongoing upgradation of NH66 in, the key commodity appearing on the Asset is construction material, destined for the sections along Kerala's coastline (Thuravoor-Paravoor stretch and Kadampattukonam-Kazhakkoottam stretch)[25]. The dominant commodities moved by 3As and MAVs include groceries (15% and 8% respectively) and manufactured items like plastic, paper & medecines. Around 23% of MAVs use the Asset to transport petroleum products. A high proportion (17%) of MAVs that carried cement and other construction materials on the Asset can be attributed to the presence of the state-owned Malabar Cement plant at Walayar and various other ancillary units along the Asset alignment. Agricultural and grocery items, largely consisting of household products were the key commodities moved by LCVs on the Asset and accounted for roughly 28% of the total.

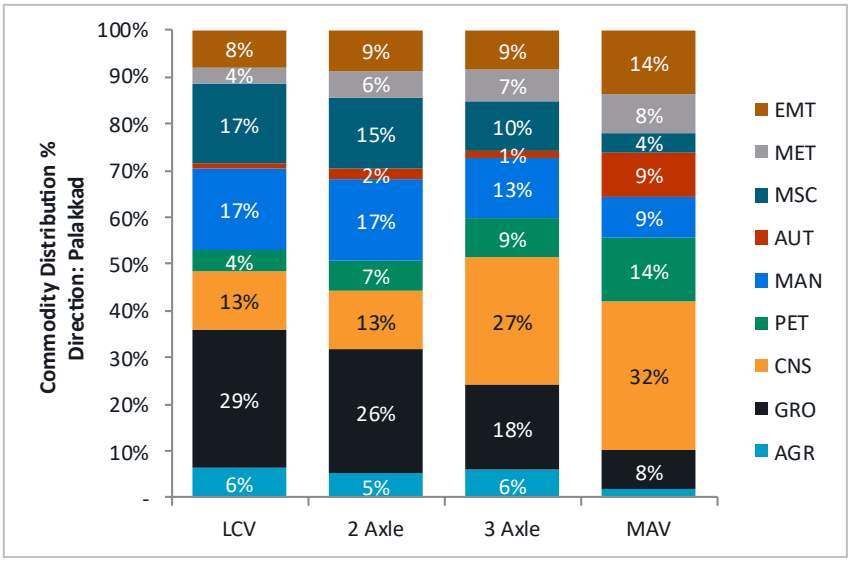
[25] **Completion of NH 66 Six-Laning Project Expected by End of 2025** (December 2024)

Figure 3-7: Commodity distribution at TP Pampampallam (Total)



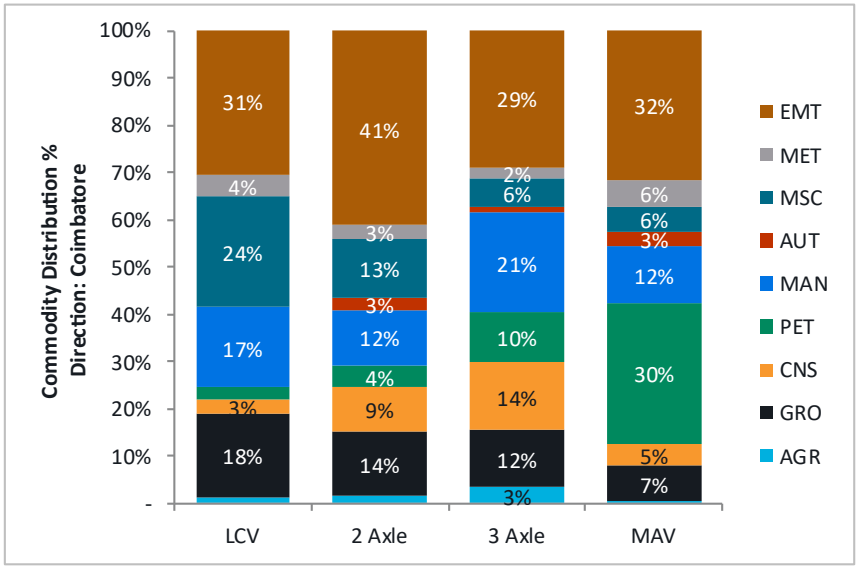
Source: Steer analysis of OD data

Figure 3-8: Commodity distribution at TP Pampampallam (towards Palakkad)



Source: Steer analysis of OD data

Figure 3-9: Commodity distribution at TP Pampampallam (towards Coimbatore)



Source: Steer analysis of OD data

3.44 Looking by direction, it is seen that around 30-40% of the goods traffic is empty while travelling towards Coimbatore whereas those going in the direction of Palakkad carry a mixture of commodities with the largest proportion of the light goods vehicles transporting groceries and agricultural products. The heavy goods vehicles, on the other hand, are observed to have carried construction material, manufacturing items and cement.

3.45 The difference in the characteristics of direction-wise commodity distribution can be attributed to Kerala's dependency on other states for meeting its demand for agricultural products and construction material. The commodity distribution shows that 32% of the MAV's carry construction related goods in the direction of Palakkad (Figure 3-8)compared to 5% of the MAV's moving towards Coimbatore (Source: Steer analysis of OD data

3.46 Figure 3-9). This directionality in construction related traffic is due to the presence of the Malabar Cement plant in Walayar.

3.47 A similar difference can be observed in the number of petroleum-carrying trucks. The proportion of trucks carrying petroleum products towards Coimbatore (30%) is more than double that in the opposite direction (14%). This high proportion of petroleum is travelling from the refinery in Kochi to the industrial centre of Coimbatore.

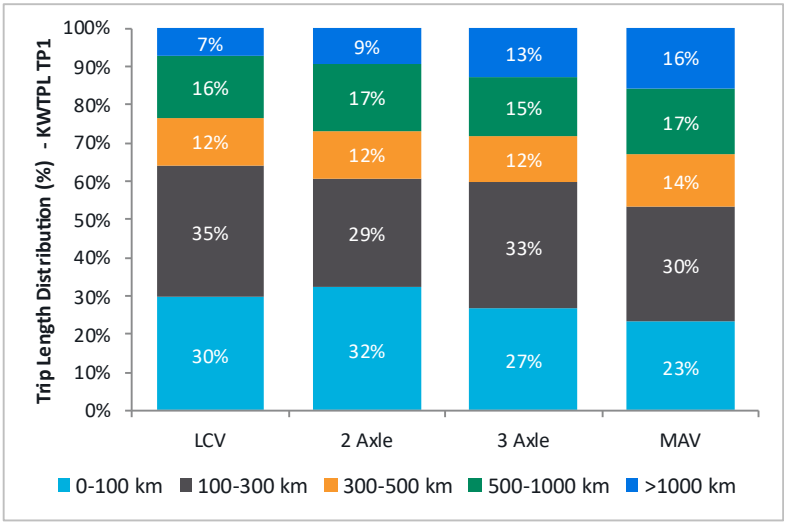
Trip length analysis

3.48 Trip-length distribution provides the distance-based trip profiles of various vehicle categories. This aids in validating assumptions around the share of macro-economic drivers, inputs from our zonal influence analysis and toll segmentation. For ease of interpretation, we have categorised distances into 5 groups – local (0-100km), short-distance (100-300 km), medium-distance (300-500 km), long-distance (500-1000 km) and

very-long-distance (+1,000 km). The trip distances were derived as driving distances from Google Distance Matrix Tool based on zonal coordinates for OD pairs.[26]

3.49 Supporting the observations made in the zonal and internal-external analysis in the previous sections, Figure 3-6 below highlights that the Asset primarily caters to short and medium distance trips. More than 50% of heavy goods vehicles (3 axles & MAVs) travel shorter distances (<300 kms), contributing to the local movement observed on the Asset. This rises to ~65% for the LCVs. This local and short distance nature of traffic on the Asset is also observed from the average trip lengths shown in Table 3.12 below.

Figure 3-10: Trip length distribution TP Pampampallam



Source: Steer analysis of OD data

Table 3.12: Average Trip Length

	LCV	2 Axle	3 Axle	MAV
Average trip length Km	398	439	462	564

Source: Steer Analysis of OD data

Conclusions

3.50 In summary, the Asset's AADT in FY25 at Pampampallam toll plaza was 22,905 in terms of absolute traffic volumes and 37,320 in terms of PCUs. The Asset has witnessed significant growth in recent years (AADT PCU CAGRs of 6.5% between FY18-25 and 13.8% between FY22-25). This growth has been bolstered by positive impacts of the underlying economic activities driving traffic on the Asset – tourism, port-related movement and the influence of construction material.

3.51 The 3A/MAV category has observed a degrowth of 5.7% in FY26YTD. This is due to the continued slowdown in movement of construction material from Tamil Nadu after the

[26] Google Distance API is a tool that is available on a chargeable basis from Google Maps Platform. Link: **https://developers.google.com/maps/documentation/distance-matrix/start**. Travel distance and time information for driving/transit under various congestion scenarios can be extracted through this tool by using macro-enabled Excel, R, etc.

introduction of the border tax in FY23, and a recent crackdown on illegal sand mining in Tamil Nadu, which has reduced the availability of transportable construction material to Kerala. However, we expect these trends to stabilise over the near term and construction material related traffic to recover as demand for construction material will remain strong in Kerala going forward

3.52 The TVC data shows minor variation on the TMS data, where at a total level, the TVC data is approximately 1.2% higher than the TMS data. Higher difference at vehicle category is due to mis classification between CJV, Mini LCV, 2A and Bus.

3.53 The OD analysis found that in terms of the zonal influence, local and IAOI areas such as Walayar and Coimbatore highly influence the movement of passenger traffic on the Asset whereas the heavy goods vehicle traffic is significantly influenced by areas in the Rest of the State such as Kochi, Thiruvananthapuram, and Ernakulam. Outside Kerala, states such as Tamil Nadu and Karnataka have a high influence on the movement of both light and heavy goods traffic on the Asset. The internal and external distribution highlights that majority of the passenger traffic originates from and is destined to places within the internal areas i.e., local and IAOI zones thereby contributing to the local movement on the Asset whereas a high proportion of heavy goods vehicle originate from external areas and end their trips in Kerala.

3.54 The key commodities transported on the Asset includes manufacturing items such as rubber, container, petroleum, groceries, plastic as well as construction goods like cement for the heavy goods traffic and grocery/agricultural items by light goods vehicle. It is also observed that a higher share of vehicles across all categories are empty travelling towards Coimbatore whereas given Kerala's high consumption demand, which is met by other states, there is a higher share of traffic carrying a mix of commodities including cement towards Palakkad, due to the presence of the Malabar Cement plant in Walayar. This is consistent with the underlying economic trends where Kerala is predominantly a destination for various consumption linked commodities as it has relatively few industries located there.

4 Socioeconomic context and traffic growth

Introduction

4.1 The growth of traffic on existing (brownfield) roads depends on, firstly, how fast the background travel demand grows (background growth); and secondly, how successful the Asset is in attracting that traffic (traffic capture). Background travel demand is driven by the socio-economic conditions of the region where the Asset is located and conditions on a national scale. These include:

- Changes in factors such as population, economic growth (regional and national) and industrial production; and
- Other local factors such as strategic port growth, and growth in local industries near the Asset.

4.2 In turn, the change in the competitive position of the Asset (and thus of the traffic capture it will achieve) derives from how the service offered and the prices charged on the Asset change in comparison to competing roads; and whether any new competing road facilities are available. In this chapter, we assess the socio-economic indicators relevant to traffic growth on the Asset.

Population growth

4.3 We have analysed the key socioeconomic drivers of the background traffic demand in the state of Kerala where the Asset is located.

National Level

4.4 Table 4.1 below shows that the total population in India has grown at a Compound Annual Growth Rate (CAGR) of 1.5% since 2000, decreasing over the years, as shown in the table below. The World Bank forecasts this growth to decrease to 0.6% CAGR by the 2030-45 period.

Table 4.1: CAGR of population in India

Years	CAGR		
	Total Population (m)	Rural Population (m)	Urban Population (m)
1970 – 1985	2.3%	1.9%	3.8%
1985 – 2000	2.0%	1.7%	2.9%
2000 – 2015	1.5%	1.0%	2.6%
2015 – 2030*	1.0%	0.3%	2.3%

Years	CAGR		
	Total Population (m)	Rural Population (m)	Urban Population (m)
2030 – 2045*	0.6%	-0.3%	1.9%

Source: World Bank Data on Health Nutrition and Population Statistics, *forecast population growth

State Level

4.5 Table 4.2 shows the evolution of population in Kerela state, compared to that of the country. The CAGR of population in Kerela has been considerably slower vis-à-vis that of India.

Table 4.2: Population Growth in Kerala and India (FY12 – FY24)

State	FY12 Population (m)	FY24 Population (m)	CAGR (FY12 – FY24)
Kerala	33.5	36.1	**0.6%**
India	1,210	1,395	**1.2%**

Source: MoSPI estimates

4.6 Due to the complexities of patterns of urbanisation, and the very dynamic nature of local population migration (which are very difficult to forecast with accuracy), we do not use population growth as a proxy for understanding future travel demand growth on the Asset. It has been included in this section simply to provide the underlying socio-economic context of the state/trends in the regions in which the Asset is located.

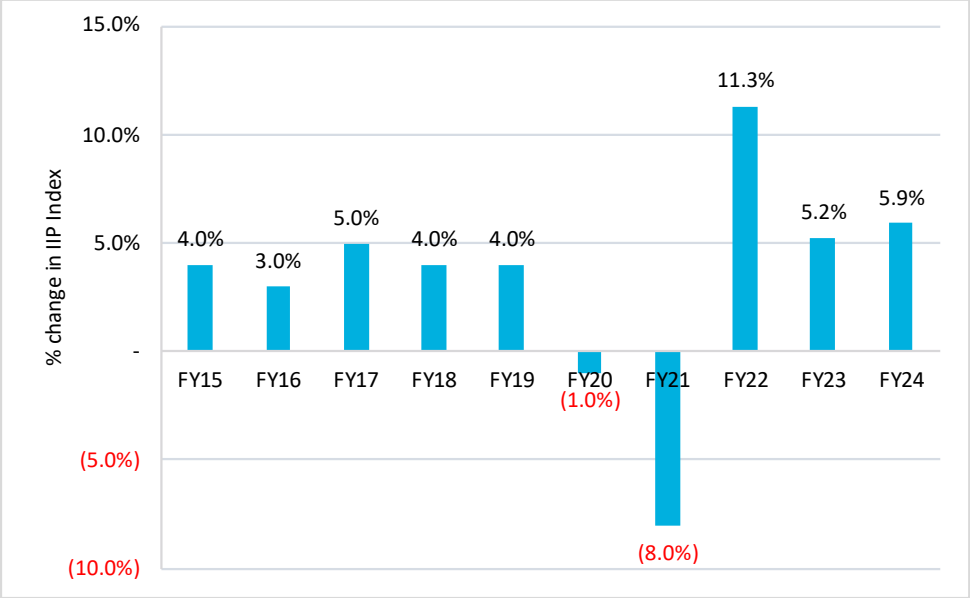
Economic Indicators

Industrial Production

4.7 The Index of Industrial Production (IIP) is a composite indicator that measures the short-term changes in the volume of production for a basket of industrial products. The IIP data tracks the manufacturing activity in different sectors of an economy, with mining, manufacturing, and electricity being the three broad sectors constituting the IIP.

4.8 Figure 4-1 below that at an annual level, national IIP was growing at an average of 4% per year over the period FY15-19, before the country underwent a liquidity crisis and experienced an overall economic slowdown in FY20. In the aftermath, IIP shrank by over 8% in FY21 due to a decline in economic activity in the wake of global lockdowns introduced to curb the Covid-19 pandemic. However, with the gradual opening up of the economy post the pandemic, and recovery in consumption demand, industrial activity also recovered with time with IIP recording growth of 5% in FY23 and 6% in FY24.

Figure 4-1: Annual growth – Index of Industrial Production



Source: Steer Analysis of MoSPI data

4.9 Since state-level IIP data is not as readily available as national level IIP, we have presented national IIP here to indicate nationwide activity in key industrial sectors like power, manufacturing, and mining, all of which influence long-distance commercial movements across the nation, and not unique to this asset. We, however, do not use it to forecast future travel demand growth since long-term forecast for IIP is not available through official sources such as MOSPI, RBI or through multilateral organisations like WB, IMF.

Vehicle Ownership

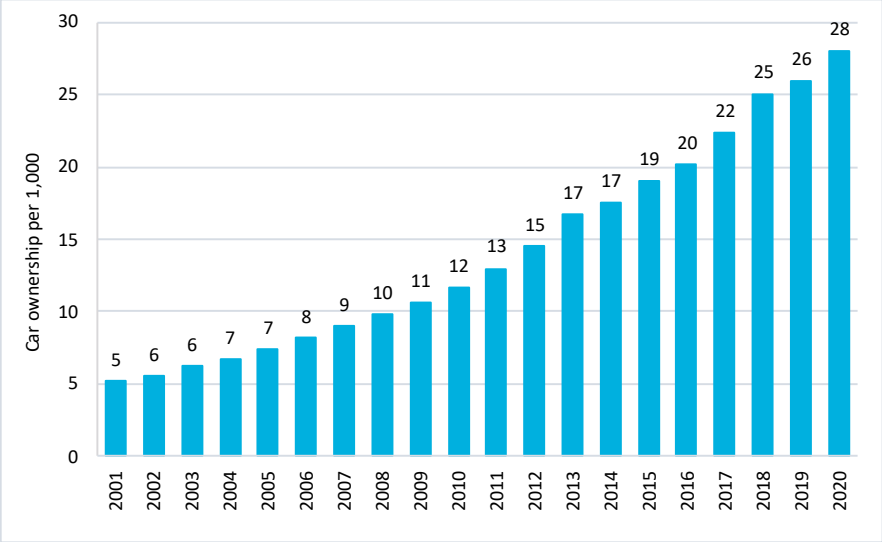
4.10 The gap in car ownership between India and developed nations remains substantial according to recent data. As of 2018, India had approximately 22 cars per 1,000 individuals, a fraction of the 980 cars per 1,000 individuals in the United States[27]. However, this pattern is changing with the increasing per capita income levels. As can be seen in Figure 4-2 below, between 2007-17, number of cars per 1,000 people has more than doubled (from 7 in 2007 to 22 in 2017) and increased at a CAGR of about 11%.

4.11 Overall, India still stands at a very nascent stage in the vehicle saturation curve, offering huge potential for growth going forward. As the income per capita of India and the region itself grow further, we expect car ownership levels to increase. As per the India Energy Outlook (2015), car ownership is projected to grow steeply to 175 cars per 1,000 population by 2040 in India.[28]

[27] India has 22 cars per 1,000 individuals: Amitabh Kant, Auto News, ET Auto

[28] https://www.gita.org.in/Attachments/Reports/IndiaEnergyOutlook_WEO2015.pdf

Figure 4-2: Car ownership in India per 1,000 population

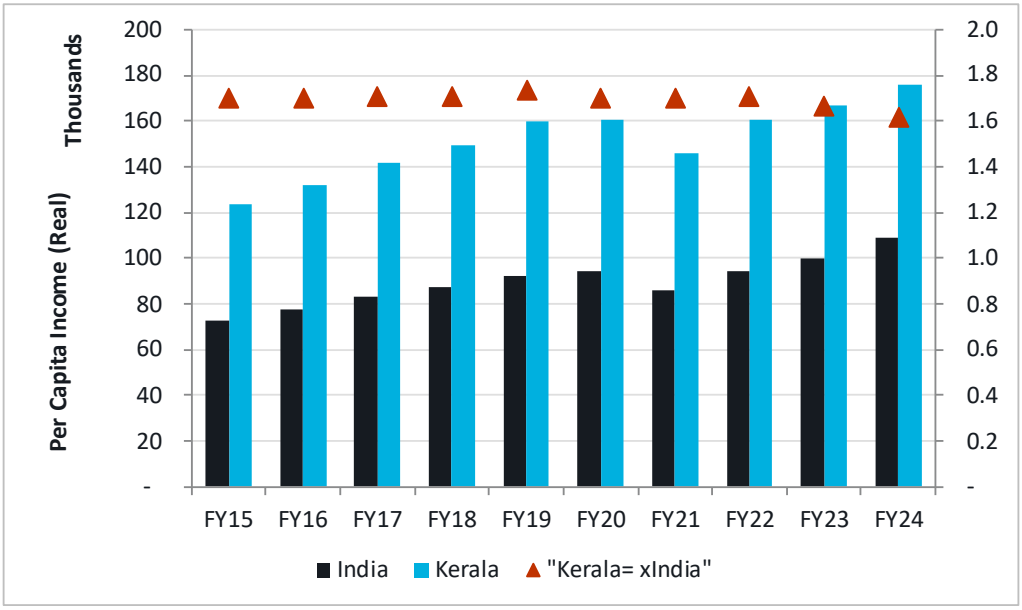


Source: International Energy Agency (IEA))

Per Capita Income (PCI)

4.12 Kerala is one of the richer states of India whose per capita income has been consistently higher than the national average as seen in the Figure 4-3 below. As of FY24, the per capita income of the state was approximately 1.6 times that of the national average.

Figure 4-3: Per Capita Income in Kerala and India (FY15 – FY24)



Source: Steer Analysis of MoSPI data

Economic Growth

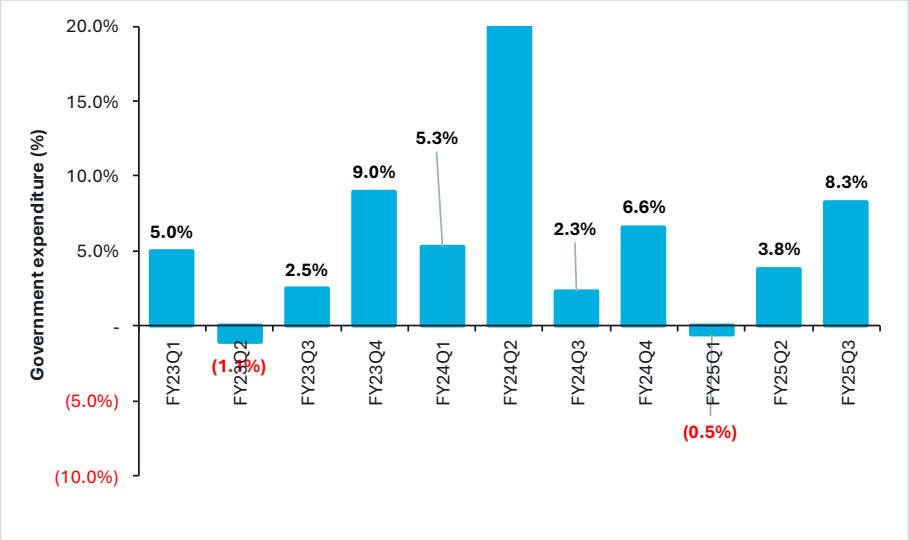
India's Performance

4.13 India's economic performance has shown signs of recovery in the recent months despite a slowdown experienced in H1FY25, as the latest Second Advance Estimates (SAE) released show the GDP growth in FY25 to be 6.5% - which is lower than the 9.2% growth observed in FY24.[29]

4.14 As shown in Figure 4-4 below, the recovery in government expenditure has been recent (FY25Q3 experienced an 8.3% year-on-year growth), while the first two quarters in FY25 observed lower growth rates than the corresponding periods in FY24 (0.5% degrowth in FY25Q1 and 3.8% growth in FY25Q2, compared to 5.3% and 20.1% growth in the respective periods in FY24).

4.15 Other contributing factors also include the impact of the 2024 general elections on central infrastructure spending, state-level fiscal constraints and rising global uncertainties such as Russia-Ukraine war and Gaza-Israel conflict which have had impact on global supply chains.

Figure 4-4: Government final consumption expenditure



Source: Steer Analysis of MOSPI Data

4.16 Weaker industrial activity, as reflected in lower IIP (Figure 4-5 below) and GVA contribution (Figure 4-6 below), directly impact freight movement and commercial traffic volume growth across the country, including on the Asset. At the same time, muted government capex had an influence on both construction-linked activity and industrial output which impacted the commercial traffic growth carrying construction material and industrial goods.

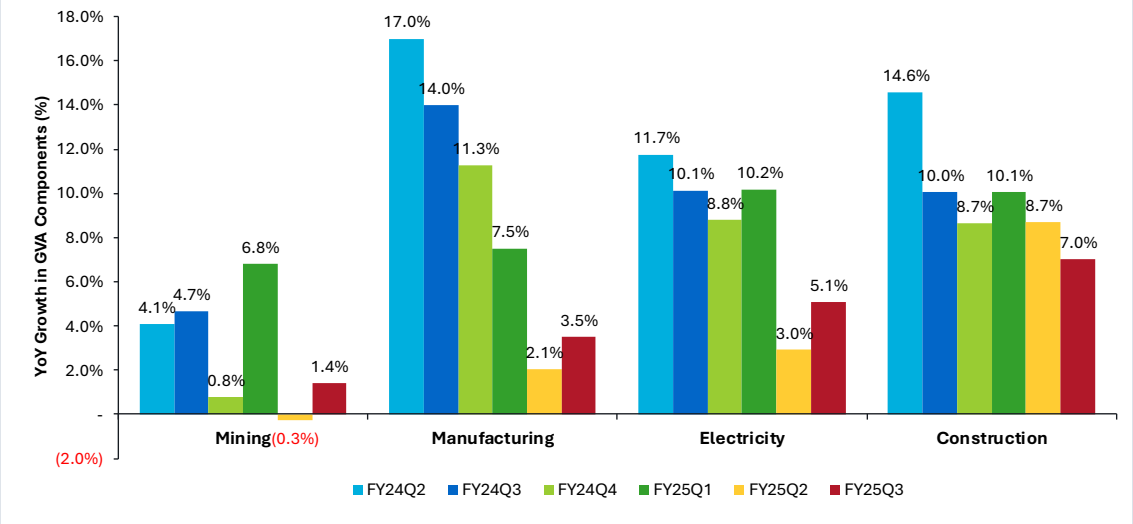
Figure 4-6: Industrial components of GVA



Source: Steer Analysis of MOSPI Data

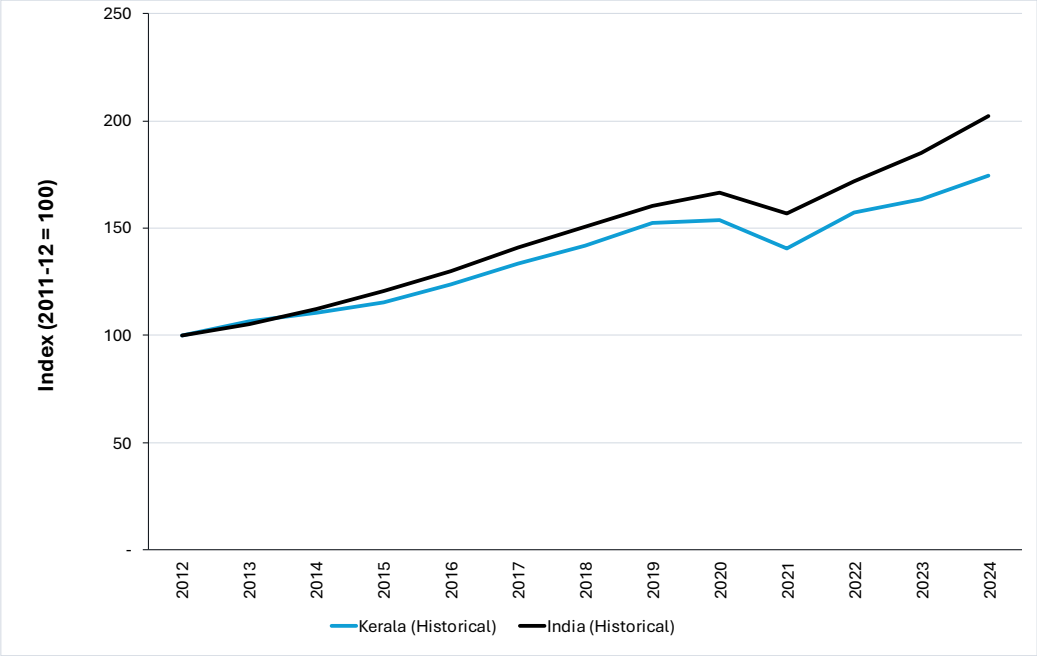
GDP and GSDP Growth

4.17 Figure 4-7 below illustrates the evolution of Kerala GSDP, with respect to the GDP of India. Between the period of FY12 and FY24, the Indian economy has grown at a CAGR of 6.0%- aided by a strong growth in the services/tertiary sector, which grew at a CAGR of 6.9% over the same period. Kerala grew at 4.7% between FY12 and FY24, with the state growing at a slower rate than the national average.

4.18 As shown in Table 4.2 above, Kerala accounted for 2.6% of national population in FY24. In terms of national economic contribution, Kerala contributed approximately 3.6% to India's GDP in FY24. Therefore, Kerala's per capita GDP contribution highlights the

importance of the region in driving consumption demand and regional traffic growth near the Asset.

Figure 4-7: Evolution of Kerala's state GDP and national GDP, FY12-24



Source: Ministry of Statistics and Program Implementation

Economic activity in the state

4.19 Kerala is a relatively small state situated in Southern India with an area of 38,863 sq.km and a population of 3.61 crore people. The share of primary sector in the state's economy has declined over the years – from 15.2% in FY12 to 8.5% in FY24, but it is a leading producer of cash crops such as coconut, rubber, coffee, pepper, cashew, and tea. Other key agricultural products include spices such as cardamom, vanilla, nutmeg, and cinnamon.[30]

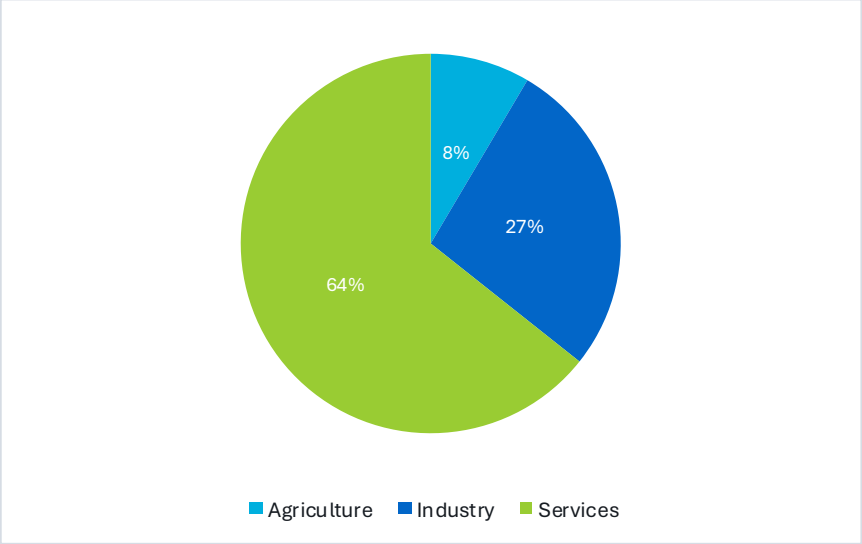
4.20 Kerela is a relatively high-income state with per capita GSDP 62% higher than the national average as per 2024 estimates[5]. Services is a dominant contributor to the State's incomes, with over 60% contribution to GSDP. Leading contributors to this sector include tourism, Ayurveda and medicinal services, pilgrimage, IT services, financial services, and education.

4.21 Major containerised traffic is routed through Cochin port and dispatched to final destinations via road. Cochin port handled total traffic of 36 million tonnes in FY24 (Table 2.3) Tea, coffee, cashew kernels, seafood, coir products and spices are major commodities exported via the port. The port also handles major import items for the State such as fertilisers, raw materials, iron and steel products, machinery and petroleum, oil and lubricants (POL).

4.22 In terms of sectoral contribution, the services sector is the biggest contributor (64%), followed by secondary (27%) and primary sector (8%), as of FY24[5]

[30] Economic Review 2024 - Government of Kerala

Figure 4-8: Sectoral contribution to Kerala's GSDP in FY24



Source: Steer Analysis of MoSPI data

4.23 The official historical GDP and GSDP data for India are released by the Steer Analysis of MoSPI data. The GDP forecasts for India are available from various reliable sources such as Oxford Economics and Consensus Economics[31], but state-specific GSDP forecasts are not published by any such sources. To derive state GSDP forecasts, we rely on past trends of the relationship between GDP and GSDP, and develop GSDP forecasts as a function of our assumed GDP forecasts[32].

4.24 For any indicator to be used as a growth driver to forecast traffic, a reliable source of historical and forecast data availability for that indicator is the key requirement. Of the key socioeconomic indicators discussed above, GDP was assessed to be the only growth driver for which reliable data is available both in terms of historical and forecast data. Therefore, to forecast traffic, we use GDP/GSDP as our key growth drivers.

Forecasts for growth drivers

4.25 Following the discussion in Chapter 4 on the nature of economic activity in the state of Kerala, in this section, we describe the assumptions in relation to forecasts of the key macro-economic drivers of traffic growth.

4.26 We have based our forecast of the GSDP for Kerala based on the forecasts of the GDP of India as provided by the Client.

National GDP

4.27 After the last period of economic slowdown in FY11-12, the country experienced an economic downturn again in late FY19 with FY20 having reported a GDP growth of 4% (relative to an average growth rate of 7% per year between FY13 and FY19). India's GDP

[31] Consensus Economics - Economic Forecasts and Indicators

[32] Assuming that the historical long-term relationship between GSDP and GDP sustains over the short-term, we project future growth in GSDP as a function of our GDP growth forecast. We taper the relationship of GSDP growth to converge to GDP growth gradually over the long-term.

growth declined as domestic investment and consumption demand were already under stress because of the liquidity crunch before Covid-19. Other factors that contributed to the economic slowdown included reduced growth rates in automobile sales and production, liquidity crunch in credit markets and rising number of Non-Performing Assets (NPAs) within the banking sector, as well as lower manufacturing production and lower rural consumption.[33]

4.28 The Covid-19 outbreak had a significant impact on the Indian economy during the first two quarters of FY21 as government mandated lockdowns across the country effectively stalled economic activity and growth. The growth momentum eventually picked up in Q3 of FY21, with a sharp rebound in the economy in FY22 (GDP recorded 9.7% growth over FY21) and has since observed a consistent growth of 7.6% in FY23 and 9.2% in FY24, before showing signs of slowdown again in FY25 (a 6.5% growth rate, as per the SAE) due to several domestic and external factors.

4.29 Figure 4-8 below shows Client-provided GDP projections for India. The forecast provided projects the Indian GDP to grow at 6.5% between FY25-FY27[34] and gradually tapering down to 5.8% by FY38. The GDP growth forecast is broadly in line with other independent forecasts available from reliable sources such as IMF, World Bank and RBI[35] in the medium term.

4.30 We have assumed the GSDP growth of Kerala to continue to stay below the national GDP throughout the concession period. There has been increasing government expenditure and push towards infrastructure development in southern India. This is expected to push the economy of the region and lead Tamil Nadu to grow faster than the national growth in the next 15 years.

5 FY26 Base year AADT and Traffic growth Analysis

Introduction

5.1 In this section, we present our approach, assumptions, and results for base (or background) traffic growth for each vehicle category on the Asset.

5.2 Traffic growth is commonly related to a variety of macro-economic and industry- or commodity-specific factors (hereafter referred to as 'traffic growth drivers'). These growth drivers are typically identified from the results of the OD data analysis and the site visits that help us appreciate the nature of traffic movement – 'what' travels 'where' and 'why'.

5.3 To understand the historical traffic trends in relation to these growth drivers, we carry out regression analyses to determine the historical relationship between each traffic belonging to each major vehicle category and its macroeconomic growth driver at each toll plaza. The dynamics of traffic demand is the dependent variable while the dynamics of one or more identified growth drivers are the independent or explanatory variables. Typically, passenger and light commercial vehicles like Cars, Buses, LCVs and 2-axle trucks grow in line with the GSDP of the state where the toll road is located. Heavy vehicle traffic like 3-axle trucks and MAVs grow in line with the national GDP. This is because most light vehicles tend to travel shorter distances within the state, whereas a significant proportion of heavy vehicles carry commodities for long-distances across the country. These commodities also tend to be part of industry ecosystems whose demand-supply relationships are scattered across the country and therefore relate more with GDP growth.

FY26 Base year AADT estimates

5.4 The base year is the year on which long-term background forecast growth rates are applied to derive year-wise average annual daily traffic (AADT) estimates for forecast years. This is therefore an important aspect of our forecasting approach as traffic and ultimately revenue forecasts for future years are built on top of the base year traffic estimate. We have used FY26 as the base year for AADT estimates for the forecast years.

5.5 To establish the base year (FY26) traffic position, we utilised information from various sources – including from the Client and our context knowledge, to assess a reasonable demand on the corridor.

Methodology

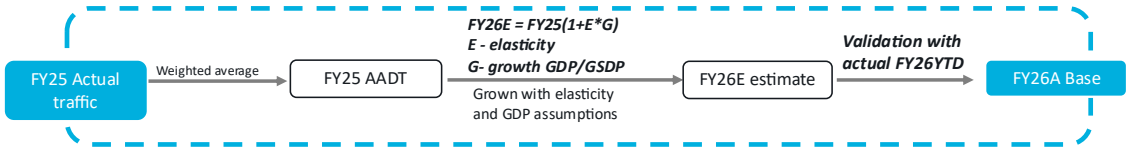
5.6 The base traffic for FY26 has been estimated utilizing the actual 12 months of FY25. The weighted average of the actual FY25 traffic (April to March) was taken to arrive at annual

FY25 AADT. Using elasticity-based growth assumptions GSDP or GDP we arrived at FY26E.

5.7 The monthly profile of the FY26E AADT was then compared to the actual traffic observed in the 6 months (Apr to Sep) of FY26. The adopted AADT FY26A is arrived at by making necessary adjustments to FY26E to reflect the outturn traffic in FY26YTD (adjusted for seasonality).

5.8 The methodology is represented using the below schematic:

Figure 5-1: FY25 Base Estimation methodology



Source: Steer Analysis

Seasonality Correction factors

5.9 Traffic on any Asset varies on a month-on-month level. Such variations maybe due to monsoons (typically Jul to Sept) or due to festivals in the region. For e.g. It is observed that typically the truck traffic during the first half of the financial year (April-September) is generally lower than the annual average, mainly because of peak summer season followed by monsoons affecting the freight movement patterns in large parts of the country in the July-September period. In addition to these there may be other seasonal variations specific to the Asset.

5.10 In order to normalise for these variations across the year to provide an AADT estimate, Seasonality Correction Factors (SCF) are used. SCFs are estimated to convert the monthly traffic numbers to an AADT level while accounting for seasonal variation due to local/national festivals, weather changes and/or temporary external impacts. These are typically estimated using historical data for each plaza and vehicle category over multiple years. An SCF >1 means that the traffic for the month is lower than the annual average and vice-versa.

5.11 To achieve this, we studied the seasonality between monthly average daily traffic (MADT) – We have analysed the seasonality trends between monthly average daily traffic (MADT) and AADT for data during the historical years of tolling excluding the years that were impacted by specific events. This averaged seasonality trend is then applied to the monthly traffic to obtain AADT as mentioned in the previous sections.

5.12 Table 5.1 below presents the average of the FY23 and FY25 SCFs, used to arrive at the FY26 base estimates (only FY23 SCFs were used for LCV and Bus categories).

Table 5.1: Seasonality correction factors for TP1 Pampampallam

Vehicle	Apr	May	Jun	Jul	Aug	Sep	Oct	Nov	Dec	Jan	Feb	Mar
CJV	1.03	0.94	1.04	1.08	1.05	0.97	1.00	1.02	0.87	0.92	1.04	1.11
LCV	0.98	1.05	1.04	1.07	0.99	1.02	1.07	0.99	0.97	0.98	0.94	0.92

Source: Steer analysis of Client historical TMS data

Adopted FY26 base estimates

5.13 Based on the above methodology and inputs, the adopted base for toll plaza is shown in Table 5.2 below:

Table 5.2: Adopted base AADT for FY26

	FY25	FY26YTD	FY26A	FY26A vs FY25
CJV	14,974	16,128	16,324	9.0%
LCV	1,954	2,173	2,181	11.6%
Bus	1,127	1,041	1,095	(2.8%)
2A	1,536	1,539	1,552	1.0%
3A/MAV	3,312	3,122	3,214	(2.9%)
OSV	3	2	2	
Total	**22,905**	**24,005**	**24,368**	**6.4%**
PCUs	**37,320**	**37,898**	**38,626**	**3.4%**

Source: Steer analysis: FY26YTD includes Apr-25 to Sep-25; FY26A is the adopted base traffic

5.14 From Table 5.2 above we see that FY26A is estimated to observe a 3.4% growth from the actual FY25 traffic on PCU terms. This growth is driven by a strong turnout of CJVs and LCVs on account of growing tourism and local activity near the Asset.

5.15 Several factors likely contributed to the lower-than-expected performance of 3A+MAVs on the Asset, including restricted construction material supply from Tamil Nadu following new regulations on illegal mining[36]; the development of new mining sites in Palakkad catering to Kerala's demand; and a decline in petroleum product shipments from Kerala to Tamil Nadu and other regions.

Estimation of background elasticities

5.16 Elasticities, in the case of traffic growth are the relationships between traffic and growth drivers. Multiplied with forecasts of growth drivers like GDP or GSDP, they provide the forecasts of background traffic growth rates.

5.17 As the TMS data did not provide a breakup between the individual vehicle categories for the toll categories 3A/MAV, we have used recent TVC 2023 split. Typically, we rely on national GDP as a growth driver for 3A/MAV trucks, given their characteristics of travelling across multiple states and carrying varied types of commodities which contribute to national GDP.

[36] ED in letter to TN DGP says sand mining happening in massive scale, demands action

[36] Keralites account for 69% of domestic tourist footfall in State - The Hindu

5.18 Table 5.3 below presents the growth drivers identified to model the background traffic growth rates.

Table 5.3: Identified growth drivers to model traffic growth

Vehicle type	GSDP Kerala	GSDP Tamil Nadu
Car	50%	50%
LCV	100%	
Bus	50%	50%
2A	100%	
3A	100%	
MAV	100%	

Source: Steer analysis of Client data

5.19 To understand the traffic growth on the Asset, we undertook regression analysis from FY16-24 for all vehicles categories of the plazas.

5.20 This Asset has shown variable growth trends every year (for the reasons described in Chapter 3), due to which econometric regression analysis did not provide robust enough results of elasticities to growth drivers. We have therefore, analysed trends of each vehicle category and compared with the growth of key drivers, as described below.

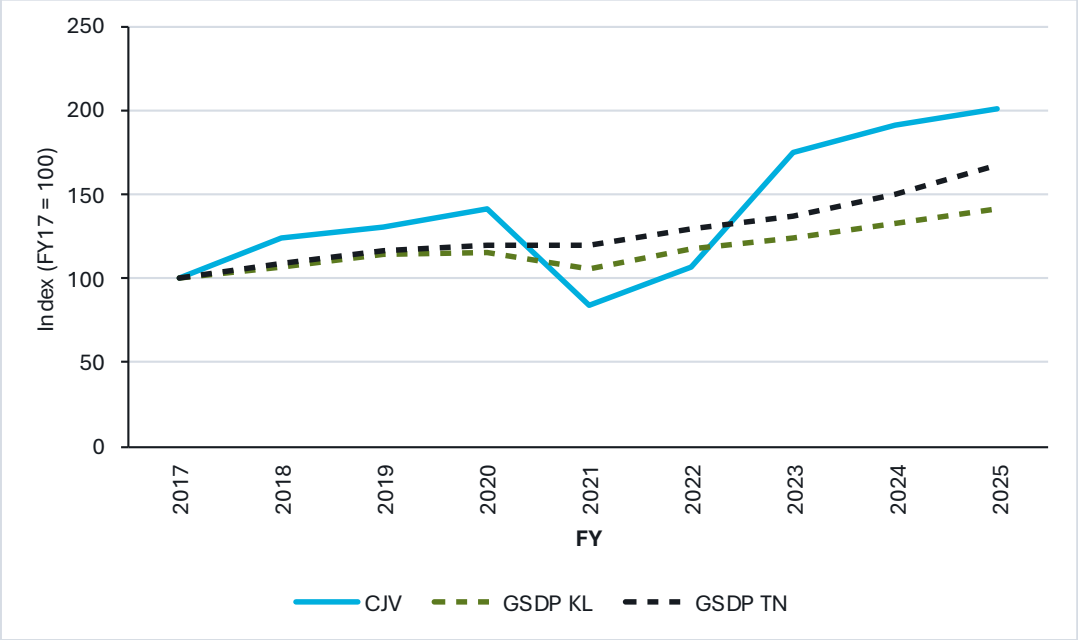
CJV

5.21 As can be seen from Figure 5-2 below, cars have shown strong growth on this Asset except in FY21 and FY22 with 9% car increase in FY24 from FY23 levels 7% increase in FY25YTD. As seen from the OD survey results from the analysis conducted in 2024, car traffic on the Asset is driven by local trips between the urban centres of Walayar, Coimbatore, Thrissur, and other areas in Palakkad district, as well as high contribution of tourism, work and educational trips.

5.22 Generally, we would expect that in fast-growing economies with relatively low car ownership levels, car traffic growth rates are often in line with or slightly higher than growth in GSDP/GDP (i.e., suggesting elasticities at or just above 1.0). Further, there is an expected increase in car ownership proportion of overall population as the economy grows. In this case with proximity from Tamil Nadu state and high share of Tamil Nadu trips, the Asset Car growth is dependent on both Kerela and Tamil Nadu.

5.23 Historically, the CJV traffic on the Asset had shown strong growth of ~14% in the FY16-FY20 period; the growth in this category slightly moderated in the recent years and saw a degrowth of 13% between FY20 and FY22. However, it has bounced back to achieve a 33% CAGR from FY22 to FY24, mainly driven by a significant post-pandemic ramp up in traffic in FY23.

Figure 5-2: Relationship between CJV traffic and GSDP of Kerala & Tamil Nadu



Source: Steer analysis of Client TMS data and publicly available GSDP data

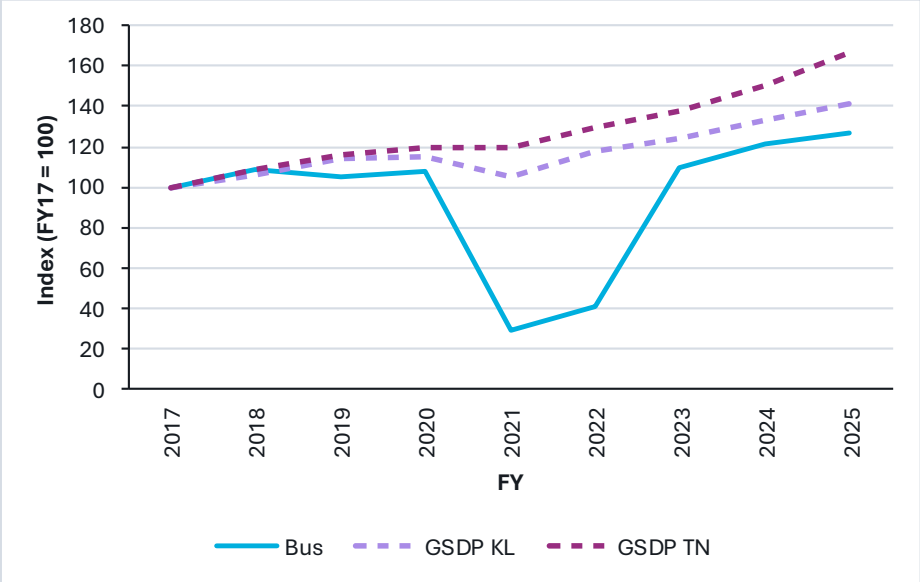
5.24 Nevertheless, the relationship to GSDP suggests that during more stable years post pandemic, CJVs have grown with a background traffic growth elasticity of 1.1. Considering the tourism-oriented nature of passenger traffic on the Asset, we have assumed a forecast background elasticity of 1.2 with the GSDPs of Kerala and Tamil Nadu.

Bus

5.25 Bus growth tends to be largely supply-driven in many parts of the country, with new buses being bought and deployed by the government at intervals of time. Based on our experience across the country, buses on inter-urban and tourism corridors show elasticities of 0.20 to 0.50 with respect to the GSDP.

5.26 The bus traffic trend on this Asset showed a modest growth rate of 3.8% from FY16-20. However, during Covid bus traffic was significantly impacted given prolonged lockdown in the state impacting tourism and leisure-bound bus traffic which recovered back to pre-covid levels in FY23. We expect the buses on this Asset to have an overall stable low growth in the forecast, with a relationship lower than benchmark states, to reflect this slower growth observed in recent years, and have used an elasticity of 0.4 to GSDP

Figure 5-3: Relationship between Bus traffic with GSDP of Kerala & Tamil Nadu



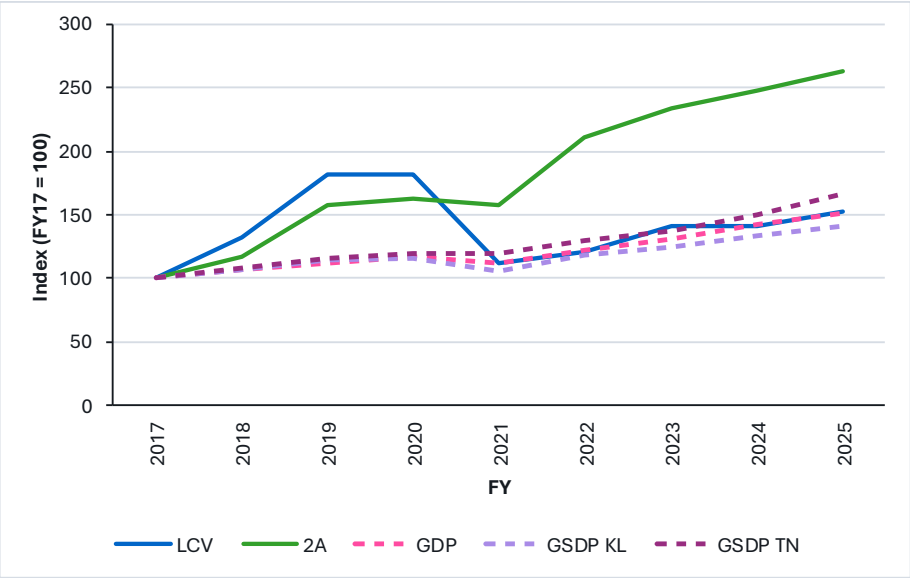
Source: Steer analysis of Client TMS data and publicly available GDP and GSDP data

LCV, 2A

5.27 Despite similar traffic characteristics regarding commodities and distance (as detailed above, in the Key findings of the origin-destination analysis), 2A and LCV vehicle segments showed divergent growth between FY18 and FY24. Notably, 2A trucks experienced a substantial 13.4% increase, while LCVs grew by a comparatively lower 1.1%. In addition to the typical influence of GDP and consumption demand-led growth, 2As have benefitted from the shifting preference of truckers from 3As - as a result of better unit economics – which has been observed on Assets across the country.

5.28 Therefore, looking forward, we have assumed lower elasticity of 0.40 for LCV and a higher elasticity of 0.80 for 2A with respect to GDP India, which is within the range of benchmarks observed in other parts of the country.

Figure 5-4: Relationship between LCV and 2A with GSDP of Kerala



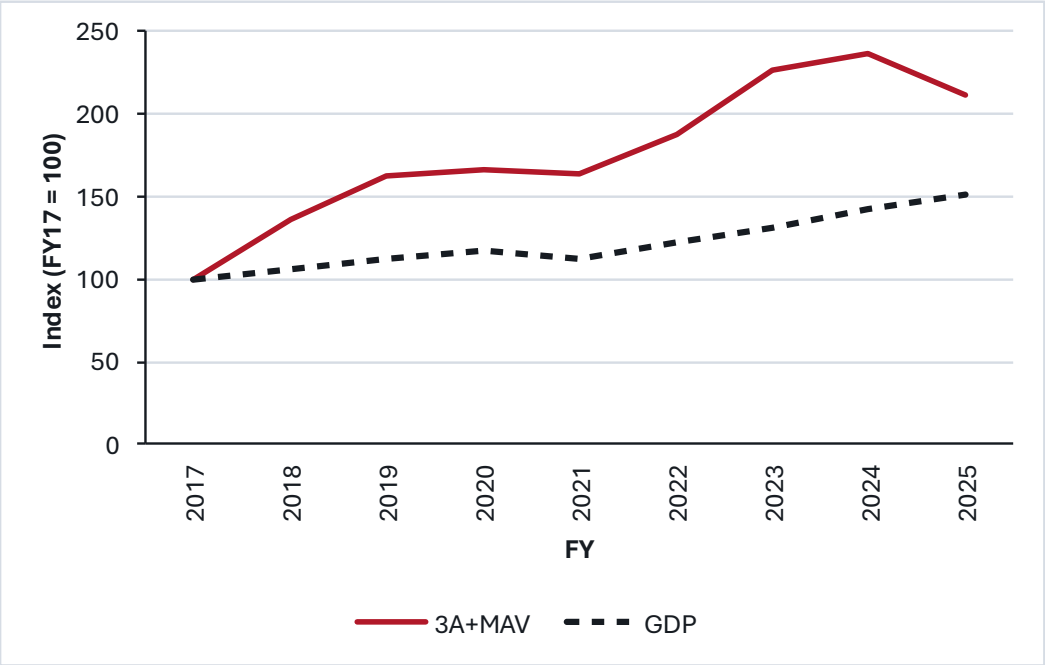
Source: Steer analysis of Client TMS data and publicly available GDP and GSDP data

3A/MAV Trucks

5.29 In general, across the country, we have observed that 3As grow slower than MAVs due to a shift between these categories, as there is an increasing preference observed for MAVs among truck operators (instead of 3As). This is because MAVs have higher load capacity which generate economies of scale and therefore lower transportation costs for high volume goods relative to 3A trucks. It is however unlikely that 3A trucks will disappear from the market completely due to this observed trend as certain commodities or movements are still (and will continue to remain) best served by 3As.

5.30 Based on these trends, we have assumed elasticities of 0.20 and 0.90 for 3A and MAV trucks respectively, with respect to GDP India, which are in line with benchmarks observed across the country.

Figure 5-5: Relationship between 3A + MAV and GDP India



Source: Steer analysis of Client TMS data and publicly available GSDP data

Forecasts for background elasticities

5.31 Table 5.4 below presents a summary of the results of the regression analysis carried out on historical toll plaza data and the macroeconomic drivers (GDP/GDSP), along with the assumed forecast elasticities for forecasting our background traffic growth.

5.32 3A category has largely remained flat in the FY22-26 YTD period. The reduction in 3A volume is partly a result of the declining demand for 3A vehicles itself, which are being replaced by 2A and MAV trucks. MAVs offer higher tonnage capacity making them more cost-effective for transporters. While the increase in 2A volume reflects the growing preference for these vehicles due to favourable changes in the legal permissible loads for 2As and their suitability for e-commerce-related freight, particularly high-value, low-volume goods over medium to long distances. This is consistent with our discussion with

various transporters and OEMs across the country who are favouring 2A and 5A vehicles for commodity movement due to better unit economics.

5.33 As a consequence of these evolving axle preferences, it has been assumed that the relationship between 3As and GDP will be relatively muted, whereas 2As and MAVs are expected to grow more closely in line with the country's GDP.

Table 5.4: Adopted forecast elasticities for background growth

Vehicle type	Growth driver	Historical Derived Elasticity	Period Considered	Forecast	
				Adopted Elasticity	Evolution of elasticity
Car	GSDP Kerala	0.74	FY17-24	1.20	reduced to 1.10 from FY30 and 1.00 from FY35 onwards
	GSDP Tamil Nadu		FY17-24		
LCV	GSDP Kerala	3.46	FY17-24	0.4	No change
Bus	GSDP Kerala	2.16	FY17-24	0.4	No change
	GSDP Tamil Nadu		FY17-24		
2A	GDP India	N/A*	FY17-24	0.8	No change
3A+MAV#	GDP India	3.06	FY17-24	0.2 for 3A & 0.9 for MAV	No change

6 Forecasts: Network overlays and forecasts

Introduction

6.1 Following the discussion on our forecast of base growth rates in the previous chapter, this chapter first covers the forecasting assumptions around base year AADT and potential network impacts on traffic growth on the Asset. Thereafter, we present our assumptions around toll segmentations, trip factors and evolution of toll rates for the concession period which are used to forecast revenues as derived from forecast traffic. In the final section, this chapter summarises traffic growth rates for the forecast years.

Analysis of potential network/developmental impacts

6.2 The section below details the impacts which we believe would affect traffic on the Asset during the concession period. As discussed earlier in Chapter 2, to assess the impacts on the Asset, whether positive or negative, we have studied developments (alternate roads, feeder roads and regulatory) in the surrounding road network.

Construction Recovery

6.3 Throughout FY24 and FY25, the construction activities on the expansion of road network in the southern parts of Kerala have been negatively impacted due to unavailability of materials like aggregate and sand, since these regions source their construction material from Tamil Nadu. Changes in the quarrying landscape of the region in Tamil Nadu in Q2 and Q3 of FY24, which continued in FY25 and FY26, also affected the movement of construction materials on the project road.

6.4 We have therefore assumed a recovery profile in construction related traffic as presented in Table 6.1 below. This recovery in construction activity is expected to largely affect the 3A and MAV categories which have historically carried construction related goods:

Table 6.1: Impact of Recovery in Construction for TP1

Vehicle category	FY27	FY28	FY29 Onwards
Staging	*20%*	*80%*	*100%*
3A	0.4%	1.4%	1.8%
MAV	1.0%	4.0%	5.0%

Source: Steer analysis

Revenue forecasting assumptions

6.5 To forecast the revenues for a forecast year, the traffic forecast for each vehicle type is converted into tickets sold, which is then multiplied with the corresponding toll rate. While toll segmentation provides the breakup of trips paying each ticket type, trip factors provide the conversion factor to convert from traffic (trips) to tickets sold. This section discusses assumptions related to toll segmentation, trip factors and toll rates for the forecast period.

Toll evolution

6.6 Based on the concession agreement and the gazetted toll notification, we understand that base toll rates increase every year (revision month is April) based on WPI-linked inflation. These are rounded up to the nearest five to estimate the final toll rate charged to users.

6.7 We have used actual toll rates from the FY25 and FY26 toll notifications and FY27 WPI to validate the modelling of future toll evolution. Increase in WPI was calculated based on the Client's WPI forecasts, as shown Table 6.2 below. The upward trend in inflation is expected to continue in the medium term, before gradually tapering to 4.1% in the long term.

Table 6.2: WPI growth forecast assumptions

Financial year	WPI growth (%)
FY26	2.57%
FY27	2.4%
FY28	5.0%
FY29	5.1%
FY30	4.9%
FY31	4.4%
FY32 onwards	4.1%

Source: Client inputs used for WPI FY27 onwards

Toll segmentation

6.8 The Ministry of Road Transport & Highways has finalized a compensation formula for existing toll concessionaires to offset revenue loss from the Annual Pass scheme for non-commercial vehicles. To access the document, refer to the following **link**.

6.9 Across multiple assets, the number of passes sold has observed to be rising on a day-to-day basis, indicating an early adoption among frequent users since its introduction on 15th August 2025 till 30th September 2025, and a corresponding decline in other ticket categories mainly in the single and return categories. The evolution of proportion of users using the annual pass up to September 2025 is presented below:

	15th to 31st Aug	1st to 15th Sept	16th to 30th Sept
%CJV using Annual pass	6.0%	8.5%	10.2%

6.10 CJV Segmentation for FY26 has been developed using the pre annual pass segmentation till 14th August 2025, and daily Annual Pass transaction data from 15th August 2025 till 30th September 2025. Post September 2025, a gradual ramp up is assumed such that they form a large portion of the CJV trips by the end of FY26. This corresponds to a reduction in a proportionate decrease in single and return trips. For FY27 and beyond, we have assumed the share of annual pass trips to be in line with that observed at the end of March 2026, by when we believe the distribution of ticket categories in CJVs should stabilise.

6.11 In FY26, the share of CJVs using the Annual Pass is projected at **9%** (on an annual basis) with a March 2026 estimate of around 19%, which from FY27, expected to stabilize at March'26 levels.

6.12 For other vehicle categories we have analysed the historical TMS data split by ticket categories, to understand trends, as shown in Chapter 3. For the traffic and revenue forecast, FY26YTD (Apr- Aug) as discussed in the earlier sections, can be considered a normal period.

6.13 Table below shows the toll segmentation assumed for the period of forecast.

Table 6.3: Forecast toll segmentation from FY26 onwards

Ticket type	CJV (FY26)	CJV (from FY27)	Mini LCV	Bus	LCV	2A	3A/MAV	OSV
Single	34%	30%	38%	43%	35%	57%	61%	47%
Return	54%	47%	59%	29%	55%	43%	39%	53%
Monthly	2%	2%	2%	27%	9%	-	-	-
Annual Pass	9%	19%	-	-	-	-	-	-
Local personal	-	-	-	-	-	-	-	-
Violations	0%	0%	0%	0%	0%	0%	0%	-
Exemptions	2%	2%	2%	0%	0%	0%	0%	0%

Source: Steer analysis of Client TMS data; ticket segmentation for all vehicle categories other than CJVs are from FY26 onwards

6.14 The Annual pass compensation is separately calculated using the formula prescribed by NHAI in the same circular. Following Table 6.6 presents the Annual pass compensation computed for the toll plaza.

Table 6.4: Annual pass compensation for CJVs (in Crore)

Toll Plaza	FY26	FY27	FY30	FY35	FY38
Pampampallam	3.0	7.8	10.6	18.6	26.1

Source: Steer Analysis

Trip factors

6.15 Trip factors are used to calculate the revenue for the trips made on passes such as return, local personal, monthly passes. The trip factors assumed are based on the latest FY25 data available and listed in Table 6.5 below:

Table 6.5: Trip factors for the forecast years

Ticket Category	CJV/Mini LCV	LCV	Bus	2A	3A/MAV	OSV
Single	1	1	1	1	1	1
Return	2	2	2	2	2	2
Monthly	4,357	48	48	227	34	45
Local Commercial	1	1	1	1	1	1
Local Personal	18	1	103	1	1	1
Exemptions	1	1	1	1	1	1

Source: Steer analysis of Client TMS data

Revenue reconciliation

6.16 As part of validating the data provided by the Client, as well as our assumptions around toll calculations, we have reconciled the actual reported revenue on a daily level for the Asset against our modelled revenue.

6.17 To reconcile our modelled revenue with reported revenue, we used the FY26YTD (April to September) toll segmentation and MADT of the month, comparing it with the reported revenue for that month. The Steer revenue calculations have been built up from monthly raw traffic data files, containing monthly data and ticket type information; and the toll notifications – all shared by the client.

6.18 As shown in Table 6.6 below, depicts the difference between modelled revenue and the reported revenue is within 1%, which gives us confidence in the historical traffic and revenue data provided by the Client as well as our forecasting assumptions around the toll escalation mechanism. This analysis also validates our segmentation and trip factor assumptions used for forecasting.

Table 6.6: FY26YTD AADC (April – September) Revenue reconciliation summary (INR lakhs)

Vehicle Category	Modelled	Actual	Difference (%) Modelled vs Actual
	FY26YTD	FY26YTD	
Total	30.65	30.60	**(0.2%)**

Source: Steer comparison between modelled and reported revenue for FY26YTD (April to September)

Traffic and Revenue forecasts

6.19 Based on the traffic and revenue-related forecast assumptions discussed above, we have modelled traffic and revenue forecasts for the Asset over its full concession period. Table 6.7 below presents the AADT/PCU and revenue forecast growth rates and CAGRs on this Asset. Further, Appendix C (Detailed forecasts) presents the AADT and revenues for the forecast period.

Table 6.7: Forecast (background plus impacts) AADT for TP1 Pampampallam

Vehicle Type	FY26	FY27	FY30	FY35	FY38
CJV	14,454	15,566	19,115	26,390	31,846

Upside and Downside cases

Upside and Downside scenario assumptions

6.21 We have developed our base case scenario considering a balanced view on the risks associated with input assumptions around GDP growth and traffic growth elasticities. There is always a risk that the outturn values of these inputs will vary as compared to the assumptions taken due to exogenous impacts, e.g. GDP growth could be influenced both positively and negatively by the impact of monsoons, export-import balances, political changes etc.

6.22 Similarly, traffic growth elasticities could be influenced by increased efficiencies achieved by technology, large shifts in commodity prices globally, changes in local manufacturing practices. However, at this stage we consider that the base case represents a central case scenario given the risks of variation of input assumptions.

6.23 Further, network developments are highly dependent on governmental directions, policies, legal and financial measure which might result in early or delayed completion of developments. Therefore, we have included an Upside (optimistic) and a Downside

(pessimistic) case. However, at this stage, we consider that the base case represents a central case scenario given the risks of variation of input assumptions

6.24 To account for the possible variations in the growth drivers, we are also presenting an Upside (optimistic) and a Downside (pessimistic) scenario. These scenarios are defined by the following variations from the base assumptions:

Table 6.11: Summary of Macro-economic Assumptions for upside and downside cases

Input	Upside	Downside
Macro Assumptions		
GDP/GSDP	+1% every year	-1% every year
WPI	+1% every year	-1% every year
Elasticities	+ 10%	- 10%

Source: Steer analysis

6.25 Further, network developments are highly dependent on governmental directions, policies, legal and financial measure which might result in early or delayed completion of developments. Therefore, we have included an Upside (optimistic) and a Downside (pessimistic) case. However, at this stage, we consider that the base case represents a central case scenario given the risks of variation of input assumptions.

Impacts-Upside Case

6.26 The upside case impacts included in forecasts are summarised in below.

Table 6.12: Summary of impacts on the Assets

Development	Year of Impact	Change in impact w.r.t base case	Magnitude of impact TP1 Pampampallam
Construction Recovery	FY27*	Same as base case	3A: 1.8% MAV: 5.0%

Source: Steer analysis of OD data; *same timeline as base scenario

Impacts-Downside Case

6.27 The downside case impacts included in forecasts are summarised in below.

Table 6.13: Summary of impacts on the Assets

Development	Year of impact	Change in impact w.r.t base case	Magnitude of impact TP1 Pampampallam
Construction Recovery	FY27*	-100% of the base case	3A: 0% MAV: 0%

Source: Steer analysis of OD data; *same timeline as base scenario

Upside and Downside Case Forecasts

6.28 Table 6.14 below presents the difference between the Upside and Downside Case forecasts relative to the Base Case forecasts in FY38 (i.e., the concession end year) for the Asset. Figure 6-2 and Figure 6-3 below plot the Upside and Downside Case forecasts

relative to the Base Case forecasts for the Asset over its full concession period (FY26-FY38).

Table 6.14: Percentage Difference Upside and Downside Case Forecasts vs. Base Case Forecasts – FY38

Case	Measure	TP Pampampallam
Upside Case	Traffic (PCU)	18.9%
Downside Case		(15.3%)

Summary outlook

6.29 Kerala is largely a consumption driven economy, and the state has significant cement and other construction material demand carried in commercial vehicles due to large scale construction activities undertaken in the State. Given the presence of Cochin international port, and the BPCL refinery at Kochi, POL items move between Coimbatore (Tamil Nadu) and Kochi (Kerala) as well.

6.30 The state's per capita income has historically remained higher than national per capita income levels. As of FY24, this ratio stood at 1.6 times the national benchmark[1], highlighting Kerala's growth story as largely driven by the services sector, (that contributed to 64% of state GSVA in FY24). The tertiary sector's high contribution consists primarily of tourism- and pilgrimage-related traffic, as well as the rapidly growing financial services sector. While the sub-sector of hotels and restaurants has grown at a CAGR of 6.5% between FY12 and FY24, the corresponding growth in the financial services sector has been 6.8%.

6.31 Overall, passenger traffic on the Asset is primarily driven by tourism and leisure travel from nearby states such as Tamil Nadu and Karnataka. After being significantly impacted during FY20 and FY21 due Covid-19 lockdowns across the state and country, passenger traffic rebounded strongly post reopening of the state after easing of Covid-19 restrictions, with tourist arrivals registered at over 2.2 crores in 2024.[4] Bus traffic also returned along with cars during that time, further adding to overall traffic recovery on the Asset post easing of the pandemic-related restrictions.

6.32 Commercial traffic observed on the Asset is driven by demand for construction material in various parts of Kerala where materials are sourced from neighbouring Tamil Nadu. This movement is also related to POL products moving out of Kochi and into Tamil Nadu and other parts of the country further north and east of the Asset.

6.33 The demand for construction materials has remained strong due to several infrastructure projects that have been taken up in the vicinity of the Asset – the widening of NH66[6], construction of the Lulu Mall in Kottayam[7] and the construction of Government Medical College, Idukki[8]

6.34 Overall, we retain a positive outlook for the Asset as it serves as the primary route for tourism-related travel in Kerela and Tamil Nadu. The positive outlook for the underlying growth drivers on the corridor also include construction activity within the state, which we expect to remain strong over the medium term as major construction activities and infrastructure projects in the state will continue to keep demand buoyant. Finally, the continued focus of the state government on harnessing Kerala's tourism potential also bode well for the Asset and will both directly and indirectly allow for sustained growth on the Asset – both for passenger vehicles, as well as construction related truck volumes

Our findings and estimates in this report are based on our understanding from the site visit, analysis of primary data available both from surveys and the toll management system (both historical and current), macroeconomic assumptions prescribed by Client, feedback from Client meetings and secondary publicly available data. There can be both positive and negative risks associated with assumptions and the forecasts using them as summarised below

Appendices

A Top 10 OD Pairs

A.1 Further to the OD analysis presented in Chapter 3 this appendix presents the top 10 OD pairs at each toll plaza. Please see this data for both CJVs and Bus and, 3 Axles and MAVs combined below.

Table A.1: Top 10 OD pair shares at TP1 Pampampallam: CJVs and Buses

	OD Pair	Share
1.	Palakkad-Coimbatore	33%
2.	Palakkad-walayar	7%
3.	Thrissur-Coimbatore	7%
4.	Ernakulam-Coimbatore	4%

6.	Bengaluru-COCHIN	3%
7.	Palakkad-walayar	3%
8.	Palakkad-Bengaluru	2%
9.	Salem-COCHIN	2%
10.	Kollam-Coimbatore	2%

B Data collection exercise

B.1 To validate and inform various inputs used in our forecasting, we undertook primary data collection on the Asset. OD survey data was collected on behalf of the Client, TVC surveys were commissioned by Steer with a third party. OD data collection typically involves manual data entry by enumerators based on oral surveys with road users crossing toll plazas. TVC data collection involves video-graphic capture of traffic passing crossing the toll plazas, followed by manual counting.

3 days TVC count

Table B.1: 3-day TVC counts at TP1 Pampampallam

C Detailed forecasts

C.1 Further to the summary of forecasts presented in Chapter 6, this appendix presents detailed forecasts.

Traffic forecasts

C.2 This section presents the detailed traffic forecasts for the forecast period until FY38, year of expected close of the concession. The following two tables show the traffic growth rates and AADT, respectively.

Table C.1: Forecasts for (background + impacts) AADT at TP1 Pampampallam

Vehicle Category	CJV	Mini LCV	LCV	Bus	2A	3A	MAV	Total	PCU
FY26	14,454	1,871	2,181	1,095	1,552	636	2,579	24,368	38,626
FY27	15,566	1,945	2,250	1,131	1,630	646	2,753	25,923	40,911
FY28	16,727	2,022	2,320	1,168	1,712	661	3,138	27,749	44,023
FY29	17,911	2,098	2,390	1,205	1,795	671	3,339	29,412	46,494
FY30	19,115	2,175	2,460	1,242	1,879	679	3,515	31,067	48,891
FY31	20,376	2,254	2,531	1,279	1,965	687	3,697	32,791	51,379
FY32	21,716	2,335	2,604	1,318	2,056	695	3,712	34,437	53,376
FY33	23,194	2,422	2,682	1,359	2,155	703	3,913	36,430	56,219
FY34	24,751	2,511	2,762	1,400	2,258	712	4,124	38,520	59,195
FY35	26,390	2,602	2,844	1,443	2,365	720	4,344	40,712	62,307
FY36	28,117	2,696	2,928	1,486	2,477	729	4,575	43,010	65,565

Disclaimer

This report has been produced for the sole benefit of Cube Highways Pvt. Ltd ("the Client"). The report may only be relied upon by Approved Addressees in accordance with the terms of our engagement letter. This Report (the "Report") is confidential and disclosed only for information purposes, and it may not be relied upon by any party other than the Client or a Party to a Reliance Letter, and Steer: a) makes no warranty, expressed or implied, with respect to the use of any information or methods disclosed in this Report; and b) assumes no liability with respect to the use of any information or methods disclosed in this document. Any such party by its acceptance or use of this Report releases Steer from any liability for direct, indirect, consequential, or special loss or damage whether arising in contract, warranty, express or implied, tort or otherwise.

The Report is based on standard professional efforts, and information available to us at the time the review took place and is subject to time and budget constraints of the Report's scope of work. This Report, information and statements contained herein, are all based on third party data provided to us, or sourced by us, and Steer has not sought to establish the reliability of the data, except as specifically stated in the Report. Steer bears no responsibility for the results of any actions taken based on third-party data.

Certain forward-looking statements in the Report are estimates based on interpretations or assessments of information available at the time of writing. The Report is thus to be viewed as an assessment that is time-relevant, specifically referring to conditions at the time of the review. Steer undertakes no obligation to update the Report for any reason.

While the estimates contained in the Report are not precise forecasts, they do represent, in our view a reasonable expectation of the future, based on information we have been provided with or sourced. However, the estimates necessarily rely on numerous assumptions and judgements, and circumstances may occur over the timeframe of the project that go counter to these assumptions and judgements and that affect the project's realized revenues. Actual events may differ from those assumed, and events are subject to change. Therefore, Steer makes or provides no warranty, whether implied or otherwise, as to the accuracy of forward-looking information presented. Further, it is important to note that forecasts presented represent long term growth profiles; the results for individual time periods may vary from forecasted values.

Traffic Consultant developed the relationships in the models used to produce the forecasts for the projects based on data available through September 2025. This report does not consider variations in traffic performance due to changing macro and force majeure events such (but not limited to) as global wars, economic uncertainty (high inflation, global recession), and changes in the regulatory environment. The situation remains dynamic and is subject to significant change in the short and medium term. In this challenging context, Traffic Consultant has produced base forecasts with a view on a possible scenario for the traffic forecasts. However, it is important to note that this is only one view, and there continues to remain uncertainty as to the short-term, intermediate or prolonged effects of and responses to such macro-economic/force majeure events. As a result, no assurance can be provided by Traffic Consultant that the scenarios and assumptions Traffic Consultant has identified will prove to be accurate. Given the uncertainty inherent in this scenario, Traffic Consultant advises that all readers of the Report consider the Report in the context of their own assessment of the impact of such events.

TO THE FULLEST EXTENT PERMITTED BY APPLICABLE LAW, THE LIABILITY OF THE TRAFFIC CONSULTANT FOR ANY LOSS, DAMAGE, COST OR EXPENSE SUFFERED OR INCURRED BY ALL PERSONS OR ENTITIES AND FOR ALL CLAIMS RESPECTING ITS WORK PERFORMED IN CONNECTION WITH THE ISSUE OR THE REPORTS IS HEREBY LIMITED IN THE AGGREGATE TO THE AMOUNT OF FEES ACTUALLY PAID BY THE CLIENT TO THE TRAFFIC CONSULTANT IN RESPECT OF THE REPORTS AND CONNECTED SERVICES.

TMS	Traffic Management System
TVC	Traffic Volume Count
WADT	Weekly average daily traffic
YTD	Year to Date

1 Introduction

The assignment

1.1 The Cube Highways Fund Advisors Private Limited (the "Client") has commissioned Steer Davies Gleave India Private Limited ("Steer") for a traffic due diligence to be carried out on the Lucknow Raebareli Toll Road (hereafter called "Asset"). This report forms part of the annual fair market valuation (FMV) undertaken as part of the "Transit 10 project". This report presents an update of the traffic and revenue forecasts based on primary surveys undertaken in 2024, actual traffic data available up to September 2025 and latest macro-economic assumptions.

1.2 The Asset Lucknow Raebareli consists of the single toll road section with its own special purpose vehicle (SPV). For the purpose of this report, we hereafter call the toll plaza on the Asset as TP1.

- Lucknow Raebareli Tollway Limited: LRTL: TP1 – Dakhina Sekhpur

1.3 Our scope of work for the traffic and revenue forecasts process includes:

Table 1.1: Scope of work and sources of data

Scope of work	Data source
• Review of historical Traffic Management System (TMS) data, Vendor reports and documents	• Provided by client for the period between Oct'20 and Sept'25
• Historical analysis and forecasts for baseline growth, including; – Background growth, and – Seasonality trends	• Historical toll plaza data provided by Client and benchmarks from Asset in the vicinity wherever long time series historical data was not available
• Validation of revenue reported FY26 YTD	• TMS data provided by the Client • Revenue reconciliation is done using toll plaza traffic and ticket type data to calculate revenue and to reconcile it with toll plaza reported revenue
• Origin Destination (OD) analysis to understand growth drivers: – Zonal influence and Top OD pairs – Commodity distribution – Trip length distribution	• Origin Destination (OD) surveys undertaken by a survey agency appointed by Steer. The surveys were undertaken in the year 2024.
• Analysis of upcoming network improvements and other developments, that may have future impacts on traffic	• Secondary research and Steer's in-house experience of working in the vicinity of the Asset. Impact analysis conducted by Steer based on

Scope of work	Data source
	Generalised Journey Cost spreadsheet-based analysis
• Historical revenue analysis and forecasts for revenue estimation, including: – Toll segmentation and trip factors – Overloading shares	• Calculated from historical data provided by the Client
• Final traffic growth forecasts including baseline growth rates and potential future impacts	• Elasticity based base growth and potential impacts from secondary research, Asset historical traffic performance and Steer's in-house experience of working on toll roads on the corridor
• Toll revenue estimation for the entire concession, including toll evolution	• Toll evolution based latest on toll notification published by National Highway Authority of India (NHAI); and the latest Wholesale Price Index (WPI) trends as shared by the client.

Our approach

1.4 Our approach follows well-established practices for forecasting ongoing traffic growth on an existing/brownfield Asset. The analysis has focused on two sets of issues, namely:

- understanding the traffic that is currently using the Asset; and
- identifying how and why that traffic is likely to change in the future.

1.5 To understand the current traffic on the Asset, we have analysed traffic data from multiple independent sources:

- Client-provided secondary data, including:
  - TMS data starting October 2020 to September 2025.
  - Concession agreement and toll notifications for FY25 and FY26.
  - Previous studies related to traffic and revenue
  - Steer-commissioned OD survey on 26th June 2023 to validate any change in growth drivers and travel patterns as part of earlier commission.
  - Steer-commissioned TVC survey in 2021 as part of earlier commission
- We undertook revenue reconciliation for FY26 YTD, by building up revenue from the traffic reported by each of the toll plazas and subsequently matching them to the reported revenue for FY26YTD using the prevalent toll rates and reported segmentation/toll-frequencies for FY26YTD. This has been a key part of our analysis to validate the segmentation/toll-frequency assumptions, and the Annual Average Daily Traffic (AADT) reported for each of the toll plazas.

1.6 The estimation of future traffic demand on the Asset was undertaken using:

- Estimating the FY26 base year position. The FY25 AADT was calculated using the monthly traffic data for FY25. The FY25 AADT thus computed was then grown with elasticity linked GDP/GSDP growth to arrive at the FY26 expected traffic. To determine the estimates for FY26, the expected FY26 traffic was validated against the six months

of actual FY26 traffic (Apr to Sept) and necessary adjustments were made where required.
- Secondary research to understand plans for new developments and the progress of ongoing developments on the Asset.
- Developing a bespoke growth model for each Asset/plaza/toll class to forecast year-on-year traffic growth from FY26 to the end of concession period.
- Investigating the elasticity of historical traffic growth compared to state (GSDP) and national (GDP) growth. Where historical data is limited, we have benchmarked the Asset against Steer's knowledge base (e.g., similar Asset types in the same state or on the same corridor), to derive appropriate elasticities.
- Applying our elasticities to independent GDP forecasts as provided by the client.
- Identifying and analysing the potential impacts of any relevant changes to the competitive position of each Asset – these include impacts of changes to road network such as expressways and opening of competitive modes of travel.
- Identifying and analysing any other potential impacts on traffic and revenue on each Asset – these include axle load norms, axle shift for heavy goods, FASTag implementation.
- Considering changes in the trends of segmentation over time and making suggestions for changes in exemptions in the future
- Preparing traffic and revenue forecast for the Asset for the complete length of concession. The analysis here includes the specific impacts of network, or other exogenous factors specific to the Asset. We have developed a set of forecasting assumptions for three scenarios: a base case and upside and downside scenarios.

Contents of this report

The report has been divided into the following chapters:

- Chapter 1 introduces the methodology and approach to undertake the traffic and revenue due diligence;
- Chapter 2 describes the key characteristics of the Asset and its surrounding road network, primarily based on site visits;
- Chapter 3 summarises the current and historical traffic on the Asset, including results from the TMS, TVC and OD analysis;
- Chapter 4 presents the socio-economic context of the corridor and the region/state containing the Asset, along with our approach and results on estimating background traffic demand growth; and
- Chapter 5 presents our baseline year forecast and summarises our results on estimating background traffic demand growth
- Chapter 6 summarises our assessment of network impacts and presents concession traffic and revenue forecasts for the Asset along with the assumptions for upside and downside case

2 The Asset

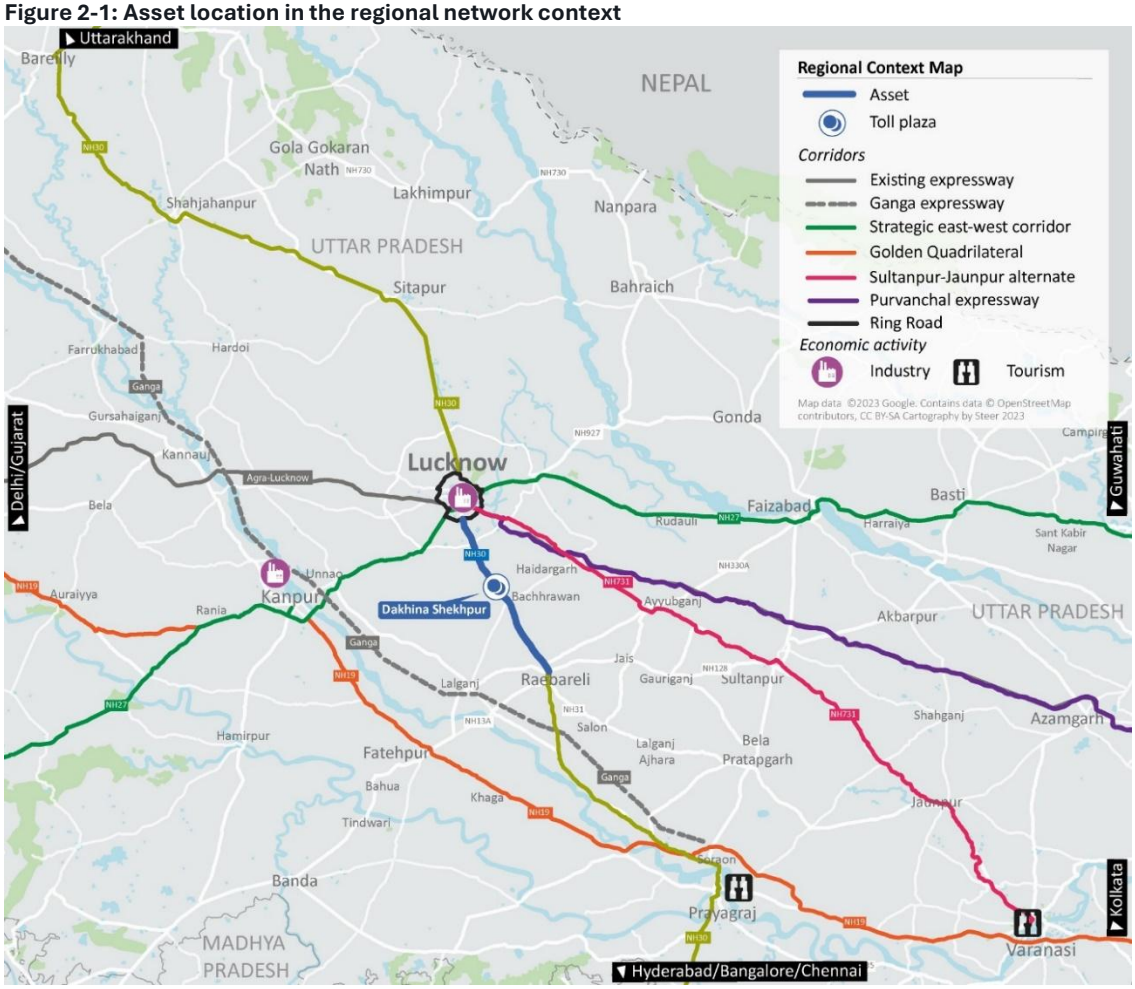
Introduction

2.1 This chapter provides a description of the Asset, based on both primary data (from site visits), and our understanding of the region and network surrounding the Asset. It covers the strategic network context, followed by key economic activities and network developments around the Asset.

Strategic network

2.2 The Asset is situated in the state of Uttar Pradesh, connecting the state capital Lucknow to Raebareli in the south-central part of the state. The following figure shows the regional road network in which the Asset is located.

Figure 2-1: Asset location in the regional network context



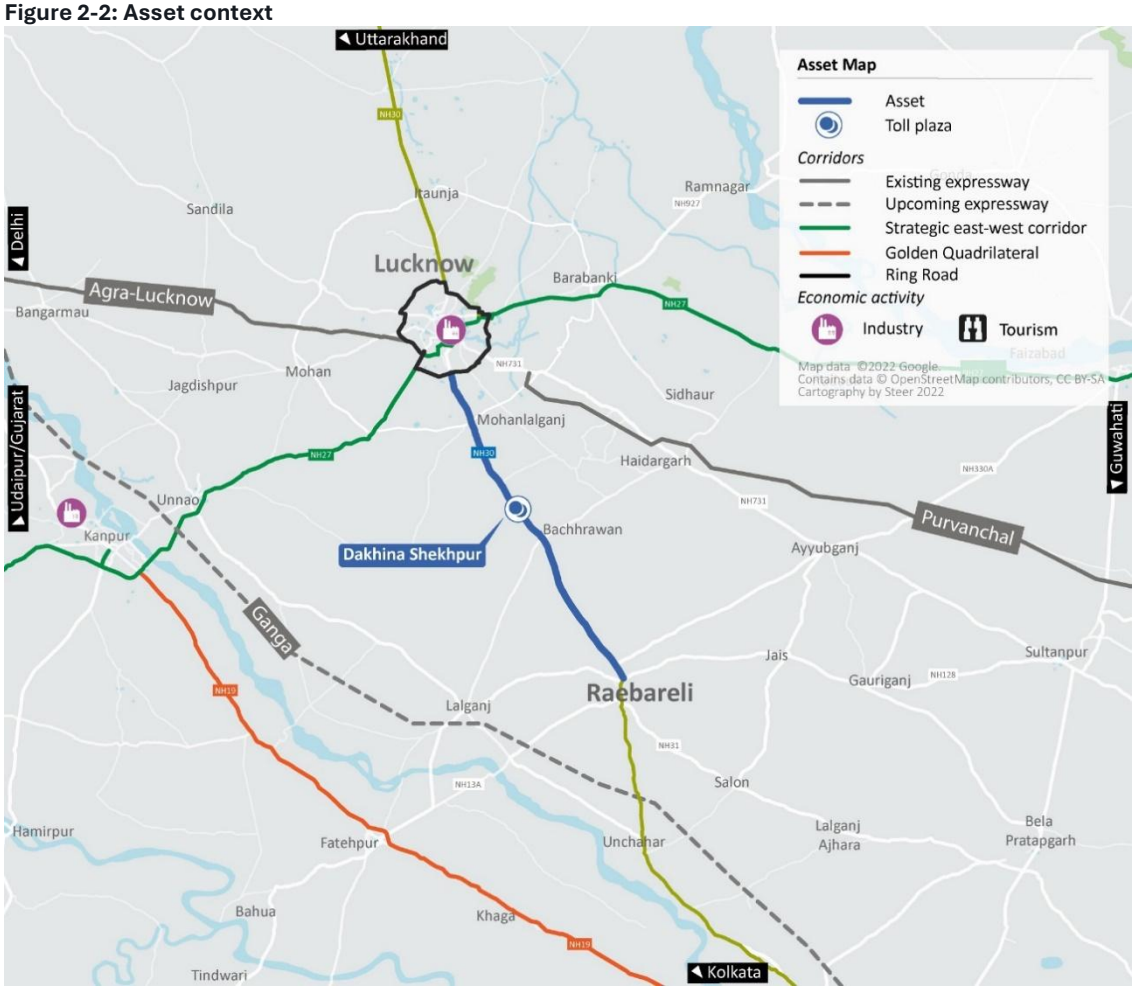
Source: Steer cartography using OpenStreetMap data

2.3 This Asset primarily caters to two different types of movements:

- **Short-distance trips** undertaken majorly by passenger vehicles such as cars for work/business and tourism/pilgrimage purposes wherein the movement is predominantly local between Lucknow, Raebareli, Prayagraj, Varanasi and Mirzapur. Further, LCVs cater to the local demand generated by two large consumption centres – Lucknow and Raebareli. Short-distance trips made by MAVs feeds into the local consumption demand and carries significant amount of Cement from the cement factories (Birla Cement, ACC Cement) in the vicinity.
- **Long-distance trips** undertaken by heavy trucks between Punjab, Haryana, Uttar Pradesh, West Bengal, and Jharkhand, traversing through this route, carrying a mix of commodities such as agriculture/grocery items, metal, cement, petroleum, and manufacturing items.

2.4 This Asset is a 70 km long toll road which forms part of the NH 30 in Uttar Pradesh. It is a four-lane road with one toll plaza, namely, **Dakhina Sekhpur (TP1)** at Km 42.5 (closer to Lucknow). The following figure provides a closer view of the Asset in the context of its immediate surroundings.

Figure 2-2: Asset context



Source: Steer cartography using OpenStreetMap data

Concession and tolling details

2.5 The toll plaza on the Asset has been operational since March 2015, and the client took over its operations in October 2020. There are still 25 years left in the concession period which ends in FY51. The following table presents a summary of the concession.

Table 2.1: Summary of concession

Particulars	Details
State	Uttar Pradesh
Highway and lane configuration	NH 30 four lane
Toll plazas	TP1: Dakhina Sekhpur
Length (km) as per concession agreement, applicable	TP1: 70 km
Commencement of operations	TP1: March 2015
Operated by Client since	October 2020
Concession period	30 years
Last year of concession	FY51

Source: Client data and Concession agreement

Figure 2-3: Typical cross-sections and toll plazas on the Asset

Source: Steer site visit

Tolls are collected across various vehicle categories as per toll notification and rates as shown in the following table. The toll plaza has dedicated ETC/FASTag lanes for electronic tolling. Like the other National Highway plazas, the Asset has Single, Return, Local Commercial, Local Personal, Monthly and Local Monthly tickets.

Table 2.2: Single toll rates on the Asset (INR), applicable FY26

Type of Vehicle	Single Journey Fee
CJV	120
LCV	190
Bus/Truck	400
3A	435

Key economic activities

2.6 Uttar Pradesh remains the most populous state in India, accounting for approximately 17% of the country's total population. This large consumer base continues to be a significant driver of economic activity and a key contributor to the national GDP. The state's real GSDP for FY25 is estimated at INR 29.6 trillion, reflecting robust growth from previous years. Between FY12 and FY25, Uttar Pradesh's real GSDP has grown at a CAGR of 6.1%, indicating a steady upward trajectory. In FY25, the state contributed 8.9% to India's national GDP, up from 8.2% in FY24[1]

2.7 Agriculture is the most important and the biggest sector in the state economy followed by the services sector comprising of travel, tourism, real estate, insurance and the finance industry.

2.8 The capital city of Lucknow, which is on one end of the Asset and a major traffic generator, is the main centre of administration, governance, commerce, technology, culture and tourism in the state with the presence of major IT companies, automotive industry, handicrafts sector (which accounts for 60% of the total exports from the state), education sector and research and development institutes. In recent times, it has emerged to become a growing IT hub, wherein the UP government has awarded the IT Special Economic Zone project to HCL Technologies in Lucknow.

2.9 With the vision of the current government to make UP a $1 trillion economy, the capital city Lucknow has received more than 2000 crore of investments to open 1000 acres integrated textile park under PM Mitra Park[2]. In the E-commerce sector, over 400 crore worth of investments from players like Amazon, Flipkart have been made in Lucknow in 2023 largely to create warehousing facilities.[3]

2.10 The fact that the city connects to five national highways and several districts, the Lucknow Outer Ring Road (ORR) recently constructed will ease congestion and improve connectivity.

2.11 Raebareli, situated on the other end of the Asset, is a centrally located city in the state which is well connected to other parts of the state as well as the country, with four

[3] India warehousing: Warehouse leasing in Lucknow on the rise: CBRE - The Economic Times (indiatimes.com)

national highways traversing through the city. It is home to some of the major industries such as the Rail Coach Factory at Lalganj, National Thermal Power Corporation (NTPC) power plant at Unchahar, where the coal for the plant is supplied from Jharkhand and MP Birla Cement Plant at Raebareli and at Kundanganj.

2.12 The existing cement plants in the region, have the potential to propel growth of the cement industry in the surrounding areas of the Asset. For instance,- MP Birla group has a cement plant in Raebareli with a capacity of over 1.3 million tonnes per annum (MTPA) as per 2023 figures, it has also acquired a plant in Kundanganj to augment the capacity from 1.2 MTPA to 3.6 MTPA.[45] ACC limited has a plant in Tikaria at distance of 50 km from Raebareli with plans to further augment capacity. The Asset enables the transport of cement from Varanasi and Prayagraj to the western region of the state and caters to the movement of cement trucks from plants located in Mirzapur, Sonbhadra and Raebareli to their Lucknow regional offices or distributors in Lucknow.

2.13 The Asset plays an integral part in connecting the rest of the country and the state to two of the key cities of great religious importance-- Prayagraj known for the confluence of the rivers Ganga, Yamuna and Saraswati (Triveni Sangam), Magh Mela and Kumbh Mela, and Varanasi known for its temples and famous ghats along river Ganga. Varanasi is also known for commercial activities such as silk sarees and clothing. These two destinations also attract people from other parts of the world.

2.14 Evidently, the Asset is a key enabler of movement of both the passenger and commercial traffic within the state wherein the local car movement makes up for majority of the trips between places such as Lucknow, Raebareli, Bachhrawan, Fatehpur, Varanasi and Lalganj to name a few.

Alternate Routes

2.15 Several network developments have taken place in the recent past which have affected traffic volumes on the Asset. These include phase-wise (1 and 2) completion of Varanasi Ring Road, and six laning of Kanpur – Prayagraj- Varanasi highway (NH19). Further, state highway network in the region went through upgradation. For example, the SH-13 which intersects with the Asset at Bachhrawan was upgraded from a level crossing to a road over-bridge (ROB). This has enabled sand carrying trucks from Banda to easily access areas like Barabanki and Bahraich, which are located to the northeast of the Asset.

2.16 The Raebareli–Unchahar section of NH-30, located south of the project corridor, is currently undergoing upgradation to a 4-lane configuration[6]. The project is part of the NHAI's broader initiative to enhance key stretches of the National Highway network, with the objective of improving regional connectivity, reducing travel time, and facilitating safer and more efficient movement of goods and passengers across UP. However, the ongoing construction works have led to diversion of long-distance traffic from the project road to alternate routes, primarily NH-731 and the Purvanchal Expressway, resulting in a

[6] **https://www.informalnewz.com/raebareli-prayagraj-highway-106km-is-being-widened-these-districts-will-benefit/**

temporary decline in traffic volumes on the asset. The official date of completion of the said project was December 2024. However, the project has faced constant delays in construction. Online sources[7] suggest the project is anticipated to be completed by June'2025. Presently, there is no official information to suggest when this project may be completed.

2.17 Further, as a part of road infrastructure development in the state, India's longest six-lane access-controlled expressway, the Ganga Expressway is set to complete by end of 2025. This expressway will significantly reduce travel time and improve LOS moving from Eastern to Western part of the state. With a section of expressway running parallel to the Asset, we assume share of Asset's traffic to shift once the expressway opens. Hence, an impact of this shift has been assumed in Chapter 6. For the sections including Varanasi-Sultanpur, Purvanchal expressway we assume that the expected shift has already happened. Hence no further impact has been assumed.

3 Traffic description

Introduction

3.1 This chapter outlines the current traffic and revenues on the Asset, as also Steer's analysis of origin-destination (OD) data and traffic count data. This covers data, which was collected as a part of this study, previous studies, as well as data provided by the Client.

3.2 Traffic demand data is generally collected and analysed to understand the vehicle distribution and volume of demand currently using the Asset, while OD data is used to obtain a better understanding of travel patterns, trip lengths, trip purposes and areas of influence in the vicinity of the Asset, as also the commodities being moved by goods vehicles. This analysis, combined with our understanding of the Asset (based on our site visits), enables us to identify the key drivers of demand on the Asset.

3.3 Actual toll plaza data is used as the basis from which the current/base year annual average daily traffic (AADT) is established. This data is typically provided by the Client and independently analysed and validated by Steer using traffic volume count (TVC) information.

PCU Factor assumption for reporting

3.4 The PCU values have been taken from 'IRC 64:1990- Guidelines for Capacity of Roads in Rural Areas'. For MAV, based on the discussion with the Client, we have referred to the rigid and trailer splits in the latest TVC counts conducted in 2023 for calculating the effective PCU for MAVs. For rigid trailer trucks we have assumed a PCU factor of 3, whereas for trailer trucks we have assumed a PCU factor of 4.5. These factors have been used to arrive at the PCU values presented in the following sections.

Table 3.1: PCU factors

Vehicle Category	PCU Factor
CJV/ Mini LCV	1.0
LCV	1.5
Bus/2A/3A	3.0
MAV*	3.4
OSV	4.5

Source: Steer analysis and IRC64,1990, * Rigid-Trailer PCU

Historical Trends

3.5 The following table explains the historical traffic recorded by vehicle class from October 2020 to September 2025 (as provided by the client). There is lack of long-term historical data available on the Asset since tolling was started by the client only in October 2020 and both the available years of data, FY21 and FY22 were impacted by COVID-19 related restrictions. Therefore, starting FY23 traffic on the Asset has started to get normalised with similar travel patterns recorded in FY24-25. Q3 and Q4 of FY25 were impacted by

MahaKumbh-2025, thereby leading to increase in the traffic on the Asset. FY26 YTD exhibits similar travel pattern as FY24.

3.6 As discussed in chapter 2, the Asset is located between two major cities, with Lucknow being a major traffic generator for the Asset. Thus, the Asset observes healthy proportion of passenger traffic.

Table 3.2: Average Daily Traffic at TP1 Dakhina Sekhpur

Vehicle category	FY21*	FY22	FY23	FY24	FY25	FY26 YTD	CAGR FY23-25
CJV	10,832	10,031	10,351	10,747	12,358	11,874	9.3%

Tollable PCU	**21,183**	**19,022**	**17,433**	**17,605**	**18,337**	**17,552**	**2.6%**

Source: Steer analysis of Client data, (FY21* includes 6 months of data from Oct'20 to Mar'21); FY26YTD includes data till Sept'25

3.7 As per the table above, it can be observed that 2A/3A/MAV traffic on the Asset showed a consistent decline/flatlining trend between FY21-26YTD.

3.8 The exceptional increase in CJV and Bus volumes observed in FY25 can be attributed as a temporary increase, due to the Mahakumbh Mela held in January – February 2025. CJV volumes in FY26YTD continues to growth at a steady rate on month-on-month basis.

The trend of tollable traffic on the Asset has largely followed that of total traffic where Cars and Bus category recorded 3-5% growth in FY25 compared to FY24, due to the temporary increase because of the Mahakumbh mela, as discussed above.

3.9 3A category has declined in the FY21-26 YTD period. The reduction in 3A volume is a result of the declining demand for 3A vehicles, which are being replaced by 2A and MAV's. MAVs offer higher tonnage capacity making them more cost-effective for transporters. While the increase in 2A volume reflects the growing preference for these vehicles due to favourable changes in the legal permissible loads for 2As and their suitability for e-commerce-related freight, particularly high-value, low-volume goods over medium to long distances. This is consistent with our discussion with various transporters and OEMs across the country who are favouring 2A and 5A vehicles for commodity movement due to better unit economics.

3.10 Based on the OD results it is observed that the share of North India/Western UP moving to Eastern UP using the Asset has reduced by ~20%, which has led to fall in traffic in FY23-24. The same is validated by the comparison of trip lengths where the share of 3A and MAV's travelling over 500kms has reduced by ~20% and ~30% in the latest set of surveys which were carried out. Our observation is that this traffic has shifted to existing alternate routes by virtue of improved connectivity and quality upgradation, including:

- Lucknow – Kanpur - Prayagraj – Varanasi six lane corridor via NH19
- Lucknow – Sultanpur- Varanasi four lane corridor via NH731
- Lucknow – Purvanchal Expressway- Sultanpur- Varanasi via Expressway and NH731

3.11 These sections offer better level of service to truck users. Further the local traffic dependent on cement factories feeding into local construction in the region has also been impacted due to construction completion and covid related disruptions resulting in non-revival of such traffic on the Asset.

3.12 A combination of all the above-mentioned factors has resulted in lower volumes of traffic on the Asset and, accordingly, a necessary adjustment has been made to reflect the new base AADT position. This has been explained further in Chapter 6 as well.

Historical Revenue

3.13 The CJVs are the biggest revenue contributors on the Asset, with a ~54% share in FY25 followed by MAVs (21% share). Lower per day collection in FY22 compared to FY21 can be attributed to COVID-19 with restricted traffic movements. FY23 and FY24 recorded a similar average per day collection of INR 17 lakhs. A recovery to an AADC of ~INR 19 lakhs daily can be seen in FY25 with AADC increasing in the months of November to March majorly driven by increase in the CJV traffic due to MahaKumbh.

3.14 The following table shows the reported revenue by vehicle type at each toll plaza for period FY21 to FY26YTD:

Table 3.3: Revenue (in INR Cr) at TP1 Dakhina Sekhpur, and AADC (in INR Lakhs)

	CJV	LCV	Bus	2A	3A	MAV	OSV	Total	AADC	AADC Growth
FY21	13.8	1.6	2.8	2.9	3.4	11.3	-	**35.8**	**21.3**	**-**
FY22	25.9	2.6	5.6	6.7	6.2	19.9	0.0	**66.8**	**18.3**	**(14.1%)**

Source: Steer analysis of Client data, (FY21* From Oct-20 (last 12 days) to Mar-21; AADC represents Average Annual Daily Collection; FY26YTD includes data till Sept'25 without the Annual Pass compensation revenue.

Toll Frequencies

3.15 Toll frequency or segmentation is typically the share of each ticket category recorded for a particular vehicle type. This is based on the toll policy which forms a part of the concession agreement. Each vehicle category has different segmentation. As a part of historical analysis, we calculate the toll frequency for each vehicle category from the monthly data shared by the client. The most common ticket categories observed on a typical National Highway are: Single, Return, Monthly, Local and Exempt. Given the local nature of traffic, some toll plazas offer custom made local passes to attract the local commuters to opt for these passes instead of evading toll.

3.16 The following are the types of tickets being sold at the plazas of the Asset.

Table 3.4: Typical ticket types sold at NHAI plazas

Category	Description
Single	Allows the vehicle to cross the toll plaza once
Return	Allows for a return journey within a day with a 50% discount on the return trip.
Monthly Pass	Discounted single entry ticket for users who undertake multiple trips within a month can buy the monthly pass.
Local Personal	Discounted single entry pass only for private cars of residents within 20km radius of toll plaza
Local Commercial	50% discount on single trips for commercial vehicles registered in the local district. This pass allows single entry only
Exemptions	Officially exempted vehicles like ambulance, police cars, key political personnel etc.

3.17 Further, the toll plazas also record violations which are non-paying users, who are not officially allowed under exemptions category but are forced exemptions. For some Assets, the Exemption and violations are at time reported together.

3.18 Generally, over the period the shares of single/return/monthly tickets tend to stabilise within 2-3 years of Asset operations. Only in the cases where trip patterns are expected to change significantly due to urban expansion is where we expect these shares to change over the period or due to some external events impacting the trip patterns.

3.19 Further, FY21 was impacted due to the mandatory implementation of FASTag as a mode of payment, where users were now paying via an online payment system instead of cash payments at the toll plaza. Additionally, in FY22 traffic and travel patterns were impacted by the second wave of COVID-19 in Q1 and Q2. With FY21 and FY22 being impacted these

external events, the segmentation began to stabilise from FY23 onwards and reached steady state starting FY24.

Introduction of Annual pass for CJVs

3.20 The National Highway Authority of India launched the "The FASTag Annual Pass" on August 15, 2025, a prepaid facility that allows private CJVs to travel across designated National Highway and National Expressway toll plazas. The annual pass is worth INR 3,000. The pass is valid for one year or 200 trips, whichever occurs first and is applicable only to private, non-commercial vehicles (Car/Jeep/Vans).

Since this pass has been introduced by NHAI, it is not valid on

- state governed toll plazas on highways
- state governed toll plazas expressways
- Parking areas or other non-NHAI tolling locations

3.21 The pass can be activated via the RajmargYatra app or the NHAI website, and links directly to an existing FASTag.

The Annual Pass aims to:

- Promote cashless and seamless travel on national highways.
- Reduce congestion and improve traffic flow at toll plazas
- Provide cost-effective travel for frequent users of NH/NE toll roads.

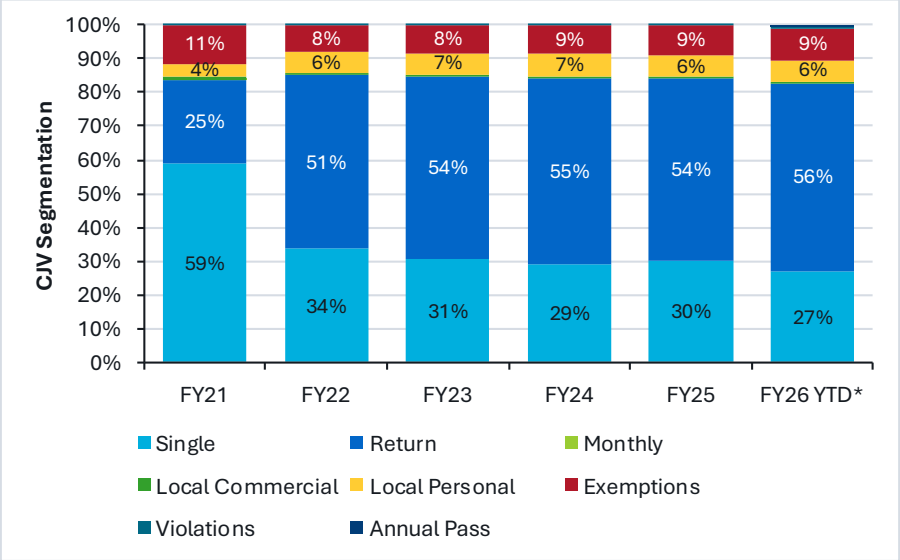
Share of traffic by payment type

3.22 The figures below show the ticket segmentation for CJV and MAV categories. It can be observed that both CJVs are dominated by return journeys whereas MAVs prefer single tickets.

3.23 FY23 onwards there have not been any pandemic related disruptions, or any one-time events which could affect traffic movement on the Asset. Hence, the segmentation as derived from the historical data of FY23 onwards has been considered as the normal segmentation on the Asset for all other vehicle categories except for the CJVs.

3.24 In case of the CJVs which dominate the traffic profile on the Asset the segmentation is computed considering the penetration of Annual Pass. CJV segmentation for FY26 and FY27 is detailed out in "Toll segmentation" section in Chapter 6.

Figure 3-1:Ticket-segmentation for CJV at TP1 Dakhina Sekhpur

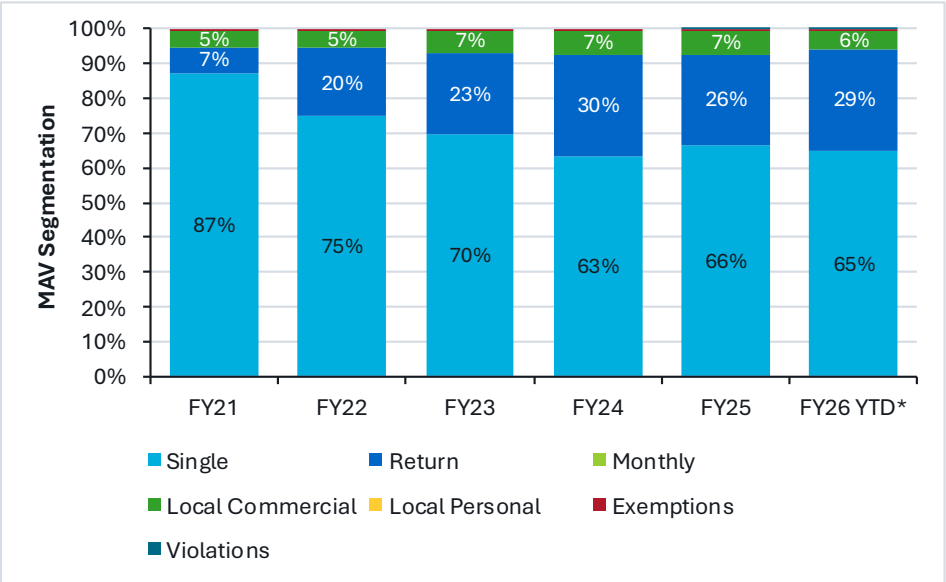


Source: Steer analysis of the Client data (FY21 has data for Oct-20 to Mar-21); FY26YTD includes data till Aug'25

3.25 The share of single journeys on the Asset has exhibited a consistent decline, reducing from 59% in FY21 to 30% in FY25. Correspondingly, the share of return tickets has increased significantly from 25% in FY21 to 54% in FY25. This notable shift in journey segmentation became particularly evident in FY22, primarily driven by the implementation of FASTag in FY21, which enabled 24-hour return ticket to be availed.

3.26 The segmentation trends for Commercial Vehicle Journeys (CJVs) have remained relatively stable from FY23 onwards. Given the Asset's proximity to major urban clusters, it caters to a significant volume of daily commuters. This localised movement often results in multiple trips through the toll plaza within the same day, contributing to the higher share of return tickets among CJV users.

Figure 3-2: Ticket-segmentation for MAV at TP1 Dakhina Sekhpur



Source: Steer analysis of the Client data (FY21 has data for Oct-20 to Mar-21); FY26YTD includes data till Aug'25

3.27 For MAVs, approximately 60-70% of all tickets sold on the Asset have been 'Single' tickets, after FY23. This can be attributed to the long-distance traffic observed on the Asset which can also be validated by higher average length of MAVs in the OD results. Around 30% of share of return and local commercial trips can be attributed to proximity of the Asset to the urban cluster of Lucknow. However, compared to FY22, FY25 observed a shift of MAVs from single to return category which can be attributed to shift of long-distance traffic on alternates, as discussed in sections above.

3.28 FY26YTD segmentation shows that LCVs, 2As and 3As trucks primarily use single tickets (44%, 56% and 46%), while buses overwhelmingly prefer return tickets (92%), reflecting their structured round-trip operations. Return ticket usage is also high for LCVs (53%), 2As (40%) and 3As (49%), indicating frequent round-trip freight movement. Local commercial and exemption categories remain minimal, while monthly and local personal passes see no recorded usage, suggesting that most vehicle movements are intercity rather than local.

Table 3.5: Ticket segmentation for LCV, Bus, 2A and 3A at TP1 Dakhina Sekhpur

Ticket Category	LCV	Bus	2A	3A
Single	44%	5%	58%	43%
Return	53%	94%	37%	55%
Local Commercial	1%	0.5%	3%	2%
Monthly	-	-	-	-
Local Personal	-	-	-	-
Violation	-	-	-	-
Exemption	1%	0.5%	1%	1%

Source: Steer analysis of Client data

Data Collection exercise

3.29 As mentioned previously, to validate and inform various inputs used in Steer's forecasting model, we undertook primary data collection on the Asset, comprising the surveys listed in the table below. Both, the OD and TVC surveys were commissioned by Steer to a third party. While the OD data collection typically involves manual data entry by enumerators based on oral surveys with road users crossing toll plazas the TVC data collection involves video-graphic capture of traffic crossing the toll plazas, followed by manual counting.

Table 3.6 Data collection schedule

TP	7-day videography-based TVC			1-day OD survey			
	Start date	End date	Time (hrs)	Start date	Start time	End Date	End Time

Source: Steer analysis

3.30 It should be noted that, in our experience, traffic on national highways shows variation across the week due to the economic activities surrounding each road. To derive a representative TVC count considering daily variations, a three-seven-day traffic counts are generally recommended. Therefore, to fully understand the impact of this weekly fluctuation on the Asset, we collected seven-day counts at the toll plaza.

Key findings of the TVC data analysis

WADT estimates

3.31 Taking an average of the seven-day TVC counts (19th Jan – 25th Jan 2021, 00:00-23:59), we obtained the following weekly average daily traffic (WADT) for each toll plaza. This WADT excludes non-tollable vehicles such as tractors, two-wheelers, bullock-carts, etc., but includes officially exempt vehicles such as police cars, ambulances, emergency response vehicles, government vehicles and other vehicle types officially allowed as 'exempted' under the concession agreement.

Table 3.7 WADT from TVC counts

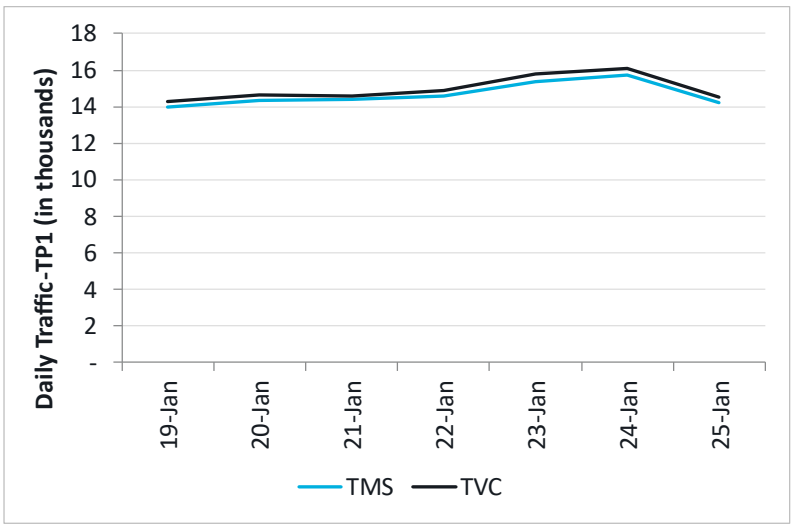
Toll Plaza	CJV	Mini LCV	LCV	Bus	2A	3A	MAV	OSV	Total
Dakhina Sekhpur	9,739	952	908	778	430	678	1,485	-	14,969

Source: Steer analysis of TVC data

TVC v/s TMS analysis

3.32 Since we use the TMS data to estimate the base year MADT, we have used our TVC data to validate the TMS data on those days, as provided by the Client. The following figures show the comparison between the daily traffic observed by TVC and TMS for the toll plaza.

Figure 3-3 :Comparison between TVC and TMS daily traffic data on TP1 Dakhina Sekhpur

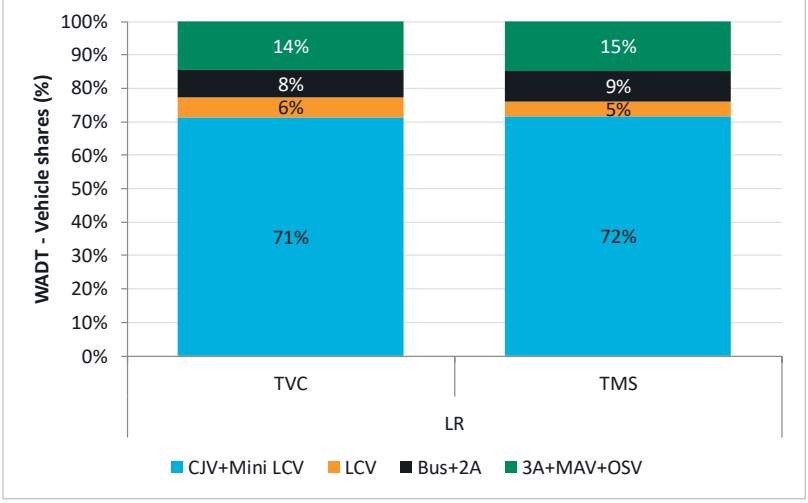


Source: Steer analysis of TVC and Client TMS data

3.33 Figure 3-4 below compares the shares of vehicle types at both toll plazas observed by the TVC and TMS data. As can be seen, whilst the share of CJVs and 3A+MAV+OSV is

marginally higher for TMS compared to TVC, it is equal for bus/2A and lower for LCV category. This difference can be attributed to common misclassification of vehicle categories.

Figure 3-4: Comparison between vehicle shares from TVC and TMS WADTs



Source: Steer analysis of TVC and Client TMS data

3.34 Considering the smaller variation between the TVC and TMS data for the largest revenue generator 3A+MAVs, and an approximate match in the traffic volumes, TVC-TMS analysis gives us the confidence that the base year traffic calculated using the Client data forms a reliable base year traffic estimate.

Key findings of origin-destination analysis

Overview

3.35 Origin-destination (OD) analysis enables the understanding of the nature of traffic movement on the Asset. As mentioned previously, the OD analysis presented here has been based on the data collected on 23rd-24th June 2023.

3.36 We have analysed the regional drivers of demand based on the following analyses:

Zonal influence
Commodity distribution
Top OD pairs
Trip length distribution

3.37 While zonal analysis and the list of top OD pairs help to understand 'where to and from' people and goods travel, commodity distribution sheds light on 'what' goods get transported. Trip length distribution show 'how far' vehicles and people travel, and goods get transported. This set of analyses is generally used to estimate the key drivers of traffic and aid the making of informed forecasting assumptions around traffic demand elasticities, growth drivers and exogenous impacts.

Sample rates

3.38 Sample rates help understand the reliability of OD data. They are calculated by dividing OD samples captured by the traffic counts (based on the TMS data) during the same time. The table below presents the sample rates for key vehicle type aggregations at the toll

plaza. We believe that the sample rates of the OD data are reasonable for the analysis required.

Table 3.8: Sample rates for OD data

Vehicle type	TP1 Dakhina Sekhpur
Passenger (CJV+Bus)	30%
Goods (LCV+2A+3A+MAV+OSV)	66%

Source: Steer analysis of OD data

Zone Categories

3.39 To facilitate better interpretation of key regional drivers of traffic as determined by their OD zones, and influenced by various towns, cities, states and regions in the vicinity of the Asset, we have aggregated zonal data as described in the table below. The methodology behind this aggregation of zones may vary as per the characteristics displayed by the different Assets being studied.

Table 3.9: Zone aggregations for zonal influence analysis

Aggregate Zone	Description
Local	Local zones are those that fall on or very close to the Asset.
IAOI (Immediate Area of Influence)	IAOI zones are the locations which generate traffic and lie within approximately 75-150 km distance from the Asset.
Rest of State	Rest of the cities/Districts in the state that Asset lies in (other than Local/IAOI)
Delhi	Delhi NCR
North India	Uttarakhand, Haryana, Punjab, Jammu and Kashmir
Central India	Madhya Pradesh, Chhattisgarh
West India	Gujarat and Maharashtra
South India	Tamil Nadu, Karnataka, Kerala, Andhra Pradesh
East & Northeast India	West Bengal, Orissa, Jharkhand and Northeast Indian states

Source: Steer analysis

Zonal influence

3.40 The zonal influence is the contribution of the zone or the zonal aggregation to trips by a vehicle type. This section presents the zonal influence[8] at each toll plaza of each Asset, based on zonal aggregation listed in the previous sub-section. It should be noted that zonal influence is analysed on where the trip ends and not trip origination.

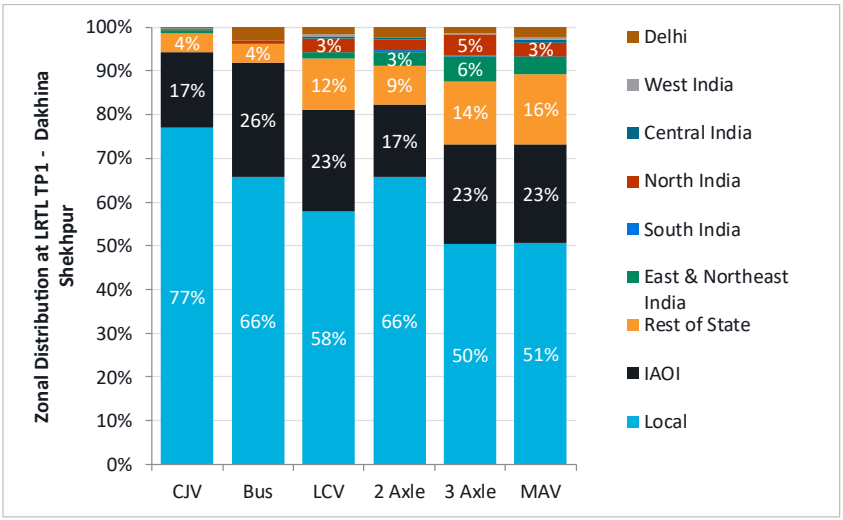
3.41 As can be seen from the figure below, there is a higher share of local trips for both the passenger and commercial vehicles wherein 77% of the influence for CJVs, 51% for MAVs and 50% for 3A vehicles are from areas near the Asset. This analysis is in line with our

[8] For example, if out of 100 trips at a toll plaza on an Asset, 10 trips are between Hyderabad and Delhi and 90 trips are between Hyderabad and Chennai, then zonal influence of Hyderabad would be 50% since one end of all trips are at Hyderabad. Likewise, zonal influence of Delhi and Chennai would be 5% and 45%, respectively.

understanding gained from the site visit, wherein a heavy influence on the traffic from the surrounding local areas and rest of the state was observed. Also, the results of the top OD pair analysis, as given in the appendices, show that most of the trips originate and end in local and IAOI areas for Car, Bus and 2A trips, whereas for heavy goods traffic 3A and MAV, regions such as Kolkata, Punjab and Uttarakhand also make it to the Top OD pairs.

3.42 Outside the state of Uttar Pradesh, cities/towns in East & Northeast India such as Bihar, Jharkhand, Assam and West Bengal majorly influence the long-distance heavy goods traffic followed by those in the rest of north India such as Uttarakhand, Himanchal Pradesh, Punjab and Haryana. In short, North to East India is one of the key long-distance movements observed on the Asset, with trucks travelling from Punjab-Haryana-Moradabad-Lucknow to East India.

Figure 3-5: Zonal influence at TP1 Dakhina Sekhpur



Source: Steer analysis of OD data

Internal External analysis

3.43 Internal-External analysis helps in identifying the trips which have both the origin and destination on the Asset (Internal-Internal or I-I), any one end on the Asset (Internal-External or I-E), or neither end on the Asset i.e., through trips (External-External or E-E). 'Internal' zones are those that were analysed as 'local' and 'IAOI' in the zonal influence analysis, i.e., lying on the Asset or in the "immediate area of influence", 'Rest of State' zones are those origins and destinations aggregated as "Rest of State" in the zonal analysis while 'External' zones are all other zones.

3.44 Figure 3.6 below show the distribution of trips based on these categories. Understandably, these reflect the observations seen in the zonal influence presented earlier, at a higher level of aggregation.

3.45 We observed that there is very little external traffic of MAV on the Asset and that 56% of MAV are making Internal trips and 15% to the rest of the state. This indicates the local nature of the traffic on the Asset.

Figure 3-6: Internal-external distribution at TP1 Dakhina Sekhpur

	Internal	Rest of State	External
External	6%	3%	4%
Rest of State	15%	2%	1%
Internal	56%	10%	4%

Source: Steer analysis of OD data

Commodity distribution

3.46 We have grouped various commodities into aggregate categories for ease of interpretation, as shown in the table below. The charts in the following sub-section present information in terms of aggregate commodity categories.

Commodity Description	Code	Combined codes used for charts
Agriculture Products / Cash crops (Wheat, Rice, Sugar cane, Maize etc.)	AGR	AGR
Cattle Food / Live Stock (sheep, goat, cow, cattle food etc)	LIV	
Perishable Items (Fruits, vegetables)	PER	GRO
Animal Products/Dairy/Eggs/Fish/Meat/Animals	DFM	
Groceries / Food items (Soap, Salt, Sugar, Pulses, Spices, Biscuits, bread, cool drinks, beer etc.)	GRO	
Building Material / Construction (Cement, Lime, Brick, fly ash, etc)	CNS	CNS
Sand/Clay	SND	
Stone (kota stone, marble, Granite, Aggregate stone etc.)	STN	
Ceramic	CRM	
Petroleum Products (Oil, LPG, CNG, etc.)	PET	PET
Chemicals / Fertilizers (Acids, Fertilizers etc.)	CHM	
Electrical/Manufacturing items (Electronic items, Medicine, Leather, Wine, Rubber/ Tyre, Plastics, Cloth, Paper etc.)	MAN	MAN

Raw Wood, Cork & Wood Products, Furn	WUD	
Machinery / Spare parts	MAC	
Automobiles (Finished products, auto parts, Car/bike manufacturing, New Chassis)	AUT	AUT
Basic / Fabricated Metals (Iron, Steel / Metal)	MET	MET
Mining Minerals (Coal, Gypsum, Cobalt etc.)	MIN	
Empty	EMT	EMT
Container	CTR	MSC
Miscellaneous (Parcel, Courier, Household items etc.)	MSC	
Passengers	PAS	
Scrap	SCR	

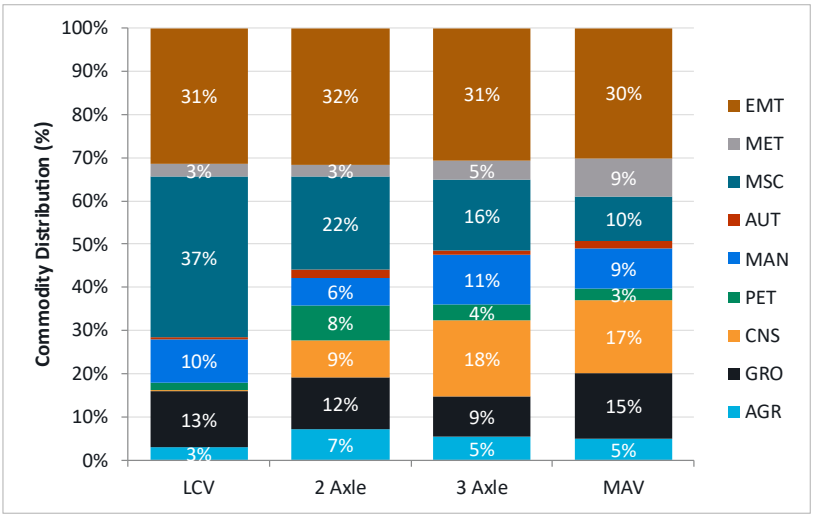
Source: Steer Analysis

3.47 The following figures present the commodity distribution for goods vehicles at the toll plaza, at the total level and also split by direction, towards Lucknow and towards Raebareli. Construction goods were the key commodity category moved by 3A vehicles accounting for 19% of the share followed by miscellaneous items like containers, parcels and couriers. The dominant commodity moved by MAVs includes construction and grocery, and around 9% of the MAVs used the Asset to transport manufactured goods. Miscellaneous goods like household items made up for the key commodity being carried by light-goods vehicles accounting for 37% and 22% respectively of both the 2A and LCV vehicle type followed by grocery items.

3.48 A high percentage of vehicles moving grocery and miscellaneous items are observed as this Asset connects two major cities in Uttar Pradesh and these cities have a large inherent demand of fast-moving consumer goods. The agricultural and grocery items are carried over both short-distances from and to local places such as Lucknow, Raebareli and Kanpur, and over long-distances such as Uttarakhand, Punjab and Delhi. A similar mix of short and long distances trips are observed for vehicles carrying manufactured goods.

3.49 On a direction towards Lucknow, we observe all vehicle categories except MAV are higher travelling empty. This is because MAV vehicles carrying construction material make up for a 34% share moving towards Lucknow. This higher share of construction in this direction can be probably attributed to cement being transported from the plants near Raebareli to Lucknow with 34% of MAVs and 27% 3A vehicles in this direction contributing to the construction share. Overall, vehicles moving towards Lucknow seem to carry a more diverse mix of commodities than those travelling in the direction of Raebareli.

Figure 3-7: Commodity distribution at TP1 Dakhina Sekhpur



Source: Steer analysis of OD data

Trip length analysis

3.50 Trip-length distribution provides the distance-based profile of various vehicle types. This aids in validating assumptions around the share of macro-economic drivers, inputs from zonal influence and toll segmentation. For ease of interpretation, we have categorised distances into 5 groups – local (0-100 km), short-distance (100-300 km), medium-distance (300-500 km), long-distance (500-1000 km) and very-long-distance (+1,000 km). The trip distances were derived as driving distances from Google Distance Matrix Tool based on zonal coordinates for OD pairs.[9]

3.51 Supporting the observations made in zonal & internal-external analysis in the previous sections, Figure 3-8 below highlights that about 70% of light goods vehicles like LCVs and 2 Axles travel shorter distances up to 300 kms, largely contributing to the local movements on the Assets.

3.52 Even amongst heavier goods vehicles, 60-65% of the trips made by 3A and MAV are within 300km. It suggests that the Asset is largely local in nature. This is also observed in the internal-external analysis and is also brought out by the average trip lengths as shown in the Table 3.10.

[9] Google Distance API is a tool that is available on a chargeable basis from Google Maps Platform. Link: **https://developers.google.com/maps/documentation/distance-matrix/start**. Travel distance and time information for driving/transit under various congestion scenarios can be extracted through this tool by using macro-enabled Excel, R, etc.

Figure 3-8: Trip length distribution TP1 Dakhina Sekhpur

	LCV	2 Axle	3 Axle	MAV
Average trip length (km)	272	279	363	339

Source: Steer analysis of OD data

Conclusions

3.53 In summary, CJVs, and 3A+MAV are the key contributors to the total revenue collected on the Asset. CJV's similarly hold the most significant share of the traffic volumes on the Asset.

3.54 The analysis on ticket-segmentation reflects that for CJVs, return is the most dominant category with 55%, while for MAVs, single is the most dominant category at 63% followed by single at 29% and return with 30% for CJV and MAV respectively. Compared to FY22, FY24 observed 15% shift of MAVs from single to return category which can be attributed to shift of long-distance traffic on alternates.

3.55 The TVC-TMS analysis highlights minor variation between the two datasets wherein at the total level, TVC is approximately 2% higher than the TMS data with the difference being negligible for the larger revenue generating categories (3A, MAV, and OSV combined) within 1%.

3.56 The OD analysis found that in terms of zonal influence, the passenger and commercial traffic is heavily influenced by local areas such as Lucknow, Raebareli, Prayagraj and Bachhrawan with the influence ranging from 77% for CJVs, 41% for MAVs and 40% for 3A vehicles, which is also in line with our understanding gained from the site visit. Further, places in East & Northeast India such as Bihar, Jharkhand, Assam, and West Bengal majorly influence the long-distance heavy goods traffic followed by places in the rest of north India such as Uttarakhand, Himanchal Pradesh, Punjab and Haryana.

3.57 The key commodities transported on the Asset includes grocery products, construction items, minerals, and agricultural commodities by the heavy goods vehicle and

grocery/agricultural items by light goods vehicle. It is also observed that an average of ~42% of heavy goods vehicles (3A, MAV) travel empty towards Raebareli with grocery and miscellaneous items being the top commodities with average shares of ~21% and 23% respectively towards Raebareli. In the direction towards Lucknow, 34% share of MAV and 27% 3A carry construction materials from plants near Raebareli.

3.58 Overall, across all categories it is seen that majority of the traffic is internal in nature and therefore it can be inferred that the growth of traffic is directly proportional to the growth of state GDP. This is further supported by the top 10 OD pairs for this Asset as well as the trip length distribution which reflect that majority of all traffic covers distances up to 300km. It can also be seen that the average trip length for all goods categories is below 400km, with 95% of MAVs having one end of the trip in the state and only ~5% of trips are through which are external.

3.59 Therefore, analysing the vehicle share on the Asset and understanding the OD analysis, CJVs make up for the highest share of traffic and significantly contributed to the local traffic share. Heavy goods vehicles, although accounting for around only ~15% of the traffic on an average over the months, contributes the most to the total revenue share, wherein construction items, and groceries are the top commodity being transported on the Asset by these vehicles.

4 Socio economic context and traffic growth

Introduction

4.1 The growth of traffic on any existing (brownfield) road depends on, firstly, how fast the background travel demand grows (background growth); and secondly, how successful the roads are in attracting that traffic (traffic capture). Background travel demand is driven by the socio-economic conditions in the region where the Asset is located and the country. These include:

- Changes in factors such as population, economic growth (regional and national) and industrial production; and
- Other local factors such as strategic port growth, and growth in local industries near the Asset.

4.2 In turn, the change in the relative competitive position of the Asset (and thus of the traffic capture they can achieve) derives from how the relative offer for the roads changes, i.e. the service offered, and the tolls charged on the project roads, in comparison to that on competing roads; and whether any competing road facilities are planned.

4.3 In this chapter, we have assessed the trends of the above growth drivers, as indicators of the socio-economic conditions in the regions surrounding the Asset.

Population growth

4.4 We have analysed the key socioeconomic drivers of the background traffic demand in Uttar Pradesh state, where the Asset is located.

National level

4.5 Table 4.1 below the total population in India has grown at a Compound Annual Growth Rate (CAGR) of 1.5% since 2000, decreasing over the years, as shown in the table below. The World Bank forecasts this growth to decrease to 0.6% CAGR by the 2030-45 period.

Table 4.1: CAGR of population in India

Years	CAGR		
	Total Population (m)	Rural Population (m)	Urban Population (m)
1970 - 1985	2.3%	1.9%	3.8%
1985 - 2000	2.0%	1.7%	2.9%
2000 - 2015	1.5%	1.0%	2.6%
2015 – 2030*	1.0%	0.3%	2.3%

Years	CAGR		
	Total Population (m)	Rural Population (m)	Urban Population (m)
2030 – 2045*	0.6%	-0.3%	1.9%

Source: World Bank Data on Health Nutrition and Population Statistics, *forecast population growth.

State level

4.6 Uttar Pradesh represents approximately 17% of the country's population, with the total state population of 237 million, as of FY24. Table 4.2 shows the evolution of population in the state of Uttar Pradesh (containing the Asset), compared to that of the country.

Table 4.2: Population Growth in Uttar Pradesh and India (2012-2024)

State	2012 Population (m)	2024 Population (m)	CAGR (2012 – 2024)
Uttar Pradesh	201	237	**1.4%**
India	1,210	1,395	**1.2%**

Source: MoSPI Estimates

4.7 Due to the complexities of the patterns of urbanisation and migration (which are very difficult to forecast with accuracy), we do not use population growth as a proxy for understanding future travel demand growth on the Asset. The same has been included in this section simply to provide a socio-economic context of the trend in the region in which the Asset is located.

Economic Indicators

Industrial Production

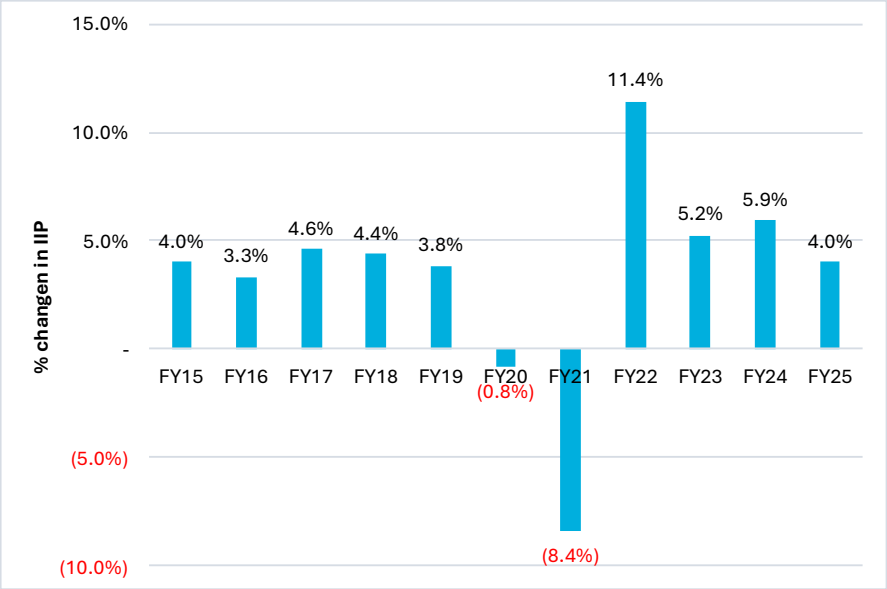
4.8 The Index of Industrial Production (IIP) is a composite indicator that measures the short-term changes in the volume of production for a basket of industrial products. The IIP data tracks the manufacturing activity in different sectors of an economy, with mining, manufacturing, and electricity being the three broad sectors constituting the IIP.

4.9 **Figure 4-1** below shows that at an annual level, national IIP was growing at an average of 4% per year over the period FY15-19, before the country underwent a liquidity crisis and experienced an overall economic slowdown in FY20. In the aftermath, IIP shrank by over 8% in FY21 due to a decline in economic activity in the wake of global lockdowns introduced to curb the Covid-19 pandemic. Post the immediate recovery in FY22, IIP growth has since stabilised, with FY25 recording 4% growth over FY24.

4.10 Since state-level IIP data is not as readily available as national level IIP, we have presented national IIP here to indicate nationwide activity in key industrial sectors like power, manufacturing, and mining, all of which influence long-distance commercial movements across the nation, and not unique to this asset. However, we do not use it to forecast future travel demand growth since long-term forecast for IIP is not available through official sources such as MOSPI, RBI or through multilateral organisations like WB, or the IMF.

4.11

Figure 4-1: Annual growth – Index of Industrial Production



Source: Ministry of Statistics and Program Implementation (MoSPI)

4.12 Since state-level IIP data is not as readily available as national level IIP, we have presented national IIP here to indicate nationwide activity in key industrial sectors like power, manufacturing, and mining, all of which influence long-distance commercial movements across the nation, and not unique to this asset. We however, do not use it to forecast future travel demand growth since long-term forecast for IIP is not available through official sources such as MOSPI, RBI or through multilateral organisations like WB, or the IMF.

Vehicle ownership

4.13 The gap in car ownership between India and developed nations remains substantial according to recent data. As of 2018, India had approximately 22 cars per 1,000 individuals, a fraction of the 980 cars per 1,000 individuals in the United States[10]. However, this pattern is changing with the increasing per capita income levels. As can be seen in Figure 4-2 below, between 2007-17, number of cars per 1,000 people has more than doubled and increased at a CAGR of about 11%. The corresponding ownership rates for urban cities like Delhi, Mumbai, Bengaluru, and Chennai are over 100 cars per 1,000 people[11] (GoI 2011; MoRTH 2012). . The region where the Asset lie is highly urbanised, therefore the car ownership in Uttar Pradesh is higher than the India average with 50 cars per 1,000.

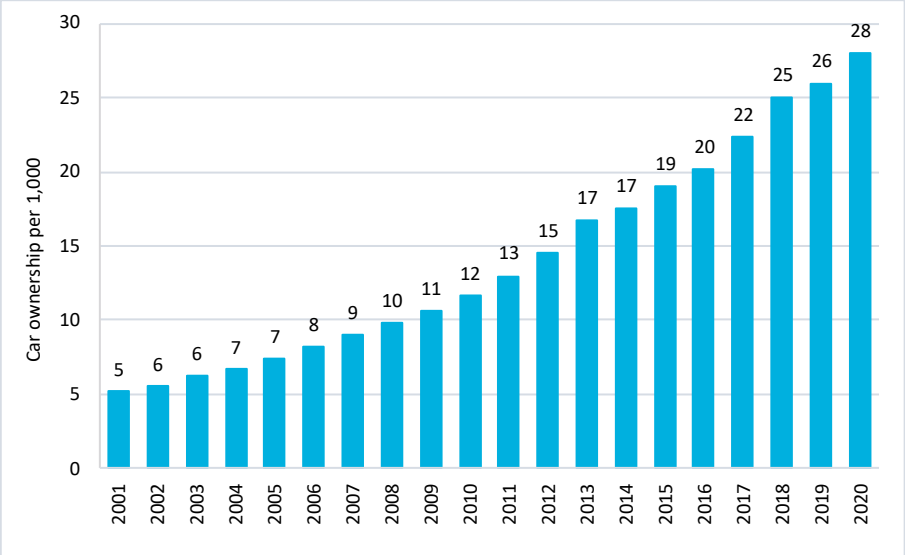
4.14 Overall, India still stands at a very nascent stage in the vehicle saturation curve, offering huge potential for growth going forward. As the income per capita of India and the region itself grow further, we expect car ownership levels to increase. As per the India Energy

[10] India has 22 cars per 1,000 individuals: Amitabh Kant, Auto News, ET Auto

[11] Proliferation of Cars in Indian Cities

Outlook (2015), car ownership is projected to grow steeply to 175 cars per 1,000 population by 2040 in India.[12]

Figure 4-2: Car Ownership in India per 1,000 population

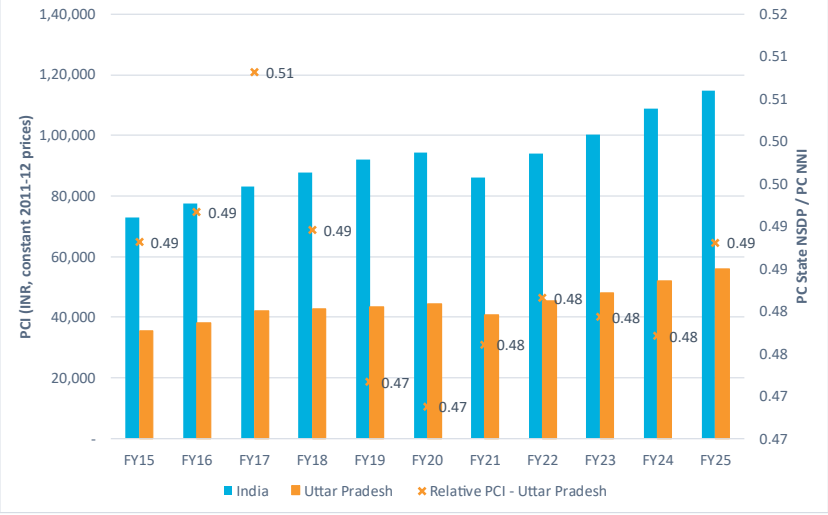


Source: International Energy Agency (IEA)

Per Capita Income (PCI)

4.15 The per capita income of the state where the Assets lies i.e., Uttar Pradesh is lower as compared to the national average. In dollar terms, PCI of just $1,000 per head indicates that the state is at a very early stage of consumption curve. Going forward, we therefore expect local consumption to be strong which would drive the growth in both passenger and commercial traffic.

Figure 4-3: Per Capita Income



Source: Steer Analysis of MoSPI data

[12] https://www.gita.org.in/Attachments/Reports/IndiaEnergyOutlook_WEO2015.pdf

4.16 Given that there is dearth of district level PCI data as also non-availability of long-term forecast for PCI we have not used this indicator as a growth driver.

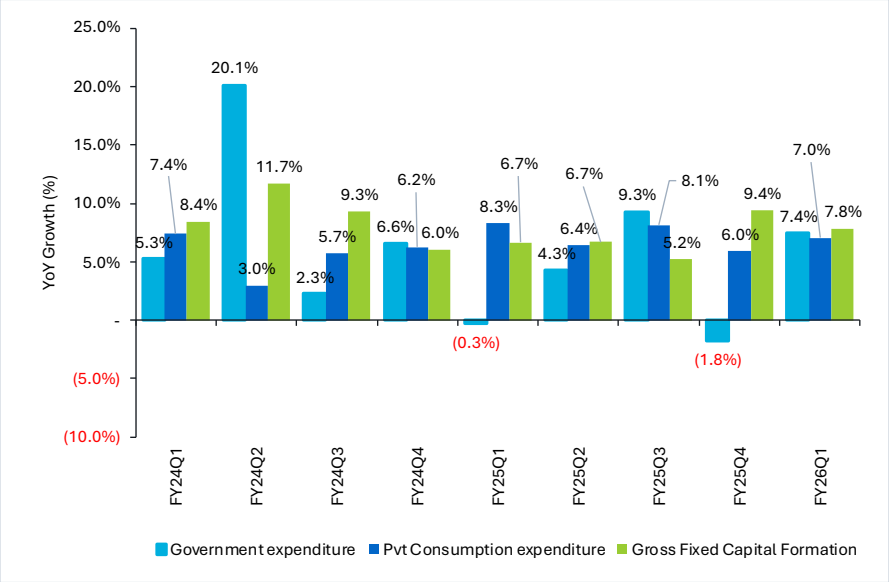
Economic growth

India's Performance

4.17 Despite a slowdown in the economy during H1FY25, the Indian economy has observed strong growth each quarter since FY25Q2, with the latest published estimates for FY26Q1 GDP at 7.8% over FY25Q1. This performance has been driven by strong growth in investment and consumption expenditures and higher consumer optimism for the year ahead[13].

4.18 In Figure 4-4 below, we present quarterly Y-o-Y growth in three major components of GDP – government expenditures, consumption expenditures, and business investment (gross fixed capital expenditure) over the past two years (FY24-FY26Q1).

Figure 4-4: YoY Growth in Government, Consumption and Business Expenditures



Source: Steer Analysis of MOSPI Data

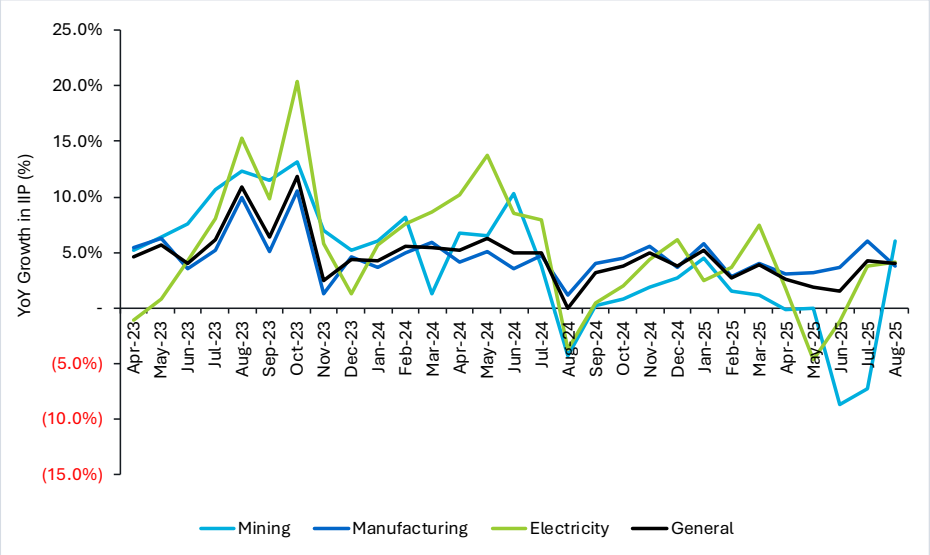
4.19 While consumption and investment expenditures have continued to show consistent growth over the past two quarters, government expenditures observed a marginal decline in FY25Q4. In FY26Q1, government expenditures rebounded, recording 7.4% growth over FY25Q1 levels.

4.20 Performance across different types of industrial activities (such as Mining, Manufacturing, and Power Generation) directly impact freight movement and commercial traffic volume growth across the country, including on the Asset. In Figure 4-5 below, we present growth trends in IIP – a measure that tracks the performance of the economy across these activities. As of FY26YTD (Apr-Aug '25), the Manufacturing sector continues to perform strongly, recording positive y-o-y growth since FY25Q3. While industrial activity across the

[13] Government of India, PIB Release Oct 1 '25

two other sectors (i.e., Power Generation and Mining) dropped between May and Jun/Jul '25, they have since rebounded and show signs of continued growth going forward.

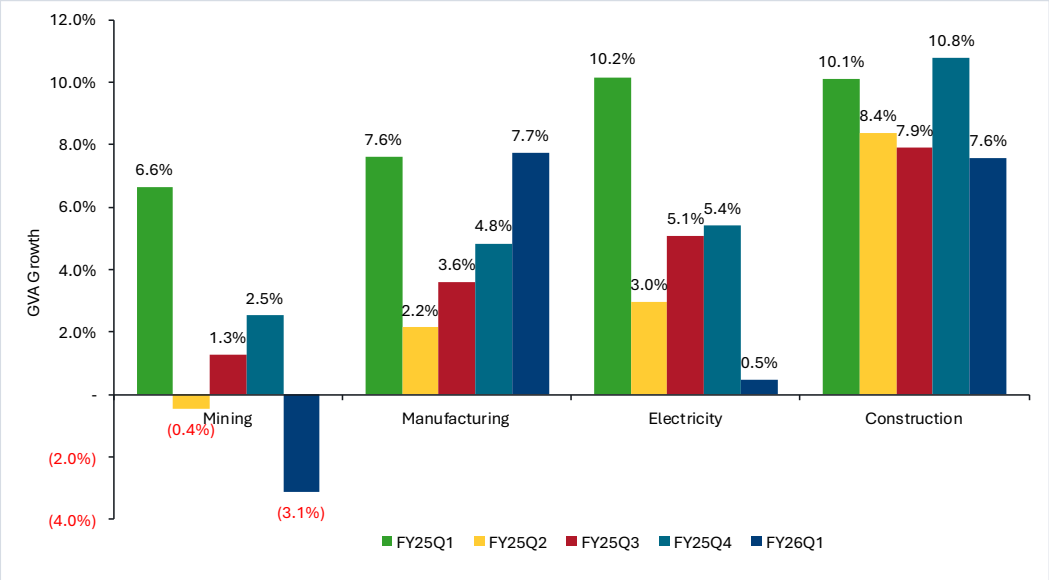
Figure 4-5: Month on Month IIP performance



Source: Steer Analysis of MOSPI Data

4.21 In addition to monthly trends in IIP, Figure 4-6 below presents y-o-y growth of quarterly GVA in four industrial sectors - Mining (& Quarrying), Manufacturing, Electricity (and other Utilities), and Construction. While the Mining and Power sectors observed decline and muted growth in FY26Q1, the Manufacturing and Construction sectors experienced strong growth. Generally, economic growth has remained resilient as of FY26YTD, but performance across industries have varied, impacting economic growth across different regions and on the Asset as well.

Figure 4-6: Industrial components of GVA



Source: Steer Analysis of MOSPI Data

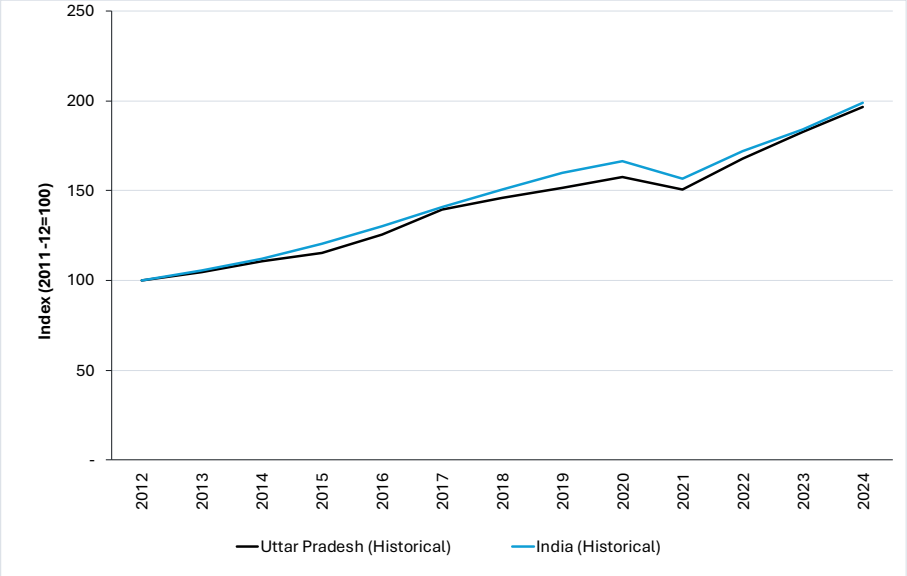
GDP and GSDP Growth

4.22 Over the period FY12-FY24, the Indian economic has grown at a CAGR of approx. 6% aided by growth in the tertiary sector which grew at a CAGR of approx. 6.9% over the same period.

4.23 The economic performance of Uttar Pradesh has been weaker than the country as a whole. The state contributes approximately 8% to India's GDP. In terms of sectoral contribution to the state GDP, tertiary sector has the highest share (47%) followed by secondary (28%) and primary (24%), with the sectoral shares remaining stable over the last few years.

4.24 The Figure 4-7 illustrates the evolution of Uttar Pradesh's GSDP.

Figure 4-7: Evolution of Uttar Pradesh's state GDP and national GDP



Source: Steer Analysis of MOSPI Data

4.25 Uttar Pradesh is the most populous state in India with a population of ~237 million people in FY24. The state has a large pool of skilled, semi-skilled and unskilled labour. Uttar Pradesh is also considered the largest consumer base in the country. The tertiary sector has the highest sectoral contribution to the state GDP followed by the secondary and primary sectors. These shares have remained stable for the past decade.

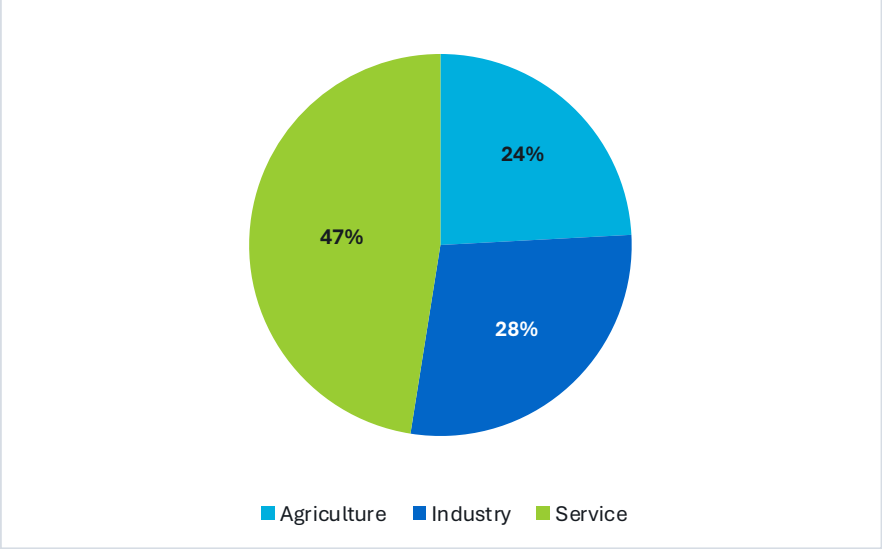
4.26 The tourism and transport sector constitute a majority of the state's tertiary sector. Uttar Pradesh is considered a favoured tourist destination in India, with key tourist attractions being Agra, Varanasi, Mathura and Prayagraj. In 2024, the state attracted the highest domestic tourist arrivals in the country with 649 million visits[14]. The state holds sixth position in the country in foreign tourist arrivals with over 2.3 million.

4.27 In terms of secondary sector, the state has key industrial areas in Khurja (Ceramic); Moradabad (Metals); Meerut, Bareilly, Mirzapur and Lucknow (Handloom & Handicrafts); and Kanpur and Noida (Leather and tannery). The state also has an oil refinery in Mathura, operated by Indian Oil Corporation.

[14] 'Tourist arrivals in U.P. surge by 17 cr in 2024 - Hindustan Times

4.28 Uttar Pradesh has very fertile Gangetic land with a large share of population dependent upon agriculture sector for the livelihood. The key primary industries in the state include food processing, crop production and horticulture. The state is mainly known for production of wheat, sugarcane, potato and mango.

Figure 4-8: Sectoral Distribution of GSDP of Uttar Pradesh for 2024



Source: Steer Analysis of MOSPI Data

4.29 The official historical GDP and GSDP data for India are released by the Ministry of Statistics and Program Implementation (MoSPI). The GDP forecasts for India are available from various reliable sources such as Oxford Economics and Consensus Economics[15], but state-specific GSDP forecasts are not published by any such sources. To derive state GSDP forecasts, we rely on past trends of the relationship between GDP and GSDP, and develop GSDP forecasts as a function of our assumed GDP forecasts[16].

4.30 For any indicator to be used as a growth driver to forecast traffic, a reliable source of historical and forecast data availability for that indicator is the key requirement. Of the key socioeconomic indicators discussed above, GDP was assessed to be the only growth driver for which reliable data is available both in terms of historical and forecast data. Therefore, to forecast traffic, we use GDP/GSDP as our key growth drivers.

Forecasts for growth drivers

4.31 Following the discussion in Chapter 4 on the nature of economic activity in the state of Uttar Pradesh, in this section, we describe the assumptions in relation to forecasts of the key macro-economic drivers of traffic growth. Particularly, we have based our forecast on GDP and GSDP using forecasts of GDP as provided by the Client.

[15] Consensus Economics - Economic Forecasts and Indicators

[16] Assuming that the historical long-term relationship between GSDP and GDP sustains over the short-term, we project future growth in GSDP as a function of our GDP growth forecast. We taper the relationship of GSDP growth to converge to GDP growth gradually over the long-term.

National GDP

4.32 After the last period of economic slowdown in FY11-12, the country experienced an economic downturn again in late FY19 with FY20 having reported a GDP growth of 4% (relative to an average growth rate of 7% per year between FY13 and FY19). India's GDP growth declined as domestic investment and consumption demand were already under stress because of the liquidity crunch before Covid-19. Other factors that contributed to the economic slowdown included reduced growth rates in automobile sales and production, liquidity crunch in credit markets and rising number of Non-Performing Assets (NPAs) within the banking sector, as well as lower manufacturing production and lower rural consumption.[17]

4.33 The Covid19 outbreak had a significant impact on the Indian economy during the first two quarters of FY21 as government mandated lockdowns across the country effectively stalled economic activity and growth. The growth momentum eventually picked up in Q3 of FY21, with a sharp rebound in the economy in FY22 (GDP recorded 9.7% growth over FY21), and has since observed a consistent growth of 7.6% in FY23, 9.2% in FY24 and 6.5% in FY25 (as per the SAE) before slowing down over the past year due to several domestic and external factors.

4.34 Figure 4-9 below shows client provided GDP projections. The forecast provided by the Client expects the Indian GDP to grow at 6.5% between FY25-FY27[18] and gradually tapering down to 5.2% by FY51, end of concession. The India GDP growth forecast provided by the Client is broadly in line with other independent forecasts available from reliable sources such as IMF, World Bank and RBI[19] in the medium term.

4.35 By comparing historical trends of regional GSDP growth with the national GDP growth we have established GSDP projections for each state. We assumed that as the Indian economy grows, the states which have historically grown at a faster pace will, over 10 years, see a slowdown in GSDP growth, tending to the national average, whereas the states that have grown slower than the national GDP will begin to pick-up. The GDP-GSDP gap would partially converge by 2040 and fully converge by 2049.

5 FY26 Base year AADT and Traffic growth Analysis

Introduction

5.1 In this section, we present our approach, assumptions, and estimates for base year AADT and background traffic growth for each vehicle category on the Asset.

5.2 Traffic growth is commonly related to a variety of macro-economic and industry- or commodity-specific factors (hereafter referred to as 'traffic growth drivers'). These growth drivers are typically identified from the results of the OD data analysis and the site visits that help us appreciate the nature of traffic movement – 'what' travels 'where' and 'why'.

5.3 While comprehensive historical data on the asset is not available, we have access to six years of records. Despite some inconsistencies, this dataset provides a reasonable foundation for analysis. As a result, statistical methods to estimate background growth relationships could not be applied. Instead, we conducted a benchmarking exercise, supported by trip length and origin-destination (OD) analysis, to derive elasticity estimates. These are discussed in detail below.

FY26 Base year AADT estimates

5.4 The base year is the year on which long-term background forecast growth rates are applied to derive year-wise average annual daily traffic (AADT) estimates for forecast years. This is therefore an important aspect of our forecasting approach as traffic and ultimately revenue forecasts for future years are built on top of the base year traffic estimate. We have used FY26 as the base year for AADT estimates for the forecast years.

5.5 As described previously in Chapter 3, to establish the base year (FY26) traffic position, we utilized information from various sources – including from the Client and our context knowledge, to assess a reasonable demand on the corridor.

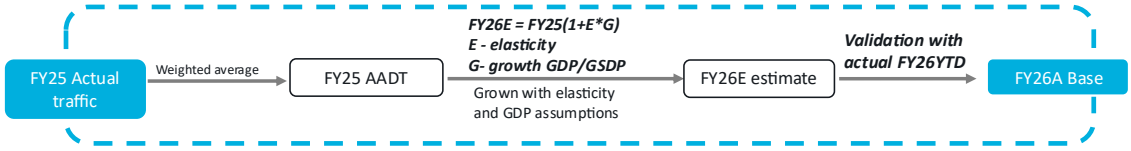
Methodology

5.6 The base traffic for FY26 has been estimated utilizing the actual 12 months of FY25. The weighted average of the actual FY25 traffic (April to March) was taken to arrive at annual FY25 AADT. Using elasticity-based growth assumptions GSDP or GDP we arrived at estimated FY26 (FY26E).

5.7 The monthly profile of the FY26E AADT was then compared to the actual traffic observed in the six months (April 2025 to September 2025) of FY26. The Adopted FY26 AADT (FY26A) is derived by making necessary adjustments to FY26E to reflect the outturn in traffic in FY26YTD (adjusted for seasonality).

5.8 The methodology is represented using the flow chart given below:

Figure 5-1: FY25 Base Estimation methodology



Source: Steer Analysis

5.9 The two key inputs to estimate the base year FY25 traffic are FY24 traffic and seasonality correction factor (SCF).

Seasonal Correction Factors

5.10 Traffic on any Asset varies on a month-on-month level. Such variations maybe due to monsoons (typically Jul to Sept) or due to specific festivals in the region. For e.g. It is observed that typically the truck traffic during the first half of the financial year (April-September) is lower than the annual average. This is mainly because of the peak summer season followed by monsoons affecting the freight movement patterns in larger parts of the country, largely in the July-September period. In addition, there may be other seasonal variations specific to a particular Asset.

5.11 To normalise for these variations across the year to provide an AADT estimate, Seasonality Correction Factors (SCF) are used. SCFs are estimated to convert the monthly traffic numbers to an AADT level while accounting for seasonal variation due to local/national festivals, weather changes and/or temporary external impacts. These are typically estimated using historical data for each plaza and vehicle category over multiple years. An SCF >1 means that the traffic for the month is lower than the annual average and vice-versa.

5.12 Historical traffic data was available for all toll vehicle categories starting October 2020 up-to Sept 2025.

5.13 The below table present the average of FY23 and FY24 SCF used to estimate the AADT for all categories except 3A and MAV for the Asset.

5.14 In the case of 3A and MAV FY23 SCF are considered since it better represents the actual seasonality of the traffic. FY25 is not considered due to construction activities occurring between Raebareli and Prayagraj thereby affecting the long-distance traffic on the Asset.

Table 5.1: SCF values for TP1 Dakhina Sekhpur

Vehicle Category	Apr	May	Jun	Jul	Aug	Sep	Oct	Nov	Dec	Jan	Feb	Mar
CJV	1.06	0.97	0.96	1.07	1.11	1.11	1.05	0.94	0.92	1.02	0.87	0.98
LCV	0.90	0.89	0.87	1.03	1.15	1.09	1.01	0.97	1.01	1.13	1.02	1.03
Bus	1.04	1.01	0.99	1.01	1.02	1.01	1.00	0.96	0.99	1.07	0.93	0.98
2A	0.96	0.90	0.83	1.05	1.15	1.10	1.03	1.02	0.97	1.08	0.98	1.04
3A	0.77	0.89	0.84	1.14	1.25	1.11	1.15	0.93	0.97	1.01	1.04	1.11
MAV	0.86	0.96	0.90	1.15	1.20	1.22	1.13	0.85	0.86	0.98	1.02	1.06

Source: Steer analysis based on benchmarks

Adopted base estimates

6.1 Based on the above methodology and inputs, the adopted base for the toll plaza has been shown below:

Table 5.2: Adopted base estimates AADT

	FY25	FY26YTD	FY26A	FY26A vs FY25
CJV	12,358	11,874	12,361	0.0%
LCV	404	371	362	(10.4%)
Bus	778	733	741	(4.8%)
2A	444	430	423	(4.6%)
3A	186	184	179	(3.9%)
MAV	694	669	700	0.9%
Total	**14,864**	**14,262**	**14,767**	**(0.7%)**
PCU	**19,520**	**18,721**	**19,287**	**(1.2%)**

Source: Steer analysis: Steer analysis: FY25 actual full year, FY26YTD includes 06 months (Apr-Sept) of FY26, FY26A is adopted base for FY26

5.15 A comparison between the FY26 adopted estimates and the FY25 actual traffic shows a marginal decline of (0.7%) in AADT and (1.2%) in PCU. However, this apparent de-growth is not indicative of a negative trend, but rather a normalization of traffic volumes following an exceptional surge during the Maha Kumbh Mela held in January–February 2025.

5.16 The Asset, which serves as a key feeder route to the pilgrimage site of Prayagraj, experienced a temporary spike in traffic across all vehicle categories driven by heightened tourist and pilgrim activity from regions such as Lucknow, Sitapur, and other parts of Uttar Pradesh. The FY26 estimates reflect a return to typical traffic patterns post-event.

5.17 In terms of goods traffic, the degrowth in 2A/3A/MAV traffic (a combined decrease of ~3%, in FY26) is mainly due to several local network improvement activities around the Asset including Purvanchal Expressway, Lucknow – Sultanpur, Varanasi, construction of Varanasi ring road where some share of traffic has already shifted to these alternate routes from the Asset.

5.18 Furthermore (as discussed in section 2.16) the ongoing construction of Raebareli–Unchahar section of NH-30, located south of the asset has further led to a diversion of long-distance traffic to alternate routes, including NH-731 and the Purvanchal Expressway, resulting in a decline in traffic volumes on the asset in FY26.

5.19 Given the Asset's enhanced connectivity to Prayagraj, the host city of the Kumbh Mela held every 12 years we anticipate short- to medium-term growth in CJV traffic. Furthermore, with continued government investments and road infrastructure development in Lucknow (as detailed in Chapter 3), both CJV and Goods traffic on the Asset are expected to maintain healthy growth from FY26 onwards.

Estimation of background elasticities

Overview

5.20 For the brownfield Assets, where sufficient historical traffic evolution is available, it is common practice to use regression model analysis to determine the relationship, expressed as elasticity, between traffic growth and key socioeconomic drivers. This relationship is then applied to assumptions of future socio-economic developments to estimate future traffic growth.

5.21 Due to the absence of a consistent historical trend for this Asset, we used a benchmarking approach to estimate our forecast elasticities. This benchmarking relied on several sources: our internal understanding of the Asset, the elasticities the client used in their bid for the TOT3 package, and the client's subsequent lender study. Additionally, we conducted regional benchmarking against assets with similar traffic profiles, which provides us with reasonable confidence in the proposed relationships.

5.22 In terms of selection of growth drivers for vehicle types, in general we have assumed state GSDP as the key driving factor for the CJVs and Buses given this traffic is generally driven by the local economies of the cities and state containing the Asset. The heavier commercial vehicles such as generally ply long-distance, and the underlying growth is governed by the general economies of several states or nation as whole.

5.23 Given the nascent stage of India's logistics sector, characterized by a highly fragmented trucking industry (95% of operators owning fewer than five trucks) and low car ownership rates (30-35 per 1000 people), the forecast elasticities are projected to remain constant throughout the concession period. This assumption is grounded in historical trends and a long-term perspective on regional and national growth, suggesting market maturity is still several years away.

5.24 The below table presents the growth drivers identified to model the forecast background traffic growth rates.

Table 5.3: Identified growth drivers to model traffic growth

Vehicle type	GDP India	GSDP Uttar Pradesh
Car	-	100%
LCV	-	100%
Bus	-	100%
2A	100%	
3A	100%	-
MAV	100%	-

Source: Steer

5.25 Further to developing estimates for FY26 AADT, the Asset has operational history between FY22 and FY25, proving us three years of traffic growth on the Asset. The table below summarises the volume growth across each of the vehicle categories. For this comparison we have normalised the FY22 AADT for COVID19 by adopting seasonally corrected H2FY22 as the FY22 normalised (FY22N)

Table 5.4: Passenger and Commercial growth with normalised FY22 – TP Dakhina

	FY22N	FY24	FY25	FY26A	FY22N-26 CAGR
CJV	10,834	10,747	12,358	12,361	4.5%
LCV	585	402	404	362	(12.3%)
Bus	652	689	778	741	3.2%
2A	608	450	444	423	(9.3%)
3A	497	237	186	179	(24.0%)
MAV	1,022	691	694	700	(8.8%)
OSV	-			-	-
Total	**14,198**	**13,218**	**14,864**	**14,767**	**1.7%**
PCUs	**20,418**	**17,803**	**19,520**	**19,287**	**(1.1%)**
Passenger	11,486	11,436	13,136	13,102	4.4%
Commercial	2,127	1,378	1,324	1,303	(12.0%)

Source: Steer Analysis; Note; Passenger includes CJV and Bus traffic whereas Commercial includes 2A/3A/MAV traffic

5.26 Asset observed a de-growth of 1% from FY22N to FY26 at the PCU level. Passenger traffic, which includes CJV and buses, is projected based on the state's GSDP, as the growth is driven by the regional local economy. Meanwhile, commercial traffic (2A/3A/MAV) is growing in relation to GDP, as the Asset lies on the NH30 corridor, which primarily facilitates movement between Delhi, Uttar Pradesh and Jharkhand. Any growth observed on the Asset is influenced by regions along this route.

5.27 The sections below detail out the reasoning for selection of respective growth driver(s) for each vehicle category.

Table 5.5: Elasticity recommendations for the Asset (Lucknow-Raebarelli)

Vehicle Category	Proposed Growth Driver	Elasticity	Comments
CJV	Uttar Pradesh GSDP	1.0	CJV cater to local movement (98% trips within state) between Lucknow, Raebareli and Allahabad. Strong car growth expected as these populous and big towns grow.
Mini LCV	Uttar Pradesh GSDP	0.4	The Mini LCV contribute largely to the local consumption demand of Lucknow-Raebareli region. These trips are predominantly short distance (under 300km). Considering this along with our experience across the toll roads in the region, we believe the assumption of 0.3 elasticity with the state GSDP to be appropriate.
Buses	Uttar Pradesh GSDP	0.5	It seems that buses currently are serving local intercity demand. As these cities grow, the buses are also expected to respond to the increasing demand however only at a 0.5 relationship to GSDP.

Vehicle Category	Proposed Growth Driver	Elasticity	Comments
LCV	Uttar Pradesh GSDP	0.4	LCV/2A contribute to the local consumption demand of Lucknow-Raebareli. The trip lengths of LCV and 2A category (up to 80%) are predominantly short distance <300Km. Which confirms the understanding that the movements cater to local demand. Considering the above observations, and our experience across other toll roads in the region, we believe that elasticities of 0.4 with respect to state GSDP are considered reasonable.
2A	GDP India	0.4	2A/3A/MAVs are primarily long-distance traffic carrying a healthy mix of commodities. Historically, the Asset saw a mix of medium and long-distance trips, with trip lengths for more than 80% of the MAV are more than 300km, signifying long distance nature of the movement. The Asset serves as a key connector for long-distance trucks travelling between Punjab, Haryana, Uttar Pradesh, West Bengal and Jharkhand. Therefor a relation of 0.5 to GDP has been considered to MAVs. We believe 3A to grow slower as compared to MAV as there is an increasing preference to use MAVs for long-distance movements, as discussed in Chapter 3 above.
3A	GDP India	0.3	
MAV	GDP India	0.5

6 Forecast: Network overlays and forecasts

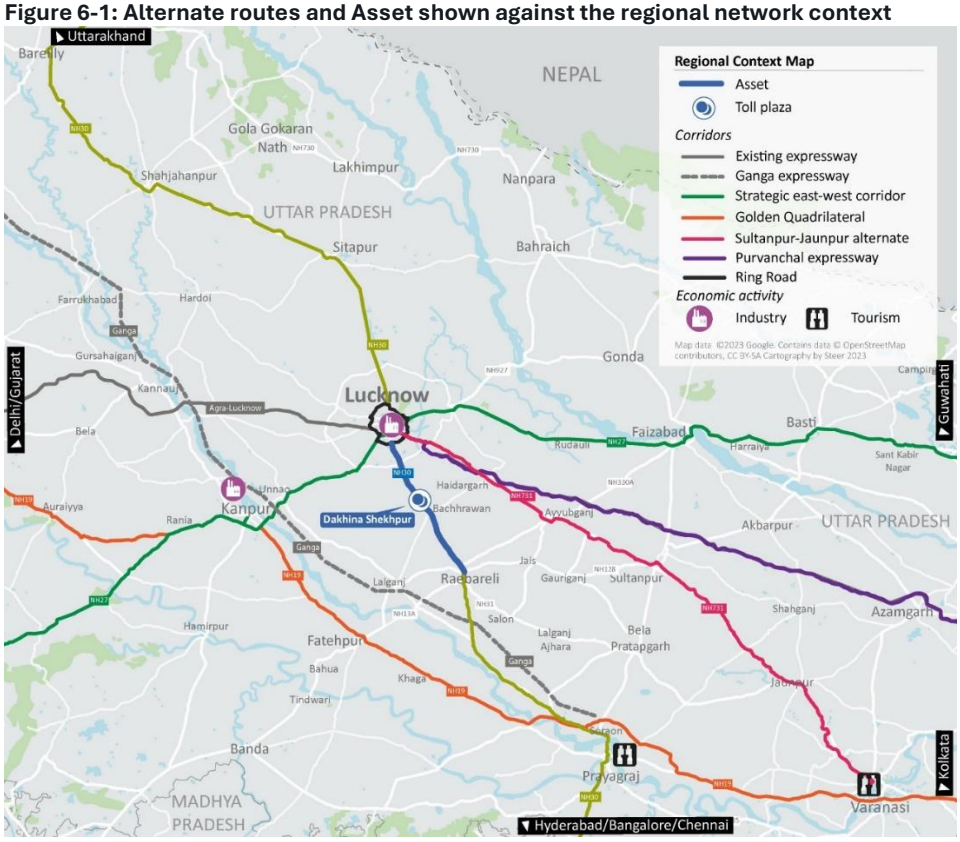
Introduction

6.2 Following the discussion on our forecast of background growth rates in the previous chapter, this chapter first covers the potential network impacts on traffic growth on the Asset. Thereafter, we present our assumptions around toll segmentation, trip factors and evolution of toll rates for the forecast period which are used to forecast revenues as derived from forecast traffic. In the final section, this chapter summarises traffic growth rates for the forecast years.

Analysis of potential network/developmental impacts

6.1 This section details the impacts which we believe would affect traffic on the Asset during the concession period. As discussed in previous Chapters, to assess the impacts on the Asset, whether positive or negative, we have studied developments (alternate roads, feeder roads and regulatory) in the surrounding road network.

Figure 6-1: Alternate routes and Asset shown against the regional network context



Source: Steer cartography using OpenStreetMap data

Ganga Expressway

6.2 A 594km greenfield six-lane expressway is being developed by the Uttar Pradesh Expressways Industrial Development Authority (UPEIDA) connecting Meerut and Prayagraj. The expressway will pass through 12 districts in Uttar Pradesh including Meerut, Shahjahanpur, Kannauj, Unnao, Rae Bareli, Prayagraj etc.

6.3 The benefits will be mostly valued by long and medium distance users which make end to end movements and movement between important districts compared to short distance users. This expressway is expected to be operational by Q4 FY26.

6.4 The table below shows the comparison of the key input toll, and time comparison via Asset and alternate.

Table 6.1: Toll & Time Comparison between Asset and Alternate

Vehicle category	Toll		Time	
	Via Asset	***Via Alternate***	***Via Asset***	***Via Alternate***
CJV	720	1,366	12	8
LCV	1,140	2,168	14	10
2A	2,360	4,598	15	10
3A	3,150	5,031	16	11
MAV	3,645	7,229	16	11

Table 6.2: Impact of Ganga Expressway

Vehicle category	FY27 onwards
Car	(0.2%)
2A	(1.2%)
3A	(2.0%)
MAV	(0.8%)

Source: Steer analysis; Considering 50% of the full impact will be applicable from FY27

Increase in Passenger Traffic due to Ardha-Kumbh and Maha Kumbh Mela

6.5 The Lucknow-Raebareli Asset acts as a feeder to the important pilgrimage site of Prayagraj. This holy site plays host to the Kumbh Mela every 12 years, which attracts tens of millions of devotees. It also hosts the Ardha-Kumbh every six years after the Kumbh.

6.6 Due to this, the years when these festivals are held, witness increased tourist activities which is reflected in an increase in Car and Bus volumes travelling from Lucknow, Sitapur and other parts of the state and country to Prayagraj.

6.7 The table below shows the impact of the Kumbh Mela on traffic volumes. This impact will recur at six-year intervals for Kumbh and Ardha-Kumbh respectively:

Table 6.3: Increase in Car and Bus traffic due to Kumbh Mela

Vehicle category	FY31 onwards (every 6 years)
CJV	2.1%
Buses	2.2%

Source: Steer analysis

Post - Construction Recovery

6.8 The Raebareli–Unchahar section of NH-30, located south of the project corridor, is currently undergoing upgradation to a 4-lane configuration, as discussed in Chapters 2 and 3. However, the ongoing construction work has led to the diversion of long-distance traffic from the project road to alternate routes, primarily NH-731 and the Purvanchal Expressway. This has resulted in a temporary decline in traffic volumes on the asset.

6.9 Presently, there is no official information to suggest when this project may be completed. However, online sources suggest the project is anticipated to be completed by June'25[6]. We have assumed completion of the project by Dec'25 to allow for any unanticipated delay in its eventual completion.

6.10 Once construction is complete, the diverted traffic is expected to return to our Asset resulting in positive impact from FY27 onwards.

Table 6.4: Post-Construction Impact on the Asset

Vehicle category	FY27-FY28	FY29 onwards
2A	0.8%-1.4%	1.9%
3A	0.3%-0.6%	0.9%
MAV	0.8%-1.4%	1.9%

Source: Steer analysis

Revenue forecasting assumptions

6.11 To forecast the revenues for a particular financial year, the traffic forecast for each vehicle type is converted into tickets sold, which is then multiplied with the corresponding toll rate, which grows over the years as defined in the Concession Agreement. While “trip factors” provide the conversion factor to the former, i.e., traffic (trips) to tickets sold, “toll segmentation” provides the latter i.e., the breakup of trips paying each ticket type. This section discusses assumptions related to trip factors, toll segmentation and toll rates for the forecast period.

Segmented traffic (CJV)= Total Traffic for CJV Segmentation share of CJV*

*Total revenue= Segmented traffic * Toll Rates a vehicle and ticket category/ Trip factor for a vehicle category*

Trip factors

6.12 Trip factors are used to calculate the revenue for the trips made on passes such as return, local personal, monthly passes. The trip factors assumed are based on the latest FY25 data available and listed in the table below:

Table 6.5: Trip factors at TP1 Dakhina Sekhpur

Forecast	CJV/MLCV	LCV	Bus	2A	3A	MAV
Single	1	1	1	1	1	1
Return	2	2	2	2	2	2
Monthly	45	45	50	45	45	45
Local Commercial	1	1	1	1	1	1
Local Personal	59	20	20	20	20	20

Source: Steer analysis of Client TMS data

Toll segmentation

6.13 The Ministry of Road Transport & Highways has finalized a compensation formula for existing toll concessionaires to offset revenue loss from the Annual Pass scheme for non-commercial vehicles.[20]

6.14 Across multiple assets, the number of passes sold has observed to be rising on a day-to-day basis, indicating an early adoption among frequent users since its introduction on 15th August 2025 till 30th September 2025, and a corresponding decline in other ticket categories mainly in the single and return categories. The evolution of proportion of users using the annual pass up to September 2025 is presented below:

	15th to 31st Aug	1st to 15th Sept	16th to 30th Sept
% CJV using Annual pass	7.9%	12.9%	15.2%

6.15 CJV Segmentation for FY26 has been developed using the pre annual pass segmentation till 14th August 2025, and daily Annual Pass transaction data from 15th August 2025 till 30th September 2025. Post September 2025, a gradual ramp up is assumed such that they form a large portion of the CJV trips by the end of FY26. This corresponds to a reduction in a proportionate decrease in single and return trips. For FY27 and beyond, we have assumed the share of annual pass trips to be in line with that observed at the end of March 2026, by when we believe the distribution of ticket categories in CJVs should stabilise.

6.16 In FY26, the share of CJVs using the Annual Pass is projected at **13%**, while from FY27, this share is expected to stabilize at **29%.**

Table 6.6: Segmentation for forecast years, TP1 Dakhina Sekhpur

Ticket type	CJV FY26	CJV FY27	MLCV	LCV	Bus	2A	3A	MAV
Single	23%	18%	27%	44%	5%	58%	43%	65%
Return	48%	37%	57%	53%	94%	37%	55%	29%
Local Commercial	0%	0%	-	1%	0.5%	3%	2%	6%

Annual Pass	**13%**	**29%**		-	-	-	-	-

Source: Steer analysis of Client TMS data; ticket segmentation for all vehicle categories other than CJVs are from FY26 onwards

6.17 The Annual pass compensation is separately calculated using the formula prescribed by NHAI in the same circular. Following Table 6.7 presents the Annual pass compensation computed for the toll plaza.

Table 6.7: Annual pass compensation for CJVs (in Crore)

Toll Plaza	FY26	FY28	FY33	FY38	FY43	FY51
Dakina Shekpur	5.2	14.4	23.5	39.1	66.8	141.2

Source: Steer Analysis

Toll evolution

6.18 Based on the concession agreement and the gazetted toll notification, we understand that base toll rates increase every year (revision month is April) based on WPI-linked inflation. These are rounded up to the nearest five to estimate the final toll rate charged to users.

6.19 We have used actual toll rates from the FY25 toll notifications and FY26 WPI to validate the modelling of future toll evolution. Increase in WPI was calculated based on the Client's WPI forecasts, as shown in the table below. The upward trend in inflation is expected to continue in the medium term, before gradually tapering to 4.1% in the long term.

Table 6.8: WPI growth forecast assumptions

Financial year	WPI growth (%)
FY26	2.57%
FY27	2.4%
FY28	5.0%
FY29	5.1%
FY30	4.9%
FY31	4.4%
FY32 onwards	4.1%

Source: FY27 onwards WPI print as per client inputs

Revenue reconciliation

6.20 As part of validating the data provided by the Client, as well as our assumptions around toll calculations, we have reconciled the actual reported revenue on a monthly level for the Asset.

6.21 The Steer revenue calculations have been built up from monthly raw traffic data files, containing monthly data and ticket type information; and the toll notifications – all shared by the client. The comparison, as shown in the table below, depicts the difference between modelled revenue and the reported revenue is within 0.3%, which gives us confidence in the long-term assumptions for trip segmentation and trip factors for revenue estimation.

Table 6.9: FY26YTD Revenue reconciliation summary

AADC Modelled (INR Lakhs)	AADC Reported (INR Lakhs)	Modelled vs Reported (Difference %)
18.7	18.8	(0.3%)

Source: Steer comparison between modelled and reported revenue

Traffic and Revenue forecasts

6.22 Based on the traffic and revenue-related forecast assumptions discussed above, we have modelled the traffic and revenue forecasts for the forecast period for the Asset. The table below presents the AADT/PCU and revenue forecast growth rates and CAGRs on this Asset. Further, Appendix B presents the AADT and revenues for the forecast period.

Table 6.10: Forecast traffic forecast for TP1 Dakhina Sekhpur

Vehicle Type	FY26	FY28	FY33	FY38	FY43	FY51

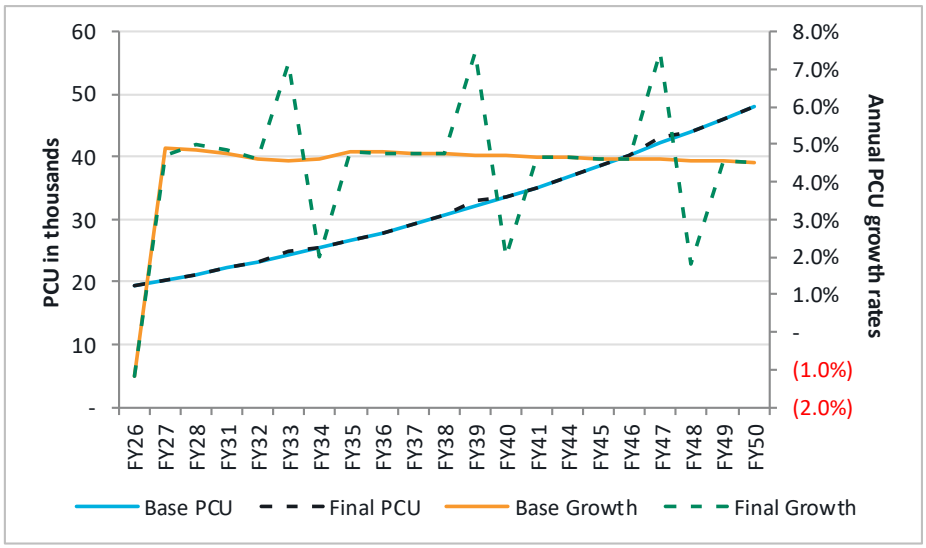
Figure 6-2 Forecast PCUs and growth rates at TP1 Dakhina Sekhpur



Source: Steer analysis

Target revenues and modification of concession period

6.23 As per the concession agreement, the target revenue should be 15.80 Cr for the month of March 2030 first calculation of target revenue and 38.02 Cr for the month of March 2040 for the second calculation of target revenue. The traffic sampling will be undertaken for a continuous period of 7 days during anytime within 15 days prior to the date on the specified year, previous year and following year. The average thereof will be deemed as 'actual revenue.'

6.24 If the target revenue falls short or exceeds by 20% and 30% for extensions 1 and 2 respectively, the concession period shall be deemed to be modified using the laid-out conditions in the concession agreement. The table below presents the summary of the analysis.

Table 6.14: Target Revenues for Extension 1

Asset	Target Month	Target Revenue	Estimated Revenue			Average Revenue	Variation (%)
		Cr	2029	2030	2031		
LR TP1	Mar-30	9.1	7.9	8.6	9.6	8.7	(4.0%)

Source: Steer analysis

Table 6.15: Target Revenues for Extension 2

Asset	Target Month	Target Revenue	Estimated Revenue			Average Revenue	Variation (%)
		Cr	2029	2030	2031		
LR TP1	Mar-40	21.6	19.0	20.7	22.6	20.8	(4.1%)

Source: Steer analysis

6.25 We have used the average AADT forecast for the target year, previous year and following year as a proxy for 'actual traffic.' We have forecast seasonality of March month to adjust for seasonal trends and arrive at March traffic from AADT traffic, which is then segmented according to the forecast toll segmentation and trip factors and multiplied with respective estimated toll rates to get to a monthly revenue collection.

6.26 As seen from the table above, the target revenue forecast for the Asset is lower than the concession agreement target revenue by around 4.0% for target date 1 and 4.1% for target date 2 respectively. As the difference below above the permitted threshold of 20% and 30% for target date 1 and 2 respectively, no change in the length of the concession agreement is expected.

Upside and Downside cases

Upside and Downside scenario assumptions

6.27 We have developed our base case scenario considering a balanced view on the risks associated with input assumptions around GDP growth and traffic growth elasticities. There is always a risk that the outturn values of these inputs will vary as compared to the

assumptions taken due to exogenous impacts, e.g. GDP growth could be influenced both positively and negatively by the impact of monsoons, export-import balances, political changes etc.

6.28 Similarly, traffic growth elasticities could be influenced by increased efficiencies achieved by technology, large shifts in commodity prices globally, changes in local manufacturing practices. However, at this stage we consider that the base case represents a central case scenario given the risks of variation of input assumptions.

6.29 To account for the possible variations in the growth drivers, we are also presenting an Upside (optimistic) and a Downside (pessimistic) scenario. These scenarios are defined by the following variations from the base assumptions:

Table 6.16: Summary of Macro-economic Assumptions for upside and downside cases

Input	Upside	Downside
Macro Assumptions		
GDP/GSDP	+1% every year	-1% every year
WPI	+1% every year	-1% every year
Elasticities	+ 10%	- 10%

Source: Steer analysis

6.30 Further, network developments are highly dependent on governmental directions, policies, legal and financial measure which might result in early or delayed completion of developments. Therefore, we have included an Upside (optimistic) and a Downside (pessimistic) case. However, at this stage, we consider that the base case represents a central case scenario given the risks of variation of input assumptions.

Impacts-Upside Case

6.31 The upside case impacts included in forecasts are summarised in below.

Table 6.17: Summary of impacts on the Assets

Development	Year of impact	Change in impact w.r.t base case	Magnitude of impact
Ganga Expressway	FY27*	+25% of base case	CJV: (0.1%) 2A: (0.9%) 3A: (1.5%) MAV: (0.6%)
Increase in Passenger traffic due to Ardhakumbh and Mahakumbh Mela	FY31* (30% of the impact for Ardh-Kumbh) FY37* (60% of the impact for Mahakumbh		CJV: 8.6% Bus: 9.1%
Post -Construction Recovery	FY27*	No Change	No Change

Source: Steer analysis; * Same as base case timeline

Impacts-Downside Case

6.32 The downside case impacts included in forecasts are summarised in below.

Table 6.18: Summary of impacts on the Assets

Development	Year of impact	Change in impact w.r.t base case	Magnitude of impact
Ganga Expressway	FY27*	-25% of base case	CJV: (0.2%) 2A: (1.5%) 3A: (2.5%) MAV: (1.0%)
Increase in Passenger traffic due to Ardhakumbh and Mahakumbh Mela	FY31* (30% of the impact for Ardh-Kumbh) FY37* (60% of the impact for Mahakumbh		CJV: 5.2% Bus: 5.5%
Post -Construction Recovery	FY27-FY29* (-ve impact) FY30-FY33* (+ve impact) FY34 onwards* (+ve impact)		2A: (1.3%) -(0.7%) 3A: (1.0%) -(0.5%) MAV: (1.6%) -(0.8%) 2A: 0.6% -1.8% 3A: 0.2% -0.9% MAV: 0.6% -1.8% 2A: 2.3% 3A: 1.1% MAV: 2.3%

Source: Steer analysis; * Same as base case timeline

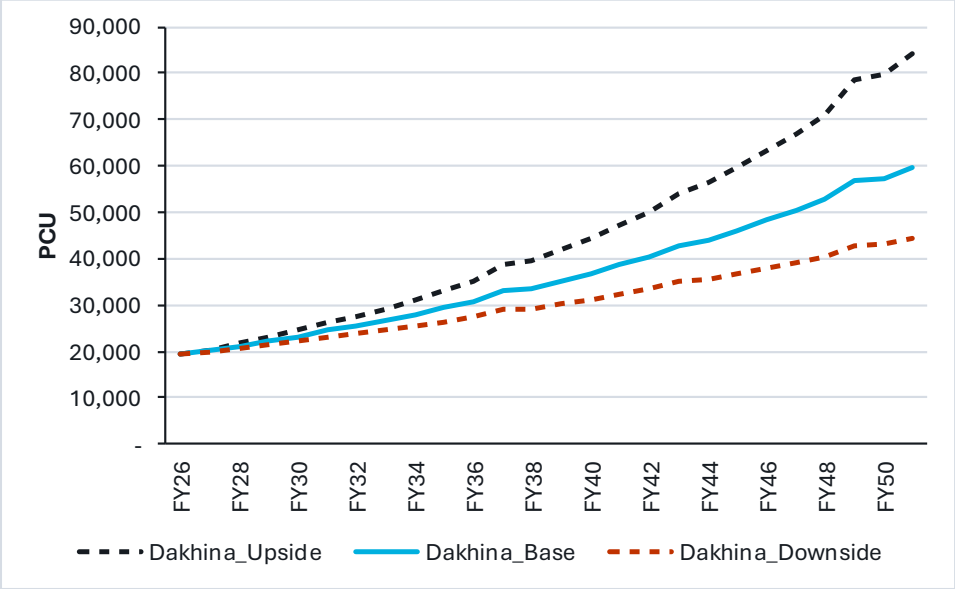
6.33 Based on the above assumptions for upside and downside scenarios, the following table summarizes the upside potential and downside risks associated with the PCU and the revenue for Dakhina Shekpur toll plazas at the end of the concession i.e. FY51.

Table 6.19: Upside potential and Downside PCU scenario – FY51

Toll Plaza	Upside Potential	Downside Risk
Dakhina Shekpur	40.9%	(25.9%)

Source: Steer Analysis of client data

Figure 6.3: Long term PCU forecasts for Dakhina Shekpur TP including upside and downside scenario



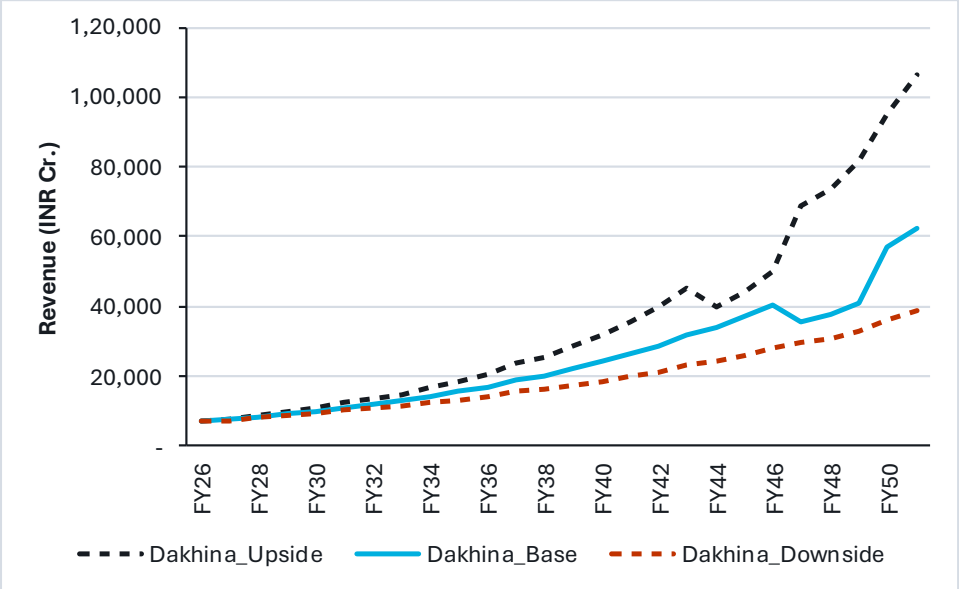
Source: Steer Analysis

Table 6.20: Upside potential and Downside Revenue scenario – FY51

Toll Plaza	Upside Potential	Downside Risk
Pundag	75.2%	(42.9%)

Source: Steer Analysis of client data

Figure 6.4: Long term Revenue forecasts for Dakhina Shekpur TP including upside and downside scenario



Source: Steer Analysis

6.34 Revenue projections exhibit variability in both the upside and downside cases, driven by fluctuations in macro-economic factors such as WPI, GDP/GSDP, elasticities and the network impacts.

Summary outlook

6.35 Passenger movement on the Asset is the largest share of traffic on this Asset. On one side is the state capital of Lucknow and on the other side is the state judicial capital and a major tourism/pilgrim centre of Prayagraj. Cars are expected to see a healthy growth on the Asset following the overall behavioural shift of users with the increasing per capita income.

6.36 The Asset benefits from its strategic location connecting the east-west movement of goods from Uttarakhand and Northern Uttar Pradesh towards South-eastern Uttar Pradesh, Jharkhand, and West Bengal. The 3A/MAV traffic on the Asset is a mix of regional and long-distance traffic carrying a variety of commodities ranging from agricultural products, manufacturing items and minerals. This portion of traffic is assumed to see a strong growth relationship with the national GDP and state GSDP.

6.37 Our findings and estimates in this report are based on our understanding from the site visit, analysis of primary data available both from surveys and the toll management system (both historical and current), macroeconomic assumptions prescribed by the Client, feedback gathered from Client meetings and secondary publicly available data. There can be both positive and negative risks associated with assumptions and the forecasts using them as summarised below:

6.38 Overall, we see a positive outlook for the region and the Asset, given that it serves major urban centres of Lucknow and Prayagraj and eastern Uttar Pradesh as a whole. The underlying growth drivers of the corridor are strong and are expected to deliver long term sustained growth.

Appendices

A Top 10 OD Pairs

A.1 Further to the OD analysis presented in Chapter 3 this appendix presents the top 10 OD pairs at each toll plaza. For both CJVs and MAVs and OSVs the top OD Pairs are combined below:

Table A.1: CJV, Bus and Mini Bus top 10 OD pair shares at TP1 Dakhina Sekhpur

	OD Pair	Share
1.	Raebareli-Lucknow	32%
2.	Lucknow-Prayagraj	13%
3.	Bachhrawan-Lucknow	8%
4.	Bachhrawan-nigoha	3%
5.	Lalganj-Lucknow	2%
6.	Lucknow-Pratapgarh	2%
7.	Mohanlalganj-Raebareli	2%
8.	Lucknow-Fatehpur	2%
9.	Mohanlalganj-Bachhrawan	2%
10.	Lucknow-Lucknow	1%

Table A.2: 3A and MAV top 10 OD pair shares at TP1 Dakhina Sekhpur

	OD Pair	Share
1.	Raebareli-Lucknow	15%
2.	Lucknow-Prayagraj	11%
3.	Lucknow-Varanasi	5%
4.	Bachhrawan-Lucknow	4%
5.	kundanganj-Lucknow	4%
6.	Lucknow-Banda	3%
7.	Lalganj-Lucknow	2%
8.	Varanasi-NCT of Delhi	2%
9.	Kanpur-Prayagraj	1%
10.	Lucknow-Pratapgarh	1%

B Data collection exercise

B.1 To validate and inform various inputs used in our forecasting, we undertook primary data collection on the Asset. OD survey data was collected on behalf of the Client, TVC surveys were commissioned by Steer with a third party. OD data collection typically involves manual data entry by enumerators based on oral surveys with road users crossing toll plazas. TVC data collection involves video-graphic capture of traffic passing crossing the toll plazas, followed by manual counting.

7 days TVC count

Disclaimer

This report has been produced for the sole benefit of Cube Highways Pvt. Ltd ("the Client"). The report may only be relied upon by Approved Addressees in accordance with the terms of our engagement letter. This Report (the "Report") is confidential and disclosed only for information purposes, and it may not be relied upon by any party other than the Client or a Party to a Reliance Letter, and Steer: a) makes no warranty, expressed or implied, with respect to the use of any information or methods disclosed in this Report; and b) assumes no liability with respect to the use of any information or methods disclosed in this document. Any such party by its acceptance or use of this Report releases Steer from any liability for direct, indirect, consequential, or special loss or damage whether arising in contract, warranty, express or implied, tort or otherwise.

The Report is based on standard professional efforts, and information available to us at the time the review took place and is subject to time and budget constraints of the Report's scope of work. This Report, information and statements contained herein, are all based on third party data provided to us, or sourced by us, and Steer has not sought to establish the reliability of the data, except as specifically stated in the Report. Steer bears no responsibility for the results of any actions taken on the basis of third-party data. Certain forward-looking statements in the Report are estimates based on interpretations or assessments of information available at the time of writing. The Report is thus to be viewed as an assessment that is time-relevant, specifically referring to conditions at the time of the review. Steer undertakes no obligation to update the Report for any reason. While the estimates contained in the Report are not precise forecasts, they do represent, in our view a reasonable expectation of the future, based on information we have been provided with or sourced. However, the estimates necessarily rely on numerous assumptions and judgements, and circumstances may occur over the timeframe of the project that go counter to these assumptions and judgements and that affect the project's realized revenues. Actual events may differ from those assumed, and events are subject to change. Therefore, Steer makes or provides no warranty, whether implied or otherwise, as to the accuracy of forward-looking information presented. Further, it is important to note that forecasts presented represent long term growth profiles; the results for individual time periods may vary from forecasted values.

Traffic Consultant developed the relationships in the models used to produce the forecasts for the projects based on data available through September 2025. This report does not consider variations in traffic performance due to changing macro and force majeure events such (but not limited to) as global wars, economic uncertainty (high inflation, global recession), and changes in the regulatory environment. The situation remains dynamic and is subject to significant change in the short and medium term. In this challenging context, Traffic Consultant has produced base forecasts with a view on a possible scenario for the traffic forecasts. However, it is important to note that this is only one view, and there continues to remain uncertainty as to the short-term, intermediate or prolonged effects of and responses to such macro-economic/force majeure events. As a result, no assurance can be provided by Traffic Consultant that the scenarios and assumptions Traffic Consultant has identified will prove to be accurate. Given the uncertainty inherent in this scenario, Traffic Consultant advises that all readers of the Report consider the Report in the context of their own assessment of the impact of such events.

TO THE FULLEST EXTENT PERMITTED BY APPLICABLE LAW, THE LIABILITY OF THE TRAFFIC CONSULTANT FOR ANY LOSS, DAMAGE, COST OR EXPENSE SUFFERED OR INCURRED BY ALL PERSONS OR ENTITIES AND FOR ALL CLAIMS RESPECTING ITS WORK PERFORMED IN CONNECTION WITH THE ISSUE OR THE REPORTS IS HEREBY LIMITED IN THE AGGREGATE TO THE AMOUNT OF FEES ACTUALLY PAID BY THE CLIENT TO THE TRAFFIC CONSULTANT IN RESPECT OF THE REPORTS AND CONNECTED SERVICES.

Glossary Items

Acronym	Meaning
2A/ Truck	2 Axle/ Truck
3A	3 Axle
AADT	Annual Average Daily Traffic

LMV	Light motor vehicles
MADT	Monthly average daily traffic
MAV	Multi Axle Vehicle
NH	National Highway
NHAI	National Highways Authority of India
NSDP	National State Domestic Production
OD	Origin Destination
OSV	Over sized vehicles
PCU	Passenger Car Unit; it is a measure of standard vehicle unit to convert all vehicle classes to a single unit by using PCU factors to compute total traffic on an Asset.
Q1	Quarter 1 of financial year, from April to June
Q2	Quarter 2 of financial year, from July to September
Q3	Quarter 3 of financial year, from October to December
Q4	Quarter 4 of financial year, from January to March
RNP	Registered Number Plate
SCF	Seasonality Correction Factor

Acronym	Meaning
SH	State Highway
T&R	Traffic and Revenue
TMS	Traffic Management System
TVC	Traffic Volume Count
WADT	Weekly average daily traffic
YTD	Year to Date

1 Introduction

The assignment

1.1 The Cube Highways Fund Advisors Private Limited (the "Client") has commissioned Steer Davies Gleave India Private Limited ("Steer") for a traffic due diligence to be carried out on the Mahua-Bharatpur Toll Road (hereafter called "Asset"). This report forms part of the annual fair market valuation (FMV) undertaken as part of the "Transit 10 project". This report presents an update of the traffic and revenue forecasts based on actual traffic data available up to September 2025 and latest macro-economic, and network assumptions.

1.2 The Asset Mahua-Bharatpur consists of a single stretch of toll road with two toll plazas. For the purpose of this report, we hereafter call the toll plazas present on the Asset as TP1 and TP2 respectively.

- TP1 – Amoli
- TP2 – Ludhawai

1.3 Our scope of work for the traffic and revenue forecasting process includes:

Table 1.1: Scope of work and sources of data

Scope of work	Data source
• Review of historical Traffic Management System (TMS) data, Origin-Destination (OD) data, Vendor reports and documents	• Provided by client for the period between Apr'09 and Sep'25
• Historical analysis and forecasts for baseline growth, including; — Background growth, — Seasonality	• Historical toll plaza data provided by Client and benchmarks from Assets in the vicinity wherever long time series historical data was not available
• Validation of Revenue reported in FY26YTD	• TMS data provided by Client • Revenue reconciliation using toll plaza traffic and ticket type data to calculate revenue and reconciling it with toll plaza reported revenue.
• Origin Destination (OD) analysis to understand growth drivers: — Zonal influence and Top OD pairs — Commodity distribution — Trip length distribution	• Origin Destination (OD) surveys undertaken by Steer in 2019 (TP1) and 2023 (TP2) respectively
• Analysis of upcoming network improvements and other developments, that may have future impacts on traffic	• Secondary research and our in-house experience of working in the vicinity of the Asset. Impact analysis to be conducted by Steer based on

Scope of work	Data source
	Generalised Journey Cost spreadsheet-based analysis
• Historical revenue analysis and forecasts for revenue estimation, including — Toll segmentation and trip factors, — Overloading shares,	• Calculated from historical data provided by Client
• Final traffic growth forecasts including baseline growth rates and potential future impacts •	• Elasticity based base growth and potential impacts from secondary research and Steer's in-house experience of working in the vicinity of the Asset
• Toll revenue estimation for the entire concession including toll evolution	• Toll evolution based on toll notification published by National Highway Authority of India (NHAI); and Gross Domestic Product (GDP) & Wholesale Price Index (WPI) trends as shared by the client

Our approach

1.4 Our approach follows well-established practices for forecasting ongoing traffic growth on an existing/brownfield Asset. The analysis focused on two sets of issues, namely:

- understanding the traffic that is currently using the Asset; and
- identifying how and why that traffic is likely to change in the future.

1.5 To understand the current traffic on the Asset, we have analysed traffic data from multiple independent sources:

- Client-provided secondary data, including:
  - TMS data starting April FY09 to September 2025
  - Concession agreement and toll notifications for FY25 and FY26
  - Previous studies related to traffic and revenue
  - Steer-commissioned OD survey on 27th June 2023 at TP2 of the Asset to validate any change in growth drivers and travel patterns.
  - Steer-commissioned TVC survey from 26th June 2023 to 29th June 2023 at TP2
- We undertook revenue reconciliation for FY26YTD, by building up revenue from the traffic reported by each of the toll plaza and subsequently match it to the reported revenue for FY26 using the prevalent toll rates and reported segmentation/toll-frequencies for FY26, this is a key part of our analysis to validate the segmentation/toll-frequency assumptions and the Annual Average Daily Traffic (AADT) reported for each of the toll plaza.

1.6 The estimation of future traffic demand on the Asset was undertaken through:

- Estimating FY26 base year position. The FY26 AADT was calculated using the monthly traffic data for FY25 and FY26YTD. The annual FY26 AADT was then grown with elasticity linked GDP/GSDP growth to arrive at the FY26 expected traffic. To determine the adopted FY26, the expected FY26 traffic was validated against six months of actual traffic (Apr-Sep 2025) and necessary adjustments were made where required.

- Secondary research to understand plans for new developments and progress of ongoing developments on the Asset.
- Steer independent primary surveys and site visits to validate our network and contextual understanding.
- Developing a bespoke growth model for each Asset/plaza/toll class to forecast year-on-year traffic growth from FY26 to the end of concession period.
- Investigating the elasticity of historical traffic growth compared to state (GSDP) and national (GDP) growth. Where historical data is limited, we have benchmarked the Asset against our Steer knowledge base (e.g., similar Asset types in the same state or on the same corridor), to derive appropriate elasticities.
- Applying our elasticities to independent GDP forecasts as provided by client.
- Identifying and analysing the potential impacts of any relevant changes to the competitive position of each Asset – these include impacts of changes to road network including expressways and opening of competitive modes of travel.
- Identifying and analysing any other potential impacts to traffic and revenue on each Asset – these include axle load norms, axle shift for heavy goods.
- Considering changes in trends of segmentation over time and making suggestions for changes in exemptions in the future
- Preparing traffic and revenue forecast for the Asset for the complete length of concession. The analysis here includes the specific impacts of network, or other exogenous factors specific to the Asset. We have developed a set of forecasting assumptions for three scenarios: a base case and upside and downside scenarios.

Contents of this report

1.7 The report has been divided into the following chapters, including Chapter 1 providing an introduction:

- Chapter 1 introduces the methodology and approach to undertake the traffic and revenue due diligence;
- Chapter 2 describes the key characteristics of the Asset and its surrounding road network, primarily based on site visits;
- Chapter 3 summarises the current and historical traffic on the Asset, including results from the TMS, TVC and OD analysis;
- Chapter 4 presents the socio-economic context of the corridor and region/state containing the Asset, along with our approach and results on estimating background traffic demand growth; and
- Chapter 5 presents our baseline year forecast and summarises our results on estimating background traffic demand growth
- Chapter 6 summarises our assessment of network impacts and presents concession traffic and revenue forecasts for the Asset along with the assumptions for upside and downside cases

2 The Asset

Introduction

2.1 This chapter provides a description of the Asset, primarily based on primary (site visits) data, our understanding of the region and network surrounding the Asset. We cover the strategic network context, followed by key economic activities and network developments around the Asset.

Strategic network

2.2 The Asset is situated in the state of Rajasthan, connecting Mahua to Bharatpur, near the border of Rajasthan with south-western Uttar Pradesh (UP).

2.3 Figure 2.1 shows the regional road network in which the Asset is located.

Figure 2.1: Asset location in the regional network context

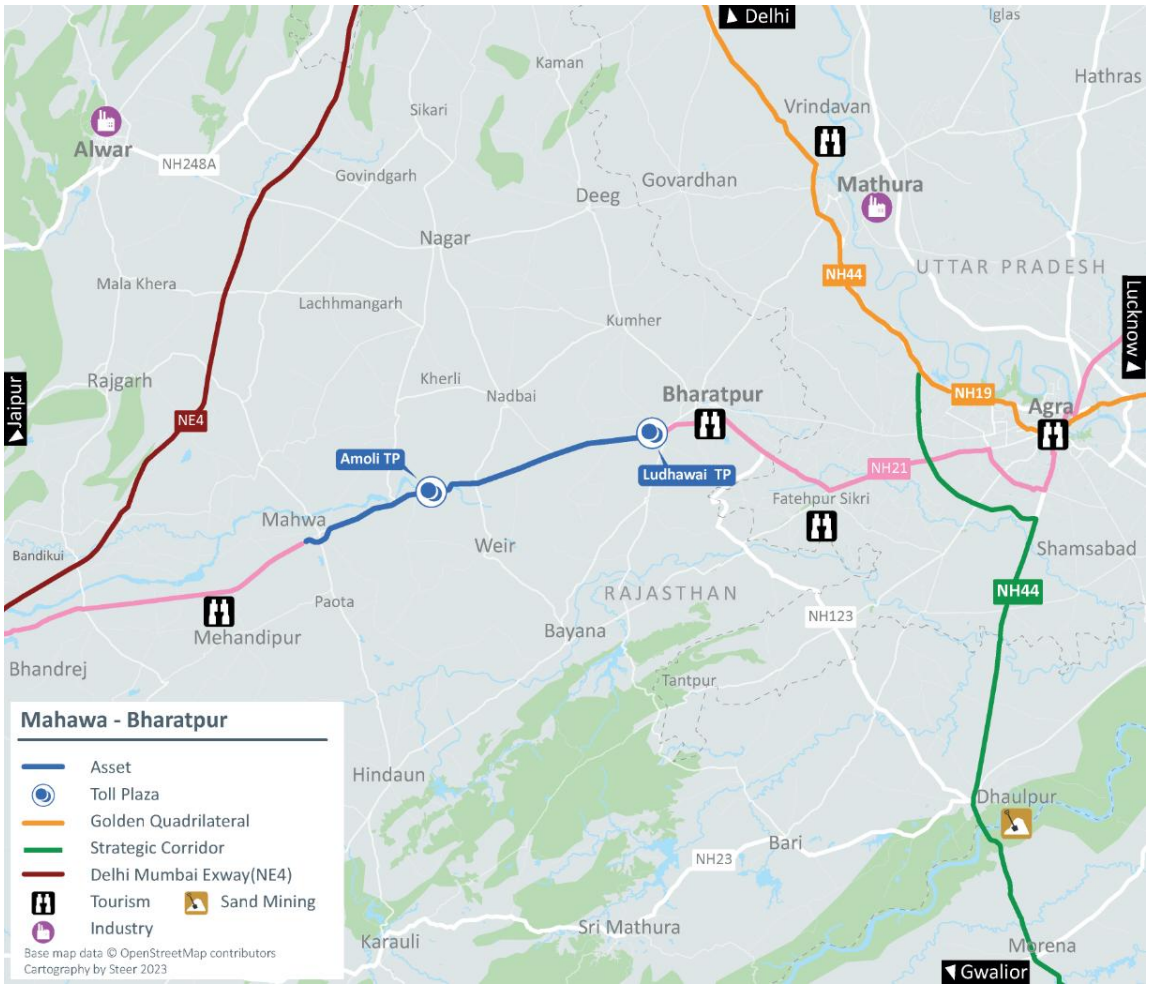
Source: Steer cartography using OpenStreetMap data

2.4 This Asset primarily caters to three different types of strategic movements:

- **Short-distance trips** including tourism and leisure trips between some of the most attractive tourist destinations in India. Such trips are mostly comprising of CJVs which are either local or run between key tourist locations of Agra and Bharatpur at one end and Jaipur on the other.
- **Medium-distance trips** between Rajasthan and Uttar Pradesh connect marble-processing sites of Rajasthan to its consumption sites in Uttar Pradesh. The Asset also transports significant number of manufactured products across the states of UP and Rajasthan.
- **Long-distance trips** between the region consisting of Gujarat and southern Rajasthan, and UP/East India connects ports and industries of western India to major consumption and production centres in North and East India.

2.5 The Asset is a 57.3 km toll road which forms a part of the NH 21 (Jaipur – Agra – Bareilly) in Rajasthan. This is a four-lane road with two toll plazas, namely, Amoli (TP1) at Km 98.5 (closer to Mahua) and Ludhawai (TP2) at Km 64.5 (closer to Bharatpur). Figure 2.2 provides a closer view of the Asset in the context of its immediate surroundings and location of toll plazas.

Figure 2.2: Asset context



Source: Steer cartography using OpenStreetMap data

Concession and tolling details

2.6 The toll plaza on the Asset have been operational since April 2009 and the Client took over the operations in May 2015. There are 7 years left in the concession period with FY32 being the last year of concession period. Table 2.1 presents a summary of the Asset.

Table 2.1: Summary of concession

Particulars	Details
State	Rajasthan
Highway and lane configuration	NH 21 four lane
Toll plazas	• TP1: Amoli • TP2: Ludhawai
Length (km) as per concession agreement, applicable	• TP1: 38.65 Km • TP2: 18.65 Km
Commencement of operations*	May 2009
Operated by Client since	May 2015
Concession period	25 years
Last year of concession	FY32

Source: Client data

2.7 Figure 2.3 shows a typical cross-section of the Asset and its toll plazas.

Figure 2.3: Typical cross section of the Asset road and toll plazas

Source: Steer site visit

2.8 The tolls on the Asset are collected for the following vehicle category with rates as shown in Table 2.2 below. The toll plazas have dedicated ETC/FASTag lanes for electronic tolling.

Table 2.2: Single toll rates on the Asset (INR), applicable July 2025 to June 2026

Type of Vehicle	Single Journey Fee	
	TP1 Amoli	TP2 Ludhawai
CJV	55	25
LCV	100	45
Bus/Truck	200	95
3A/MAV	320	155
HCM/EME/OSV	320	155

Source: NHAI Revision of User fee

2.9 The Asset currently issues tickets including single, local commercial, local personal and through ticket under NHAI concession. There are no return and monthly tickets issued on the Asset. The local commercial and local personal ticket categories are discounted single entry tickets for trips within 20kms and 10kms respectively. The Asset issues special category of "through ticket" where a user can buy a ticket for both plazas, a common ticket to cross the entire length, this ticket can be bought at either plaza which can be redeemed at another. Further, detailed information on this have been provided in Chapter 3 of the report.

Key Economic activities

2.10 Rajasthan is the largest state in India by area, sharing borders with five major states- Uttar Pradesh, Haryana, Punjab, Madhya Pradesh, and Gujarat. It is rich in natural resources particularly minerals and produces about 57 different minerals.[1] Predominantly an agrarian economy and a major producer of grains, oilseeds and edible oil, Rajasthan has seen a rise in the service sector recently wherein the sector contributed to 45% to state's GSDP in FY25 followed by agriculture at 30% and industries at 25%.[2]

Urban centres, business, and tourism

2.11 The state of Rajasthan and its bordering cities in UP (e.g. Agra and Mathura) are known for their tourist destinations. This contributes significantly to high passenger traffic volumes both within cities and on highways. The Bharatpur area with the presence of the Keoladeo Ghana National Park is a major attraction for tourists, known for its birds. The capital city of Jaipur, located on one end of the Asset, is a thriving urban city which is the main centre of administration, governance, culture, education, business and service sector in the state. It is a prominent tourism destination contributing majorly to the flourishing hospitality industry in the state. This reflects in considerable passenger volumes between the three nodes of India's Golden Triangle - Delhi, Jaipur and Agra – observed on the Asset engaged in tourism and related activities. In recent times, the city has also emerged as a promising hub for global outsourcing and IT industry. Jaipur's strategic location on the golden quadrilateral connects it with major industrial, agricultural, and cultural centres of Chennai, Kolkata, Delhi, and Mumbai.

[2] Rajasthan State Economic Survey 2024

Marble, cement, and sand

2.12 The State is also a leading producer of Masonry stone with around 136.1 million tonnes of production in FY24.[3] Areas such as Kishangarh, Kota and Dausa produce stone and sand, apart from being a hub of major marble processing centres, with a history of supplying marble to the rest of India.

2.13 Rajasthan accounts for 70 per cent of the country's stone production. There are 4,920 mining leases in the state[4]. Rajasthan produces 90 percent of the marble and sandstone in the country. In terms of Granite, in FY24 Rajasthan produced more than 10.4 million tonnes compared to 9.3 million tonnes in FY23[5]. This is due to the increased export demand from countries like US, China and Europe.

2.14 Sandmining in India has long faced issues of corruption involving local mafias and a lack of proper implementation of mining policies by the government. In November FY18, when Supreme Court order ruled the requirement of environmental clearances for all sand mines, including those less than five hectares of size, there was a reported drop in traffic carrying construction-related commodities on the Asset, particularly sand. However, in 2020, following the implementation of the Major and Minor Mineral Policy, the mining industry in the state was regularized by imposing a ban on illegal mining activities. Additionally, sand mining leases were reduced to two years, with an improved replenishment cycle. The policy also mandated the use of 25% M-Sand (manufactured sand) as an alternative to riverbed sand for construction activities in Rajasthan.

2.15 After the policy implementation, the combination of reduced legalized sand mining, award of leases, and increasing demand for construction material for local activities led to a continued demand for sand and other construction materials in the region. In terms of lease tenure related to this commodity within the Rajasthan mining policy:

- Sand mining leases- 2 years (re-award of new leases after 2 years): Additionally, to reduce illegal mining and allow for the full replenishment cycle of rivers in the region, the state government has reduced the validity of sand mining leases from the existing five years to two years.
- Aggregate mining leases- 5 years (re-award of new leases after 5 years)

Alternate Routes

2.16 For long-distance trips connecting Gujarat and southern Rajasthan to Uttar Pradesh and other eastward states, there is an alternative route along NH 27 that joins Udaipur and Kanpur via Chittorgarh-Kota-Jhansi. Majority of travel patterns are already well established and the choice between using NH27 vs. NH48 and the Asset for east-west movements has been established over a number of years. However, for a small proportion of traffic on NH27; the route via the Asset is expected to become more attractive as the key feeders of the Asset improve. In Chapter 6, we have discussed how the completion of southern bypass of Agra Ring Road improves the relative level of service

[3] Minor mineral production in Rajasthan

[4] 70% of stone production in India comes from Rajasthan: RIICO Chairman (knnindia.co.in)

[5] Granite production in Rajasthan

on the Asset corridor and has a positive impact. The traffic impact of Jaipur Ring Road is already part of the current volumes appearing on the Asset and no further adjustments have been made to the traffic forecasts.

2.17 During our site visit to the Asset, no major micro-diversions through local roads were observed close to the toll plazas. Chapter 6 provides a discussion and estimation of potential impacts on the Asset.

Delhi-Mumbai Expressway

2.18 The Delhi-Mumbai Expressway is a 1290-KM long greenfield expressway that has been developed to provide an improved 8-lane route to long-distance traffic between North/Western India to Mumbai. The competing movements which may choose to take the DME are as follows:

Traffic originating near Uttar Pradesh and Rajasthan

- Vehicles making trips between Northern Uttar Pradesh i.e Moradabad, Bareilly, Haldwani going towards Jaipur/Alwar/Rajasthan which earlier made the trip via NH21 section of Moradabad- Aligarh- Mathura- Bharatpur- Amoli- Amoli – Mahwa – Laxmangarh – Alwar, now has an alternative available in the form of the DME which provides direct connectivity from Faridabad. The alternative route will materialise as a conjunction of the DME and the Faridabad bypass. It will provide connectivity from Dausa – NE4 – Faridabad bypass at Kaligaon.
- By virtue of the route being supplemented by the Faridabad bypass, traffic destined to Delhi and north will get access to smoother passage by being able to avoid entering the city altogether.

2.19 An additional spur has been constructed between Bandikui on NE4 and Bagrana on the Jaipur Ring Road (which is located west of TP1). This spur has been operational since July 2025. As a result, a significant part of the increase in volumes observed by virtue of the DME is expected to be lost since access to Jaipur will not require the passage of traffic via the Asset. Based on the site observation, the section wise update on the Delhi Mumbai Expressway section is given below:

Table 2.3: Section Wise Delhi Mumbai Expressway status

S. No	Section	Length (in km)	Sub-Section	State	Status	Expected Data of Completion
1	Delhi-Faridabad-KMP	59	Faridabad-KMP	Delhi, Haryana	Operational	Opened Nov'24
2	Sohna-KMP-Vadodara	844	Sohna – Sawai Moadhopur	Haryana	Operational	Opened Sept'23
			Sawai-Madhopur-Jhalawar	Sawai-Madhopur-Jhalawar	Under Construction	Expected end of FY26 (75-90%

S. No	Section	Length (in km)	Sub-Section	State	Status	Expected Data of Completion
						construction completed)[67]
			Jhalawar-Timarwani	Jhalawar-Timarwani	Operational	Opened Sept'23
			Timarwani-Vadodara	Madhya Pradesh, Gujarat	Under Construction	Expected Dec 2025 (75-80% construction completed)[8]
3	Vadodara – Virar	354	Vadodara-Bharuch	Gujarat	Operational	Opened Feb'24
			Bharuch-Virar	Gujarat, Maharashtra	Under Construction	Expected October 2025 (50-60% construction completed)[9]
4	Virar- JNPT	92	Virar- JNPT	Maharashtra	Under Construction	Expected FY28
Spur Development						
5	Jaipur – Bandikui Expressway	67	Jaipur – Bandikui	Rajasthan	Operational	Operational starting July 2025

3 Traffic Description

Introduction

3.1 This chapter outlines the historical and current traffic and revenues on the Asset, as well as our analysis of origin-destination (OD) data and traffic volume count (TVC) data. This includes data collected as a part of this study and previous studies of this Asset, as well as data provided by the Client.

3.2 Traffic demand data is generally collected and analysed to understand the volume and vehicle composition of demand currently using the Asset, while OD data is used to obtain a better understanding of commodity movements, travel patterns, trip lengths, trip purposes and areas of influence in the vicinity of the Asset, as well as the commodities being moved by goods vehicle. This analysis, combined with our understanding of the Asset (based on our site visits), enables us to identify the key drivers of demand, on the Asset.

3.3 Actual toll plaza data is used as the primary basis from which the current/base year annual average daily traffic (AADT) is established. This data is typically provided by the Client and independently analysed and validated by us using traffic volume count (TVC) information.

PCU factors considered for reporting

3.4 The PCU values have been taken from 'IRC 64:1990- Guidelines for Capacity of Roads in Rural Areas'. For MAV, based on the discussion with the Client, we have referred to the rigid and trailer splits in the latest TVC counts conducted in 2023 for calculating the effective PCU for MAVs. For rigid trailer trucks we have assumed a PCU factor of 3, whereas for trailer trucks we have assumed a PCU factor of 4.5. These factors have been used to arrive at the PCU values presented in the following sections.

Table 3.1: PCU factors

Vehicle Category	PCU Factor
CJV	1.0
Mini LCV	1.0
LCV	1.5
Bus/2A/3A	3.0
MAV	3.99
OSV	4.5

Source: Steer analysis and IRC64,1990

Historical trends

3.5 The following table presents the historical variation in traffic volume at both the Asset plazas, in terms of total AADT, vehicle shares and yearly volume growth. The table below shows the traffic evolution on TP1 and TP2 of recent years FY16-25YTD.

Table 3.2: Historical evolution in AADT by vehicle class at TP1 – Amoli

Class	FY16	FY17	FY18	FY19	FY20	FY21	FY22	FY23	FY24	FY25	FY26 YTD	CAGR (20-25)	CAGR (16-25)

Source: Steer analysis of Client data; FY26YTD includes data between April 2025 and September 2025

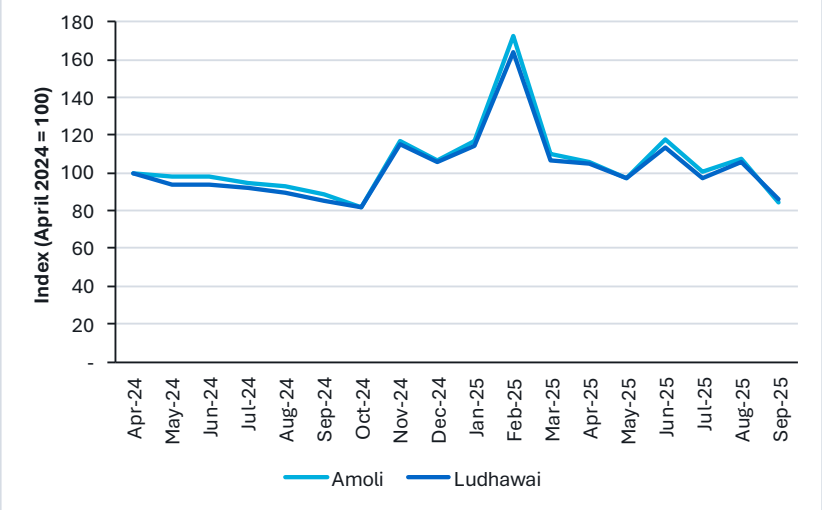
Figure 3.1: Passenger Traffic trends on the Asset (April 2024 to September 2025)



Source: Steer analysis of Client data

3.7 On the Asset, a slowdown was observed between FY19 and FY20, driven by a combination of factors:

- Completion of large construction activities in the vicinity (Agra-Lucknow expressway) – negative traffic impact due to construction
- Construction activity on a key feeder route (Dausa-Lalsot) - traffic loss due to construction
- Construction of Jaipur ring road - negative traffic impact due to construction
- Revision in axle load norms and economic slowdown - observed over seven quarters starting FY19 up to Q3 FY20 resulting a negative impact on Asset's traffic

3.8 As of FY26YTD, the Asset is recording ~30,000 PCUs, with both plazas witnessing similar trends on a PCU as well as vehicle level. In terms of vehicle composition, CJVs are the largest contributors, accounting for over 50% of the traffic, followed by MAVs with a share of around 30%.

3.9 In terms of traffic growth, FY26YTD (April-September) showed positive trends, with TP1 and TP2 experiencing PCU growth rates of 3.4% and 3.9% respectively compared to FY25. However, historical analysis from FY16-25 indicates a flat 3A/MAV growth trajectory, with TP1 (Amoli) registering a modest 1.1% CAGR and TP2 (Ludhawai) observing a slightly

higher 1.6% CAGR over the same period. This stagnant trend is attributed to various factors affecting goods vehicle growth, including the diversion of traffic due to the opening of the Delhi Mumbai Expressway in February 2023 and fluctuations caused by erratic rainfall and holiday seasons like Diwali, particularly evident in lower October traffic volumes. The DME/NE4 in conjunction with the Faridabad bypass now provides a better alternative to vehicles moving between Uttar Pradesh and Rajasthan.

3.10 3A+MAVs maintain significant importance as the second-largest traffic contributor on the Asset, both historically and in FY26YTD. They hold a substantial share of 27% at TP1 and 25% at TP2. This dominance in traffic is linked to the state's thriving marble and sand mining activities, which generate substantial demand for goods transportation services. Overall, the combination of historical trends and current insights highlights the dynamic nature of traffic patterns, influenced by infrastructural developments, regulatory changes, and regional economic activities.

3.11 For CJVs, TP1 witnessed a strong 8.1% CAGR between FY16 and FY25, while TP2 recorded a commendable 9.2% CAGR during the same period. This can be largely attributed to the upswing in tourism activity in Rajasthan, coupled with the reopening of popular tourist destinations. Notably, TP2 outpaced TP1 in growth due to its strategic proximity to pilgrimage sites such as Mahendipur Balaji, Mahua, and Agra, which experienced a surge in daily CJV trips. Additionally, TP2's direct connectivity to Morena and Gwalior via NH21 further bolstered the higher traffic volumes observed in this region.

3.12 Additionally, there's notable rise in car volumes during Jan'25, as seen Figure 3.1 above, driven by increased travel to the 2025 Maha Kumbh Mela in Prayagraj [10]. As a result, passenger traffic on the Asset witnessed a substantial increase in pilgrim-related volumes during Jan 2025 on both toll plazas. This is an one time increase and hence has been considered as an one time increase in our forecasts.

3.13 LCV's on both the plazas are witnessing a dropping trend historically (reduced by 13.4% CAGR at Amoli and 14.4% CAGR at Ludhawai) between FY16-25. This is attributed to the shift happening between LCV and 2A, and some mini-LCV counted under LCV category being now reclassified under the CJV category post implementation of FASTag.

3.14 On MBEL, 2A and Buses have the same toll rates. (INR 200 and INR 95 for TP1 and TP2 respectively for a single ticket in FY26) and so do 3A and MAV (INR 320 and INR 155 for TP1 and TP2 respectively for a single ticket in FY26). Although 2A and Buses share the same toll rate, the current TMS reports them as separate categories. In contrast, 3A and MAV are combined into a single category. However, post FASTag implementation there has been a reclassification of Buses and 2As which are now tolled basis their vehicle mapping. To accurately assess the historical growth of these categories and adjust for any discrepancies due to this reclassification, we have combined the 2A and Bus categories for our analysis.

3.15 To further validate individual growth of each category (Bus/2A/3A/MAV), we conducted independent counts at various points in time to ensure the true representation of individual volumes for the asset. The results of the split are presented in the 'Key findings of the TVC data analysis' section of Chapter 3 of the report. Therefore, the split that we

[10] The Maha Kumbh Mela, held once every 144 years, is regarded as a once-in-a-lifetime spiritual event, significantly influencing regional traffic patterns.

have derived from our counts is the split we are using in our projection to forecast the growth of each individual category for this Asset.

3.16 Overall, on the Asset level, CJV witnessed healthy five-year traffic growth of 13.1% from FY20-25 at TP1 and 12.9% at TP2 respectively. It is mostly driven by increased tourism activity in Rajasthan and re-opening of tourist places which increased daily CJV trips where TP2 witnessed higher growth due to its direct connectivity to Morena and Gwalior via NH21 further bolstered the higher traffic volumes observed in this region

3.17 The trend of tollable traffic on the Asset has largely followed that of total traffic. TP1 has recorded 3.3% tollable PCU growth in FY16-25 which is 3.2% in total whereas TP2 recorded 3.4% tollable PCU growth which is 3.8% in total.

Historical Revenue

3.18 Table 3.5 below presents the reported historical revenue on the Asset.

Table 3.5: Historical revenue evolution (in INR crores) and AADC (in INR Lakh) :

		FY16	FY17	FY18	FY19	FY20	FY21	FY22	FY23	FY24	FY25	FY26 YTD	CAGR (20-25)	CAGR (16-25)
Amoli	Total	31.9	31.5	41.0	39.1	42.8	44.0	53.5	62.7	68.6	74.2	30.8	-	-
	AADC	8.7	8.6	11.2	10.7	11.7	12.1	14.6	17.2	18.7	20.3	20.2	11.6%	9.8%
Ludhawai	Total	20.8	26.5	31.1	28.7	28.4	21.6	27.1	31.7	34.3	36.8	15.3	-	-
	AADC	5.7	7.3	8.5	7.9	7.8	5.9	7.4	8.7	9.4	10.1	10.0	5.3%	6.6%
Asset (Cr)		52.7	58.0	72.1	67.8	71.3	65.6	80.7	94.4	102.9	111.0	46.2	9.6%	8.7%

Source: Steer analysis of the Client data, FY25YTD included data till Sept'25

3.19 The revenue collection for the Asset has increased from INR 52.7 Cr in FY16 to INR 111.0 Cr in FY25, witnessing a CAGR of 8.7%. This is with the positive increase in 3A and MAV construction traffic on the Asset. Per day collection on the Asset has increased from INR 25.9 lakh in FY23 to INR 30.4 lakh in FY25 whereas FY26YTD (till September 2025) is reporting INR 30.2 Lakh. This growth can be attributed to various factors, including increased tourism activity in Rajasthan and re-opening of tourist places which led to positive revenue increase on the Asset. Positive tick in revenue prior FY23 is due to post-pandemic recovery, as discussed earlier.

3.20 Furthermore, an increase in overloading revenue has contributed to higher revenue receipts from FY22 onwards. In FY25, the daily overloading collection at Amoli is INR 0.91 lakhs, while at Ludhawai, it stands at INR 0.44 lakhs.

Toll Frequencies

3.21 Toll frequency or segmentation is typically the share of each ticket category recorded for a particular vehicle type. Each vehicle category has different segmentation. As a part of historical analysis, we calculate the toll frequency for each vehicle category from the monthly data shared by the client. The most common ticket categories observed on a typical National Highway concession are: Single, Return, Monthly, Local and Exempt. Given the local nature of traffic, some Assets offer custom made local passes to attract the local commuters to opt for these category passes instead of evading toll. Brief description of different ticket-types is given in the subsequent table.

3.22 Understanding the toll frequency gives insights into the nature of traffic. CJVs generally have higher shares of return passes or monthly passes, while heavy trucks mostly have single tickets since they travel long distance. However, this varies from Asset to Asset or even toll plaza to toll plaza. The Asset catering to short distance local traffic generally observes high share of return or other local monthly passes while the Asset catering to strategic long-distance traffic generally observes high share of single ticket traffic. The same can be verified through OD data where the vehicle category with high single ticket shares would have longer trip length with one of their trip end outside the Asset state. Other reasons for high single shares include the absence of return, local passes, through in and through-out tickets issued on the Asset. This is especially post- FASTag implementation where the user is allowed to pay at each toll plaza.

3.23 Single ticket category is highest share across vehicle categories on both the plazas. In case of CJV, over 90% of trips are under single where 80% of CJV's appearing on the Asset have one of their trip end in Rajasthan, Uttar Pradesh or Gujarat. For MAV as well single is the highest ticket issued category which is justified by the trip length where at all plazas of the Asset more than 60% of MAV trips as reported in FY23 are over 500kms moving towards Gujarat, Central and North India. This is also verified by internal-external analysis where around 45% MAV trips have one of their ends outside the Asset state. Post FASTag implementation local passes like monthly, through in and through-out got discontinued on the Asset which is another possible behind increasing shares Single ticket for each vehicle category.

3.24 However, on this Asset since return and monthly passes are not available, 90% of the tickets issued are single. Primarily, the traffic which is not eligible for local personal and commercial passes have single ticket as the only option, which explains high share of single traffic on the Asset, as discussed in the next section.

3.25 The following are the types of tickets being sold at the plazas of the Asset.

Table 3.6: Typical ticket types sold at NHAI plazas

Category	Description
Single	Allows the vehicle to cross the toll plaza once
Local Personal	Discounted monthly pass only for private cars of residents within 20km radius of toll plaza
Local Commercial	50% discount on single trips for commercial vehicles registered in the local district
Exemptions	Officially exempted vehicles like ambulance, police cars, key political personnel etc.
Through traffic	Allows vehicle to buy ticket one plaza of the Asset and get redeemed at another and vice versa

Introduction of Annual pass for CJVs

3.26 The National Highway Authority of India launched the "The FASTag Annual Pass" on August 15, 2025, a prepaid facility that allows private CJVs to travel across designated National Highway and National Expressway toll plazas. The annual pass is worth INR 3,000. The pass is valid for one year or 200 trips, whichever occurs first and is applicable only to private, non-commercial vehicles (Car/Jeep/Vans).

Since this pass has been introduced by NHAI, it is not valid on

- state governed toll plazas on highways
- state governed toll plazas expressways
- Parking areas or other non-NHAI tolling locations

3.27 The pass can be activated via the RajmargYatra app or the NHAI website, and links directly to an existing FASTag.

The Annual Pass aims to:

- Promote cashless and seamless travel on national highways.
- Reduce congestion and improve traffic flow at tolls
- Provide cost-effective travel for frequent users of NH/NE toll roads

FASTag implementation

3.28 Government of India has introduced (and more recently, mandated) Electronic Toll Collection (ETC) across National Highways in India, collected via "FASTag". The timeline of ETC implementation is presented in the following table.

Table 3.7: Timeline of national ETC implementation

Date	ETC Development
2014	FASTag system set up as a pilot on the Ahmedabad to Mumbai stretch of the Golden Quadrilateral, in November 2014 it was also implemented on the Delhi to Mumbai stretch of the Quadrilateral.
December 2019	FASTag is made mandatory on all National Highways with only one lane on either side keep as a Cash lane, cash users entering ETC lanes were charged double the toll.
February 2021	FASTag is made mandatory for all vehicles at every toll plaza in the country starting 15th Feb 2021

Source: NHAI.gov.in and Wikipedia

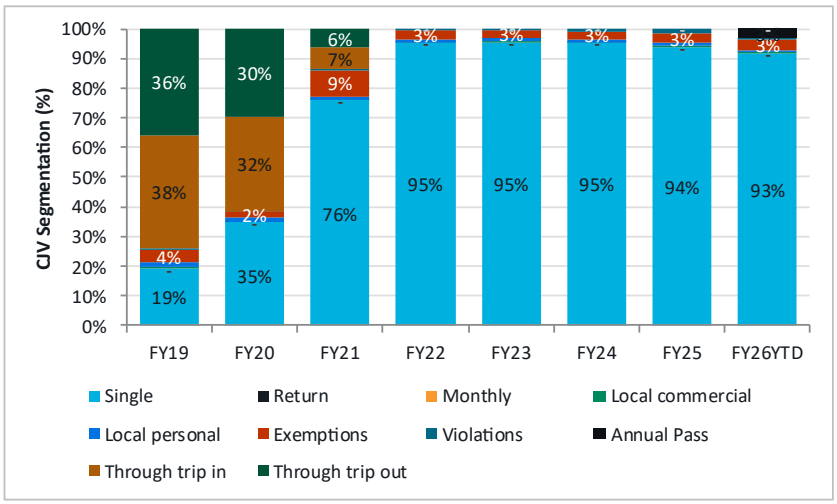
3.29 As we can see from Table 3.7 above most of the categories of vehicle types across the toll plaza are reporting more than 95% FASTag penetration, with CJV's also reporting more than 90% proportions. These high penetration levels improve the overall service levels of the toll plaza and reduces the transaction time.

Segmentation

3.30 FY21 was a partial year in terms of operation of the toll plazas. Further, there was a change in ticket patterns due to the mandatory implementation of FASTag as a mode of payment (share of single tickets increased in FY21). FY22 was also impacted by 2nd wave of COVID-19 in Q1 and Q2 of FY22. Hence during this period travel patterns were also disrupted, with more shorter trips being undertaken since several states implemented state entry barriers, resulting in an increase in the proportion of short distance trips. By Q3FY22 travel patterns returned to normal levels and hence, it is assumed that segmentation after FY22 is considered to be normal. With FY21 and FY22 being Covid-19 impacted it is assumed that segmentation of FY23 onwards is normal. The resultant segmentation, therefore, has been assumed as the forecast segmentation as well.

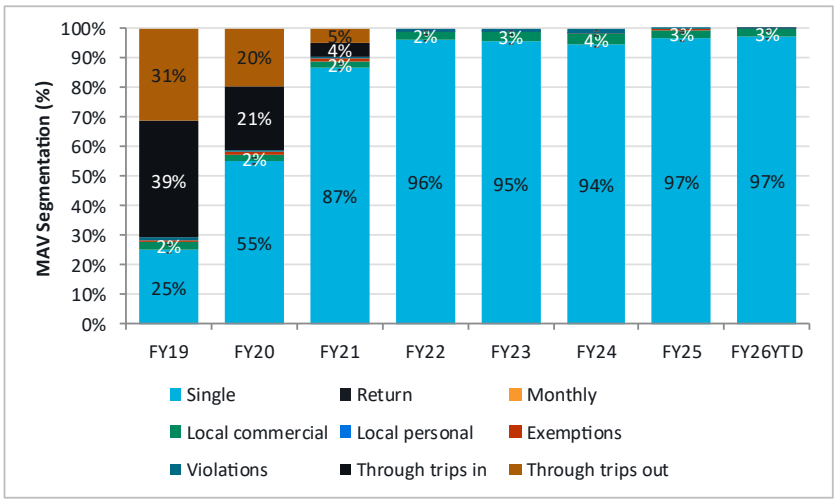
3.31 The following figures provide the toll segmentation for the historical years at TP1 Amoli and TP2 Ludhawai for CJV and MAV while the table provides the same for the remaining vehicle types.

Figure 3.2 Ticket-segmentation for CJV at TP1 Amoli



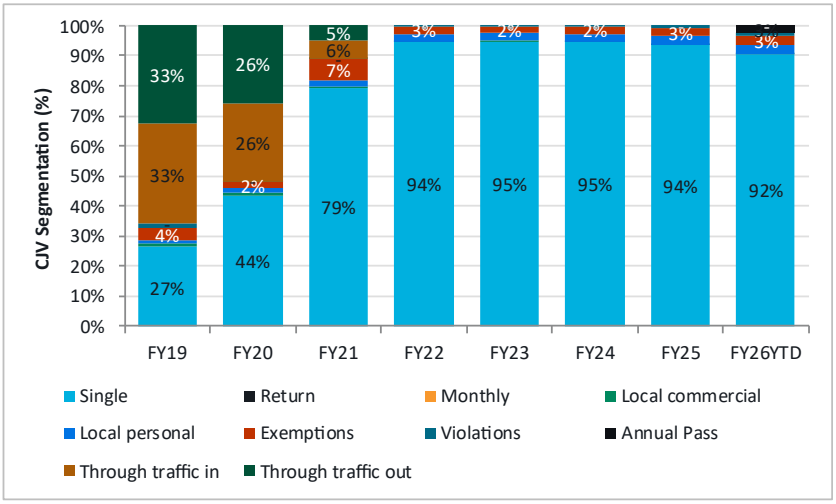
Source: Steer analysis of the Client data, FY26 YTD includes data till August'25; Segmentation does not include return trips

Figure 3.3 Ticket-segmentation for MAV at TP1 Amoli



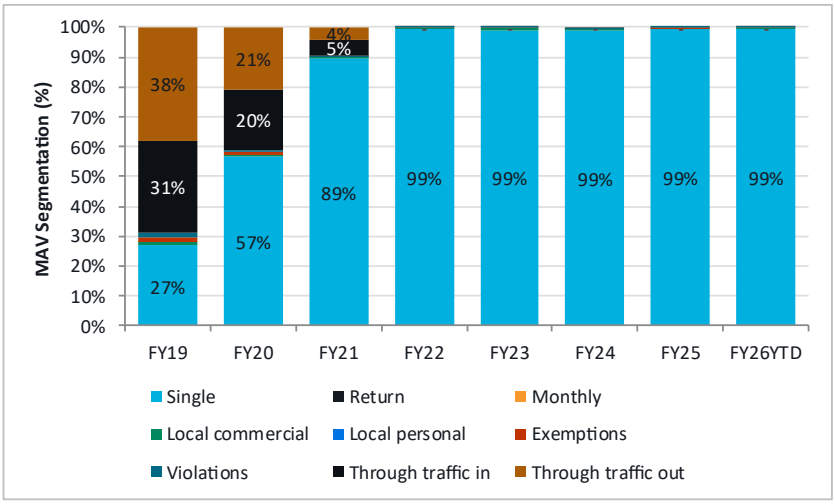
Source: Steer analysis of the Client data, * FY26 YTD includes data till August'25; Segmentation does not include return trips

Figure 3.4 Ticket-segmentation for CJV at TP2 Ludhawai



Source: Steer analysis of the Client data, FY26 YTD includes data till August'25; Segmentation does not include return trips

Figure 3.5 Ticket Segmentation for MAV at TP2 Ludhawai



Source: Steer analysis of the Client data, * FY26 YTD includes data till August'25; Segmentation does not include return trips

3.32 The traffic segmentation charts indicate that the pattern observed in FY26YTD remains broadly consistent with previous years. As illustrated in the figure and table below, in FY26YTD, the share of single-ticket transactions for CJVs at TP1and TP2 is 92% and 93% respectively.

3.33 The Asset does not have return ticket, explaining the very high proportion of single tickets in the toll segmentation. Also, the CJVs plying on the Asset are doing short-medium distanced movement within 300kms also in the Figure 3.17 and Figure 3.18 below. Major share of these CJV trips originate outside 10kms of the Asset making them non-valid for a discounted local pass. This is in line with the Asset being a major tourist driven corridor fetching passenger from other surrounding regions.

3.34 Ticket shares in FY23-FY26YTD are similar with 99% MAV taking single ticket travelling long distance to medium distance. In case of CJV at both the plaza the exemptions have

stabilised FY23 onwards with ~3% share of total trips. The ticket segmentation of other vehicle types is presented in Table 3.8 and Table 3.11 below. The declining exemption and violation shares starting FY22 towards FY26YTD is a result of FASTag implementation which has resulted with better management of traffic system and operations. Through traffic tickets were discontinued in FY22 as a result of FASTag implementation where the operators discontinued the discounted tickets which are not in accordance with NHAI concession.

Table 3.8: Historical ticket segmentation at TP1 Amoli (LCVs)

	FY19	FY20	FY21	FY22	FY23	FY24	FY25	FY26YTD
Single	25.3%	31.1%	66.0%	96.5%	97.2%	97.1%	96.8%	97.8%

Overloading

3.35 The Asset being a part of NHAI concession follows the NHAI Overloading policy released in 2016 which bans the overloading of commercial vehicle on any NHAI toll plaza. In case of non-compliance, overloaded vehicles on the Asset are charged twice the toll fee they would otherwise pay for a Single ticket at the toll plaza.

3.36 The plaza currently charges overloading under single and local commercial category. These shares are determined using the total single journey traffic and total local commercial traffic. The table shows the share of overloaded vehicles paying twice the Single journey toll fee on each toll plaza upto FY25. FY25 reports a lower percentage of overloading shares as compared to FY24. This can be a result of strict regulatory implementation of less overloading and also the rainfall impact for most of the year on construction traffic which did not appear on the Asset.

Table 3.14: Overloading shares for FY19 - FY26

Vehicle	TP1 Amoli							TP2 Ludhawai						
	Single Overloading shares													
	FY19	FY20	FY22	FY23	FY24	FY25	FY26	FY19	FY20	FY22	FY23	FY24	FY25	FY26

Data Collection exercise

Overview

3.37 To validate and inform our forecasts, we collected primary data on the Asset through the surveys listed in Table 3-11 below. OD survey data was collected on behalf of the Client, TVC surveys were commissioned by Steer with a third party. OD data collection typically involves manual data entry by enumerators based on oral surveys with road users crossing toll plazas, which Steer also commissioned with a third party. TVC data collection involves video-graphic capture of traffic passing crossing the toll plazas, followed by manual counting.

Table 3.15: Data collection schedule

TP	7-day videography-based TVC			1-day OD survey	
	Start date	End date	Time (hrs)	Start date	Start time
TP1	27 Jan2021	02 Feb 2021	0000-2359	09 July 2019	0900 hours
TP2	26 Jun 2023	29 Jun 2023	0000-2359	26 June 2023	27 June 2023

2Source: Steer analysis

3.38 It should be noted that, in our experience, traffic on national highways shows variation across the week due to the economic activities surrounding each road. To derive a representative TVC count considering daily variation, three-day to seven-day traffic counts are generally recommended, and hence, in order to fully understand the impact of this weekly fluctuation on the Asset, we collected seven-day counts at each toll plaza.

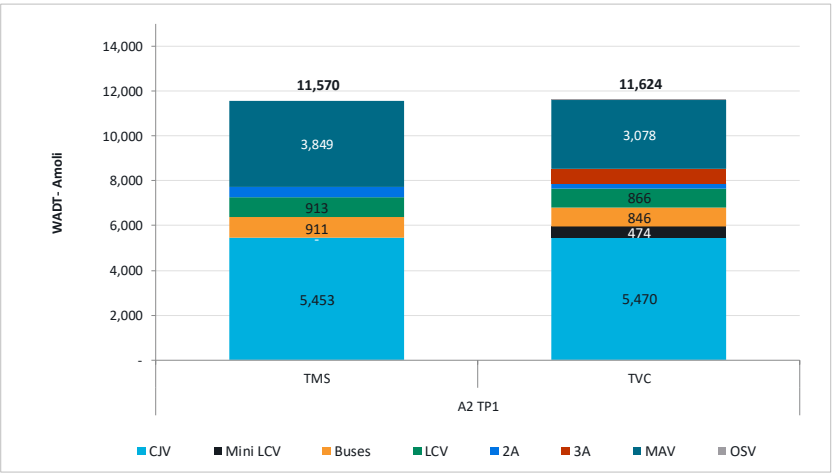
3.39 Please also note that current OD survey data was available only at Ludhawai toll plaza and not Amoli. Since Amoli and Ludhawai toll plazas show similar traffic profiles, as observed both from the historical data and our site visits, the OD findings seen at Ludhawai can be applied to Amoli as well.

Key findings of the TVC data analysis

WADT estimates

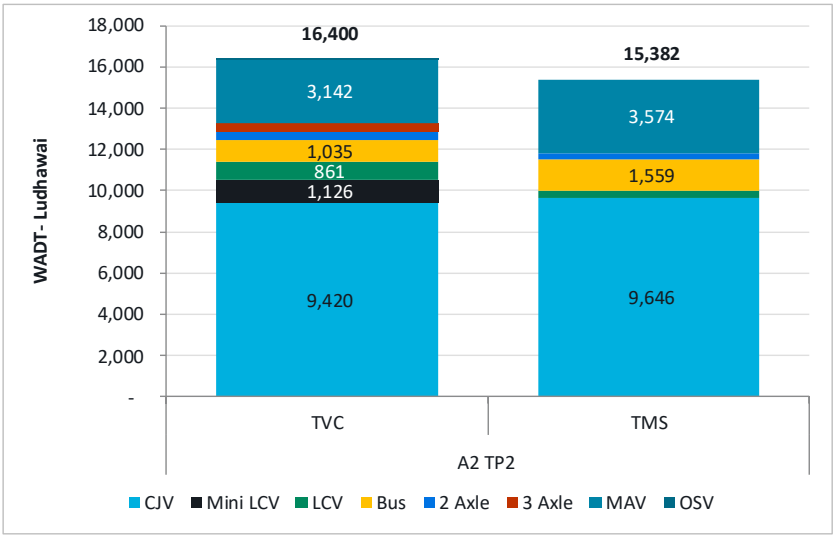
3.40 Taking an average of the seven-day TVC counts (27th Jan – 2nd Feb 2021, 0000-2359 hours) for TP1 and (26th Jun– 29th Jun 2023, 0000-2359 hours), we obtained the following weekly average daily traffic(WADT) for each toll plaza. This WADT excludes non-toll able vehicle such as tractors, two-wheelers, bullock-carts, etc., but includes officially exempt vehicles such as police cars, ambulances, emergency response vehicle, government vehicle and other vehicle types officially allowed as 'exempted' under the concession agreement.

Figure 3.6 A2 TVC WADT- TP1



Source: Steer analysis of TVC data

Figure 3.7 A2 TVC WADT- TP2



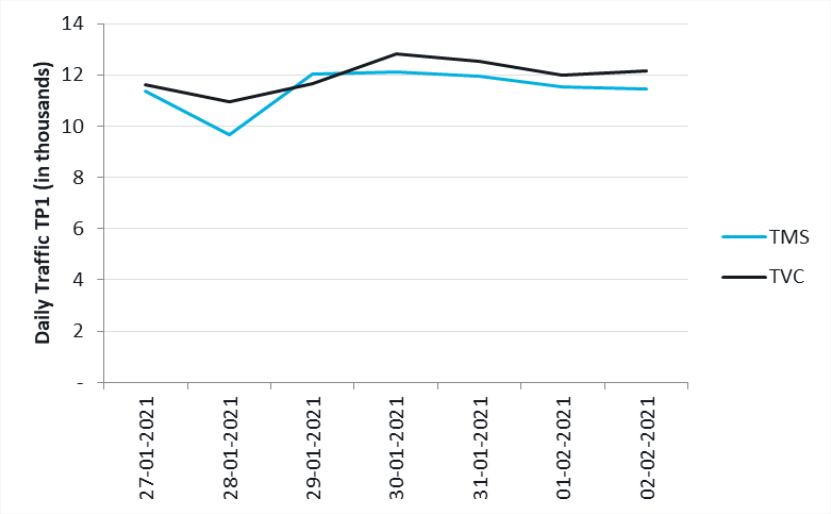
Source: Steer analysis of TVC data

TVC v/s TMS analysis

3.41 As we use the TMS data to estimate the base year AADT, we have used our TVC data to validate the TMS data on those particular days, as provided by the Client.

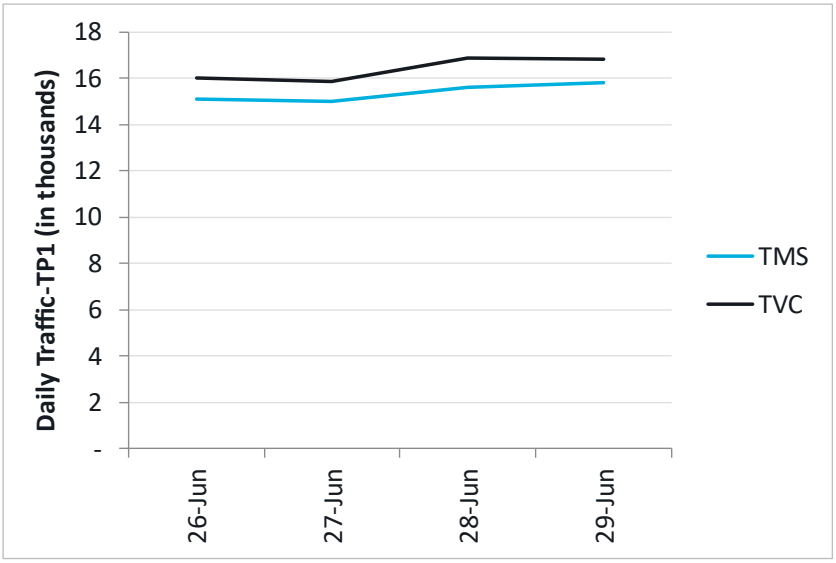
3.42 The following figures show the comparison between the daily traffic observed by TVC and TMS for the two toll plazas. As shown in Figure 3.8 and Figure 3.9 below, the TVC and TMS overall are within the acceptable range of variation.[11]

Figure 3.8: Comparison between TVC and TMS daily traffic data on TP1 Amoli



Source: Steer analysis of TVC and Client TMS data

Figure 3.9: Comparison between TVC and TMS daily traffic data on TP2 Ludhawai



Source: Steer analysis of TVC and Client TMS data

3.43 Figure 3.10 and Figure 3.11 below compare the shares of vehicle types at both plazas, between TVC and TMS data. It can be observed from the figure below, while shares of CJVs are higher for TVC compared to TMS, it is vice-versa for other vehicle categories. This difference can be attributed to common misclassification of vehicle categories.

[11] One of the reasons for the difference between TVC and TMS is the different time slots being considered. TMS data provided ranges from 0600 hrs to 0559 hrs whereas TVC data ranges from 0000 hrs to 1159 hrs.

Figure 3.10 Comparison between vehicle shares from TVC and TMS WADTs- TP1

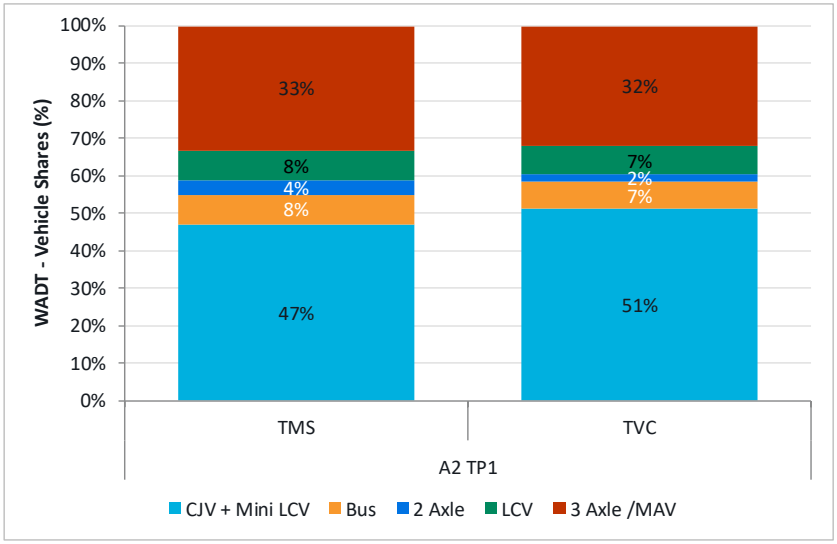


Figure 3.11 Comparison between vehicle shares from TVC and TMS WADTs- TP2

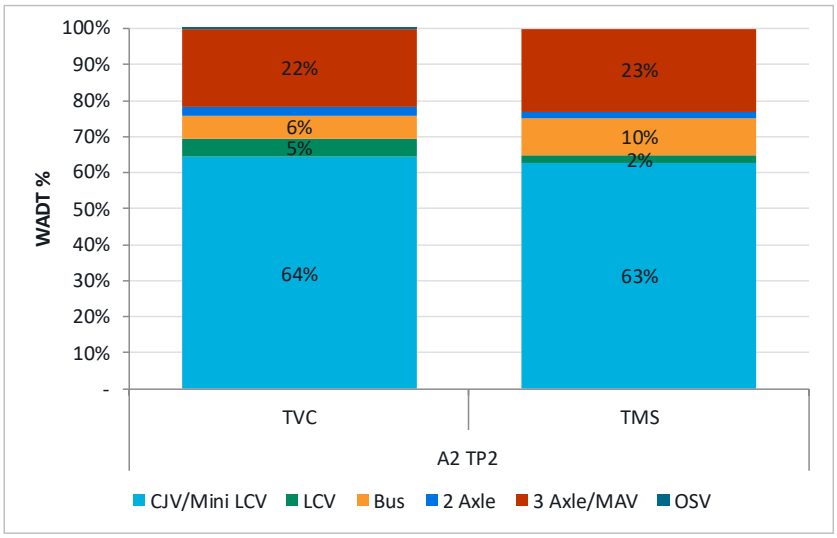


Source: Steer analysis of TVC and Client TMS data

3.44 Considering the above findings, the TVC-TMS analysis gives us the confidence that the base year traffic calculated using the Client data forms a reliable base year traffic estimate.

Key findings of origin-destination analysis

Overview

3.45 Origin-destination (OD) analysis enables the understanding of the nature of traffic movement on the Asset. The OD analysis presented here is based on data collected on behalf of the Client in July 2019. More recent OD surveys were not undertaken as this Asset has a long operational history and we did not believe material changes in these patterns would have occurred in this period.

3.46 We have analysed the regional drivers of demand based on the following analysis:

1. Zonal influence

2. Commodity distribution
3. Top OD pairs
4. Trip length distribution

3.47 While zonal analysis and the list of top OD pairs help us to understand 'where' people and goods travel, commodity distribution sheds light on 'what' goods get transported on this Asset. Trip length distribution show 'how far' vehicles and people travel, and goods get transported. This set of analysis is generally used to estimate key drivers of traffic and aid making informed forecasting assumptions related to traffic demand elasticities, growth drivers and exogenous impacts.

Sample rates

3.48 Sample rates help understand the reliability of OD data. They are calculated by dividing OD samples captured by the traffic counts (based on the TVC data) during the same time period. Table 3.16 below presents the sample rates for key vehicle type aggregations at TP1 Amoli. We believe that the sample rates of the OD data are reasonable for the analysis required.

Table 3.16: Sample rates for OD data

Vehicle type	TP2 Ludhawai
Passenger (CJV+Bus)	31%
Goods (LCV+2A+3A+MAV)	68%

Source: Steer analysis of OD data

Zone categories

3.49 To facilitate better understanding of key regional traffic drivers as determined by their OD zones, and influenced by various towns, cities, states and regions in the vicinity of the Asset, we have aggregated zonal data as described in Table 3.17 below. The methodology behind this aggregation of zones may vary as per the characteristics displayed by the different Assets being studied.

Table 3.17: Zone aggregations for zonal influence analysis

Aggregate Zone	Description
Local	Local zones are those that fall on or very close to the Asset.
IAOI (Immediate Area of Influence)	IAOI zones are the locations which generate traffic and lie within approximately 75-150 km distance from the Asset.
Rest of Rajasthan	Rest of the cities/Districts in the state that Asset lies in (other than Local/IAOI)
Rest of Uttar Pradesh	Uttar Pradesh (excluding parts of Uttar Pradesh which are a part of IAOI Agra, Mathura)
Rest of North India	Uttarakhand, Haryana, Punjab, Jammu and Kashmir
Central NCR	Delhi State, including New Delhi
Gujarat & Maharashtra	Gujarat and Maharashtra (including Mumbai)
Central India	Madhya Pradesh, Chhattisgarh
South India	Tamil Nadu, Karnataka, Kerala, Andhra Pradesh
East & Northeast India	West Bengal, Orissa, Jharkhand and Northeast Indian states

Aggregate Zone	Description
Outside India	Nepal, Bhutan, Bangladesh

Source: Steer analysis

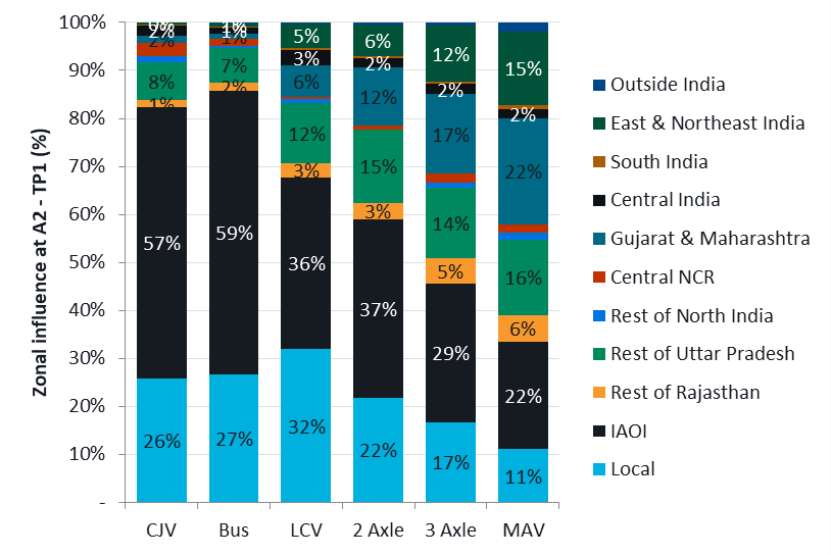
Zonal influence

3.50 The zonal influence is the contribution of the zone or the zonal aggregation to trips by a vehicle type. This section presents the zonal influence at TP2 Ludhawai, aggregated based on zonal aggregation listed in the previous sub-section. Please note that zonal influence is analysed based on trip ends and not trips. [12]

3.51 As can be seen from Figure 3.12 and Figure 3.13 below, IAOI zones, followed by local zones, have the largest influence. IAOI trips range from 28% for MAV to 56% for CJV, with major zonal influence from Jaipur.

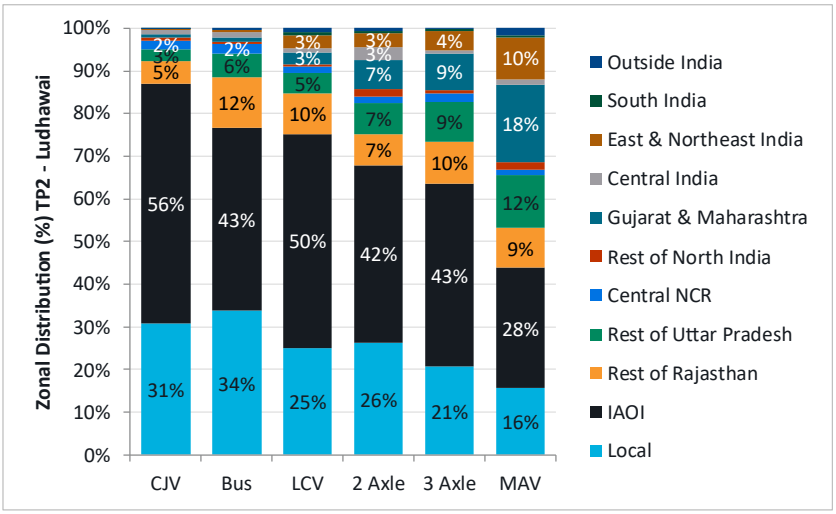
3.52 Besides IAOI and local zones, we see an equally high share of 'Rest of Uttar Pradesh' (7-12%), 'Gujarat & Maharashtra' (7-18%) and 'East & Northeast India' (3-10%) in the zonal influence of 2A, 3A and MAV categories. We assume a similar OD zonal influence at Amoli as well.

Figure 3.12: Zonal influence at TP1 Amoli



[12] For example, if out of 100 trips at a toll plaza on an Asset, 10 trips are between Hyderabad and Delhi and 90 trips are between Hyderabad and Chennai, then zonal influence of Hyderabad would be 50% since one end of all trips are at Hyderabad. Likewise, zonal influence of Delhi and Chennai would be 5% and 45%, respectively.

Figure 3.13: Zonal influence at TP2 Ludhawai



Source: Steer analysis of OD data

Internal External analysis

3.53 Internal-External analysis helps in identifying the trips which have both the origin and destination on or near the Asset i.e local/IAOI zones (Internal-Internal or I-I), any one end on the Asset (Internal-External or I-E), or neither end on the Asset i.e. through trips (External-External or E-E). RoS here represents areas within the state which are neither local or IAOI. 'Internal' zones are those that were analysed as 'local' and 'IAOI' in the zonal influence analysis, i.e. lying on the Asset, while 'External' zones are areas lying outside the state.

3.54 Figure 3.14 shows the distribution of trips based on these categories. Understandably, these reflect the observations seen in the zonal influence presented earlier, at a higher level of aggregation but at a trip level.

Figure 3.14: Internal-external distribution at TP2 Ludhawai

	Internal	Rest of State	External
External	17%	6%	35%
Rest of State	1%	0%	9%
Internal	13%	2%	17%

Source: Steer analysis of OD data

3.55 We see that TP2 Ludhawai has about 35% of E-E trips for MAVs even though there is limited economic activity in the vicinity of the Asset, since the traffic on this Asset is largely non divertible due to absence of any other viable alternate roads. As expected,

CJVs, Bus, LCV and 2A show much lower E-E trips and more trips in the I-E, E-I and I-I mix as they travel shorter distances.

3.56 Since data is not available for TP1 Amoli, keeping in view the short length of the Asset and the fact that there are no major attractors or generators present along the Asset, it is assumed that TP1 Amoli has similar Internal-External distribution to TP2 Ludhawai.

Commodity distribution

3.57 We have grouped various commodities into aggregate categories for ease of interpretation, as shown in the table below. The charts in the following sub-section present information in terms of aggregate commodity categories.

Table 3.18: Aggregate commodity categories

Commodity Description	Code	Combined codes used for charts
Agriculture Products / Cash crops (Wheat, Rice, Sugar cane,Maize etc.)	AGR	**AGR**
Cattle Food / Live Stock (sheep, ghoat, cow,cattle food etc)	LIV	
Perishable Items (Fruits, vegetables)	PER	**GRO**
Animal Products/Dairy/Eggs/Fish/Meat/Animals	DFM	
Groceries / Food items (Soap, Salt, Sugar, Pulses, Spices, Biscuits, bread,cool drinks, beer etc.)	GRO	
Building Material / Construction (Cement, Lime, Brick, fly ash, etc)	CNS	**CNS**
Sand/Clay	SND	
Stone (kota stone, marble, Granite, Aggregate stone etc.)	STN	
Ceramic	CRM	
Petroleum Products (Oil, LPG, CNG, etc.)	PET	**PET**
Chemicals / Fertilizers (Acids,Fertilizers etc.)	CHM	
Electrical/Manufacturing items (Electronic items, Medicine, Leather, Wine, Rubber/ Tyre, Plastics, Cloth, Paper etc.)	MAN	**MAN**
Raw Wood,Cork & Wood Products, Furn	WUD	
Machinery / Spare parts	MAC	
Automobiles (Finished products, auto parts, Car/bike manufacturing, New Chassis)	AUT	**AUT**
Basic / Fabricated Metals (Iron, Steel / Metal)	MET	**MET**
Mining Minerals (Coal, Gypsum, Cobalt etc.)	MIN	
Empty	EMT	**EMT**
Container	CTR	**MSC**
Miscellaneous (Parcel, Courier, House hold items etc.)	MSC	
Passengers	PAS

Source: Steer analysis

3.58 Figure 3.16 below presents the commodity distribution for goods vehicles at TP2 Ludhawai, at the total level as well as by direction, towards Jaipur and towards Agra. As observed during our site visit, we see that at the total level (Figure 3.16) agricultural and grocery products make up the highest shares in the distribution at 13-32%, mostly comprising trips within Rajasthan. The second largest contributor is construction products, which have a share of 20% among MAVs. It majorly comprises of marble being transported from Kota, Kishangarh in Rajasthan towards Uttar Pradesh, Bihar, Odisha etc.

3.59 Looking by direction, a greater share of vehicles also travels empty towards Jaipur (29%-37%), than those travelling in the opposite direction towards Agra (4-12%). Another key difference is the share of construction products, which is much greater travelling towards Agra 27% among MAVs than travelling towards Jaipur 8%.

Figure 3.15: Commodity distribution at TP1 (Both directions)

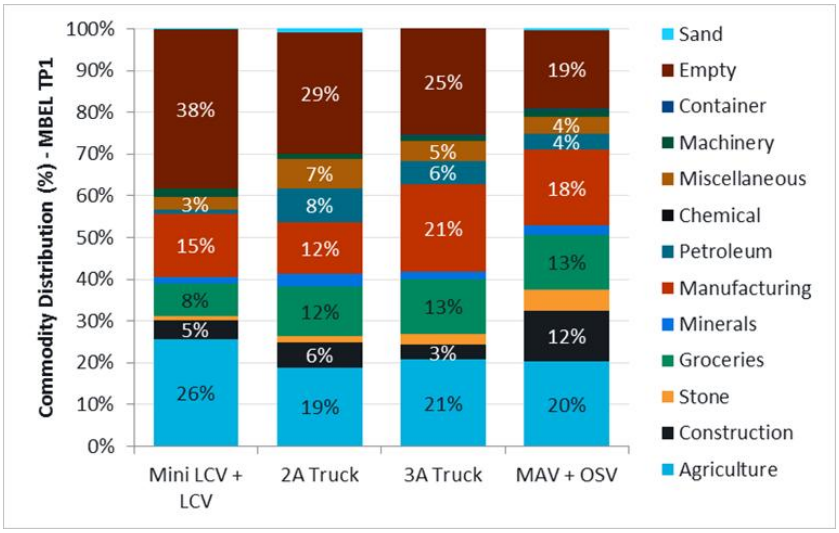

Figure 3.16: Commodity distribution at TP2 (Both directions)

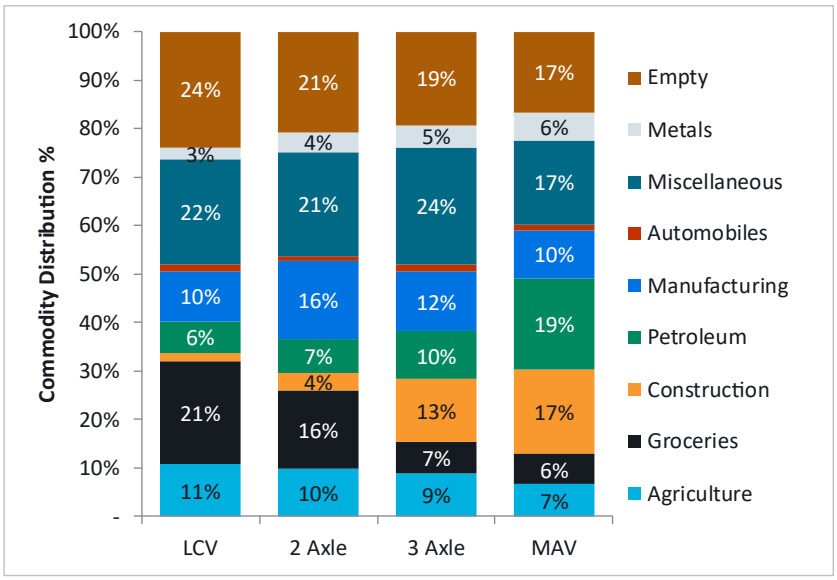
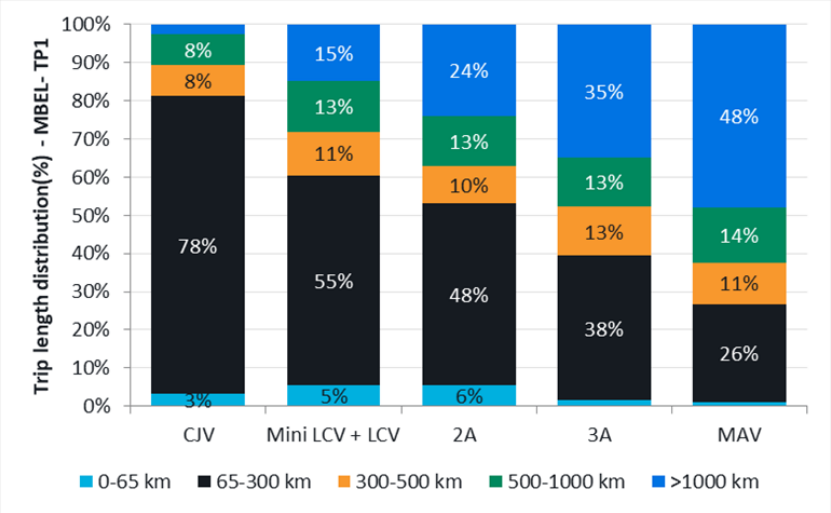


Source: Steer analysis of OD data

Trip length analysis

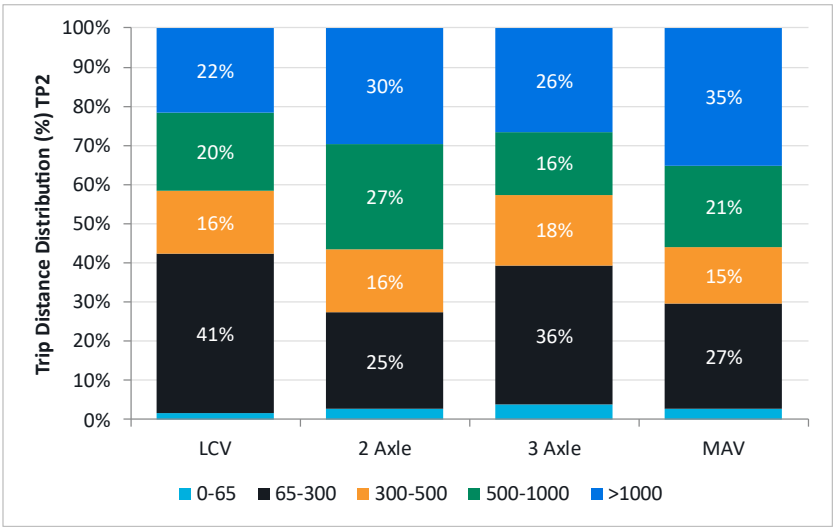
3.60 Trip-length distribution provides the distance-based profile of various vehicle categories. This helps to validate assumptions around the share of macro-economic drivers, inputs from zonal influence and toll segmentation. For ease of interpretation, we have categorised distances into 5 groups – local (0-65km), short-distance (65-300 km), medium-distance (300-500 km), long-distance (500-1000 km) and very-long-distance (+1,000 km). The trip distances were derived as driving distances from Google Distance Matrix Tool based on zonal coordinates for OD pairs.[13]

Figure 3.17: Trip length distribution, TP1 Amoli



[13] Google Distance API is a tool that is available on a chargeable basis from Google Maps Platform. Link: **https://developers.google.com/maps/documentation/distance-matrix/start**. Travel distance and time information for driving/transit under various congestion scenarios can be extracted through this tool by using macro-enabled Excel, R, etc.

Figure 3.18: Trip length distribution, TP2 Ludhawai



Source: Steer analysis of OD data

3.61 Figure 3.17 and Figure 3.18 above, a significant share of trips (especially for LCVs) are shorter than 300 km long as LCVs nature of movement is primarily short-distance. On the other hand, over half of MAV trips do trips longer than 500 km due to long distance movements between Gujarat at one end and Uttar Pradesh, east and north-eastern India at the other end. This has also been observed across other Assets in the country. These findings are in line with the zonal influence and top OD pairs observed on the Asset as well.

Conclusions

3.62 In summary, the vehicle shares of the Asset, the dominant vehicle class is CJVs, holding 50% of the vehicle class share followed by MAV holding approx. 30% of traffic share. Traffic has shown significant recovery starting FY22 and has continued in FY23 as a result of overall resumption in economic and travel activity and also a result of network changes such as completion of the Dausa-Lalsot section and Jaipur Ring Road resulting in improved connectivity to Delhi and South. Also, with the re-opening of tourist sites in Rajasthan and Delhi, the CJV traffic has increased. MAV's have also grown in the recent years driven by increase in sand mining traffic as one of the key reasons.

3.63 Passenger traffic has seen a significant growth in the month of Jan'25 on both TP1 and TP2 due to the 2025 Maha Kumbh Mela. Necessary adjustment to downturn this additional temporary gain in traffic observed in Q4 for FY25 due to Maha Kumbh mela has been made in the forecast to reflect the true nature of future traffic on the Asset.

3.64 The TVC counts does show some variation on the TMS, at the total level TMS is 4% lower than TVC at TP1, and 3% lower than TVC at TP2. However, the differences are small for larger revenue generating categories (3A, MAV and OSV combined), 1.4% and 0.5% at TP1 and TP2 respectively. Considering these findings and only slight variations, we are confident in the accuracy of using the Client TMS data.

3.65 Key takeaways from the OD analysis include a dominant influence of IAOI and local trips, particularly for CJVs which is largely influenced by Jaipur. Agricultural products and manufacturing products hold the greatest commodity shares. Following these, groceries

and stone also hold considerable shares (13% and 5% respectively). Majority of the traffic is sticky to the Asset with only 12% being external-external in PCU terms which is using the Asset as it offers excellent connectivity to the regions in the immediate vicinity of the corridor.

3.66 The overall characteristic of the Asset is strategic is nature connecting several key urban and economic activity centres of Jaipur, Agra, Bharatpur in immediate vicinity with wider generators and attractors of south Rajasthan, Gujrat, Maharashtra to Uttar Pradesh and Delhi NCR also being connected by the Asset. Urban population and tourism linked growth is seen as an added advantage for CJV and Bus traffic.

4 Socio Economic Context

Introduction

4.1 The growth of traffic on existing (brownfield) roads depends on, firstly, how fast the background travel demand grows (background growth); and secondly, how successful the Asset is in attracting that traffic (traffic capture). Background travel demand is driven by the socio-economic conditions of the region where the Asset is located and conditions on a national scale. These include:

- Changes in factors such as population, economic growth (regional and national) and industrial production; and
- Other local factors such as strategic port growth, and growth in local industries near the Assets.

4.2 In turn, the change in the competitive position of the Asset (and thus of the traffic capture it will achieve) derives from how the service offered and the prices charged on the Asset change in comparison to competing roads; and whether any new competing road facilities are available.

4.3 In this chapter, we assess the socio-economic indicators relevant to traffic growth on the Asset.

Population growth

4.4 We have analysed the key socioeconomic drivers of the background traffic demand in the state of Rajasthan where the Asset is located.

National Level

4.5 The total population in India has grown at a Compound Annual Growth Rate (CAGR) of 1.5% since 2000, decreasing over the years, as shown in Table 4.1 below. The World Bank forecasts this growth to decrease to 0.6% CAGR by the 2030-45 period.

Table 4.1: CAGR of population in India

Years	CAGR		
	Total Population (m)	Rural Population (m)	Urban Population (m)
1970 - 1985	2.3%	1.9%	3.8%
1985 - 2000	2.0%	1.7%	2.9%
2000 - 2015	1.5%	1.0%	2.6%
2015 – 2030*	1.0%	0.3%	2.3%
2030 – 2045*	0.6%	-0.3%	1.9%

Source: World Bank Data on Health Nutrition and Population Statistics, *forecast population growth

State Level

4.6 Table 4.2 shows the evolution of population in the state of Rajasthan (containing the Asset), compared to that of the country. Overall, as can be seen, the trend observed at the country level is also noticeable at the state level, namely, a move towards urban agglomeration with the growth in rural population being slower than that of urban population. Further, Rajasthan has grown at a rate which is slightly higher than the country average, in the decade between 2001 and 2011.

Table 4.2: Population Growth in India (2001 – 2011)

State	2001 Population (m)			2011 Population (m)			CAGR (2001 – 2011)		
	Total	Rural	Urban	Total	Rural	Urban	Total	Rural	Urban
Rajasthan	56.5	43.3	13.2	68.5	51.5	17.0	2.0%	1.8%	2.6%
India	1,028	742	286	1,210	833	377	1.6%	1.2%	2.8%

Source: National Institution for Transforming India (NITI Aayog) – Census Data

4.7 Due to the complexities of patterns of urbanisation, and the very dynamic nature of local population migration (which are very difficult to forecast with accuracy), we do not use population growth as a proxy for understanding future travel demand growth on the Asset. It has been included in this section simply to provide the underlying socio-economic context of the state/trends in the regions in which the Asset is located.

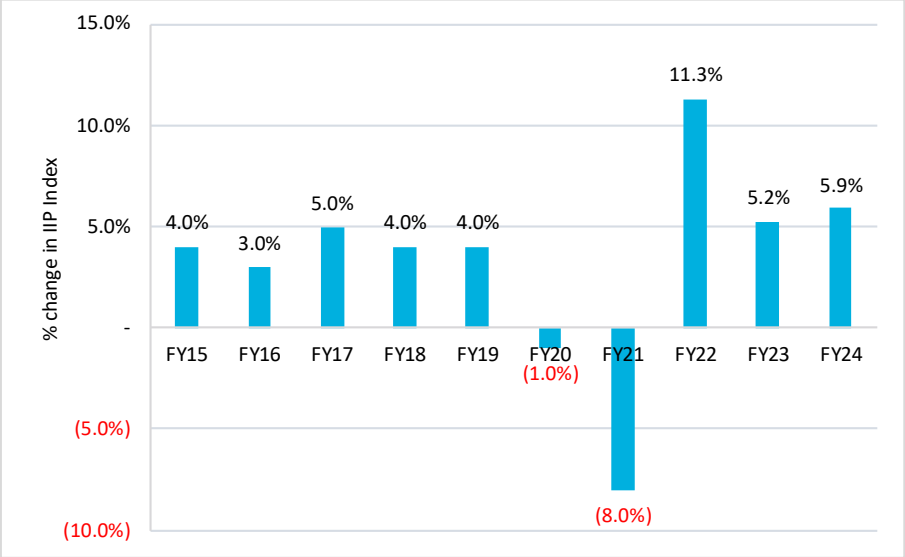
Economic Indicators

Industrial Production

4.8 The Index of Industrial Production (IIP) is a composite indicator that measures the short-term changes in the volume of production for a basket of industrial products. The IIP data tracks the manufacturing activity in different sectors of an economy, with mining, manufacturing, and electricity being the three broad sectors constituting the IIP.

4.9 At an annual level, national IIP was growing at an average of 4% per year over the period FY15-19, before the country underwent a liquidity crisis and experienced an overall economic slowdown in FY20 (as presented in Figure 4.1 below). In the aftermath, IIP shrank by over 8% in FY21 due to a decline in economic activity in the wake of global lockdowns introduced to curb the Covid-19 pandemic. However, with the gradual opening up of economy post the pandemic, and recovery in consumption demand, industrial activity also recovered with time with IIP recording growth of 5% in FY23 and 6% in FY24.

Figure 4.1: Annual growth – Index of Industrial Production



Source: Steer analysis of MoSPI data

4.10 Since state-level IIP data is not as readily available as national level IIP, we have presented national IIP here to indicate nationwide activity in key industrial sectors like power, manufacturing, and mining, all of which influence long-distance commercial movements across the nation, and not unique to this asset. We, however, do not use it to forecast future travel demand growth since long-term forecast for IIP is not available through official sources such as MOSPI, RBI or through multilateral organisations like WB, or the IMF.

Vehicle Ownership

4.11 Car ownership in India has traditionally been very low at 22 cars per 1000 individuals, compared to developed countries like the United States, which has approximately 980 cars per 1,000 individuals.[14] However this is slowly changing with the increasing per capita income levels. As can be seen in Figure 4.2 below, between 2007-17, the number of cars per 1,000 people more than doubled from 9 in 2007 to 22 in 2017 growing at a CAGR of approximately 11%. The corresponding ownership rates for urban cities like Delhi, Mumbai, Bengaluru, and Chennai are over 100 cars per 1,000 people [15] (GoI 2011; MoRTH 2012).

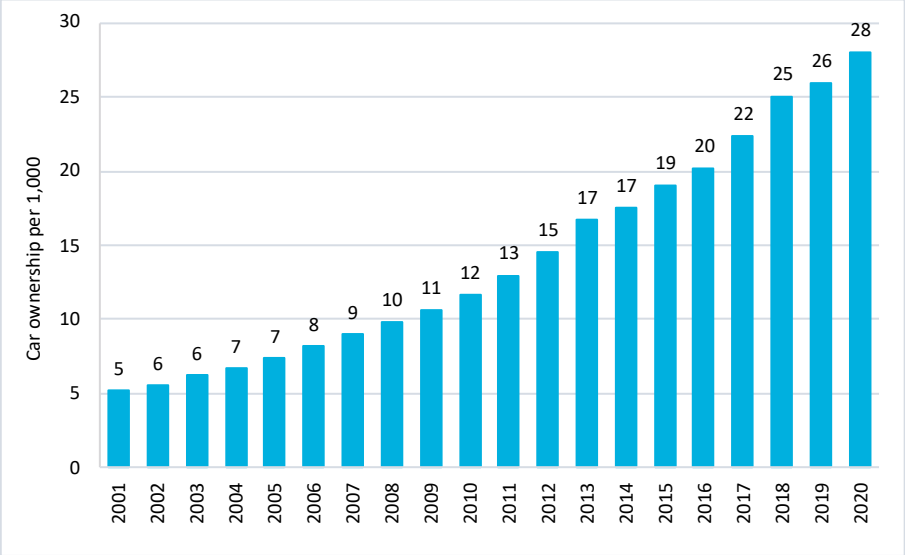
4.12 Overall, India still stands at a very nascent stage in the vehicle saturation curve, offering huge potential for growth going forward. As the income per capita of India and the region itself grow further, we expect car ownership levels to increase. As per the India Energy Outlook (2015), car ownership is projected to grow steeply to 175 cars per 1,000 population by 2040 in India.[16]

[14] **India has 22 cars per 1,000 individuals**

[15] **Proliferation of Cars in Indian Cities**

[16] **https://www.gita.org.in/Attachments/Reports/IndiaEnergyOutlook_WEO2015.pdf**

Figure 4.2: Car ownership in India per 1,000 population

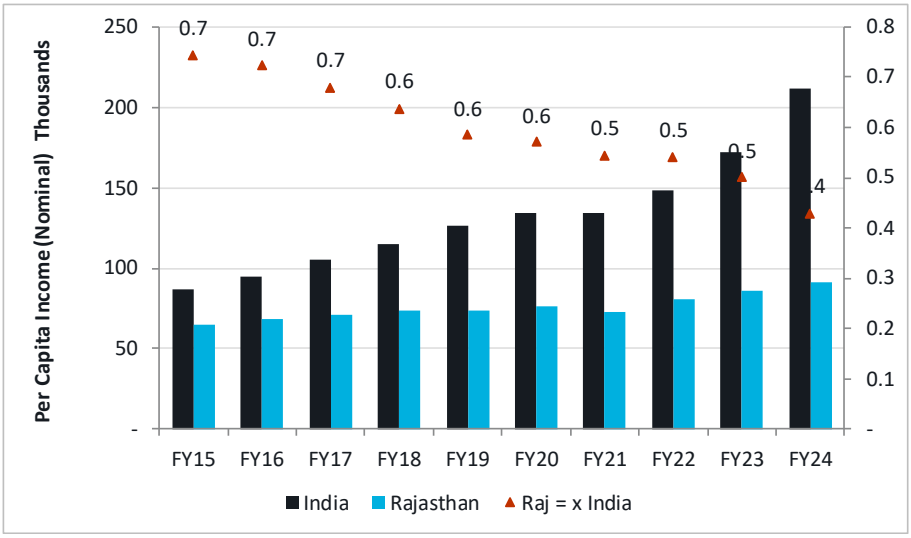


Source: International Energy Agency (IEA)

Per Capita Income (PCI)

4.13 The per capita income of the state where the Asset lies, i.e., Rajasthan has been lower than the national average, trending at 50-60% of the national per capita income in the recent years. This level of income suggests that the asset is influenced by both Delhi and north and Uttar Pradesh, both of which have exhibited faster growth than Rajasthan's statewide trends in recent years and are expected to continue on this trajectory. Going forward, we therefore expect local consumption to be strong which would drive the growth in both passenger and commercial traffic.

Figure 4.3: Per Capita Income



Source: Steer analysis of MoSPI data

4.14 However, given the difficulty in obtaining granular district level PCI data it is not advisable to use this as a growth driver. Also, the long-term forecast for PCI is not available we therefore refrain from using it to forecast traffic.

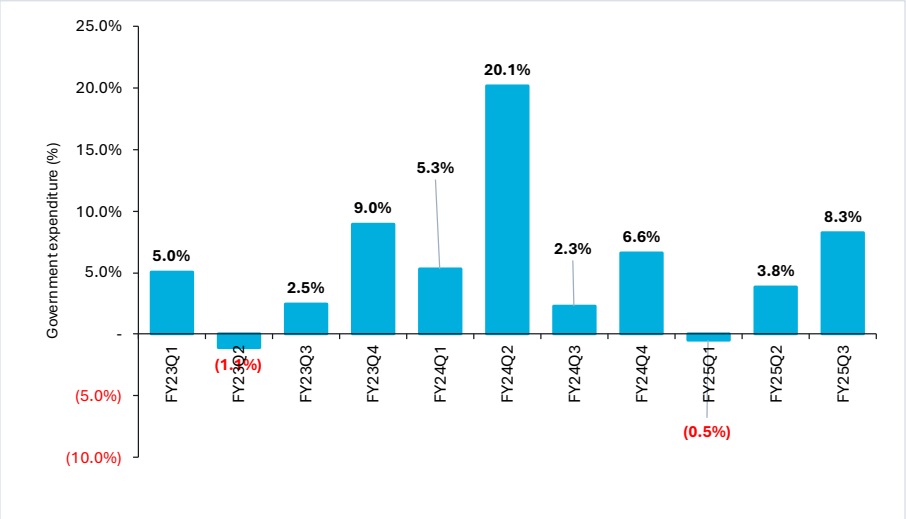
Economic growth

India's Performance

4.15 Figure 4.4 below shows that India's economic performance in Q3 of FY25 has shown signs of recovery in recent months despite slowdown experienced in FY25H1, as the latest SAE estimates released show FY25 growth rate to be 6.5%, which is lower than that observed in FY24 i.e., 9.2%.[17] This deceleration can majorly be attributed to a downturn in industrial output – specially manufacturing, electricity, and mining (as shown in Figure 4.6 below) – along with a decline in government capital expenditure in FY25 (presented in Figure 4.4 below).

4.16 Other contributing factors also include the impact of the 2024 general elections on central infrastructure spending, state-level fiscal constraints and rising global uncertainties such as Russia-Ukraine war and Gaza-Israel conflict which have had impact on global supply chains.

Figure 4.4: Government final consumption expenditure



Source: Steer Analysis of MOSPI Data

4.17 Weaker industrial activity, as reflected in lower IIP (Figure 4.5) and GVA contribution (Figure 4.6), directly impact freight movement and commercial traffic volume growth across the country, including on the Asset. At the same time, muted government capex had an influence on both construction-linked activity and industrial output which impacted the commercial traffic growth carrying construction material and industrial goods. Export oriented corridors across the country have also seen muted traffic performance in FY25 due to global supply chain disruptions and the Red-Sea crisis, with exported commodities like manufactured goods, marble, and ceramics experiencing declines as well.

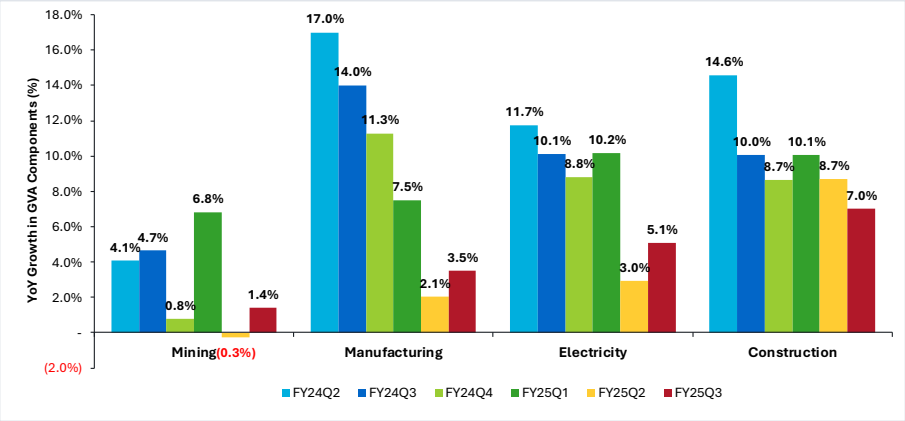
Figure 4.6: Industrial components of GVA



Source: Steer Analysis of MOSPI Data

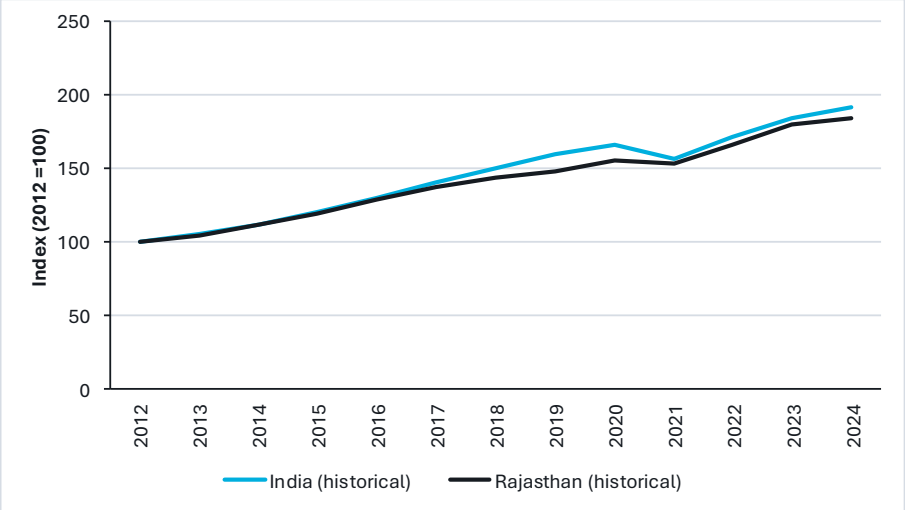
GDP and GSDP Growth

4.18 Over the period FY12-FY24, the Indian economic has grown at a CAGR of approx. 6% aided by growth in the tertiary sector which grew at a CAGR of approx. 6.9% over the same period. The economic growth of Rajasthan (state GSDP) has been somewhat slower than the country overall for the past 5 years but it seems to have caught up with the national rate since the COVID19 pandemic. [18]

4.19 The Asset, lies in the state of Rajasthan. The state contributes approximately 5% to India's GDP. The following figures illustrates the evolution of India and Rajasthan GDP.

[18] GSDP is the Gross State Domestic Product i.e., the GDP equivalent for a particular state, it is the final value of goods and services produced by a particular state

Figure 4.7: Evolution of Rajasthan's state GDP and national GDP; FY12-24



Source: Ministry of Statistics and Program Implementation (MoSPI)

Economic activity in the state

4.20 Rajasthan, the largest (area-wise) state in India, is in the north-western part of the country. In terms of sectoral contribution to the state GDP, tertiary sector has the highest share followed by primary and secondary, with the shares remaining stable during the last five years.

4.21 The tourism and transport sector constitutes a major share of the state's tertiary sector. Rajasthan is considered a favoured tourist destination in India, with key tourist attractions being Jaipur, Jodhpur, Jaisalmer, Bharatpur and Udaipur. In 2018, the state attracted over 50 million domestic tourist arrivals in the country whereas, in terms of foreign tourist arrivals it holds fifth position with over 1.7 million tourist visiting state every year. [19]

4.22 In terms of secondary sector, the state has key industrial areas in Kishangarh (marble); Manesar (automobile), Pali and Jodhpur (textiles), Chittorgah -Neemuch (cement), Kota (stone). Rajasthan is one of the largest mineral producing states in India and the sole producer of lead and zinc ores in the country. The state has one of the largest limestone reserves, making it a hub for cement industries. In terms of agricultural produce, the state is largely known for its production of wheat, cotton, cereals and pulses.

Forecasts for growth drivers

4.23 Following the discussion in Chapter 4 on the nature of economic activity in the state of Rajasthan, in this section, we describe the assumptions in relation to forecasts of the key macro-economic drivers of traffic growth. We have based our forecast on GDP and GSDP using forecasts of GDP as provided by the Client.

National GDP

4.24 After the last period of economic slowdown in FY11-12, the country experienced an economic downturn again in late FY19 with FY20 having reported a GDP growth of 4%

[19] http://tourism.gov.in/sites/default/files/Other/India%20Tourism%20Statistics%20at%20a%20Glance%202019.pdf

(relative to an average growth rate of 7% per year between FY13 and FY19). India's GDP growth declined as domestic investment and consumption demand were already under stress because of the liquidity crunch before Covid-19. Other factors that contributed to the economic slowdown included reduced growth rates in automobile sales and production, liquidity crunch in credit markets and rising number of Non-Performing Assets (NPAs) within the banking sector, as well as lower manufacturing production and lower rural consumption.[20]

4.25 The Covid19 outbreak had a significant impact on the Indian economy during the first two quarters of FY21 as government mandated lockdowns across the country effectively stalled economic activity and growth. The growth momentum eventually picked up in Q3 of FY21, with a sharp rebound in the economy in FY22 (GDP recorded 9.7% growth over FY21), and has since observed a consistent growth of 7.6% in FY23, 9.2% in FY24 and 6.5% in FY25 (as per the SAE) before slowing down over the past year due to several domestic and external factors.

4.26 Figure 4.8 below shows client provided GDP projections for India. The forecast provided by the Client expects the India GDP to grow at 6.5% between FY25-FY27[21] and gradually tapering down to 4.1% by FY32, end of concession. The India GDP growth forecast provided by the Client is broadly in line with other independent forecasts available from reliable sources such as IMF, World Bank and RBI[22] in the medium term.

4.27 Over the near term, Rajasthan's GSDP growth assumes to continue outpacing the national GDP throughout the concession period. We believe this is a realistic position based on the current and future development plans of local and state governments

4.28 There are significant investments expected to take place as part of the state's plan and Rajasthan is expected to receive a significant proportion of these investments, given its leading position in industrial investments. Higher than expected GSDP growth rate across the concession period could be achieved if such investments were realised as they are expected to give an additional boost to Rajasthan's state economy.

4.29 In the long term, we believe that as other smaller state economies of India catch up with the national economic growth, the gap between growth rates of larger state economies, such as Gujarat, Maharashtra and Karnataka, and the national GDP growth rate will start reducing.

5 FY26 Base Year AADT and Traffic growth analysis

Introduction

5.1 In this chapter, we present our approach, assumptions and results for base (or background) traffic growth for each vehicle category on the Asset.

5.2 Traffic growth is commonly related to a variety of macro-economic and industry- or commodity-specific factors (hereafter referred to as 'traffic growth drivers'). These growth drivers are typically identified from the results of the OD data analysis and the site visits that help us appreciate the nature of traffic movement – 'what' travels 'where' and 'why'.

5.3 To understand the historical traffic trends in relation to these growth drivers, we carry out regression analysis to determine the historical relationship between each traffic belonging to each major vehicle category and its macroeconomic growth driver at each toll plaza. The dynamics of traffic demand is the dependent variable while the dynamics of one or more identified growth drivers are the independent or explanatory variables.

5.4 Typically, passenger and light commercial vehicles like cars, buses, LCVs and 2-axle trucks grow in line with the GSDP of the state where the toll road is located. Heavy vehicle traffic like 3-axle trucks and MAVs grow in line with the national GDP. This could be because most light vehicles tend to travel shorter distances within the state, whereas a significant proportion of heavy vehicles carry commodities for long-distances across the country. These commodities also tend to be part of industry ecosystems whose demand-supply relationships are scattered across the country and therefore relate more with GDP growth.

FY26 Base year AADT estimates

5.5 The base year is the year on which long-term background forecast growth rates are applied to derive year-wise average annual daily traffic (AADT) estimates for forecast years. This is therefore an important aspect of our forecasting approach as traffic and ultimately revenue forecasts for future years are built on top of the base year traffic estimate. We have used FY26 as the base year for AADT estimates for the forecast years.

5.6 As described previously in Chapter 3, to establish the base year (FY26) traffic position, we utilised information from various sources – including from the Client and our context knowledge, to assess a reasonable demand on the corridor.

Methodology

5.7 The base traffic for FY26 has been estimated utilizing the actual 12 months of FY25. The weighted average of the actual FY25 traffic (April to March) was taken to arrive at annual

FY25 AADT. Using elasticity-based growth assumptions GSDP or GDP we arrived at FY26E.

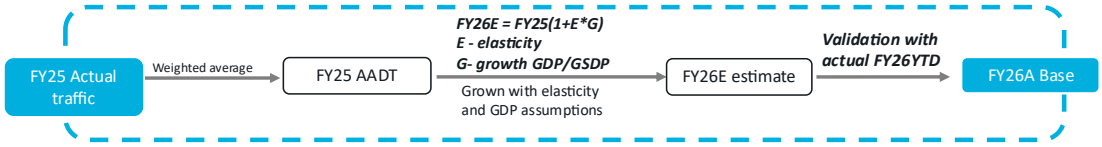
5.8 The monthly profile of the FY26E AADT was then compared to the actual traffic observed in the six months (April to September) of FY26 (FY26YTD). The Adopted FY26 AADT (FY26A) was then arrived at by making necessary adjustments to FY26E to reflect the outturn traffic in FY26YTD after adjusting for seasonality.

5.9 Historical traffic data was available for all toll vehicle categories starting October 2020 up-to January 2025. Therefore, in absence of longer-term historical data for the Asset where FY21 and FY22 are COVID-19 impacted years, we assume FY23 and FY24 to be normal years, with the latest full year considered for the FY25 base year estimation

5.10 As a validation, the FY26 was estimated using SCF (Seasonality Correction Factor) based on ten months of FY26 data where the adopted FY26 AADT (FY26A) is within ~0.5% of the AADT arrived using SCF approach.[23] This validates the robustness of the approach used to estimate the FY26 base AADT. The SCFs used in our analysis have been explained in the subsequent section.

5.11 The methodology is represented using the below schematic:

Figure 5.1: FY26 Base Estimation methodology



Source: Steer Analysis

5.12 The two key inputs to estimate the base year FY26 traffic are FY25 traffic and seasonality correction factor (SCF).

Seasonal Correction Factors

5.13 Traffic on any Asset varies on a month-on-month level. Such variations maybe due to monsoons (typically Jul to Sept) or due to festivals in the region. For e.g. It is observed that typically the truck traffic during the first half of the financial year (April-September) is generally lower than the annual average, mainly because of peak summer season followed by monsoons affecting the freight movement patterns in large parts of the country in the July-September period. In addition to these there may be other seasonal variations specific to the Asset.

5.14 In order to normalise for these variations across the year to provide an AADT estimate, Seasonality Correction Factors (SCF) are used. SCFs are estimated to convert the monthly traffic numbers to an AADT level while accounting for seasonal variation due to local/national festivals, weather changes and/or temporary external impacts. These are typically estimated using historical data for each plaza and vehicle category over multiple years. An SCF >1 means that the traffic for the month is lower than the annual average and vice-versa.

[23] *SCF- SCFs are estimated to convert the monthly traffic numbers to an AADT level while accounting for seasonal variation due to local/national festivals, weather changes and/or temporary external impacts.*

5.15 To achieve this, we studied the seasonality between monthly average daily traffic (MADT) – We have analysed the seasonality trends between monthly average daily traffic (MADT) and AADT for data during the historical years of tolling (as described in Chapter 3, section 3.19), excluding the years that were impacted by specific events. This averaged seasonality trend is then applied to the monthly traffic to obtain AADT as mentioned in the previous sections.

5.16 The seasonality factors assumed for individual vehicle types are shown in the table below.

Table 5.1: Seasonality correction factors for TP1 Amoli

	Apr	May	Jun	Jul	Aug	Sep	Oct	Nov	Dec	Jan	Feb	Mar
CJV	1.01	1.04	1.00	1.05	1.06	1.15	1.19	0.93	0.95	1.01	0.85	0.93
LCV	0.99	1.01	0.96	1.09	1.15	1.14	1.03	1.00	0.98	1.02	0.84	0.97

Adopted FY26 base estimates

6.1 Based on the above methodology and inputs, the adopted base for both toll plazas has been shown below:

Table 5.3 Adopted base estimates - TP1 Amoli

	FY25	FY26YTD	FY26A	FY26A vs FY25
CJV	8,260	7,961	8,402	1.7%
LCV	293	268	280	(4.5%)
Bus/2A	1,920	1,883	1,969	2.6%
3A/MAV	3,978	3,888	4,164	4.7%
Total	**14,451**	**13,999**	**14,815**	**2.5%**
PCUs	**29,878**	**29,078**	**30,868**	**3.3%**

Source: Steer analysis: FY25 actual full year, FY26YTD includes 6 months of FY26, FY26E is estimated base for FY26, FY26A is adopted base for FY26. Note: On this toll plaza, we have 3A/MAV combined volumes. However, for PCU calculations, to maintain consistency, we have used the shares derived from the latest TVC on the plaza

Table 5.4: Adopted base estimates- TP2 Ludhawai

	FY25	FY26YTD	FY26A	FY26A vs FY25
CJV	9,557	9,341	9,751	2.0%

LCV	310	281	291	(6.0%)
Bus/2A	1,994	1,934	2,018	1.2%
3A/MAV	3,976	3,899	4,163	4.7%
Total	**15,836**	**15,455**	**16,222**	**2.4%**
PCUs	**31,413**	**30,678**	**32,375**	**3.1%**

Source: Steer analysis: FY25 actual full year, FY26YTD includes 6 months of FY26, FY26E is estimated base for FY26, FY26A is adopted base for FY26. Note: On this toll plaza, we have 3A/MAV combined volumes. However, for PCU calculations, to maintain consistency, we have used the shares derived from the latest TVC on the plaza

5.17 From the above tables it can be ascertained that the Asset is expected to grow at an average of 3.2% on PCU levels from FY25 to FY26A. This growth on both toll plazas is being driven off a robust growth profile observed in MAV's. This can be attributed to the overall growth of the urban centres in close vicinity of the Asset including increased economic activity helping commercial traffic growth. The moderation in CJV growth is due to the adjustment of the additional traffic which used the Asset in the months of Jan and Feb-25 due to Kumbh mela, demand which was a one time increase and not expected to be part of base traffic in future years.

5.18 We have combined Bus and 2A volumes for our base estimation because as mentioned before, TMS reports discrepancies in the data. Therefore, the split that we have derived from our counts is the split we are using in our projection to forecast the growth of each individual category for this Asset.

Estimation of background elasticities

5.19 Elasticities, in the case of traffic growth are the relationships between traffic and growth drivers. Multiplied with forecasts of growth drivers like GDP or GSDP, they provide the forecasts of background traffic growth rates.

5.20 Table 5.5 presents the growth drivers identified to model the forecast background traffic growth rates.

Table 5.5: Identified growth drivers to model traffic growth

Vehicle type	GDP India	GSDP Rajasthan
Car		100%
LCV		100%
Bus		100%
2A		100%
3A	100%	
MAV	100%	

Source: Steer analysis of Client data

5.21 The TMS data for the Asset reports 3A and MAV together where Bus and 2A reported separately, hence splits were required to understand the 3A and MAV growth pattern. For this Asset Car, Bus and LCV do more regional movement as validate from OD trip length and zonal analysis hence the growth of this vehicle category is more influenced by Rajasthan GSDP. Whereas 2A, 3A and MAV carry heavy commodities like construction

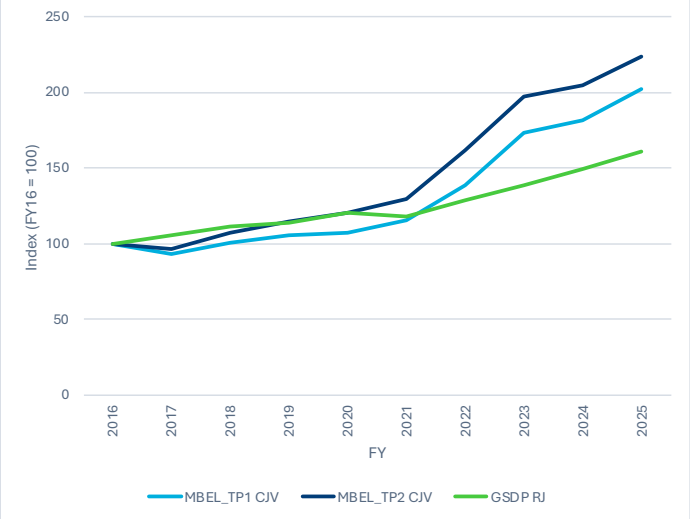
material and agricultural products from Rajasthan across states and internationally hence more linked to GDP growth.

5.22 For the purpose of regression analysis we have considered the period of FY16-24. FY16 and before were chequered period for the Asset with combination of illegal mining and overloading ban. The commercial traffic did not witness significant negative impact on volumes except for first nation-wide lockdown in March and April 2021. Hence we have considered FY21 and FY22 for the regression analysis.

CJV

5.23 It was observed from the OD data that CJVs primarily cater to regional movements between Jaipur, Bharatpur, Agra and other towns in the vicinity of the Asset. We have therefore assumed Rajasthan GSDP to be the growth driver for modelling growth of CJV traffic. Figure 5.2 shows the relationship between indexed values of CJV traffic and Rajasthan GSDP at TP1 Amoli and TP2 Ludhawai. CJV traffic on TP1 has shown 8.1% growth from FY16-25 while for the same period TP2 recorded 9.4%.

Figure 5.2: Relationship between CJV traffic and Rajasthan GSDP



Source: Steer analysis of Client TMS data and publicly available GDP/GSDP data

5.24 Generally, we would expect that in fast-growing economies with relatively low car ownership levels, car traffic growth rates are often in line with or are slightly higher than growth in GSDP/GDP (i.e. suggesting elasticities at or just above 1.0). Further, the opening of the Delhi Mumbai section upto Lalsot has had a significant impact on Car traffic on the corridor on both toll plazas adding additional impetus to car growth. This has also increased the influence of tourism related movement on the Asset, due to the significant volumes contributed by DME onto the corridor and hence it is expected that car growth will remain robust on the Asset. In addition, there is an expected increase in car ownership proportion of overall population as the economy grows.

5.25 Taking note of the positive outlook for passenger traffic on the tourism-driven Asset we have assumed a forecast background elasticity of 1.10 with respect to Rajasthan GSDP for CJV at both the toll plazas.

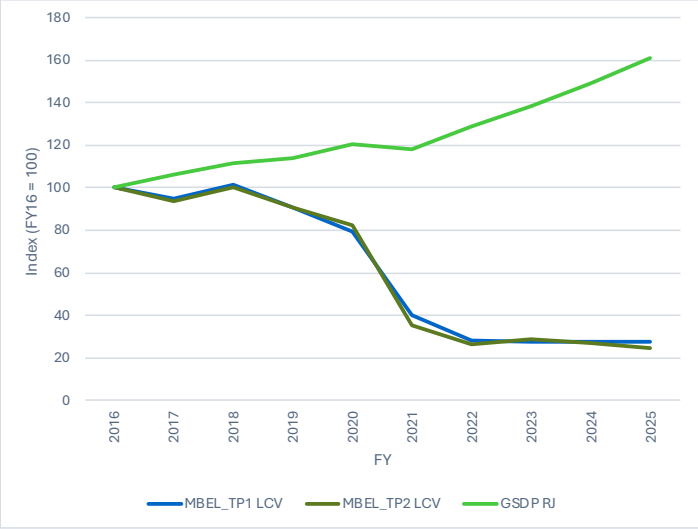
LCV, Bus, 2A

5.26 Compared to heavy vehicles such as 3A and MAV, LCV, Buses and 2As are used for more regional movements within the state – Rajasthan in this case as seen in the OD data analysis. More than 80% of LCVs and Buses and 70% of 2As have one trip end in Rajasthan. We have therefore taken GSDP of Rajasthan would be a more appropriate growth driver to model growth of Bus+LCV+2A traffic. Figure 5.3 shows the relationship between indexed values of Bus+LCV+2A combined traffic and Rajasthan's GSDP.

5.27 Between 2016 and 2025, the growth rate of Bus+2A+LCV remained flat. During this time period, it was noticed that disaggregate traffic for LCVs rose slower than traffic for Buses and 2As. This could be attributable to a variety of factors, one of which is the reclassification of LCVs and 2As, which has been seen as a prevalent tendency across the country's toll highways. However, beginning in 2022, the combined volume of Bus+LCV+2A has begun to show indications of recovery, as shown in Figure 5.3 below.

5.28 Bus growth tends to be largely supply-driven in many parts of the country, with new buses being bought and deployed by the government at different intervals of time. Based on our experience across the country, buses on inter-urban and tourism corridors show elasticities of 0.4 to 0.6 with respect to the GSDP. Based on the regression results and benchmarks, we have therefore assumed an elasticity of 0.5 with respect to GSDP Rajasthan.

Figure 5.3: Relationship between LCV+Bus+2A combined traffic and Rajasthan GSDP



Source: Steer analysis of Client TMS data and publicly available GDP/GSDP data

5.29 Based on the results of the regression, analysis of historical trends on the Asset, as well as our previous experience on benchmark Assets the elasticity assumption for LCVs is 0.3 on both TPs, and for Bus and 2A which have witnessed relatively stronger growth is 0.5 and 0.6 respectively for both toll plazas.

3A/MAV Trucks

5.30 Compared to lighter trucks like LCV and 2A, 3A and MAV have more national or long-distance movements covering several states. Given that manufacturing-related commodities tend to take prominence in the commodity distribution resulting in traffic growth in 3A and MAV to be dependent on industry demand-supply ecosystems spread

across the country, therefore we have taken GDP as the growth driver to model the traffic growth in 3A and MAV. Figure 5.4 shows the relationship between indexed values of 3A+MAV combined traffic and India's GDP.

5.31 Historically, 3A+MAV combined traffic grew positively in the FY16-18 period at 8% at TP1 Amoli and 12% at TP2, before losing volumes in FY19 and FY20. However, for the recent period of FY16-25 TP1 Amoli witnessed CAGR of 1.1% and TP2 Ludhawai observed 1.6% growth. This is shown in the figure below:

Figure 5.4: Relationship between 3A+MAV combined traffic and India GDP

Source: Steer analysis of Client TMS data and publicly available GDP data

5.32 Major reasons associated with this slower growth is:

- Implementation of stringent sand mining policy 2020 in Rajasthan which reduced the illegal sand mining and associated 3A and MAV traffic (FY18-20) in the region
- Completion of Jaipur Ring Road improvising access of regions beyond Jaipur.
- Completion of Dausa to Lalsot section of DME. 3A/MAV volumes remained steady in the third quarter of FY23 on TP1 Amoli. This might be linked to the introduction of the DME in Feb 2023, which has provided an alternate route for traffic between Uttar Pradesh/Moradabad/Bareilly and Rajasthan/Jaipur/Alwar.

5.33 We believe 3A to grow slower as compared to MAV due to a shifting preference seen for MAVs from 3As for long-distance movements. This could be because MAVs have higher load capacity which generate economies of scale and therefore lower costs. However, it is unlikely that 3A trucks will disappear from the market completely as there are best suited for certain commodities or movements.

5.34 Based on the above points, we have assumed elasticities of 0.40 and 0.85 for 3A and MAV trucks respectively, with respect to India GDP growth.

Forecasts for background elasticities

5.35 Table 5.6 presents a summary of the results of the regression analysis carried out on the historical toll plaza data and the macroeconomic (GDP/GDSP) growth, along with the assumed forecast elasticities for background traffic growth.

5.36 The forecast elasticities are assumed to remain constant over the concession period as the logistics sector in still in early stages of development in India (95% of trucks still owned by operators owning less than 5 trucks). Car ownership levels are still around 30-35 per 1000 people, and it is likely to take a few years before the market reaches maturity. These trends are based on a long-term understanding of historical relationships and an overall outlook on the growth of the region and the country.

Table 5.6: Derived elasticities from regression analysis and assumed forecast elasticities for background growth

Vehicle type	Growth driver	History		Forecast	
		Derived elasticity	Years considered	Assumed forecast elasticity	Evolution of elasticity
			TP1		
Car	GSDP Rajasthan	1.50	FY16-25	1.10	No change
LCV*	GSDP Rajasthan	<0.10	FY16-25 *(LCV+2A+Bus)*	0.30	No change
Bus*	GSDP Rajasthan			0.50	No change
2A*	GSD			0.80	No change
3A*	GDP	0.20	FY16-25 *(3A+MAV)*	0.20	No change
MAV*	GDP			0.85	No change
			TP2		
Car	GSDP Rajasthan	1.73	FY16-25	1.10	No change
LCV*	GSDP Rajasthan	<0.1	FY16-25 *(LCV+2A+Bus)*	0.30	No change
Bus*	GSDP Rajasthan			0.50	No change
2A*	GDP			0.80	No change
3A*	GDP	0.29	FY16-25 *(3A+MAV)*	0.20	No change
MAV*	GDP			0.85	No change

Source: Steer analysis of Client data; regression was run on LCV-2A-Bus (against GSDP), and 3A-MAV (with GDP) combined. *The results of the regressions yielded insignificant results based on the tstat values of the outputs of the regression.

5.37 In recent historical traffic performance across national highway corridors, a notable trend has emerged: there is a discernible shift in axle preference towards 2As and MAVs, resulting in a dampening effect on the growth of 3As. This trend is mirrored in the Assets FY24 and FY25 performance as well, which has been discussed in detail in the subsequent sections. Because of these evolving axle preferences, it has been assumed that the relationship between 3As and GDP will be relatively muted, whereas 2As and MAVs are expected to grow more closely in line with the country's GDP.

6 Forecasts: Network overlays and forecasts

Introduction

6.1 Following the discussion on our forecast of background growth rates in the previous chapter, this chapter first covers the potential network impacts on traffic growth on the Asset. Thereafter, we present our assumptions around toll segmentation, trip factors and evolution of toll rates for the forecast period which are used to forecast revenues as derived from forecast traffic. In the final section, this chapter summarises traffic growth rates for the forecast years. Table 6.1 lists key intermediate and final outputs that have presented in chapter 3, 5 and 6.

Table 6.1: Key intermediate and final outputs in the forecast

Forecast	Final outputs	Intermediate outputs	Inputs	Chapter
Traffic	Base year AADT	ADT, SCF estimate for base year	Historical SCF and year-to-date AADT	Chapter 3, 5
	Background traffic growth	Background forecast elasticity	Historical elasticities with respect to growth drivers	Chapter 3,5, Appendix C
		Forecasts for growth drivers	Historical performance of growth drivers along with Client's GDP line	Chapter 4,5, Appendix C
	Impact growth rates and staging	Impacts	Asset vs alternate route costs for ongoing/upcoming network and other developments	Chapters 2,6
Revenue	Annual/daily revenue forecasts	Forecast toll segmentation: Trip frequencies and trip factors	Historical trip frequencies	Chapter 3,6
			Historical trip factors	Chapter 6
		Future toll rates	Toll evolution	Chapter 6

Source: Steer analysis

6.2 All traffic is presented as AADT for vehicle category at each plaza, for financial years (April-March). All revenue is presented in Rupees (nominal terms). Though FY32 is the last year of concession, we have developed our forecasts until FY34 for the Client's reference in the Appendices.

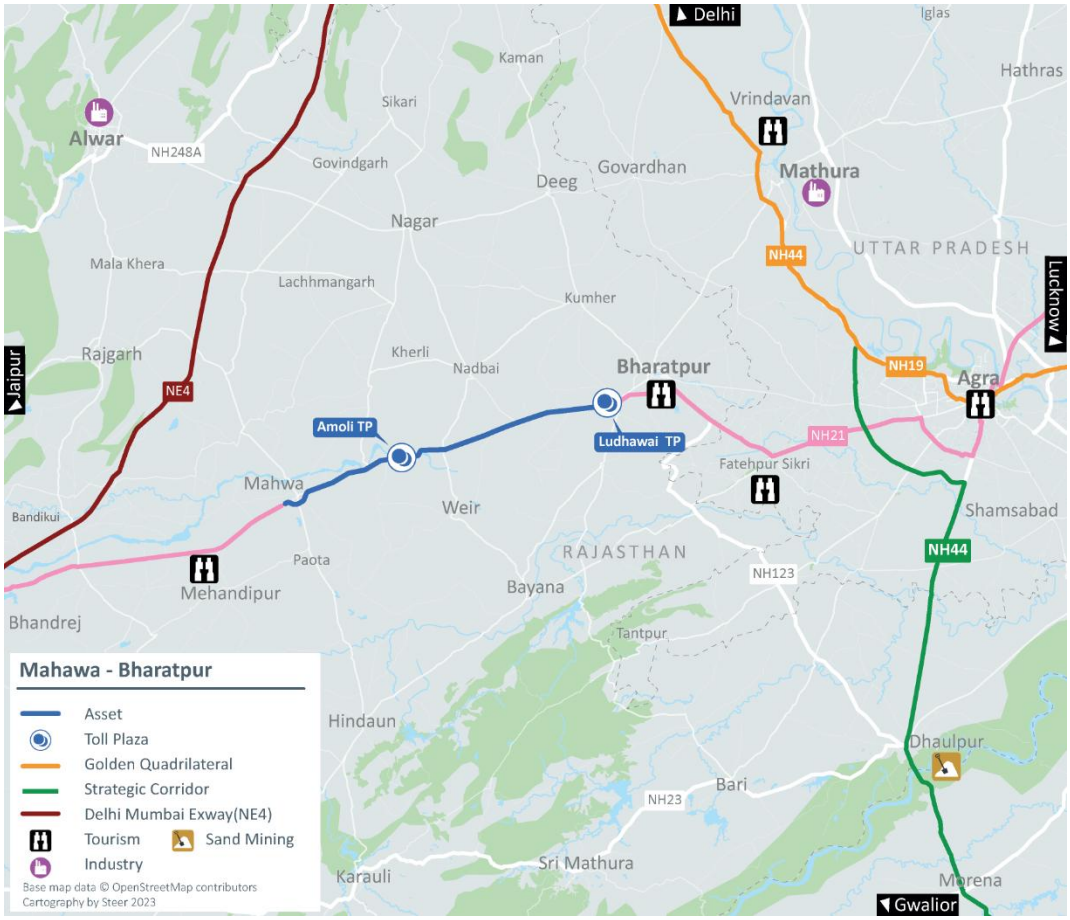
Analysis of potential network/developmental impacts

Summary of alternate routes and planned changes

6.3 The section below details the impacts which we believe would affect traffic on the Asset during the concession period. As discussed earlier in chapter 2, in order to assess the impacts on the Asset, whether positive or negative, we have studied developments (alternate roads, feeder roads and regulatory) in the surrounding road network.

6.4 The map below shows the road network surrounding the Asset.

Figure 6.1: Alternate routes and Asset route shown against the regional network context



Source: Steer analysis and cartography Recovery of traffic as observed in Q3 FY23Ease

6.5 Apart from the recovery of traffic as observed in Q3 FY23, network developments include the construction of and Agra Ring Road. Table 6.2 presents the upcoming network/other developments, corresponding alternate/feeder routes, year of completion and indicative direction of impact on the Asset.

Table 6.2: List of network/other developments

S. No.	Development	Route affected	Year of impact	Impact (+/-)	Toll plaza
1.	Completion of pending sections on Agra Ring Road	Asset route: Bhilwara/Udaipur-Jaipur-***Asset***-Agra-Kanpur Alternate route: Bhilwara/Udaipur-Chittorgarh-Kota-Jhansi-Kanpur	FY27 onwards	+ve	TP1 & TP2
2.	Delhi- Mumbai Expressway	Delhi-Jaipur connection through the expressway via Dausa interchange is expected to provide faster connectivity and improved level of service	FY27 onwards	-ve	TP1 & TP2
3.	Construction of Agra-Gwalior Expressway	Additional construction material required for the Agra-Gwalior Expressway will be sourced from Alwar and transported via MBEL Asset	FY27 onwards	+ve	TP1 & TP2

Source: Steer analysis.

Impact assessment for network/other developments

6.6 As seen in the previous sub-section, the assessed impacts primarily fall into either the category of road network developments or development in other modes of transport. Under network developments, changes in the road network could be either brownfield (upgrade to existing road) or greenfield (development of new road). We typically assess impacts of the changes in costs and travel time on routes in these networks using binary logit models that compare generalised journey costs (GJC) between Asset and alternate routes. Under other developments, we typically use historical occurrences of the future event and benchmark observations from regional reference Assets. However, each case is dealt individually in its own network or industry context.

6.7 The subsections below include a narrative of each of the improvements, as listed in the table above, and impacts associated from each of these. While this section deals with impacts that have been considered in our forecasts, Appendices A (Queries) and C (Other Impacts) present Steer's responses to the Client on queries and on the list of impacts from the scope of works part of this commission.

Diversion due to completion of pending sections on Agra Ring Road

6.8 As shown in Figure 6.2 below, the Asset is part of the long-distance east-west corridor connecting southern Rajasthan (Udaipur, Bhilwara, Chittorgarh) and Uttar Pradesh (Kanpur, Lucknow) and east. While the Asset route passes through Jaipur (NH8), Jaipur-Mahua-Asset and Agra, the alternate route passes through NH27 via Kota and Jhansi. Currently, the NH7 and NH21 connection to NH19 is not directly possible through Agra given entry restrictions from 5 AM to 11 PM. Completion of the pending section of the Agra

Ring Road is expected to improve connectivity (seamless and without time restrictions) for long-distance traffic, which will allow them to bypass Agra city and provide direct access to Agra Lucknow expressway, thereby significantly improving the access for traffic destined to Kanpur/Lucknow and east.

Figure 6.2: Asset location on long-distance route option between Udaipur/Chittorgarh and Kanpur

6.9 Source: Steer analysis and cartography

6.10 Based on our Generalised Journey Cost (GJC) based diversion analysis from the strategic route discussed above, we believe the upgrade to Agra Ring Road will result in a small positive impact on the Asset route, as summarised in the table below.

Table 6.3: Impact due to completion of missing section on Agra Ring Road, TP1 Amoli

Vehicle type	FY27	FY28 onwards
Staging	*80%*	*100%*
CJV	0.4%	0.3%

Delhi- Mumbai Expressway

6.11 NHAI is building a greenfield expressway connecting Delhi and Mumbai. The Delhi-Mumbai Expressway (DME) will connect Delhi to Mumbai with a dual carriageway with six lanes per direction. At 1350km long, it will drastically reduce travel length and times from Delhi to Mumbai. With this alignment, it is expected that once it's completed in FY26.

6.12 The benefits will also be most valued by long distance users which can make end to end trips. However this Asset is expected to have minimal impact as it caters to more east-west movement. We have assumed that the impact will be realised over two years, starting FY27.

Construction of Agra-Gwalior Expressway

6.13 Additional construction material required for the Agra-Gwalior Expressway will be transported through the MBEL Asset, which will further increase MAV traffic from FY27 onwards. However, we assume that this impact will taper off by FY29, as the expressway construction is expected to be completed by then. The phasing of the impact will see 80% of the impact in FY27, and 100% of the impact playing out in FY28.

Table 6.7: Completion of Agra-Gwalior Construction

Impact	TP1 Amoli		TP2 Ludhwai	
	FY27 (80%)	FY28 (100%)	FY27 (80%)	FY28 (100%)
MAV	1.1%	1.4%	1.1%	1.4%

Source: Steer analysis of OD data, Client TMS data and publicly available information

Revenue forecasting assumptions

6.14 To forecast the revenues for a particular year, the traffic forecast for each vehicle type is converted into tickets sold, which is then multiplied with the corresponding toll rate, which grows over the years as defined in the Concession Agreement. While "trip factors" provide the conversion factor to the former, i.e. traffic (trips) to tickets sold, "toll segmentation" provides the latter i.e. the breakup of trips paying each ticket type. This section discusses assumptions related to trip factors, toll segmentation and toll rates for the forecast period.

Trip factors

6.15 Trip factors are used to calculate the revenue for the trips made on passes such as return, local personal, monthly passes. The trip factors assumed are based on the latest FY24 data available and listed in the table below:

Table 6.8: Trip factors on Asset

Forecast	CJV/Mini LCV	LCV	Bus	2A	3A	MAV
Single	1	1	1	1	1	1
Monthly	45	45	45	45	45	45
Local commercial	1	1	1	1	1	1

Source: Steer analysis of Client TMS data

Toll segmentation

6.16 The Ministry of Road Transport & Highways has finalized a compensation formula for existing toll concessionaires to offset revenue loss from the Annual Pass scheme for non-commercial vehicles. To access the document, refer to the following **link**.

6.17 Across multiple assets, the number of passes sold has observed to be rising on a day-to-day basis, indicating an early adoption among frequent users since its introduction on 15th August 2025 till 30th September 2025, and a corresponding decline in other ticket categories mainly in the single and return categories. The evolution of proportion of users using the annual pass up to September 2025 is presented below:

Table 6.9: Evolution of annual pass trips (15th August to 30th September 2025)

	15th to 31st Aug	1st to 15th Sept	16th to 30th Sept
Amoli	10.8%	16.4%	18.6%
Ludhawai	9.6%	14.8%	16.8%

Source: Steer analysis of Client TMS data

6.18 CJV Segmentation for FY26 has been developed using the pre annual pass segmentation till 14th August 2025, and daily Annual Pass transaction data from 15th August 2025 till 30th September 2025. Post September 2025, a gradual ramp up is assumed such that they form a large portion of the CJV trips by the end of FY26. This corresponds to a reduction in a proportionate decrease in single trips. For FY27 and beyond, we have assumed the share of annual pass trips to be in line with that observed at the end of March 2026, by when we believe the distribution of ticket categories in CJVs should stabilise.

6.19 In FY26, the share of CJVs using annual passes at Amoli is projected at **14%** (on an annual basis) with a March 2026 estimate of around 28%, which from FY27, expected to stabilize at March'26 levels. At Ludhawai, the share of CJVs using annual passes is projected at 8% in FY26, with March 2026 estimated to be 19%, by when annual pass segmentation is expected to stabilise.

6.20 For other vehicle categories we have analysed the historical TMS data split by ticket categories, to understand trends, as shown in Chapter 3. For the traffic and revenue forecast, FY26YTD (Apr- Aug) as discussed in the earlier sections, can be considered a normal period.

6.21 The table below provides the toll segmentation assumed for the period of forecast. We believe with FASTag penetration stabilising and reaching upto 100% in MAVs and minimal impact of COVID-19 during these months, FY26YTD segmentation provides us with stable toll segmentation which can be used for the forecast years.

Table 6.10: Forecast toll segmentation, FY26 onwards at TP1 Amoli

Ticket Category	CJV (FY26)	CJV (FY27)	Mini LCV	LCV	Bus	2A	3A/MAV
Single	80.6%	66.0%	94.3%	97.8%	98.6%	98.6%	97.1%
Local commercial	0.4%	0.4%	0.5%	0.4%	0.9%	0.9%	2.7%
Local personal	1.0%	1.0%	1.0%	-	-	-	-
Exemptions	3.4%	3.4%	3.4%	1.4%	0.3%	0.3%	0.1%
Violations	0.8%	0.8%	0.8%	0.4%	0.2%	0.2%	0.1%
Annual pass	13.8%	28.4%	-	-	-	-	-

Table 6.11: Forecast toll segmentation, FY26 onwards at TP2 Ludhawai

Ticket category	CJV (FY26)	CJV (FY27)	Mini LCV	LCV	Bus	2A	3A/MAV
Single	79.8%	65.1%	93.0%	95.8%	99.1%	98.5%	99.5%
Local commercial	0.2%	0.2%	0.2%	2.5%	0.2%	0.8%	0.4%
Local personal	3.1%	3.1%	3.0%	-	-	-	-
Exemptions	3.3%	3.3%	3.2%	1.3%	0.6%	0.6%	0.1%

Ticket category	CJV (FY26)	CJV (FY27)	Mini LCV	LCV	Bus	2A	3A/MAV
Violations	0.6%	0.6%	0.6%	0.3%	0.1%	0.2%	0.1%
Annual pass	13.1%	27.8%	-	-	-	-	-

Source: Steer analysis of Client TMS data

6.22 There is no other toll category being charged, apart from the official list in the gazetted NHAI Revision of User fee rate w.e.f. 01.07.2022. This set of toll segmentation assumes that further changes in toll categories, unless specific discounts are offered, which is unlikely.

6.23 The Annual pass compensation is separately calculated using the formula prescribed by NHAI in the same circular. Following Table 6.6 presents the Annual pass compensation computed for the toll plaza.

Table 6.12: Annual pass compensation for CJVs (in Crore)

Toll Plaza	FY26	FY27	FY28	FY29	FY30	FY31	FY32
Amoli	2.1	4.6	5.4	5.7	6.6	7.6	8.1
Ludhawai	1.0	2.4	2.6	3.3	3.5	3.7	4.6

Source: Steer Analysis

Overloading

6.24 Overloaded vehicles on the Asset are charged twice the toll fee they would otherwise pay for their ticket type at the toll plaza. We have assumed that the FY26YTD overloading shares would continue in the forecast years. The table shows the assumptions for share of overloaded vehicles that are considered to pay twice the toll fee of the respective toll segmentation category, due to overloading.

Table 6.13: Overloading assumptions for forecast years FY26 onwards under various ticket categories

Vehicle type	Single	Local Commercial
TP1 Amoli		
LCV	3.9%	0.00%
Bus	2.0%	0.00%
2A	6.7%	0.00%
MAV	6.0%	0.00%
TP2 Ludhawai		
LCV	2.1%	0.00%
Bus	1.4%	0.00%
2A	4.6%	0.00%
MAV	6.5%	0.97%

Source: Steer review of Client TMS data

Toll evolution

6.25 Based on the concession agreement and the gazetted toll notification, we understand that base toll rates increase every year (revision month is July) based on WPI-linked inflation (as of March). These are rounded up to the nearest five to estimate the final toll rate charged to users.

6.26 We have used actual toll rates from the FY25 toll notifications and latest print WPI for the month of March'25 for FY26 to validate the modelling of future toll evolution. Increase in WPI was calculated based on the Client's WPI forecasts, as shown in Table 6.14 below. The upward trend in inflation is expected to continue in the medium term, before gradually tapering to 4.1% by FY32.

6.27 These forecasts provided by the Client. The WPI forecasts available from other independent forecasting agencies may vary from this assumption and could be lower or higher than that provided by the Client.

Table 6.14: WPI growth forecast assumptions

Financial year	WPI growth (%)
FY26	2.05%
FY27	4.7%
FY28	5.0%
FY29	5.1%
FY30	4.9%
FY31	4.4%
FY32	4.1%

Source: FY26 as per actual WPI March print. FY27 onwards WPI print as per client

Revenue reconciliation

6.28 As part of validating the data provided by the Client, as well as our assumptions around toll calculations, we have reconciled the actual reported revenue on a daily level for the Asset. To reconcile we have used the FY26YTD segmentation, FY26YTD AADT and compared it with the reported revenue for the year. The exercise was undertaken at an annual level. The comparison, as shown in Table 6.15 below, depicts the modelled revenue vs the reported revenue difference, and the difference lies within 0.1%, this gives us the confidence in the assumptions around segmentation and trip factors for future forecast purposes.

Table 6.15: Revenue reconciliation summary for FY26YTD

TP	Steer modelled revenue (INR lakh)	Reported revenue (INR lakh)	Difference (%)
TP1 Amoli	20.3	20.2	0.5%
TP2 Ludhawai	10.1	10.0	0.3%

Source: Steer comparison between modelled and reported revenue for FY26YTD

Traffic and Revenue forecasts

6.29 Based on the traffic and revenue-related forecast assumptions discussed above, we have modelled the traffic and revenue for the forecast period for the Asset. The table below presents the AADT/PCU and revenue forecast numbers and CAGRs on this Asset for both TP1 Amoli and TP2 Ludhawai. Further, Appendix B presents the AADT and revenues for the forecast period. Detailed forecast is tabled in Annexure C of the report.

Table 6.16: Traffic forecasts (with impacts) AADT forecast for TP1 Amoli

Vehicle Type	FY26	FY27	FY28	FY29	FY30	FY31	FY32
CJV	7,521	8,059	8,630	9,223	9,836	10,478	11,163
Mini LCV	882	910	940	969	998	1,028	1,058
LCV	280	287	292	298	303	309	314
Bus	1,411	1,457	1,504	1,551	1,598	1,645	1,694

Upside and Downside cases

Upside and Downside scenario assumptions

6.30 We have developed our base case scenario considering a balanced view on the risks associated with input assumptions around GDP growth and traffic growth elasticities. There is always a risk that the outturn values of these inputs will vary as compared to the assumptions taken due to exogenous impacts, e.g. GDP growth could be influenced both

positively and negatively by the impact of monsoons, export-import balances, political changes etc.

6.31 Similarly, traffic growth elasticities could be influenced by increased efficiencies achieved by technology, large shifts in commodity prices globally, changes in local manufacturing practices. However, at this stage we consider that the base case represents a central case scenario given the risks of variation of input assumptions.

6.32 To account for the possible variations in the growth drivers, we are also presenting an Upside (optimistic) and a Downside (pessimistic) scenario. These scenarios are defined by the following variations from the base assumptions:

Table 6.24: Summary of Macro-economic Assumptions for upside and downside cases

Input	Upside	Downside
Macro Assumptions		
GDP/GSDP	+1% every year	-1% every year
WPI	+1% every year	-1% every year
Elasticities	+ 10%	- 10%

Source: Steer analysis

6.33 Further, network developments are highly dependent on governmental directions, policies, legal and financial measure which might result in early or delayed completion of developments. Therefore, we have included an Upside (optimistic) and a Downside (pessimistic) case. However, at this stage, we consider that the base case represents a central case scenario given the risks of variation of input assumptions.

Impacts-Upside Case

6.34 The upside case impacts included in forecasts are summarised in below.

Table 6.25: Summary of impacts on the Assets

Development	Year of impact	Change in impact w.r.t base case	Magnitude of impact	
			TP1 Amoli	TP2 Ludhawai
Completion of pending sections on Agra Ring Road	FY27*	+25% of base case	Base case estimates	Base Case estimates
Delhi- Mumbai Expressway	FY27*		2A: (0.3%) 3A: (0.1%) MAV: (0.3%)	2A: (0.3%) 3A: (0.1%) MAV: (0.3%)
Completion of Agra-Gwalior Construction	FY27*		MAV: 1.7%	MAV: 1.8%

Source: Steer analysis; * Same as base case timeline

Impacts-Downside Case

6.35 The downside case impacts included in forecasts are summarised in below.

Table 6.26: Summary of impacts on the Assets

Development	Year of impact	Change in impact w.r.t base case	Magnitude of impact	
			TP1 Amoli	TP2 Ludhawai
Completion of pending sections on Agra Ring Road	FY27*	-25% of base case	LCV: 0.4% 2A: 1.9% 3A: 2.5% MAV: 3.7%	LCV: 0.3% 2A: 1.9% 3A: 2.6% MAV: 3.7%
Completion of construction of Delhi-Mumbai Expressway	FY27*		2A: (0.4%) 3A: (0.2%) MAV: (0.6%)	2A: (0.4%) 3A: (0.2%) MAV: (0.6%)
Completion of Agra-Gwalior Construction	FY27*		MAV: 1.0%	MAV: 1.1%

Upside and Dowside Forecasts

6.36 Based on the above assumptions for upside and downside scenarios, the following table summarizes the upside potential and downside risks associated with the PCU and the revenue for Amoli and Ludhawai toll plazas at the end of the concession i.e. FY32.

Table 6.27: Upside potential and Downside PCU scenario - FY32

Toll Plaza	Upside Potential	Downside Risk
Amoli	8.5%	(7.6%)
Ludhawai	8.6%	(7.7%)

Summary outlook

6.37 Passenger traffic on the Asset is driven by local movements connecting key urban centers of Jaipur, Agra, Alwar, and Bharatpur. Tourism and leisure travel between Jaipur at one end and Bharatpur and Agra at the other also contributes to passenger and bus movements, as the Asset is part of the Golden Triangle corridor (Delhi NCR, Agra, Jaipur). Even though the recent pandemic impacted passenger and tourism-related traffic, the trend of increased use of personal vehicles has led to a good recovery of car traffic in recent months.

6.38 Goods traffic are driven by agriculture commodities, construction-related traffic including stone and sand, apart from a good spread of consumption-related commodities meeting urban demand. With the lifting of sandmining ban the Asset has seen a small recovery in MAVs. The recovery in recent months has shown underlying strength in the traffic growth drivers along the Asset corridor which is expected to continue driving growth on this corridor.With the completion of the Dausa-Lalsot road and Jaipur Ring Road in the immediate forecast period and the Agra Ring Road later, both medium-distance and long-distance traffic are expected to experience positive impacts.

6.39 Our findings and estimates in this report are based on our understanding from the site visit, analysis of primary data available both from surveys and the toll management system (both historical and current), macroeconomic assumptions prescribed by Client, feedback from Client meetings and secondary publicly available data. There can be both positive and negative risks associated with assumptions and the forecasts using them as summarised below.

6.40 With regards to impacts, we see the following risks:

1. Gain of long-distance traffic from NH27 road and the sand movement would depend on the successful completion of Agra Ring Road.

- With the recent commissioning of the Delhi Mumbai expressway section upto Dausa, the network between Delhi and Jaipur has become even more connected, traffic will be negatively affected and full direct impact has been assumed from FY27.

6.41 Overall, we see a positive outlook for the region and the Asset, given that it serves major urban centres of Jaipur, Agra, Bharatpur, Alwar and Delhi NCR. It is also the primary route on the tourism corridor connecting Jaipur with Bharatpur and Agra. The underlying growth drivers of the corridor are strong and are expected to deliver long term sustained growth.

Appendices

A Developments in sand-mining

A.1 This appendix provides a chronological account of developments – policy, regulatory and judicial – in sand-mining applicable across India and particularly in Rajasthan. Please note that this list is not exhaustive and is meant to gain a high-level understanding of the issues surrounding sand-mining that affect movement of sand on the Asset.

Table A.1: History of policy and regulatory changes, and court judgements affecting sand-mining

Event	Timeline
National	
Recommendations of MoEF core group	2010
SC ruling - Orders MoEF to formulate guidelines for sustainable sand-mining	Feb FY12
MoEFCC Sustainable Sand Mining Management Guidelines - Calls for site-specific surveys by district administration - Environmental clearance mandatory for all sand mines - DEAC and DEIAA committees for less than 5 hectare mines Stop of mining during monsoon months (June-September)	Mar FY16
Amendment of EIA Notification 2006 - EI clearance mandatory for all small-scale sand mines Treat cluster mines within 500 m as single mine	May FY17
SC ban on sand-mining; prohibits 82 large sand-mining lease holders	Nov FY18
SC refuses to remove ban	Jan, Aug FY19
Rajasthan	
Mining policy	2015
NGT: Even existing licence holders need to get environmental clearance	Jan FY15
Not clear if manufactured sand can meet demand and quality needs	FY19
"Mining ban give rise to sand mafia"	Oct FY19
SC stays Rajasthan HC order that allowed sand-mining at mines with issued LoIs	May FY20
Manufactured sand policy being considered and licences for small plots being allowed	Sept FY19, Jul FY20
Replenishment study of sand mines to be taken up	Aug FY20
Rajasthan HC asks PS (RJ) to issue compounding fee on vehicle – apply consistent approach	Sept FY20
Rajasthan M-sand policy announced	2020
Revised M-sand policy and 27 monitoring teams deployed across the state	2024

B Top 10 OD Pairs

B.1 Further to the OD analysis presented in Chapter 3 this appendix presents the top 10 OD pairs at TP2 Ludhawai. Please see this data for both CJVs and Bus as well as 3As and MAVs combined below.

Table 6.29: CJV and Bus top 10 OD pair shares at TP2 Ludhawai

	OD Pair	Share
1.	Bharatpur-Jaipur	16.8%
2.	Agra-Jaipur	12.9%
3.	Bharatpur-Nadbai	7.2%
4.	Mathura-Jaipur	6.1%
5.	Bharatpur-Mahwa	3.7%
6.	Bharatpur-Dausa	2.5%
7.	Bharatpur-Halena	2.4%
8.	New Delhi-Jaipur	1.9%
9.	Mathura-Mehandipur	1.9%
10.	Agra-Mehandipur	1.5%

Source: Steer analysis

Table B.1: 3A and MAV top 10 OD pair shares at TP2 Ludhawai

	OD Pair	Share
1.	Bharatpur-Jaipur	5.3%
2.	Agra-Jaipur	5.1%
3.	Bhuj-Agra	3.5%
4.	Bihar-Bhuj	2.5%
5.	Bhuj-Lucknow	2.5%
6.	Bhuj-Kolkata	2.4%
7.	Bharatpur-Dausa	2.0%
8.	Agra-Dausa	1.9%
9.	Mathura-Jaipur	1.8%
10.	Bhuj-Mathura	1.7%

C Data collection exercise

C.1 In order to validate and inform various inputs used in our forecasting, we undertook primary data collection on the Asset. OD survey data was collected on behalf of the Client, TVC surveys were commissioned by Steer with a third party. OD data collection typically involves manual data entry by enumerators based on oral surveys with road users crossing toll plazas. TVC data collection involves video-graphic capture of traffic passing crossing the toll plazas, followed by manual counting.

7-day TVC counts

Table C.1: 7-day TVC counts at TP1 Amoli

Disclaimer

This report has been produced for the sole benefit of Cube Highways Pvt. Ltd. This Report (the "Report") is confidential and disclosed only for information purposes, and it may not be relied upon by any party other than the Client or a Party to a Reliance Letter, and Steer: a) makes no warranty, expressed or implied, with respect to the use of any information or methods disclosed in this Report; and b) assumes no liability with respect to the use of any information or methods disclosed in this document. Any such party by its acceptance or use of this Report releases Steer from any liability for direct, indirect, consequential, or special loss or damage whether arising in contract, warranty, express or implied, tort or otherwise.

The Report is based on standard professional efforts, and information available to us at the time the review took place and is subject to time and budget constraints of the Report's scope of work. This Report, information and statements contained herein, are all based on third party data provided to us, or sourced by us, and Steer has not sought to establish the reliability of the data, except as specifically stated in the Report. Steer bears no responsibility for the results of any actions taken based on the third-party data.

Certain forward-looking statements in the Report are estimates based on interpretations or assessments of information available at the time of writing. The Report is thus to be viewed as an assessment that is time-relevant, specifically referring to conditions at the time of the review. Steer undertakes no obligation to update the Report for any reason.

While the estimates contained in the Report are not precise forecasts, they do represent, in our view a reasonable expectation of the future, based on information we have been provided with or sourced. However, the estimates necessarily rely on numerous assumptions and judgements, and circumstances may occur over the timeframe of the project that go counter to these assumptions and judgements and that affect the project's realized revenues. Actual events may differ from those assumed, and events are subject to change. Therefore, Steer makes or provides no warranty, whether implied or otherwise, as to the accuracy of forward-looking information presented. Further, it is important to note that forecasts presented represent long-term growth profiles; the results for individual time periods may vary from forecasted values.

Traffic Consultant developed the relationships in the models used to produce the forecasts for the projects based on data available through September 2025. This report does not consider variations in traffic performance due to changing macro and force majeure events such (but not limited to) as global wars, economic uncertainty (high inflation, global recession), and changes in the regulatory environment. The situation remains dynamic and is subject to significant change in the short and medium term. In this challenging context, Traffic Consultant has produced base forecasts with a view on a possible scenario for the traffic forecasts. However, it is important to note that this is only one view, and there continues to remain uncertainty as to the short-term, intermediate or prolonged effects of and responses to such macro-economic/force majeure events. As a result, no assurance can be provided by Traffic Consultant that the scenarios and assumptions Traffic Consultant has identified will prove to be accurate. Given the uncertainty inherent in this scenario, Traffic Consultant advises that all readers of the Report consider the Report in the context of their own assessment of the impact of such events.

TO THE FULLEST EXTENT PERMITTED BY APPLICABLE LAW, THE LIABILITY OF THE TRAFFIC CONSULTANT FOR ANY LOSS, DAMAGE, COST OR EXPENSE SUFFERED OR INCURRED BY ALL PERSONS OR ENTITIES AND FOR ALL CLAIMS RESPECTING ITS WORK PERFORMED IN CONNECTION WITH THE ISSUE OR THE REPORTS IS HEREBY LIMITED IN THE AGGREGATE TO THE AMOUNT OF FEES ACTUALLY PAID BY THE CLIENT TO THE TRAFFIC CONSULTANT IN RESPECT OF THE REPORTS AND CONNECTED SERVICES.

Glossary Items

Acronym	Meaning
2A/ Truck	2 Axle/ Truck
3A	3 Axle
AADT	Annual Average Daily Traffic
BOT	Build Operate Transfer
CAGR	Compound Annual Growth Rate
CJV	Cars / Jeeps / Vans
COD	Commercial Operations Date
DPR	Detailed Project Report
ETC	Electronic Toll Collection, also referred to as FASTag
FY	Financial Year
GDP	Gross Domestic Product
GSDP	Gross State Domestic Product
HAM	Hybrid Annuity Model
HCM/ EME	Heavy Commercial Vehicles/ Earth Moving Machinery
IE reports	Independent Engineers' reports
INR	Indian Rupees
km	Kilometer
LCV/ LGV	Light Commercial Vehicles/ Light Goods Vehicle
LMV	Light motor vehicles
MADT	Monthly average daily traffic
MAV	Multi Axle Vehicle
NH	National Highway
NHAI	National Highways Authority of India
NHIIMPL	National Highways Infra Investment Managers Private Limited
NSDP	National State Domestic Production
OD	Origin Destination
OSV	Oversized vehicles
PCU	Passenger Car Unit; it is a measure of standard vehicle unit to convert all vehicle classes to a single unit by using PCU factors to compute total traffic on an Asset.
Q1	Quarter 1 of financial year, from April to June
Q2	Quarter 2 of financial year, from July to September
Q3	Quarter 3 of financial year, from October to December
Q4	Quarter 4 of financial year, from January to March
RNP	Registered Number Plate
SCF	Seasonality Correction Factor
SH	State Highway

Acronym	Meaning
T&R	Traffic and Revenue
TMS	Traffic Management System
TVC	Traffic Volume Count
WADT	Weekly average daily traffic
YTD	Year to Date

1 Introduction

The assignment

1.1 The Cube Highways Fund Advisors Private Limited (the "Client") has commissioned Steer Davies Gleave India Private Limited ("Steer") for a traffic due diligence to be carried out on the Madurai-Kanyakumari Tollway Road (hereafter called "Asset"). This report forms part of the annual fair market valuation (FMV) undertaken as part of the "Transit 10 project". This report presents an update of the traffic and revenue forecasts based on actual traffic data available up to September 2025 and latest macro-economic assumptions.

1.2 The Asset Madurai-Kanyakumari consists of four toll road sections, each of which has a separate special purpose vehicle (SPV). For this report, we hereafter call the four SPVs together as Asset and toll plazas on each section as TP1-TP4.

- Madurai Kanyakumari Tollways Limited: MKTL: TP1 – Kappalur
- Kanyakumari Etturvattam Tollways Limited: KETL: TP2 – Etturvattam
- Salaipudhur Madurai Tollways Limited: SMTL: TP3 – Salaipudhur
- Nanguneri Kanyakumari Tollways Limited: NKTL: TP4 – Nanguneri

1.3 Our scope of work for the traffic and revenue forecasting process includes:

Table 1.1: Scope of work and sources of data

Scope of work	Data source
• Review of historical Traffic Management System (TMS) data, Vendor reports and documents	• Provided by client for the period between Oct'20 and Sept '25
• Historical analysis and forecasts for baseline growth, including; – Background growth, and – Seasonality trends	• Historical data provided by the Client and benchmarking using plazas in the vicinity or of similar nature of the Asset has been done wherever sufficient data was unavailable
• Validation of revenue reported in FY26YTD	• TMS data provided by Client • Revenue reconciliation using toll plaza traffic and ticket type data to calculate revenue and reconciling it with toll plaza reported revenue
• Origin Destination (OD) analysis to understand growth drivers: – Zonal influence and Top OD pairs – Commodity distribution – Trip length distribution	• Origin Destination (OD) surveys undertaken by Steer. Surveys were undertaken on TP1 and TP3 in 2023 and on TP2 and TP4 in 2021.

• Analysis of upcoming network improvements and other developments, that may have future impacts on traffic	• Secondary research and our in-house experience of working in the vicinity of the Asset. Impact analysis to be conducted by Steer based on Generalised Journey Cost spreadsheet-based analysis
• Historical revenue analysis and forecasts for revenue estimation, including – Toll segmentation and trip factors, – Overloading shares	• Calculated from historical data provided by Client
• Final traffic growth forecasts including baseline growth rates and potential future impacts	• Elasticity based base growth and potential impacts from secondary research and Steer's in-house experience of working in the vicinity of the Asset
• Toll revenue estimation for the entire concession, including toll evolution	• Toll evolution based on latest toll notification published by National Highway Authority of India (NHAI); and latest Wholesale Price Index (WPI) trends as shared by the client

Our approach

1.4 Our approach follows well-established practices for forecasting ongoing traffic growth on an existing/brownfield Asset. The analysis has essentially focused on two sets of issues, namely:

- understanding the traffic that is currently using the Asset; and
- identifying how and why that traffic is likely to change in the future.

1.5 To understand the current traffic on the Asset, we have analysed traffic data from multiple independent sources as given below:

- Client-provided secondary data, including:
  - TMS data from October 2020 to September 2025
  - Concession agreement and toll notifications for FY25 and FY26
  - Previous studies related to traffic and revenue
- In the previous study in 2023, Steer-commissioned OD surveys on two plazas of the Asset, TP1 Kappalur and TP3 Salaipudhur to validate any change in growth drivers and travel patterns. Survey on TP1 was conducted on 28th August 2023 and on TP3 on 1st July 2023.
- We undertook revenue reconciliation for FY26 YTD, by building up revenue from the traffic reported by each of the toll plazas and subsequently matching them to the reported revenue for FY26YTD using the prevalent toll rates and reported segmentation/toll-frequencies for FY26YTD. This has been a key part of our analysis to validate the segmentation/toll-frequency assumptions, and the Annual Average Daily Traffic (AADT) reported for each of the toll plazas.

1.6 The estimation of future traffic demand on the Asset was undertaken through:

- Estimating the FY26 base year position. The FY25 AADT was calculated using the monthly traffic data for FY25. The FY25 AADT thus computed was then grown with elasticity linked GDP/GSDP growth to arrive at the FY26 expected traffic. To determine the estimates for FY26, the expected FY26 traffic was validated against the six months

of actual FY26 traffic (Apr to Sept) and necessary adjustments were made where required.
- Secondary research to understand plans for new developments and progress of ongoing developments on the Asset.
- Steer independent primary surveys and site visits to validate our network and contextual understanding.
- Developing a bespoke growth model for each Asset/plaza/toll class to forecast year-on-year traffic growth from FY26 to the end of concession period.
- Investigating the elasticity of historical traffic growth compared to state (GSDP) and national (GDP) growth. Where historical data is limited, we have benchmarked the Asset against our Steer knowledge base (e.g., similar Asset types in the same state or on the same corridor), to derive appropriate elasticities.
- Applying our elasticities to independent GDP forecasts as provided by client.
- Identifying and analysing the potential impacts of any relevant changes to the competitive position of each Asset – these include impacts of changes to road network including expressways and opening of competitive modes of travel.
- Identifying and analysing any other potential impacts to traffic and revenue on each Asset – these include axle load norms, axle shift for heavy goods, FASTag implementation.
- Considering changes in trends of segmentation over time and making suggestions for changes in exemptions in the future
- Preparing traffic and revenue forecast for the Asset for the complete length of the concession. We have developed a set of forecasting assumptions for three scenarios: a base case and upside and downside scenarios.

Contents of this report

1.7 The report has been divided into the following chapters, including Chapter 1 providing an introduction:

- Chapter 1 introduces the methodology and approach to undertake the traffic and revenue due diligence;
- Chapter 2 describes the key characteristics of the Asset and its surrounding road network, primarily based on site visits;
- Chapter 3 summarises the current and historical traffic on the Asset, including results from the TMS, TVC and OD analyses;
- Chapter 4 presents the socio-economic context of the corridor and region/state containing the Asset, along with our approach and results on estimating background traffic demand growth; and
- Chapter 5 presents our baseline year forecast and summarises our results on estimating background traffic demand growth
- Chapter 6 summarises our assessment of network impacts and presents concession traffic and revenue forecasts for the Asset along with the assumptions for upside and downside cases

2 The Asset

Introduction

2.1 This chapter provides a description of the Asset, based on both primary data (from site visits), and our understanding of the region and network surrounding the Asset. We cover the strategic network context, followed by key economic activities and network developments around the Asset.

Strategic network

2.2 The Asset is situated in the state of Tamil Nadu, connecting Madurai, and northern Tamil Nadu and states north of Tamil Nadu with the cities and towns in southern Tamil Nadu and Thiruvananthapuram in Kerala. The following figure shows the regional road network in which the Asset is located.

Figure 2-1: Asset location in the regional network context

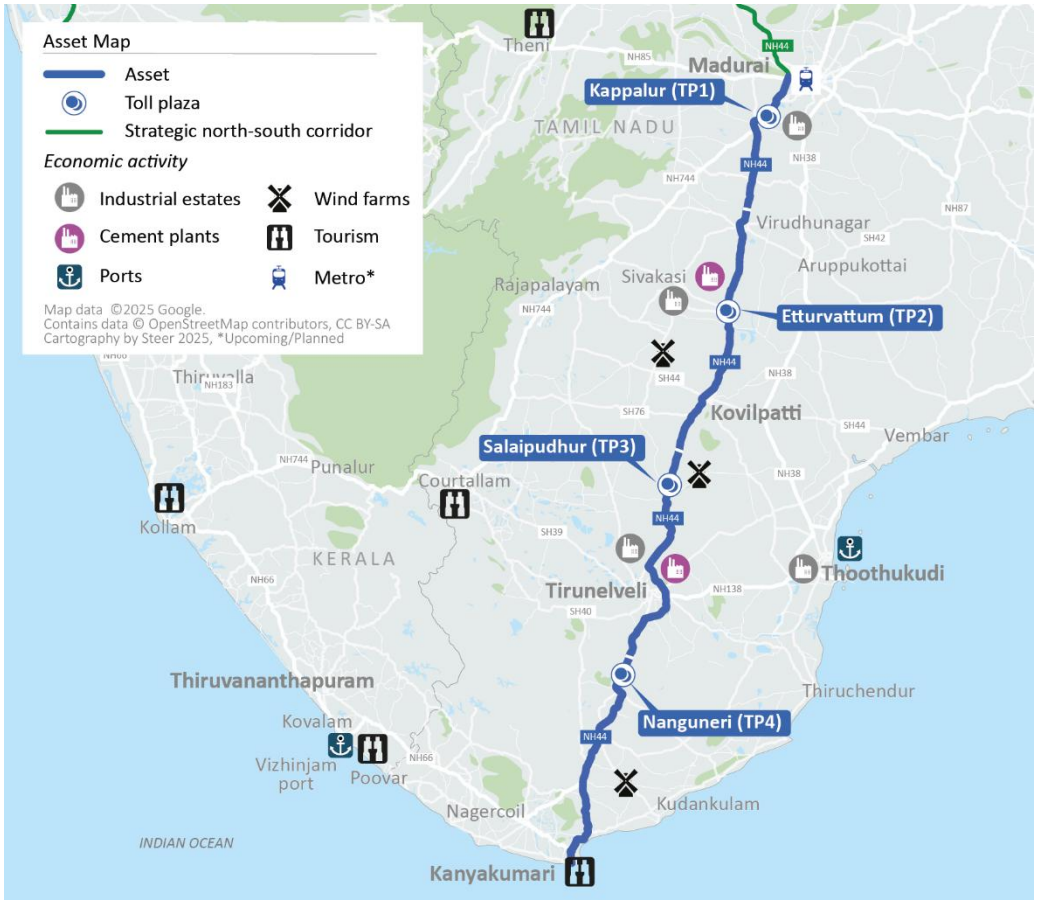
Source: Steer cartography

2.3 This Asset primarily caters to three different types of strategic movements:

- **Long-distance trips** between North India and Southern states like Andhra Pradesh, Telangana and Karnataka at one end and southern Tamil Nadu and Thiruvananthapuram at the other end.
- **Medium-distance trips** between Chennai and Bangalore at one end and southern parts of Tamil Nadu and Thiruvananthapuram at the other end.
- **Short-distance trips** between cities and towns in southern Tamil Nadu including Madurai, Thirumangalam, Tuticorin, Virudhunagar, Sivakasi, Kovilpatti, Tirunelveli and Thiruvananthapuram.

2.4 The Asset is a 243-km toll road which lies on NH44 in Tamil Nadu. It is a four-lane road with four toll plazas. The following figure provides a closer view of the Asset in the context of its immediate surroundings.

Figure 2-2: Asset context



Source: Steer cartography using OpenStreetMap data

Concession and tolling details

2.5 The three southern toll plazas (TP2: Etturvattam, TP3: Salaipudhur and TP4: Nanguneri) on the Asset have been operational since FY12 while the northernmost toll plaza (TP1 Kappalur) has been operational since FY11. The Client took over operations of the Asset in October 2020.

2.6 The following table provides a key metrics of the Asset that have their chainage from KM 0.0 to KM 243.470 of NH44.

Table 2.1: Asset description and key metrics

Asset	Particulars
State	Tamil Nadu
Highway and lane configuration	NH 44 four-lane
Toll plazas	• SPV 1: TP1: Kappalur • SPV 2: TP2: Etturvattam • SPV 3: TP3: Salaipudhur • SPV 4: TP4: Nanguneri
Road Length (km) as per concession agreement	• TP1: 52.30km • TP2: 64.20km • TP3: 63.50km • TP4: 63.47km
Commencement of operations	• TP1: Sep 2012 • TP2: 15 2011 • TP3: 23 2011 • TP4: 23 2011
Operated by Client since	October 2020
Concession period	30 years
Last year of concession	FY51

Source: Client data

2.7 The figure below shows a typical cross-section of the Asset and its toll plazas.

Figure 2-3: TP1 Kappalur, SIPCOT Industrial Park, RAMCO Cement Plant and India Cement Plant

Source: Steer site visits

2.8 Tolls are collected for the vehicle categories and rates as shown in the following table. The toll plazas have dedicated ETC/FASTag lanes for electronic tolling.

2.9 Due to general elections in India from Apr-May'24, the toll rates on the national highways across the country were changed in June 2024 onwards, instead of April 2024. For FY26 the toll rates changed from Apr'25 across most of the national highways in India including the Asset.

Table 2.2: Single toll rates on the Asset (INR), applicable for FY26

Type of Vehicle	Single Journey Fee			
	TP1 Kappalur	TP2 Etturvattam	TP3 Salaipudhur	TP4 Nanguneri
CJV	105	105	130	115
LCV	170	170	205	185
Bus/Truck	355	355	435	390
3A	385	390	475	425
MAV/HCM/EME	555	560	680	610
OSV	675	680	830	740

Source: NHAI Revision of User fee rate w.e.f. 01.04.2025

Key economic activities

2.10 Of the four plazas, TP1 Kappalur has the highest urban influence, with the toll plaza being in the suburbs of Madurai. It is situated between Madurai city and the municipality of Thirumangalam. The Asset is in a highly urbanised region of Tamil Nadu, with densities peaking at either ends of the Asset cluster – i.e., near Madurai and Kanyakumari. Demand is driven by a consumption-based economy with major economic activities surrounding cement manufacturing, container terminal, textile plants, wind power and industrial estates like State Industries Promotion Corporation of Tamil Nadu Limited (SIPCOT).

Cement

2.11 The toll plazas TP2: Etturvattam and TP3: Salaipudhur have two large cement plants close to them, namely Ramco Cements at RR Nagar (near Virudhunagar) and India Cements at Sankarnagar (north of Tirunelveli). Both are Chennai based cement companies which cater to most of the local residential and infrastructure development demand and some in surrounding states like Kerela and Andhra Pradesh.

2.12 The India Cements factory, set up in 1949 and located just north of Tirunelveli on the Asset, has an annual production capacity of 4.7 million tonnes, as per FY23 report. [1] Limestone is one of the main raw materials for cement manufacture and Nanjankulam Limestone Mines, located nearby, is one of the captive limestone mines of the Sankar Nagar factory. Besides, the Ramco Cements factory at RR Nagar in Virudhunagar is another large cement plant which grew from an annual capacity of 2 to 3.9million.

[1] The Ramco Cements Limited (RAMCOCEM) Q4 FY23 Earnings Concall Transcript | AlphaStreet

Industrial estates

2.13 The southern Tamil Nadu region in the immediate area of influence of the Asset and hosts several industrial estates including at Kappalur (Madurai), Gangaikondan (Tirunelveli) and Nanguneri. While Kappalur and Gangaikondan are already operational, the Nanguneri SEZ (Special Economic Zones) already has land allotted but is not operational yet. As per the latest information, Tamil Nadu state Government is planning to acquire 1000 acres from private developers for Nanguneri SEZ (Special Economic Zones). [2]

2.14 The Tamil Nadu Small Industries Corporation (SIDCO) industrial estate at Kappalur, located on the southern part of the Madurai bypass, is a 700-acre facility established in 1974. It has 400 units related to food processing, fabrication, textile and hardware industries and employs over 15,000 people until 2024.[3] The SIPCOT (State Industries Promotion Corporation of Tamil Nadu Limited) at Gangaikondan houses units like the LPG storage godowns of the Indian Oil Corporation, South India Bottling Company, ATC Tyres Private Limited, Nova Carbon Company and Bosch Limited.

2.15 The industrial city of Tuticorin and the surrounding region hosts the Tuticorin Port which is one of the 12 'major' ports of the country and has two container terminals.[4] There are several power plants including the Tuticorin Thermal Power Station and private ones like the captive Sterlite Industries plant. Other industries include salt pans, oil mills, chemical factories and export-based businesses.

2.16 The Asset also lies on the Chennai-Kanyakumari Industrial Corridor (CKIC) which covers 23 districts and aims to promote port-based economic development. The project aims to promote balanced regional growth and development of the southern districts. Six industrial nodes have been identified as part of the Comprehensive Development Plan of which Madurai-Dindigul-Virudhunagar-Theni and Thoothukudi-Tirunelveli have been prioritised as part of Phase-I.[5]

2.17 Based on the site observations and the latest FY24 reports it was found that India's biggest mega textile park under PM Mitra is under development in Virudhunagar along the Asset on NH44 closer TP2 Etturvattam plaza. [6]

Wind power

2.18 Tamil Nadu is the top producer of wind energy in the country with an installed capacity of about 8.7 GW across Coimbatore, Tiruppur, Tirunelveli, Thoothukudi and Kanyakumari districts[7].

2.19 Though the Madurai and Tirunelveli region were traditionally agricultural regions, with older wind farms primarily located in the southern Tirunelveli/Kanyakumari region, commissioning of wind farms in other parts of these southern districts and even western

[7] Wind energy generation picks up in T.N., consumption expected to peak at 100 million units a day this year - The Hindu

districts like Coimbatore have expanded the wind energy business. Ettaiyapuram town near Thoothukudi is a major producer and storage for wind pillar and mills. Player including Sembcorp Energy India produce these mills there.

Urban consumption centres

2.20 Given the highly urbanised nature of the region including cities like Madurai, Tirunelveli and Trivandrum, and towns like Virudhunagar, Kovilpatti and Tuticorin, there is a lot of consumption-related retail activity in the region. A lot of this regional consumption demand is met by LCVs and 2As, apart from 3As. MAVs primarily serve long-distance traffic part of the strategic movement from and to northern states.

2.21 The cities and towns in the region are culturally connected and show leisure-based car and bus travel not only between cities and towns in the southern districts but also to and from Chennai. Tourism includes both pilgrimage and leisure travel. Destinations like Rameswaram and Kanyakumari are renowned pilgrimage destinations while other cities that have religious destinations include Madurai and Tirunelveli. Leisure destinations in the immediate vicinity of the Asset are Courtallam, Cape Comorin and Manjolai Estates in Tenkasi, Kanyakumari and Tirunelvei districts.

2.22 Besides the urban centres mentioned above, the Asset also serves as the highway link between southern Tamil Nadu and Kerala. Hill stations (Thekkady, Kodaikanal and Munnar), beaches in Kerala are popular tourist destinations for domestic tourists from Tamil Nadu. Besides, Thiruvananthapuram and Kanyakumari districts are culturally connected and show inter-urban passenger movements.

Alternate routes

2.23 As seen on the map in the earlier section, the Asset lie at the southern end of NH 44, the traditional north-south corridor connecting North India with South India terminating at Kanyakumari.

2.24 For the three types of movements observed on the Asset – long-distance, medium-distance and short-distance trips – that were explained earlier in this chapter, this section introduces potential alternate routes available for diversion.

- **Long-distance:** There is no long-distance alternate to the Asset. NH 66 - the long-distance north-south corridor along the coast connecting Mumbai with Kanyakumari, does not directly compete with the Asset as it passes through highly urban and congested areas in Kerala. The Asset is the primary link between Tamil Nadu and states north of Tamil Nadu at one end and the southern districts of Tamil Nadu including Madurai, Virudhunagar, Tirunelveli, Kanyakumari and Thiruvananthapuram (Kerala) at the other end.
- **Medium-distance**: There are two major medium-distance alternatives available.
  - The Madurai-Tuticorin Expressway (MTEL) on NH 38 connects Madurai more directly with Tuticorin (2.5 hours, 150 km) compared to the Asset through Kovilpatti (3 hours, 170 km). Port traffic between the northern Tamil Nadu hinterland and the Tuticorin Port primarily use this route. However, due to current 4-lane expansion of NH38 under Chennai-Kanyakumari by National Highway Authority of India (NHAI), the section is under construction. With that, our Asset

has continued to gain some traffic. Since, the shift of traffic volume is insignificant hence no impact is considered in Chapter 6.[8]

- The NH 744 route between Madurai and Kollam, through Rajapalayam, is another competitive alternate for road users having Courtallam and Kollam district (Kerala) as destinations. Chapter 6 presents the analysis of potential impact due to the planned upgrade of NH 744 in the future. This road is currently being 4-laned from Madurai up to Rajapalayam, while other sections of the route have had DPR prepared for 4 laning.
- **Micro-diversion**: There are local roads that help road users bypass the toll plazas. While some of these movements have already been contained and the issues being addressed, two alternates had significant amount of traffic. We believe these micro-diversions have achieved equilibrium and matured in their diversion behaviour and therefore no impacts were considered in Chapter 6.
- There is metro connectivity being planned from Othakadi to Tirumangalm in Madurai which will cross TP1 Kappalur plaza. It will mostly impact the local car traffic on Asset; hence this impact is considered on the TP1 of the Asset.

3 Traffic Description

Introduction

3.1 This chapter outlines the current traffic and revenue on the Asset, as well as our analysis of origin-destination (OD) data and traffic count data. This encompasses data, which was collected as a part of this study, as well as data provided by the Client.

3.2 Traffic demand data is generally collected and analysed to understand the volume and vehicle composition of demand currently using the Asset, while OD data is used to obtain; a) better understanding of travel patterns, trip lengths, trip purposes and areas of influence in the vicinity of the Asset, and b) the commodities being moved by goods vehicles. Combined with our understanding of the Asset (based on our site visits), this analysis enables us to identify the key drivers of demand on the Asset.

3.3 Actual toll plaza data is used as the basis from which the current/base year annual average daily traffic (AADT) is established. This data is typically provided by the Client and independently analysed and validated by us using traffic volume count (TVC) information.

PCU Factor assumption

3.4 The PCU values have been taken from 'IRC 64:1990- Guidelines for Capacity of Roads in Rural Areas'. For MAV, based on the discussion with the Client, we have referred to the rigid and trailer splits in the latest TVC counts conducted in 2023 for calculating the effective PCU for MAVs. For rigid trailer trucks we have assumed a PCU factor of 3, whereas for trailer trucks we have assumed a PCU factor of 4.5. These factors have been used to arrive at the PCU values presented in the following sections.

Table 3.1: PCU factors

Vehicle Category	PCU Factor
CJV/ Mini LCV	1.0
LCV	1.5
Bus	3.0
2A	3.0
3A	3.0
MAV*	3.3
OSV	4.5

Source: Steer analysis, * Rigid-Trailer PCU

Historical trends

3.5 The following table illustrates the traffic data over the period of 5 years from October 2020 – September 2025 (provided by the Client) at a plaza level. There is lack of long-term historical data available on the Asset since tolling was started by the client only in October 2020 and both the available years of data, FY21 and FY22 were impacted by COVID-19 related restrictions. Therefore, starting FY23 traffic on the Asset has started to get normalised with similar travel patterns recorded in FY24 and FY25.

3.6 Table 3.2 and Table 3.3 below depict the historical total and tollable traffic levels at TP1 Kappalur

Table 3.2: Historical Traffic Levels at TP1 Kappalur

Vehicle category	FY21*	FY22	FY23	FY24	FY25	FY26 YTD	CAGR FY23-25
CJV	17,121	17,720	18,200	19,245	20,236	22,063	5.4%

Tollable PCU	**27,342**	**25,393**	**29,805**	**32,107**	**33,899**	**39,783**	**6.6%**

Source: Steer analysis of Client data, (FY21* includes 6 months of data from Oct'20 to Mar'21); FY26YTD includes data till Sept'25; Tollable traffic excludes exemption and violation

3.7 Passenger traffic at the TP1 Kappalur (CJV/Buses) has shown a consistently increasing trend since the pandemic-impacted year of FY22. CJVs have witnessed a ~5% CAGR from FY23 to FY25. Overall, for the period between FY23 to FY25, the toll plaza had an AADT growth of 5% and a PCU growth of 4.6%. The buses on the plaza have shown a slight degrowth in the initial months of FY26 due to ongoing court case between the NHAI and TNSRTC.

3.8 In terms of the vehicle share, the dominant category at the toll plaza is CJVs – having a 72% share, as of FY25. This is due to the proximity of the Asset to the consumption centres of Madurai and Thirumangalam. Goods vehicles (2A/3A/MAV combined) have a 10% share at the toll plaza, and their volume is the highest amongst the four toll plazas on the Asset, due to the presence of electronic and manufacturing industries in Madurai

3.9 Tollable traffic at the toll plaza showed a higher growth compared to the total (tollable + non-tollable) traffic for FY23 to FY25. TP1 Kappalur recorded a CAGR of 6.6% tollable PCU growth which is 4.6% in case of total traffic.

3.10 Higher tollable PCU growth is majorly driven by Cars and 2A - which reflects reducing exemptions and violations in these categories.

3.11 Table 3.4 and Table 3.5 presents the historical traffic profile on Etturvattam toll plaza.

Table 3.4: Historical Traffic Levels at TP2 Etturvattam

Vehicle category	FY21	FY22	FY23	FY24	FY25	FY26YTD	CAGR FY23-25

Source: Steer analysis of Client data, (FY21* includes 6 months of data from Oct'20 to Mar'21); FY26YTD includes data till Sept'25; Tollable traffic excludes exemption and violation

3.12 At TP2 Etturvatam, CJVs have historically had the highest share of traffic – like TP1 Kappalur. In FY26YTD, the CJV volume was ~10,000, which was approximately 70% of the total traffic observed at the toll plaza. The rationale for high shares of CJV traffic can be attributed to the presence of the large urban settlements and pilgrim sites on the Asset. With increasing tourism activities post COVID-19, the period between FY23 to FY25 witnessed a healthy CAGR in CJVs (9%) and Bus (9%) traffic on the plaza.

3.13 With the strong presence of industrials units of cement and textile close to TP2, the plaza observes healthy share of commercial traffic (15%). In March 2023, India's first PM Mitra textile park opened in Virudhunagar close to TP2, which is key traffic generator. The opening of the new textile park drove the increase in associated commercial traffic in FY24 (10.4%, compared to FY23). The high volumes of goods vehicles can be explained by the presence of cement plants in the vicinity of the toll plaza (Ramco and India Cement Plants).

3.14 Considering only the tollable traffic (which excludes violations and exemptions), TP2 Etturvatam has observed a higher PCU growth compared to the overall traffic in FY25. TP2 Etturvattam had recorded 9% tollable PCU CAGR which is 9.2% in case of total traffic for the period FY23 to FY25.

3.15 FY25 witnessed a higher tollable CAGR rate by 9.5% growth in CJVs and 16.2% growth in buses, compared to 9% and 9% for the total traffic respectively from FY23 to FY25.

3.16 Table 3.6 and Table 3.7 below present the historical traffic profile on Salaipudhur toll plaza.

Table 3.6: Historical Traffic Levels at TP3 Salaipudhur

Vehicle category	FY21	FY22	FY23	FY24	FY25	FY26YTD	CAGR FY23-25

Source: Steer analysis of Client data, (FY21* includes 6 months of data from Oct'20 to Mar'21); FY26YTD includes data till Sept'25; Tollable traffic excludes exemption and violation

3.17 Consistent with the trend observed at TPs 1 and 2, CJVs remain the dominant category (having a 70% share in FY25) with trips generated from/to Madurai, Tirunelveli, Kovilpatti and tourism trips towards Kanyakumari as well.

3.18 In terms of volume, CJVs were ranging at ~7800 volume in FY24 on this plaza which reached ~8400 in FY25 and have continued to increase at ~9300 in FY26YTD. This constant rise in volumes has been due to the increased tourism influence of Kanyakumari, Tirunelveli and Madurai.

3.19 Compared to the total (tollable + non-tollable) traffic, the tollable traffic at TP3 Salaipudhur recorded a 8.9% tollable PCU growth from FY23 to FY25. On the other hand, this growth is 7.9% in case of total traffic.

3.20 Higher tollable PCU growth is majorly driven by buses, which observed a 16% increase, as compared to a 9% increase in overall bus traffic

3.21 Table 3.8 and Table 3.9 below presents the historical traffic profile on Nanguneri toll plaza.

Table 3.8: Historical Traffic Levels at TP4 Nanguneri

Vehicle category	FY21	FY22	FY23	FY24	FY25	FY26 YTD	CAGR FY23-25

3.22 TP4 Nanguneri has also witnessed a healthy growth in FY25 when compared with FY24 due to increased tourism activities between the hubs of Madurai, Tirunelveli and Kanyakumari. Goods traffic on this Asset, comprising 2A/3A/MAVs, is driven by trips generated to/from Tirunelveli, Kanyakumari and Tuticorin. One of the 12 major ports in India – the V.O Chidambaranar port, is in Tuticorin.

3.23 3A category has largely remained flat historically across all the toll plazas. The reduction in 3A volume is a result of the declining demand for 3A vehicles, which are being replaced by MAV's. MAVs offer higher tonnage capacity making them more cost-effective for transporters. This is consistent with our discussion with various transporters and OEMs across the country who are favouring 5A vehicles for commodity movement due to better unit economics.

3.24 In line with the observation at the other toll plazas on the Asset, when comparing the tollable with the total (tollable + non-tollable) traffic, TP4 Nanguneri has observed a higher PCU growth in FY25 when compared with FY24. TP4 Nanguneri recorded a 3.8% tollable PCU growth, which was marginally higher than that of 3% in case of total traffic for FY23-FY25 period.

3.25 A notable development across all the 4 TPs in FY26 has been the uptick in the tollable traffic observed in the bus segment during August and September of FY26 YTD which can be attributed to the resumption of toll payments by Tamil Nadu State Transport Corporation (TNSTC) buses following the Madras High Court's intervention earlier in July 2025.[9] In this case, the Court had directed toll operators under the Madurai–Kanyakumari Tollway and related concessions to bar TNSTC buses from accessing four key toll plazas—Kappalur, Etturavattam, Salaipudhur, and Nanguneri

[9] TNSTC vs Madras HC

3.26 Subsequent compliance and settlement discussions led to the reinstatement of toll payments by the state transport undertakings, resulting in the observed increase in tollable transactions for buses across these plazas during the recent months.

3.27 This increase in tollable traffic has resulted in increased revenue collection which is discussed in the section below.

Historical Revenue

3.28 The following tables show the revenue (in INR Lakhs) by each vehicle type at the toll plaza at an annual level and at daily level.

Table 3.10: Total Revenue (in INR Cr) and AADC (in INR Lakhs) by vehicle type at TP1 Kappalur

FY	CJV	LCV	Bus	2A	3A	MAV	OSV	Total	AADC	AADC Growth

3.29 Tables above present, the revenue on the Madurai - Kanyakumari section. It can be inferred from the data that major contributor to the revenue on the Asset is the CJV category which has a share ranging from 40% to 45% of overall revenue across the Asset followed by MAVs which contribute between 15-18% of the overall revenue in case of TP1, TP3 and TP4 whereas for the TP2 the MAV revenue share is around 20%.

Toll Frequencies

3.1 Toll frequency or segmentation is typically the share of each ticket category recorded for a particular vehicle type. This is based on the toll policy which forms a part of the concession agreement. Each vehicle category has different segmentation. As a part of historical analysis, we calculate the toll frequency for each vehicle category from the monthly data shared by the client. The most common ticket categories observed on a typical National Highway are: Single, Return, Monthly, Local and Exempt. Given the local nature of traffic, some toll plazas offer custom made local passes to attract the local commuters to opt for these passes instead of evading toll.

3.2 The following are the types of tickets being sold at the plazas of the Asset.

Table 3.14: Typical ticket types sold at NHAI plazas

Category	Description
Single	Allows the vehicle to cross the toll plaza once
Return	Allows for a return journey within a day with a 50% discount on the return trip.
Monthly Pass	Discounted single entry ticket for users who undertake multiple trips within a month can buy the monthly pass.
Local Personal	Discounted single entry pass only for private cars of residents within 20km radius of toll plaza
Local Commercial	50% discount on single trips for commercial vehicles registered in the local district. This pass allows single entry only
Exemptions	Officially exempted vehicles like ambulance, police cars, key political personnel etc.

3.3 Further, the toll plazas also record violations which are non-paying users, who are not officially allowed under exemptions category but are forced exemptions. For some Assets, the Exemption and violations are at time reported together.

3.4 Generally, over the period the shares of single/return/monthly tickets tend to stabilise within 2-3 years of Asset operations. Only in the cases where trip patterns are expected to change significantly due to urban expansion is where we expect these shares to change over the period or due to some external events impacting the trip patterns.

3.5 Further, FY21 was impacted due to the mandatory implementation of FASTag as a mode of payment, where users were now paying via an online payment system instead of cash payments at the toll plaza. Additionally, in FY22 traffic and travel patterns were impacted by the second wave of COVID-19 in Q1 and Q2. With FY21 and FY22 being impacted these external events, the segmentation began to stabilise from FY23 onwards and reached steady state starting FY24.

Introduction of Annual pass for CJVs

3.6 The National Highway Authority of India launched the "The FASTag Annual Pass" on August 15, 2025, a prepaid facility that allows private CJVs to travel across designated National Highway and National Expressway toll plazas. The annual pass is worth INR 3,000. The pass is valid for one year or 200 trips, whichever occurs first and is applicable only to private, non-commercial vehicles (Car/Jeep/Vans).

Since this pass has been introduced by NHAI, it is not valid on

- state governed toll plazas on highways
- state governed toll plazas expressways
- Parking areas or other non-NHAI tolling locations

3.7 The pass can be activated via the RajmargYatra app or the NHAI website, and links directly to an existing FASTag.

The Annual Pass aims to:

- Promote cashless and seamless travel on national highways.
- Reduce congestion and improve traffic flow at toll plazas.
- Provide cost-effective travel for frequent users of NH/NE toll roads.

Share of traffic by payment type

3.8 Since the Asset is located closer to the urban clusters, it caters to a considerable number of daily commuters using the Asset. Generally, the local movement results in multiple CJV trips though the plaza, leading to higher share of return ticket for CJVs. On TP1, the level of exemptions is influenced by higher share of local traffic on the plaza.

3.9 The share of exemptions for CJVs has been stable across all toll plazas, since the reduction in FY22. A high share of non-tollable exempted traffic in buses is seen across the Asset, because of the local nature of the bus traffic. A major reduction can be seen in the exemption category because of the strict implementation of FASTag and this exempted non-paying category traffic has been converted into the Monthly passes and local commercial tickets. However, a large proportion of buses continue to not pay on each of the toll plazas.

3.10 Across the toll plazas, the CJV segmentation shares have largely been consistent from FY23 - FY25. On the other hand, MAVs have exhibited similar trends when compared with previous years where single is dominant ticket category.

3.11 The figure below shows ticket segmentation for CJV and MAV categories for TP1 Kappalur.

Figure 3-1: Ticket segmentation for CJV at TP1

Source: Steer analysis of Client data

3.16 As highlighted in the historical traffic section, the state transport buses are mandated to pay the tolls at all the toll plazas by the Madras HC, there has been a change in the segmentation of the buses with the exemptions decreasing since Aug'25. Below table highlights the segmentation for buses for the months of Aug'25 and Sept'25.

Table 3.19 Ticket segmentation for buses for the months of Aug'25 and Sept'25

Ticket Category	TP-1			TP-2			TP-3			TP-4		
	July'25	Aug'25	Sept'25	July'25	Aug'25	Sept'25	July'25	Aug'25	Sept'25	July'25	Aug'25	Sept'25
Single	8%	8%	8%	9%	11%	10%	9%	10%	10%	7%	7%	7%
Return	6%	7%	6%	51%	53%	52%	52%	56%	55%	39%	39%	38%

Exemption	24%	2%	2%	11%	0%	0%	22%	2%	2%	13%	0%	0%

Source: Steer Analysis of Client Data

3.17 We have therefore assumed that the buses on each of these toll plazas will continue to pay at the rate observed in September'25, and the same has been considered in our forecasts.

Data Collection exercise

3.18 As mentioned earlier, to validate and inform various inputs used in our forecasting, we undertook primary data collection on the Asset, comprising the surveys listed below. OD data collection typically involves manual data entry by enumerators based on oral surveys with road users crossing toll plazas, which Steer commissioned with a third party. TVC data collection involves video-graphic capture of traffic passing crossing the toll plazas, followed by manual as well as software-based counting. As part of the current study, OD surveys were undertaken on two toll plazas TP1 and TP3 to understand the change in travel patterns on the Asset. The TVC surveys and OD surveys on TP2 and TP4 were undertaken in 2021 as part of the earlier commission.

Table 3.20: Data collection exercise

Asset	7-day videography-based TVC			1-day OD survey			
	Start date	End date	Time (hrs)	Start date	Start time	End Date	End Time

Source: Steer analysis

3.19 It should be noted that, in our experience, traffic on national highways shows variation across the week due to the economic activities surrounding each road. To derive a representative TVC count considering daily variation, three-day to seven-day traffic counts are generally recommended, and hence, in order to fully understand the impact of this weekly fluctuation on the Asset, we collected seven-day counts at each toll plaza.

Key findings of the TVC data analysis

WADT estimates

3.20 Taking an average of the three/seven-day TVC counts conducted, we obtained the following weekly average daily traffic (WADT) for each toll plaza. This WADT excludes non-tollable vehicles such as tractors, two-wheelers, bullock-carts, etc., but includes officially exempt vehicles such as police cars, ambulances, emergency response vehicles, government vehicles and other vehicle types officially allowed as 'exempted' under the concession agreement.

Table 3.21: WADT from TVC counts

Toll Plaza	CJV	Mini LCV	LCV	Bus	2A	3A	MAV	Total
TP1 Kappalur	16,703	2,189	2,628	3,414	1,072	613	791	27,409
TP2 Etturvattam	7,526	806	1,391	1,172	638	306	699	12,538
TP3 Salaipudhur	6,974	828	1,333	1,044	608	282	458	11,527
TP4 Nanguneri	8,452	930	1,331	1,167	527	327	532	13,266

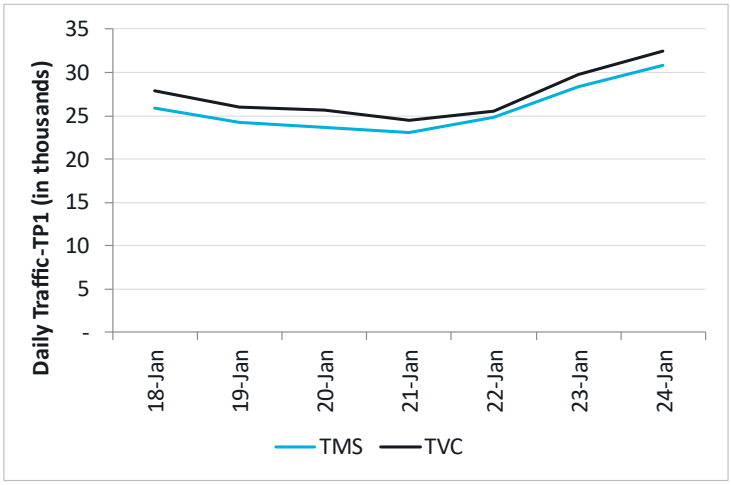
Source: Steer analysis of TVC data

TVC v/s TMS analysis

3.21 As we use the TMS data to estimate the base year AADT, we have used our TVC data to validate the TMS data on those days, as provided by the Client.

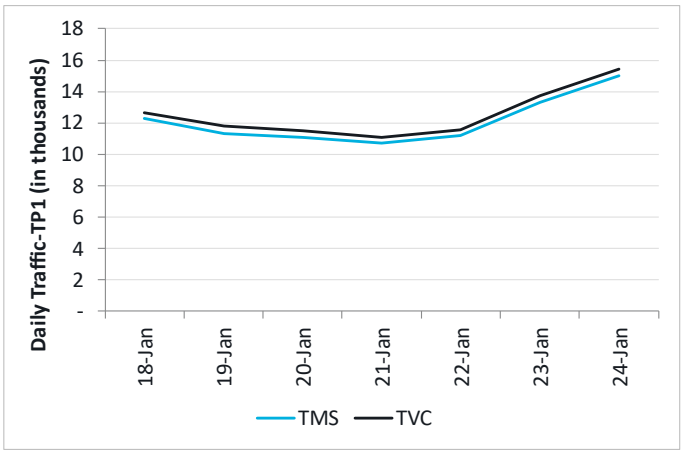
3.22 The following figures show the comparison between the daily traffic observed by TVC and TMS for the four toll plazas. As can be seen from the figures, the overall difference between TVC and TMS over the week for the four toll plazas is within the acceptable range of variation.

Figure 3-9: Comparison between TVC and TMS daily traffic data on TP1



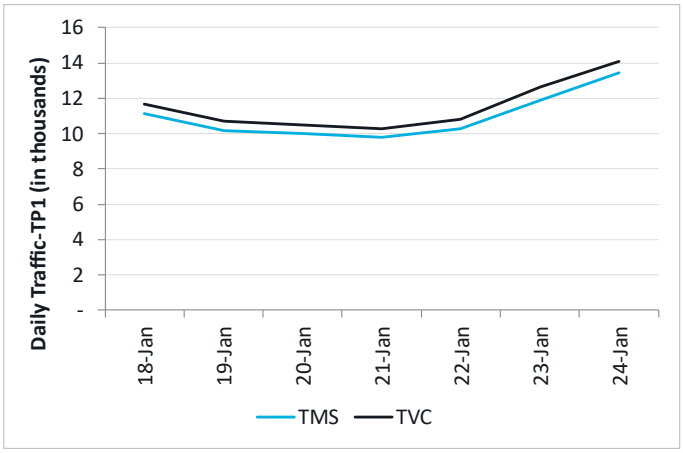
Source: Steer analysis of TVC and Client TMS data

Figure 3-10: Comparison between TVC and TMS daily traffic data on TP2



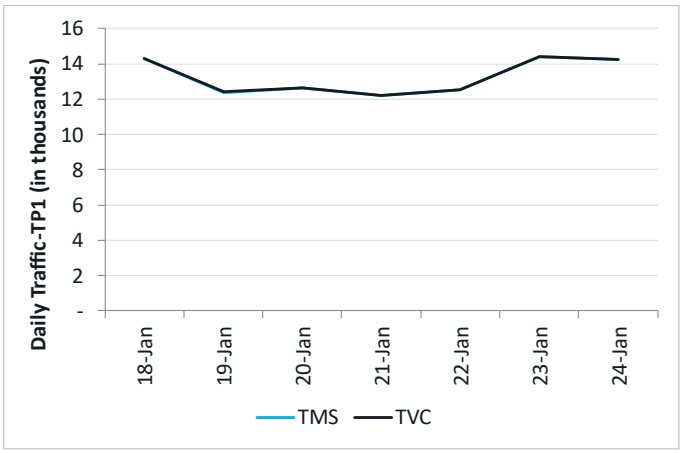
Source: Steer analysis of TVC and Client TMS data

Figure 3-11: Comparison between TVC and TMS daily traffic data on TP3



Source: Steer analysis of TVC and Client TMS data

Figure 3-12: Comparison between TVC and TMS daily traffic data on TP4

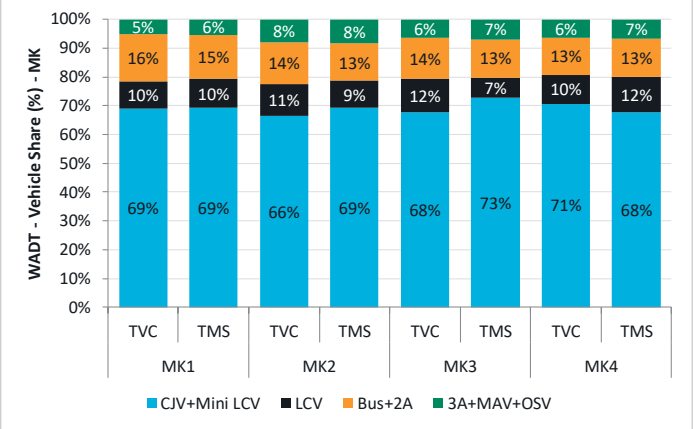


Source: Steer analysis of TVC and Client TMS data

3.23 The figure below compares the shares of vehicle types at four toll plazas observed by the TVC and TMS data. As can be seen, whilst the share of CJVs and 3A+MAV+OSV is marginally higher for TMS compared to TVC, it is equal for Bus/2A and lower for LCV

category. This difference can be attributed to common misclassification of vehicle categories.

Figure 3-13: Comparison between vehicle shares from TVC and TMS WADTs



Source: Steer analysis of TVC and Client TMS data

3.24 Considering the smaller variation between the TVC and TMS data for the largest revenue generator 3A+MAVs, and an overall match in the traffic volumes, our TVC-TMS analysis gives us confidence that the base year traffic calculated using the Client data forms a reliable base year traffic estimate.

Key findings of origin-destination analysis

Overview

3.25 Origin-destination (OD) analysis enables the understanding of the nature of traffic movement on the Asset. As mentioned previously, the OD analysis presented here has been based on the data collected on 30th Jun – 1st July 2023 for TP1: Kappalur and TP3: Salaipudhur and surveys performed in previous studies for TP2: Etturvattam and TP4: Nanguneri.

3.26 We have analysed the regional drivers of demand based on the following analyses:

Zonal influence
Commodity distribution
Top OD pairs
Trip length distribution

3.27 While zonal analysis and the list of top OD pairs help to understand ‘where’ people and goods travel, commodity distribution sheds light on ‘what’ goods get transported. Trip length distribution shows ‘how far’ vehicles and people travel, and goods get transported. This set of analyses is generally used to estimate the key drivers of traffic and aid the making of informed forecasting assumptions around traffic demand elasticities, growth drivers and exogenous impacts.

Sample rates

3.28 Sample rates help understand the reliability of OD data. They are calculated by dividing OD samples captured by the traffic counts (based on the TMS data) during the same time period. The table below presents the sample rates for passenger and goods vehicle type

aggregations at the toll plaza. We believe that the sample rates of the OD data are reasonable for the analysis required.

Table 3.22: Sample rates for OD data

Vehicle type	TP1 Kappalur	TP2 Etturvattam	TP3 Salaipudhur	TP4 Nanguneri
Passenger (CJV+Bus)	43%	27%*	41%	57%
Goods (LCV+2A+3A+MAV)	78%	31%*	68%	52%

Source: Steer analysis of OD data, *The surveys took place during the COVID-19 pandemic due to which the vehicles were reluctant to stop and answer the enumerators leading to lower sample rate.

Zone Categories

3.29 To facilitate better interpretation of key regional drivers of traffic as determined by their OD zones, and influenced by various towns, cities, states and regions in the vicinity of the Asset, we have aggregated zonal data as described in the table below. The methodology behind this aggregation of zones may vary as per the characteristics displayed by the different Asset being studied.

Table 3.23: Zone aggregations for zonal influence analysis

Aggregate Zone	Description
Local	Local zones are those that fall on or very close to the Asset.
IAOI (Immediate Area of Influence)	IAOI zones are the locations which generate traffic and lie within approximately 75-150 km distance from the Asset.
Rest of Tamil Nadu (TN)	Rest of the cities/Districts in the state that Asset lies in (other than Local/IAOI)
Kerala	Kerala
Karnataka	Karnataka
AP & Telangana	Andhra Pradesh and Telangana
North India	Uttarakhand, Haryana, Punjab, Jammu and Kashmir etc
West India	Gujarat and Maharashtra
East & Northeast India	West Bengal, Orissa, Jharkhand and Northeast Indian states
Central India	Madhya Pradesh

Source: Steer analysis

Zonal Influence

3.30 The zonal influence is the contribution of the zone or the zonal aggregation to trips by a vehicle type. This section presents the zonal influence[10] at each toll plaza of each Asset,

[10] For example, if out of 100 trips at a toll plaza on an Asset, 10 trips are between Hyderabad and Delhi and 90 trips are between Hyderabad and Chennai, then zonal influence of Hyderabad would

based on zonal aggregation listed in the previous sub-section. it should be noted that zonal influence is analysed on trip ends and not trips.

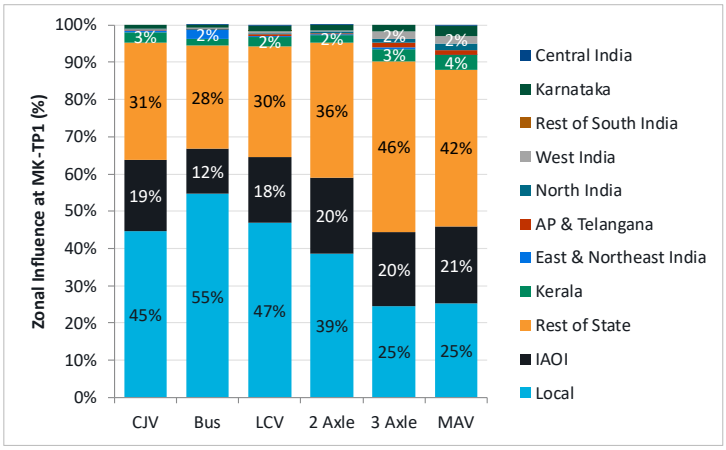
3.31 It is seen that the local, IAOI, and Rest of TN zonal shares - constitute the majority of zonal influence for all vehicle types – with more than 95% for CJVs to about 85% for MAVs. As expected, heavier vehicles have more movement to/from the rest of the state and country. This analysis is further supported by the top 10 OD pairs, given in the appendix which show that the majority of the trips originate and end in areas which are in either of the three zonal categories mentioned above.

3.32 As can be seen from the following figures, at TP1 Kappalur (Figure 3-14), there is a higher share of Rest of State trips for both the passenger and commercial vehicles wherein Local and IAOI zones combined such as Madurai, Tirumangalam, Virudhunagar etc have the greatest influence on CJV, Buses, with around 50-55% of the total share. These shares decrease with axle numbers, indicating that majority of the local movement is led by smaller vehicles. There is also a significant influence on the heavy goods traffic from areas in rest of the state like Tirunelveli, Chennai, Kanyakumari and Coimbatore with 55% and 53% influence on 3A and MAV traffic respectively.

3.33 Going from Kappalur towards Nanguneri (Figure 3-17), the local zones have decreasing influence while IAOI and rest of Tamil Nadu zones have increasing influence. This is understandable given that the southern stretch of the Asset has more urban villages and towns located further away from the highway. For example, at TP2 Etturvattam (Figure 3-19) and TP4 Nanguneri (Figure 3-17), more than 50% of the zonal influence across all vehicle categories are from areas in the rest of the state and at TP3 Salaipudhur (Figure 3-16), majority of the influence on traffic is from Rest of State zones across categories with 72% and 67% influence on 3A and MAV traffic respectively.

3.34 Outside Tamil Nadu, areas in Kerala such as Thiruvananthapuram has the highest influence of about 5-6% on traffic across all toll plazas because the Asset connects the southern part of Tamil Nadu to Kerala, wherein Thiruvananthapuram and Kanyakumari districts are culturally and economically connected cities with inter-urban traffic movements.

Figure 3-14: Zonal influence at TP1 Kappalur



be 50% since one end of all trips are at Hyderabad. Likewise, zonal influence of Delhi and Chennai would be 5% and 45%, respectively.

Internal External analysis

3.35 Internal-External analysis helps in identifying the trips which have both the origin and destination on or near the Asset i.e local/IAOI zones (Internal-Internal or I-I), any one end on the Asset (Internal-External or I-E), or neither end on the Asset i.e. through trips (External-External or E-E). RoS here represents areas within the state which are neither local or IAOI. 'Internal' zones are those that were analysed as 'local' and 'IAOI' in the zonal influence analysis, i.e. lying on the Asset, while 'External' zones are areas lying outside the state.

3.36 The figures below shows the distribution of trips based on these categories. Understandably, these reflect the observations seen in the zonal influence presented earlier, at a higher level of aggregation.

3.37 In line with our understanding from zonal influence analysis above and site visits, it is seen that a significant number of trips either originate and end internally i.e., within local or IAOI zones or have at least one end of the trip in rest of state with very less external to external movement of traffic on the Asset across all toll plazas.

3.38 At TP1 Kappalur (Figure 3-18), more than 50% of the passenger trips are Internal-Internal with this share decreasing for the goods vehicle traffic wherein the majority of the trips originate in and are destined towards areas in the rest of the state like Chennai, Coimbatore, Tirunelveli etc. This share is even higher at TP2 Etturvattam (Figure 3-19) wherein RoS-RoS trips are the highest across all vehicle categories. At TP3 Salaipudhur (Figure 3-20) and TP4 Nanguneri (Figure 3-21), apart from the high I-I movement seen especially in passenger traffic, the goods vehicle traffic sees a high number of trips originating from RoS and ending at internal areas near the Asset.

Commodity distribution

3.39 We have grouped various commodities into aggregate categories for ease of interpretation, as shown in the table below. The charts in the following sub-section present information in terms of aggregate commodity categories.

Commodity Description	Code	Combined codes used for charts
Agriculture Products / Cash crops (Wheat, Rice, Sugar cane,Maize etc.)	AGR	AGR
Cattle Food / Live Stock (sheep, ghoat, cow,cattle food etc)	LIV	
Perishable Items (Fruits, vegetables)	PER	GRO
Animal Products/Dairy/Eggs/Fish/Meat/Animals	DFM	
Groceries / Food items (Soap, Salt, Sugar, Pulses, Spices, Biscuits, bread,cool drinks, beer etc.)	GRO	
Building Material / Construction (Cement, Lime, Brick, fly ash, etc)	CNS	CNS
Sand/Clay	SND	
Stone (kota stone, marble, Granite, Aggregate stone etc.)	STN	
Ceramic	CRM	
Petroleum Products (Oil, LPG, CNG, etc.)	PET	PET
Chemicals / Fertilizers (Acids,Fertilizers etc.)	CHM	
Electrical/Manufacturing items (Electronic items, Medicine, Leather, Wine, Rubber/ Tyre, Plastics, Cloth, Paper etc.)	MAN	MAN
Raw Wood,Cork & Wood Products, Furn	WUD	
Machinery / Spare parts	MAC	
Automobiles (Finished products, auto parts, Car/bike manufacturing, New Chassis)	AUT	AUT
Basic / Fabricated Metals (Iron, Steel / Metal)	MET	MET
Mining Minerals (Coal, Gypsum, Cobalt etc.)	MIN	
Empty	EMT	EMT
Container	CTR	MSC
Miscellaneous (Parcel, Courier, House hold items etc.)	MSC	
Passengers	PAS	
Scrap	SCR	

Source: Steer analysis

3.40 The commodity analysis from the OD data shows that overall manufacturing items is the main commodity item being carried on the Asset across all toll plazas followed by agricultural and grocery items. Also, construction goods seem to be a key commodity that is carried by MAVs especially at TP3 Salaipudhur wherein about 33% of the MAVs transported construction material including cement on the Asset. The high commodity share of manufacturing items could be attributed to the presence of several industrial estates along the Asset such as the Tamil Nadu Small Industries Corporation (SIDCO)

industrial estate at Kappalur, industrial city of Tuticorin and an industrial estate in Gangaikondan, Tirunelveli.

3.41 At TP1 Kappalur (Figure 3-22), manufacturing items such as medicines, machine parts, paint etc is key commodity carried by both light and heavy goods vehicle making up for ~10-20% share across all vehicle categories. Direction wise, it is seen that a significantly higher share (13%) of MAV carry construction goods in the direction of Tirunelveli compared to those moving towards Madurai which could be attributed to the presence of India Cements plant just north of Tirunelveli and Ramco Cements near Virudhunagar. Also 22% of MAV carry manufactured good towards Tirunelveli, which is much higher than the proportion (13%) in the opposite direction. This difference is attributable to the presence of the warehouses and SIDCO industrial estate in the vicinity of TP1 Kappalur. This also stems from the connectivity provided to the Thoothukudi port from Tiruneveli.

3.42 At TP2 Etturvattam (Figure 3-23), grocery items such as biscuits, juice, sweets and other household items make up for the top commodity item that is carried by both the light and heavy goods vehicle with a 17% share for MAV and 22% share for 3A traffic, given the proximity of highly urbanised cities such as Madurai, Virudhunagar, Tirunelveli making up for the regional consumption demand. Direction wise, a relatively higher share of MAVs (more than 30%) moving towards Kanyakumari carried cement compared to those moving in the direction of Madurai.

3.43 At TP3 Salaipudhur (Figure 3-24), miscellaneous goods like household items are at the top of the commodity mix for light good vehicles and 3A traffic, however, one-third of the MAV traffic is dedicated towards carrying construction materials given the proximity of the toll plaza to cement plants nearby. Direction wise, there is a higher share of light good vehicles carrying agriculture and grocery items in the direction of Kanyakumari with around 39% of the MAV carrying construction goods. A larger share of light good vehicles show a considerable share of empty vehicles travelling towards Madurai, given the regional and short- to medium-distance movement of commodities.

3.44 At TP4 Nanguneri (Figure 3-25), agriculture items are the top commodity category for light good vehicles whereas manufacturing items, cement and construction items make up for a high share in the overall commodity mix for 3A and MAV traffic. Direction wise, there is a relatively higher share of heavy goods traffic carrying cement, agriculture items and construction material in the direction of Kanyakumari and a very high share of empty light and heavy goods vehicle moving in the direction of Madurai.

Trip length analysis

3.45 Trip-length distribution provides the distance-based profile of various vehicle types. This aids in validating assumptions around the share of macro-economic drivers, inputs from zonal influence and toll segmentation. For ease of interpretation, we have categorised distances into 5 groups – local (0-100km), short-distance (100 - 300 km), medium-distance (300 – 500 km), long-distance (500-1000 km), and very-long distance (+1000 km). The trip distances were derived as driving distances from Google Distance Matrix Tool based on zonal coordinates for OD pairs.[11]

3.46 Supporting the observations made in zonal & internal-external analysis in the previous sections, the figure below highlights, contributing to local movements on the Asset. The major proportion of the heavy goods traffic covers longer distances of 300-500 km and 500-1000 km to places such as Tirunelveli, Chennai, Coimbatore etc. Across all the plazas, 6-9% of MAV travel long distance over 1000kms.

[11] Google Distance API is a tool that is available on a chargeable basis from Google Maps Platform. Link: **https://developers.google.com/maps/documentation/distance-matrix/start**. Travel distance and time information for driving/transit under various congestion scenarios can be extracted through this tool by using macro-enabled Excel, R, etc.

Conclusions

3.47 Traffic on the Asset is dominated by CJVs which make up approximately 70% of the total vehicle composition at every plaza, with the rest dominated by buses, 2As and LCVs – the last two being the dominant goods vehicle type carrying regional movement of goods on the Asset. Heavy goods vehicles (3As and MAVs) make up a small but considerable share of the total traffic.

3.48 CJVs, having the highest share in vehicle proposition, and contribute the maximum in the revenue as well. Across all the plazas, CJVs make up around 45% of the total revenue with MAVs contributing to 16-21% to the total share (Historical Revenue)

3.49 In terms of ticket segmentation, the share of single journeys has reduced across the categories as the share of return journey tickets increased. For MAVs, Single tickets have remained dominant on the asset – with TP1 holding a share of ~80% in FY26YTD, TP2 with a share of 62%, TP3 with a share of 60%. At TP4, the share of single tickets has remained stable at 46%, with return tickets dominating at 53% in FY26YTD. The proportion of exemptions has remained similar historically at each plaza. The Asset observes 4%-12% exemptions for CJVs, with the highest of ~12% being at TP1 Kappalur due to its proximity from urban cluster Madurai having high local influence.

3.50 As a part of previous study, the TVC data shows minor variation on the TMS data, where at a total level, the TVC data is approximately 3% higher than the TMS data. This gives us confidence that the base year traffic calculated using the Client traffic data forms a reliable base year traffic estimate.

3.51 The OD analysis found that in terms of zonal influence, at TP1 Kappalur, local and IAOI zones have the greatest influence on CJV, Buses and LCV and as we towards the southern part of the Asset (to Nanguneri), the local zones have decreasing influence while IAOI and rest of Tamil Nadu zones have major influence on the traffic, especially the heavy goods vehicles. Outside Tamil Nadu, Thiruvananthapuram in Kerala has the most significant influence given its cultural connection with Kanyakumari and the resultant inter-urban traffic movements.

3.52 The key commodity transported on the Asset across all four toll plazas is manufacturing items such as medicines, machine parts, electronics etc followed by agricultural and

grocery items. Also, MAV's carrying cement make up for a very high share of traffic on the Asset especially at TP3 Salaipudhur given the proximity to cement plants such as India Cements plant just north of Tirunelveli and Ramco Cements near Virudhunagar.

3.53 The internal and external distribution highlights that majority of trips either originate and end internally i.e within local or IAOI zones or have at least one end of the trip in RoS with very less E-E movement of traffic on the Asset across all toll plazas. This is further supported by the trip length distribution analysis which shows that between 60-70% of the passenger traffic travel shorter distances of up to 300 km, contributing to local movements on the Asset whereas most of the heavy goods vehicle travel longer distances of 300-500km and 500-1000 km to places such as Tirunelveli, Chennai, Coimbatore etc with very few longer external movements to places such as Mumbai, Uttar Pradesh and Hyderabad. Overall, the OD analysis shows that the Asset has significant inter-urban traffic and regional economies of wind, cement and industrial estates providing captive traffic.

3.54 To understand the overall change in the growth drivers and travel pattern, we compared our 2023 OD results with one conducted in 2021 as a part of previous studies. It was observed that currently on TP1, the share of empty across 2A, 3A and MAV have reduced by ~5-10%. While the share of miscellaneous items parcels courier and automobiles have witnessed increase at TP1. Similar trends are observed on TP2. Other commodities including construction, manufacturing, agriculture and groceries have similar shares. Same is validated through zonal analysis where the share of local trips across vehicles categories have shifted ~5-10% from Outside Tamil Nadu share. However, on TP3 Salaipudhur being further way from the urban centre Madurai observed traffic shift from local to rest of state with reduced share of 30% in 2023.

4 Socio economic context and traffic growth

Introduction

4.1 The growth of traffic on existing (brownfield) roads depends on, firstly, how fast the background travel demand grows (background growth); and secondly, how successful the roads are in attracting that traffic (traffic capture). Background travel demand is driven by the socio-economic conditions in the region where the Asset is located and the country. These include:

- Changes in factors such as population, economic growth (regional and national) and industrial production; and
- Other local factors such as strategic port growth, and growth in local industries near the Asset.

4.2 In turn, the change in the relative competitive position of the Asset (and thus of the traffic capture they can achieve) derives from how the relative offer for the roads changes, i.e. the service offered, and the tolls charged on the project roads, in comparison to that on competing roads; and whether any competing road facilities are planned.

4.3 In this chapter, we have assessed the trends of the above growth drivers, as indicators of the socio-economic conditions in the regions surrounding the Asset.

Population growth

4.4 We have analysed the key socioeconomic drivers of the background traffic demand in Tamil Nadu state, where the Asset is located.

National level

4.5 Table 4.1 below shows that the total population in India has grown at a Compound Annual Growth Rate (CAGR) of 1.5% since 2000, decreasing over the years, as shown in the table below. The World Bank forecasts this growth to decrease to 0.6% CAGR by the 2030-45 period.

Table 4.1: CAGR of population in India

	CAGR		
Years	**Total Population (m)**	**Rural Population (m)**	**Urban Population (m)**
1970 – 1985	2.3%	1.9%	3.8%
1985 – 2000	2.0%	1.7%	2.9%
2000 – 2015	1.5%	1.0%	2.6%

Years	CAGR		
	Total Population (m)	Rural Population (m)	Urban Population (m)
2015 – 2030*	1.0%	0.3%	2.3%
2030 – 2045*	0.6%	-0.3%	1.9%

Source: World Bank Data on Health Nutrition and Population Statistics, *forecast population growth.

State level

4.6 Table 4.2 shows the evolution of population in Tamil Nadu state, compared to that of the country. The CAGR of population in Tamil Nadu has been considerably slower vis-à-vis that of India.

Table 4.2: Population Growth in Tamil Nadu and India (2012 – 2024)

State	2012 Population (m)	2024 Population (m)	CAGR (2012 – 2024)
Tamil Nadu	72.43	76.93	**0.5%**
India	1210	1,395	**1.2%**

Source: Ministry of Statistics and Program Implementation estimates

4.7 Due to the complexities of the patterns in which urbanisation takes place, and the very dynamic nature of local population migration (which are very difficult to forecast with accuracy), we do not use population growth as a proxy for understanding future travel demand growth on the Asset. It has been included in this section simply to provide a socio-economic context of the state/trends in the regions in which the Asset is located.

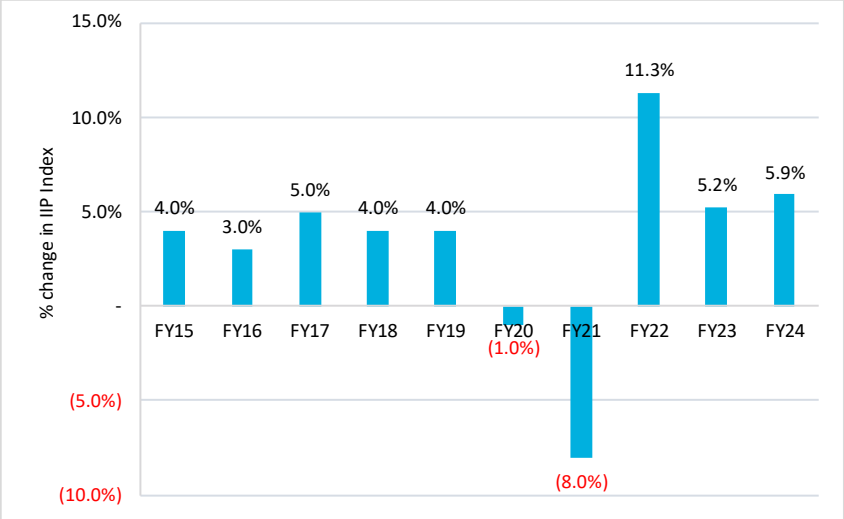
Economic Indicators

Industrial Production

4.8 The Index of Industrial Production (IIP) is a composite indicator that measures the short-term changes in the volume of production for a basket of industrial products. The IIP data tracks the manufacturing activity in different sectors of an economy, with mining, manufacturing, and electricity being the three broad sectors constituting the IIP.

4.9 As can be seen in Figure 4-1 below, at an annual level, national IIP was growing at an average of 4% per year over the period FY15-19, before the country underwent a liquidity crisis and experienced an overall economic slowdown in FY20. In the aftermath, IIP shrank by over 8% in FY21 due to a decline in economic activity in the wake of global lockdowns introduced to curb the Covid-19 pandemic. However, with the gradual opening up of economy post the pandemic, and recovery in consumption demand, industrial activity also recovered with time with IIP recording growth of 5% in FY23 and 6% in FY24.

Figure 4-1: Annual growth - Index of Industrial Production



Source: Steer Analysis of MoSPI

4.10 Since state-level IIP data is not as readily available as national level IIP, we have presented national IIP here to indicate nationwide activity in key industrial sectors like power, manufacturing, and mining, all of which influence long-distance commercial movements across the nation, and not unique to this asset. We however, do not use it to forecast future travel demand growth since long-term forecast for IIP is not available through official sources such as MOSPI, RBI or through multilateral organisations like WB, or the IMF.

Vehicle ownership

4.11 The gap in car ownership between India and developed nations remains substantial according to recent data. As of 2018, India had approximately 22 cars per 1,000 individuals, a fraction of the 980 cars per 1,000 individuals in the United States[12]. However, this pattern is changing with the increasing per capita income levels. As can be seen in Figure 4-2 below, between 2007-17, number of cars per 1,000 people has more than doubled and increased at a CAGR of about 11%. The corresponding ownership rates for urban cities like Delhi, Mumbai, Bengaluru, and Chennai are over 100 cars per 1,000 people[13] (GoI 2011; MoRTH 2012). The region where the Asset lie is highly urbanised, therefore the car ownership in Tamil Nadu is expected to be higher than the India average with 50 cars per 1,000.

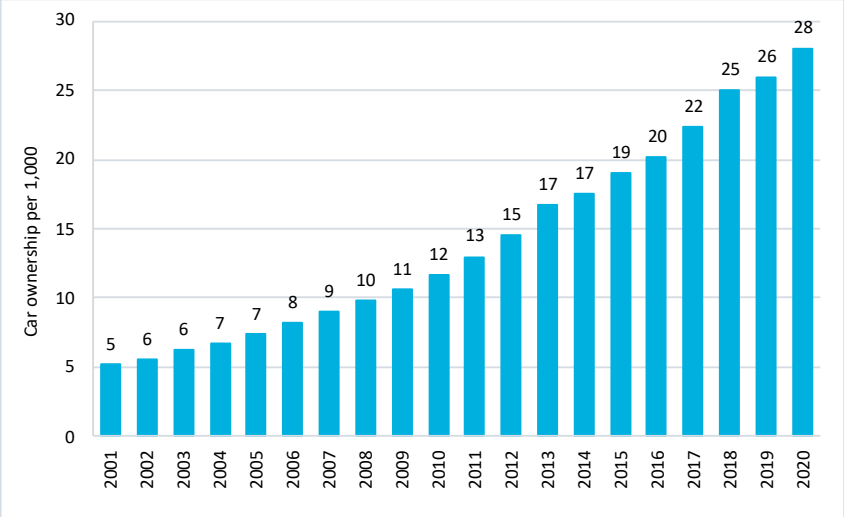
4.12 Overall, India still stands at a very nascent stage in the vehicle saturation curve, offering huge potential for growth going forward. As the income per capita of India and the region itself grow further, we expect car ownership levels to increase. As per the India Energy Outlook (2015), car ownership is projected to grow steeply to 175 cars per 1,000 population by 2040 in India.[14]

[12] India has 22 cars per 1,000 individuals: Amitabh Kant, Auto News, ET Auto

[13] Proliferation of Cars in Indian Cities

[14] https://www.gita.org.in/Attachments/Reports/IndiaEnergyOutlook_WEO2015.pdf

Figure 4-2: Car ownership in India per 1,000 population



Source: International Energy Agency (IEA)

Per Capita Income (PCI)

4.13 The per capita income of the state where the Assets lies i.e., Tamil Nadu is similar as compared to the national average, however in dollar terms, PCI of just $2,000 per head indicates that the state is at a very early stage of consumption curve. Going forward, we therefore expect local consumption to be strong which would drive the growth in both passenger and commercial traffic.

4.14 However, given the difficulty in obtaining granular district level PCI data it is not advisable to use this as a growth driver. Also, the long-term forecast for PCI is not available we therefore refrain from using it to forecast traffic.

Figure 4-3: Per capita income

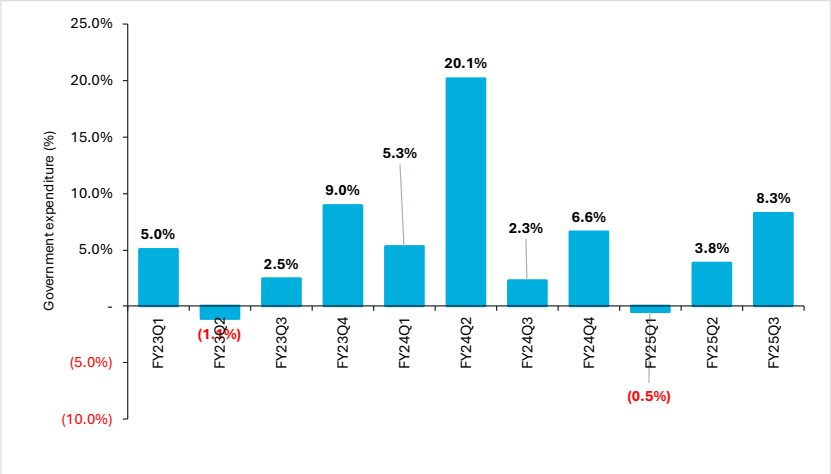
Economic growth

India's Performance

4.15 Figure 4-4 below shows that India's economic performance in Q3 of FY25 has shown signs of recovery in recent months despite slowdown experienced in FY25H1, as the latest SAE estimates released show FY25 growth rate to be 6.5%, which is lower than that observed in FY24 i.e., 9.2%.[15] This deceleration can majorly be attributed to a downturn in industrial output – specially manufacturing, electricity, and mining (as shown in Figure 4-6 below) – along with a decline in government capital expenditure in FY25 (presented in Figure 4-4).

4.16 Other contributing factors also include the impact of the 2024 general elections on central infrastructure spending, state-level fiscal constraints and rising global uncertainties such as Russia-Ukraine war and Gaza-Israel conflict which have had impact on global supply chains.

Figure 4-4: Government final consumption expenditure



Source: Steer Analysis of MOSPI Data

4.17 Weaker industrial activity, as reflected in lower IIP (Figure 4-5) and GVA contribution (Figure 4-6), directly impact freight movement and commercial traffic volume growth across the country, including on the Asset. At the same time, muted government capex had an influence on both construction-linked activity and industrial output which impacted the commercial traffic growth carrying construction material and industrial goods. Export oriented corridors across the country (such as the Asset) have also seen muted traffic performance in FY25 due to global supply chain disruptions and the Red-Sea crisis, with exported commodities like manufactured goods, marble, and ceramics experiencing declines as well.

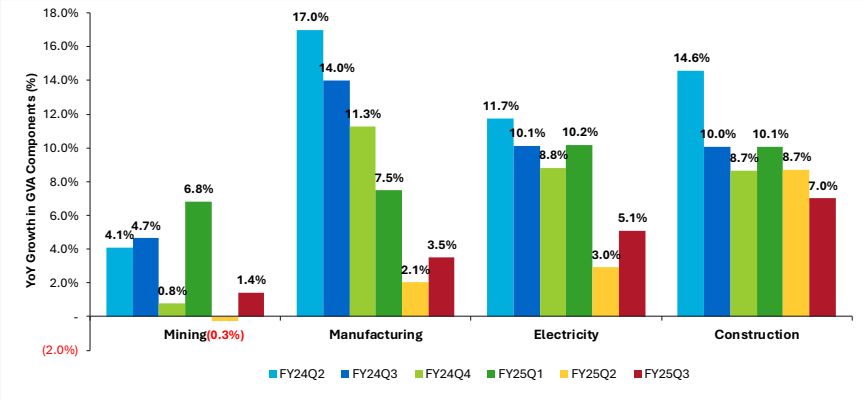
Figure 4-6: Industrial components of GVA



Source: Steer Analysis of MOSPI Data

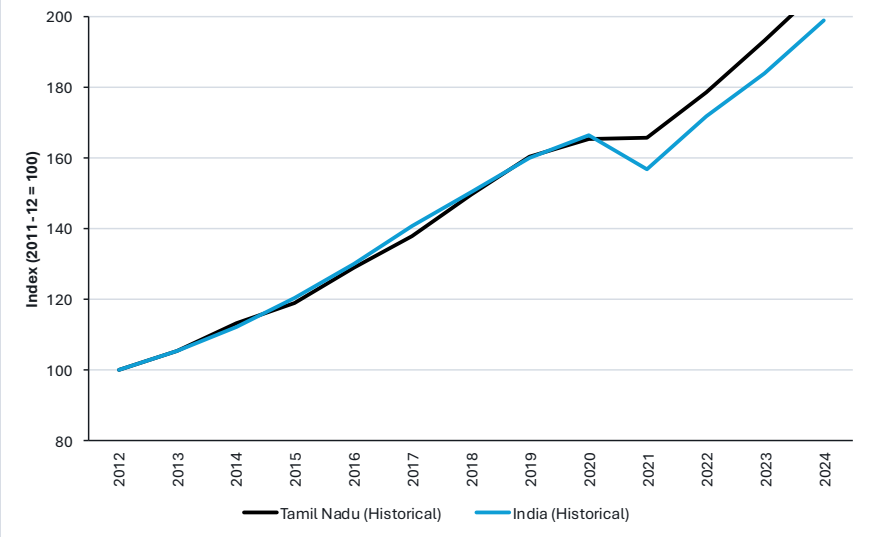
GDP and GSDP Growth

4.18 Over the period FY12-FY24, the Indian economic has grown at a CAGR of approx. 6% aided by growth in the tertiary sector which grew at a CAGR of approx. 6.9% over the same period. The economic growth of Tamil Nadu (state GSDP)[16] been faster than the country overall. Tamil Nadu's GSDP CAGR was 6.3% between FY12-24. Tamil Nadu approximately contributes 9% to the India's GDP. In terms of per capita income, Tamil Nadu has a higher per capita income than the country.

4.19 The Asset Madurai-Kanyakumari, lie in the state of Tamil Nadu. Tamil Nadu's state GSDP has historically grown at a rate that is equal or slightly lower than the national trend. The following figures illustrates the evolution of Tamil Nadu's GSDP during FY12-24.

[16] GSDP is the Gross State Domestic Product i.e., the GDP equivalent for a particular state, it is the final value of goods and services produced by a particular state

Figure 4-7: Evolution of Tamil Nadu's state GDP and National GDP, FY12-24



Source: Steer Analysis of MOSPI Data)

4.20 The official historical GDP and GSDP data for India are released by the Ministry of Statistics and Program Implementation (MoSPI). The GDP forecasts for India are available from various reliable sources such as Oxford Economics and Consensus Economics[17], but state-specific GSDP forecasts are not published by any such sources. To derive state GSDP forecasts, we rely on past trends of the relationship between GDP and GSDP and develop GSDP forecasts as a function of our assumed GDP forecasts[18].

4.21 For any indicator to be used as a growth driver to forecast traffic, a reliable source of historical and forecast data availability for that indicator is the key requirement. Of the key socioeconomic indicators discussed above, GDP was assessed to be the only growth driver for which reliable data is available both in terms of historical and forecast data. Therefore, to forecast traffic, we use GDP/GSDP as our key growth drivers.

Forecasts for growth drivers

4.22 Following the discussion in Chapter 2 on the nature of economic activity in the state of Tamil Nadu, in this section, we describe the assumptions in relation to forecasts of the key macro-economic drivers of traffic growth. Particularly, we have based our forecast on GDP and GSDP projections provided by the Client.

National GDP

4.23 After the last period of economic slowdown in FY11-12, the country experienced an economic downturn again in late FY19 with FY20 having reported a GDP growth of 4% (relative to an average growth rate of 7% per year between FY13 and FY19). India's GDP growth declined as domestic investment and consumption demand were already under

[17] Consensus Economics - Economic Forecasts and Indicators

[18] Assuming that the historical long-term relationship between GSDP and GDP sustains over the short-term, we project future growth in GSDP as a function of our GDP growth forecast. We taper the relationship of GSDP growth to converge to GDP growth gradually over the long-term.

stress because of the liquidity crunch before Covid-19. Other factors that contributed to the economic slowdown included reduced growth rates in automobile sales and production, liquidity crunch in credit markets and rising number of Non-Performing Assets (NPAs) within the banking sector, as well as lower manufacturing production and lower rural consumption.[19]

4.24 The Covid19 outbreak had a significant impact on the Indian economy during the first two quarters of FY21 as government mandated lockdowns across the country effectively stalled economic activity and growth. The growth momentum eventually picked up in Q3 of FY21, with a sharp rebound in the economy in FY22 (GDP recorded 9.7% growth over FY21), and has since observed a consistent growth of 7.6% in FY23, 9.2% in FY24 and 6.5% in FY25 (as per the SAE) before slowing down over the past year due to several domestic and external factors.

4.25 Figure 4-8 below shows Client-provided GDP projections for India. The forecast provided by the Client expects the Indian GDP to grow at 6.5% between FY25-FY27[20] and gradually tapering down to 5.2% by FY51, end of concession. The India GDP growth forecast provided by the Client is broadly in line with other independent forecasts available from reliable sources such as IMF, World Bank and RBI[21] in the medium term.

4.26 The GDP-GSDP lines are expected to converge by FY38. The chart below shows the forecast growth lines for GDP and Tamil Nadu GSDP.

5 FY26 Base Year AADT and Traffic growth Analysis

Introduction

5.1 In this section, we present our approach, assumptions, and results for base (or background) traffic growth for each vehicle category on the Asset.

5.2 Traffic growth is commonly related to a variety of macro-economic and industry- or commodity-specific factors (hereafter referred to as 'traffic growth drivers'). These growth drivers are typically identified from the results of the OD data analysis and the site visits that help us appreciate the nature of traffic movement – 'what' travels 'where' and 'why'.

5.3 While comprehensive historical data on the asset is not available, we have access to six years of records. Despite some inconsistencies, this dataset provides a reasonable foundation for analysis. As a result, statistical methods to estimate background growth relationships could not be applied. Instead, we conducted a benchmarking exercise, supported by trip length and origin-destination (OD) analysis, to derive elasticity estimates. These are discussed in detail below.

FY26 Base year AADT estimates

5.4 The base year is the year on which long-term background forecast growth rates are applied to derive year-wise average annual daily traffic (AADT) estimates for forecast years. This is therefore an important aspect of our forecasting approach as traffic and ultimately revenue forecasts for future years are built on top of the base year traffic estimate. We have used FY26 as the base year for AADT estimates for the forecast years.

5.5 As described previously in Chapter 3, to establish the base year (FY26) traffic position, we utilised information from various sources – including from the Client and our context knowledge, to assess a reasonable demand on the corridor.

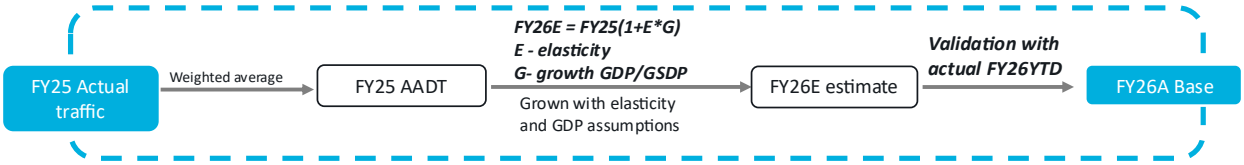
Methodology

5.6 The base traffic for FY26 has been estimated utilizing the actual 12 months of FY25. The weighted average of the actual FY25 traffic (April to March) was taken to arrive at annual FY25 AADT. Using elasticity-based growth assumptions GSDP or GDP we arrived at estimated FY26 (FY26E).

5.7 The monthly profile of the FY26E AADT was then compared to the actual traffic observed in the six months (April 2025 to September 2025) of FY26 (FY26YTD). The Adopted FY26 AADT (FY26A) is derived by making necessary adjustments to FY25E to reflect the outturn traffic in FY26YTD (adjusted for seasonality.

5.8 The methodology is represented using the below schematic:

Figure 5-1: FY25 Base Estimation methodology



Source: Steer Analysis

5.9 The two key inputs to estimate the base year FY26 traffic are FY25 traffic and seasonality correction factor (SCF).

Seasonal Correction Factors

5.10 Traffic on any Asset varies on a month-on-month level. Such variations maybe due to monsoons (typically Jul to Sept) or due to festivals in the region. For e.g. It is observed that typically the truck traffic during the first half of the financial year (April-September) is generally lower than the annual average, mainly because of peak summer season followed by monsoons affecting the freight movement patterns in large parts of the country in the July-September period. In addition to these there may be other seasonal variations specific to the Asset.

5.11 In order to normalise for these variations across the year to provide an AADT estimate, Seasonality Correction Factors (SCF) are used. SCFs are estimated to convert the monthly traffic numbers to an AADT level while accounting for seasonal variation due to local/national festivals, weather changes and/or temporary external impacts. These are typically estimated using historical data for each plaza and vehicle category over multiple years. An SCF >1 means that the traffic for the month is lower than the annual average and vice-versa.

5.12 Historical traffic data was available for all toll vehicle categories starting October 2020 up-to September 2025

5.13 The below tables present the average of FY23, FY24 and FY25 SCFs used to estimate the AADT for the four toll plazas.

Source: Steer analysis: Steer analysis; FY25 actual full year, FY26YTD includes 06 months of FY26, FY26A is adopted base for FY26

5.14 The above tables depict that the FY26A estimates over the full year FY25 AADT show a 5.4%, 6.4%, 8.6% and 6.8% PCU growth for TP1 (Table 5.5), TP2 (Table 5.6), TP3 (Table 5.7) and TP4 (Table 5.8) respectively. This is driven by passenger traffic on the Asset (CJV /Buses), as well as MAVs.

5.15 Considering only CJVs, their volume in FY26A is approximately 10%, 10%, 11% and 7% above the corresponding numbers for TP1, TP2, TP3 and TP4 respectively. As previously discussed in Chapters 2 and 3, commercial traffic on the Asset is driven by the proximity to the urban centres of Madurai, Thirumangalam, Tirunelveli and Kovilpatti (which are expected to continue driving consumption demand) and the tourist hub of Kanyakumari

5.16 In terms of MAVs, the FY26A volumes are above the FY25AADT by approximately 7%, 5%, 8% and 19%. TP1 Kappalur is the nearest to the electronic and manufacturing hub of Madurai; TP2 is located close to India's first textile park in Virudhunagar; while trips at TP3 and TP4 are generated to/from the V.O.C Port in Tuticorin. MAV growth at TP3 (8%) is expected to be driven by the solar power plant in Gangakodian, to be constructed near Salaipudhur toll plaza[22]. These underlying economic factors have driven the growth of commercial vehicles on the Asset.

Estimation of background elasticities

Overview

5.17 For brownfield Asset, where sufficient historical traffic evolution is available, it is common practice to use regression model analysis to determine the relationship, expressed as elasticity, between traffic growth and key socioeconomic drivers. This relationship is then applied to assumptions of future socio-economic evolution to estimate future traffic growth.

5.18 As for the Asset under consideration, a consistent historical trend was not available. Therefore, we undertook a benchmark in order to estimate our forecast elasticities, Sources used included our understanding of the Asset, the elasticities used during the bid for TOT3 package by the client and the subsequent lender study that was undertaken by the Client. We have also undertaken a regional benchmarking against Asset having similar traffic profiles, which give us reasonable confidence the relationships proposed.

5.19 In terms of selection of growth drivers for vehicle types, in general we have assumed state GSDP as the key driving factor for the passenger traffic given this traffic is generally driven by the local economies of the cities and state containing the Asset. The heavier

[22] https://www.deccanchronicle.com/southern-states/tamil-nadu/tata-power-has-big-plans-for-gangaikondan-1824617

commercial vehicles generally ply long-distance, and the underlying growth is governed by the general economies of several states or nation as whole.

5.20 Given the nascent stage of India's logistics sector, characterized by a highly fragmented trucking industry (95% of operators owning fewer than five trucks) and low car ownership rates (30-35 per 1000 people), the forecast elasticities are projected to remain constant throughout the concession period. This assumption is grounded in historical trends and a long-term perspective on regional and national growth, suggesting market maturity is still several years away.

5.21 Table 5.9 presents the growth drivers identified to model the forecast background traffic growth rates.

Table 5.9: Identified growth drivers to model traffic growth

Vehicle type	GSDP Tamil Nadu
Car	100%

5.22 Further to developing estimates for FY25 AADT, the Asset has operational history between FY22 and FY25, proving us three years of traffic growth on the Asset. The table below summarises the volume growth across each of the vehicle categories. For this comparison we have normalised the FY22 AADT for COVID19 by adopting seasonally corrected H2FY22 as the FY22 normalised (FY22N).

Table 5.10: Passenger and Commercial growth with normalised FY22 – MK TP1

	FY22N	FY24	FY25	FY26A	FY22N-26 CAGR

PCUs	**17,730**	**19,912**	**20,303**	**21,674**	**5.1%**
Passenger	9,838	11,303	11,787	12,679	6.5%
Commercial	1,492	1,642	1,605	1,683	3.1%

Source: Steer Analysis; Note; Passenger includes CJV and Bus traffic whereas Commercial includes 2A/3A/MAV traffic

5.23 The growth rates at a PCU level between FY22N and FY26A has been 4.7%, 7.5%, 8.1% and 5.6% at TP1, TP2, TP3 and TP4 respectively.

5.24 The sections below detail out the reasoning for selection of respective growth driver(s) for each vehicle category. We have looked at the last 3-4 years historical growth on the Asset across each vehicle category based on which we have arrived at the growth assumption of the Asset.

5.25 In recent historical traffic performance across national highway corridors, a notable trend has emerged: there is a discernible shift in axle preference towards 2As and MAVs, resulting in a dampening effect on the growth of 3As. This trend is mirrored in the Assets FY23 and FY24 performance as well, which has been discussed in detail in the subsequent sections. Because of these evolving axle preferences, it has been assumed that the relationship between 3As and GDP will be relatively muted, whereas 2As and MAVs are expected to grow more closely in line with the country's GDP.

Table 5.14: Elasticity recommendations for the Asset

Vehicle Category	Proposed	Growth Driver	Comments
CJV	TP1, 2 and 3: 1.1 TP4: 1.0	GSDP Tamil Nadu	Primarily inter-urban/local movements between Madurai, Tirunelveli, Virudhunagar, Sivakasi, Nagercoil/KK. Since Madurai has higher urban density, we grow TP1, 2 and 3 Kappalur at higher elasticity of 1.1 compared to 1.0 at TP4.
Mini LCV	TP1-4: 0.6	GSDP Tamil Nadu	Primarily inter-urban/local movements between Madurai, Tirunelveli, Virudhunagar, Sivakasi, Nagercoil/KK. Historical growth observed is similar to LCVs on all plazas hence the same elasticity is assumed as LCVs.
Buses	TP1-4: 0.4	GSDP Tamil Nadu	Mix of public and private inter-city buses, with a higher share of public buses at TP1 Kappalur. Tamil Nadu has a high volume of mofussil and intercity buses serving public transport demand. As the cities and towns grow and become more urbanised, the buses are also expected to respond to the increasing demand however at a 0.4 relationship to GSDP. This is higher than low bus-volume regions in other parts of the country.

Vehicle Category	Proposed	Growth Driver	Comments
LCV	TP1-4: 0.5	GSDP Tamil Nadu	LCVs and 2As are the major goods vehicle types and are expected to have the highest growth amongst goods vehicle types. As discussed in Chapter 3, the trip lengths of LCV and 2A category (more than 50%) are predominantly short distance, confirming the understanding that the movements cater to regional demand. Considering the above observations, and our experience across other toll roads in the region, we believe that elasticities of 0.6 with respect to state GSDP are considered reasonable.
2A	TP1-4: 0.6	GSDP Tamil Nadu	
3A	TP1-4: 0.3	GSDP Tamil Nadu	3As and MAVs cater to both regional and long-distance movement of a wide range of consumption-based commodities. Most of the traffic is within 1000km and more than 85% of trips are within the State. Given TN is an industrialised state, and the region is particularly more developed and has consumption-driven traffic, we have considered elasticities of 0.3 for 3As at all toll plazas, 0.7 for MAVs at TP1 and 0.6 for MAVs at TP 2, 3 and 4
MAV	TP1: 0.7 TP2, 3 and 4: 0.6	GSDP Tamil Nadu

6 Forecast: Network overlays and forecasts

Introduction

6.1 Following the discussion on our forecast of background growth rates in the previous chapter, this chapter first covers the forecasting assumptions around base year AADT and potential network impacts on traffic growth on the Asset. Thereafter, we present our assumptions around toll segmentation, trip factors and evolution of toll rates for the forecast period which are used to forecast revenues as derived from forecast traffic. In the final section, this chapter summarises traffic growth rates for the forecast years.

Analysis of potential network/developmental impacts

6.2 This section details the impacts which we believe would affect traffic on the Asset during the concession period. As discussed in previous Chapters, to assess the impacts on the Asset, whether positive or negative, we have studied developments (alternate roads, feeder roads and regulatory) in the surrounding road network.

6 laning LOS improvement

6.3 As per the concession agreement as soon as the Asset hits 40,000 PCUs the Asset is eligible for capacity augmentation. The PCU level need to be maintained above the 40,000 levels for 3 consecutive years and 2 years will be earmarked for DPR preparation. After that a three-year period is factored in for construction, during which the Year 1 of construction toll rates will be maintained at 75% and will remain flat at 75%. After the construction is over the toll rates will be calculated as normal, as they should have been in that year.

6.4 The improvement in Level of Service (LOS) is observed exclusively at Toll Plazas TP1 and TP4. Capacity thresholds at these locations are projected to be exceeded in FY25 and FY39, respectively. Based on the forecast and the methodology outlined above, the LOS improvements are expected to take effect from FY33 for TP1 and FY48 for TP4.

6.5 A comparison of generalised journey costs (GJC) provides how different elements of cost and time affect traffic. This comparison was done for both light and heavy vehicles. Lower GJCs correspond to higher induced traffic. Based on Steer's studies and research in India, we have found that for every 1% reduction in the GJCs, the traffic increases by a factor of 0.3. We then applied the difference of GJCs to the elasticity of 0.3 to get net influence on the traffic.

6.6 The improvement in travel costs or GJC is translated into the impact on share of local + IAOI OD movements. Therefore, the GJC influence is applied on the corresponding shares of local traffic, which were extracted from OD data.

6.7 Table 6.1 and Table 6.2 show the extent of the LOS impact and the expected timelines of the impact on the Asset.

Table 6.1: Impact of 6 laning LOS improvement for TP1 Kappalur

Madurai-Kollam (NH744 Upgrade)

6.8 NH 744 between Madurai and Kollam is getting upgraded to 4-lane which would lead to attractiveness of alternate route compared to this Asset. Medium to long distance trips from Madurai and north destined towards Thiruvananthapuram and regions close by are expected to be influenced from this improvement in level of service. This impact would only be TP2 and TP3 as the traffic taking NH744 would appear on TP1 and then take a deviation towards the NH744. The impact would not appear on TP4 as the traffic destined towards Thiruvananthapuram and regions close by currently take a deviation post TP3 and do not appear on TP4. The status of the alternative is that it is currently undergoing 4 laning work on the stretch between Madurai and Rajapalayam while the other stretches have had their DPR prepared.[23]

Figure 6-1: Madurai Metro proposed and alignment of NH744

Source: Steer Cartography

Madurai Metro

6.9 Chennai Metro Rail Ltd. (CMRL) proposed to build a mass rapid transit system (MRTS) in the form of Madurai Metro. As per the latest updates in public domain, CMRL received the Detailed Project Report (DPR) approval from the central government in January 2025.

6.10 The exact alignment of the Madurai Metro is not made public yet, however the metro-corridor traverses between Thirumangalam and Othakadai connecting major places such as Madurai Railway station, Madurai College etc and having 20 stations including one near Kappalur Toll Plaza.

6.11 Given the urban characteristics of Kappalur Toll Plaza, CJV are expected to get affected by Madurai Metro which is expected to be operational by FY32.

6.12 Table 6.5 shows the impact of the Madurai Metro at TP1 Kappalur

Table 6.5 Impact of Madurai Metro for TP1 Kappalur

Vizhinjam port traffic

6.13 With the Vizhinjam Port becoming operational, we expect it to positively influence goods movement in the region, especially along major highways. One clear sign of this could be a rise in commercial vehicle traffic at the MK4 toll plaza, as more trucks and freight vehicles use this route. This road connects Kerala and Tamil Nadu, making it an important link for cargo transport. The improved access and connections provided by the port are likely to boost trade and transport needs in the area, which in turn could lead to higher traffic on the plaza.

6.14 Table 6.6 shows the impact of the Vizhinjam port traffic at TP4 Nanguneri

Revenue forecasting assumptions

6.15 To forecast the revenues for a particular financial year, the traffic forecast for each vehicle type is converted into tickets sold, which is then multiplied with the corresponding toll rate, which grows over the years as defined in the Concession Agreement. While "trip factors" provide the conversion factor to the former, i.e. traffic (trips) to tickets sold, "toll segmentation" provides the latter i.e. the breakup of trips paying each ticket type. This section discusses assumptions related to trip factors, toll segmentation and toll rates for the forecast period.

Trip factors

6.16 Trip factors are used to calculate the revenue for the trips made on passes such as return, local personal, monthly passes. The trip factors assumed are based on the latest FY25 data available and listed in the table below:

Table 6.7: Trip factors for the forecast years for TP1 Kappalur

Vehicle category	CJV/ Mini LCV	LCV	Bus	2A	3A	MAV	OSV

Toll segmentation

6.17 The Ministry of Road Transport & Highways has finalized a compensation formula for existing toll concessionaires to offset revenue loss from the Annual Pass scheme for non-commercial vehicles.[24]

6.18 Across multiple assets, the number of passes sold has observed to be rising on a day-to-day basis, indicating an early adoption among frequent users since its introduction on 15th August 2025 till 30th September 2025, and a corresponding decline in other ticket categories.

6.19 CJV Segmentation for FY26 has been developed using the pre annual pass segmentation till 14th August 2025, and daily Annual Pass transaction data from 15th August 2025 till 30th September 2025. The adoption of Annual Pass over the 45-day period is presented below:

TP	15th to 31st Aug	1st to 15th Sept	16th to 30th Sept
TP1 Kappalur	12%	17%	20%
TP2 Etturvattam	17%	23%	26%
TP3 Salaipudhur	16%	22%	25%
TP4 Nanguneri	12%	18%	21%

6.20 Post September 2025, a gradual ramp up is assumed such that they form a large portion of the CJV trips by the end of FY26. This corresponds to a reduction in a proportionate decrease in single and return trips. For FY27 and beyond, we have assumed the share of annual pass trips to be in line with that observed at the end of March 2026, by when we believe the distribution of ticket categories in CJVs should stabilise.

6.21 At TP-1, the proportion of CJVs utilizing the Annual Pass is projected to be 15% in FY26, increasing to 29% from FY27 onwards, where it is expected to stabilize. For TP-2, the Annual Pass usage among CJVs is estimated at 20% in FY26, rising to 41% in FY27. Similarly, TP-3 is expected to see 19% usage in FY26 and 41% in FY27. At TP-4, the share of CJVs using the Annual Pass is projected at 16% in FY26, increasing to 36% in FY27.

6.22 In July 2025, the Madras High Court ruled that TNSTC buses on the Madurai–Kanyakumari route must pay toll dues and penalties. This led to a shift in how buses are segmented on the asset. Since the judgment came mid-FY26, segmentation for FY26 has been adjusted using actual data from April to July, and a weighted average for the remaining eight months. From FY27 onwards, the average segmentation from August and September 2025 is used as the stable baseline across all toll plazas.

6.23 For other vehicle categories we have analysed the historical TMS data split by ticket categories, to understand trends, as highlighted in Chapter 3. For the traffic and revenue forecast of other vehicle categories, FY26YTD (Apr- Aug) as discussed in the earlier sections, can be considered a normal period. Therefore, we believe the FY26YTD segmentation is representative of the travel patterns on the Asset and the same has been assumed for forecast years as well. This is presented below.

6.24 The table below provides the toll segmentation assumed for the period of forecast.

[24] **Annual Pass**

Total	**27.7**	**73.2**	**124**	**208.2**	**343.2**	**745.6**

Source: Steer Analysis

Toll evolution

6.26 Based on the concession agreement and the gazetted toll notification, we understand that base toll rates increase every year (revision month is April) based on WPI-linked inflation. These are rounded up to the nearest five to estimate the final toll rate charged to users.

6.27 We have used actual toll rates from the FY26 toll notification and FY27 WPI to validate the modelling of future toll evolution. Increase in WPI was calculated based on the Client's WPI forecasts, as shown in the table below. These forecasts provided by the Client expect the Indian WPI to grow at an average of 4.2% between FY25-FY51. The WPI forecasts available from other independent forecasting agencies may vary from this assumption and could be lower or higher than that provided by the client.

Table 6.16: WPI growth forecast assumptions

Financial year	WPI growth (%)
FY26	2.57%
FY27	2.4%

Financial year	WPI growth (%)
FY28	5.0%
FY29	5.1%
FY30	4.9%
FY31	4.4%
FY32 onwards	4.1%

Source: Client inputs used for WPI FY27 onwards.

Revenue reconciliation

6.28 As part of validating the data provided by the Client, as well as our assumptions around toll calculations, we have reconciled the actual reported revenue on a monthly level for the Asset. To reconcile we have used the FY26YTD segmentation, FY26YTD AADT and compared it with the reported revenue for the year. The exercise was undertaken at an annual level.

6.29 The comparison, as shown in Table 6.17 below, depicts the modelled revenue vs the reported revenue difference, and the difference lies within 1%, this gives us the confidence in the assumptions around segmentation and trip factors for future forecast purposes.

Table 6.17: FY26YTD Revenue reconciliation summary (INR Lakhs)

Asset	Modelled	Actual	Difference (%)
	FY26YTD	FY26YTD	
TP1: Kappalur	34.77	34.74	0.1%
TP2: Etturvattam	20.71	20.72	(0.1%)
TP3: Salaipudhur	22.70	22.74	(0.1%)
TP4: Nanguneri	21.0	21	(0.1%)

Source: Steer comparison between modelled and reported revenue, FY26YTD (Apr'25 to Aug'25)

Traffic and Revenue forecasts

6.30 Based on the traffic and revenue-related forecast assumptions discussed above, we have modelled the traffic and revenue forecasts for the forecast period for the Asset. The table below presents the AADT/PCU and revenue forecast growth rates and CAGRs on this Asset. Further, Appendix B (Detailed forecasts) presents the AADT and revenues for the forecast period.

Table 6.18: Traffic forecast (With Impacts) for TP1 Kappalur

6.31 As presented in the tables above, traffic CAGRs (PCUs) for the traffic forecast (with impacts) on the Asset over the concession period is ranging between 4-5% and corresponding revenue CAGR is around 9-10% over all the Asset.

6.32 This growth is majorly driven by:

- CJVs, as discussed in the historical section, this Asset has a dominant share of CJVs because the Asset lie on the urban corridor. It is expected to grow strongly with a presence of the well-established road network with stabilised travel patterns and the growth of the Buses and CJVs will be driven by the inter-urban relationships, and the presence of tourism hotspots present in the vicinity of the Asset.
- Goods vehicle, as per the forecasts, is interdependent on the growth of regional economy, which is based on the presence of Cement Industries, wind power farms, growth of the port city of Tuticorin, industrial estates (SIDCO) and the movement of Fast-Moving Consumer Goods (FMCG) and groceries on the Madurai-Kanyakumari corridor.

6.33 The peak in forecast PCUs for TP1 Kappalur in FY33 and TP4 Nanguneri in FY46 is due to the impact of 6 laning LOS improvement.

Target revenues and modification of concession period

6.34 As per the concession agreement, the target revenue for individual toll plazas should be as shown in the table below for the first calculation of target revenue and the second calculation of target revenue in March 2030 and March 2040 respectively. The traffic sampling will be undertaken for a continuous period of 7 days during anytime within 15

days prior to the date on the specified year, previous year and following year. The average thereof will be deemed as 'actual revenue.'

6.35 If the target revenue falls short or exceeds by 20% and 30% for extensions 1 and 2 respectively, the concession period shall be deemed to be modified using the laid-out conditions in the concession agreement. The table below presents the summary of the analysis.

Table 6.34: Target Revenues for Extension 1

Asset	Target Month	Target Revenue	Estimated Revenue			Average Revenue	Variation (%)
		Cr	2029	2030	2031		
TP1	Mar-30	12.2	15.4	12.7	13.32	13.8	13.4%
TP2	Mar-30	9.9	8.8	9.7	10.56	9.7	(2.0%)
TP3	Mar-30	9.8	9.6	10.6	11.55	10.6	7.7%
TP4	Mar-30	12.0	8.9	9.8	10.71	9.8	(18.2%)

Source: Steer analysis

Table 6.35: Target Revenues for Extension 2

Asset	Target Month	Target Revenue	Estimated Revenue			Average Revenue	Variation (%)
		Cr	2039	2040	2041		
TP1	Mar-40	22.8	37.0	40.5	44.2	40.6	78.1%
TP2	Mar-40	22.7	21.4	23.1	25.3	23.3	2.5%
TP3	Mar-40	22.7	23.3	25.4	27.6	25.4	11.8%
TP4	Mar-40	28.2	21.9	23.8	26.0	23.9	(15.2%)

Source: Steer analysis

6.36 We have used the average AADT forecast for target year, previous year and following year as a proxy for 'actual traffic.' We have forecast seasonality of March month to adjust for seasonal trends and arrive at March traffic from AADT traffic, which is then segmented according to the forecast toll segmentation and trip factors and multiplied with respective estimated toll rates to get to a monthly revenue collection.

6.37 As seen from the table above, the target revenue forecast for the TP1 and the estimated target revenue, difference lies above the threshold value of 30% at second target date. As per the concession agreement, for every 1% excess target revenue, the concession period shall be decreased by 1.5%, with a capping at 20%. Therefore, for the excess traffic on the toll plazas, the concession period, originally 30 years, is expected to be decreased by 5 years from FY51, potentially reducing the last date of concession to FY46 for TP1. For TP2-4 there is no change in concession period expected as the difference in estimated and target revenues lie within the threshold range as stipulated by the concession agreement.

Upside and Downside cases

Upside and Downside scenario assumptions

6.38 We have developed our base case scenario considering a balanced view on the risks associated with input assumptions around GDP growth and traffic growth elasticities. There is always a risk that the outturn values of these inputs will vary as compared to the assumptions taken due to exogenous impacts, e.g. GDP growth could be influenced both positively and negatively by the impact of monsoons, export-import balances, political changes etc.

6.39 Similarly, traffic growth elasticities could be influenced by increased efficiencies achieved by technology, large shifts in commodity prices globally, changes in local manufacturing practices. However, at this stage we consider that the base case represents a central case scenario given the risks of variation of input assumptions.

6.40 To account for the possible variations in the growth drivers, we are also presenting an Upside (optimistic) and a Downside (pessimistic) scenario. These scenarios are defined by the following variations from the base assumptions, as described in Table 6.36:

Table 6.36: Summary of Macro-economic Assumptions for upside and downside cases

Input	Upside	Downside
Macro Assumptions		
GDP/GSDP	+1% every year	-1% every year
WPI	+1% every year	-1% every year
Elasticities	+ 10%	- 10%

Source: Steer analysis

6.41 Further, network developments are highly dependent on governmental directions, policies, legal and financial measure which might result in early or delayed completion of developments. Therefore, we have included an Upside (optimistic) and a Downside (pessimistic) case. However, at this stage, we consider that the base case represents a central case scenario given the risks of variation of input assumptions

Impacts-Upside Case

6.42 The upside case impacts included in forecasts are summarised in below.

Table 6.37: Summary of impacts on the Assets

Development	Year of impact	Change in impact w.r.t base case	Magnitude of impact			
			TP1 Kappalur	TP2 Etturvattam	TP3 Salaipudhur	TP4 Nanguneri

Source: Steer Analysis

6.46 Revenue projections exhibit variability in both the upside and downside cases, driven by fluctuations in macro-economic factors such as WPI, GDP/GSDP, elasticities and the network impacts.

Summary outlook

6.47 Passenger traffic on the Asset is largely inter-urban driven by business, tourism and leisure travel between the cities of Madurai, Tirunelveli, Nagercoil, Thiruvananthapuram, Kanyakumari and towns in the southern Tamil Nadu (TN) region.

6.48 Goods traffic serve the regional industries of wind power and cement, apart from consumption-based movements feeding demand from urban areas. While wind farms are concentrated in the Tirunelveli and Kanyakumari regions, two large operational cement plants are located on the Asset between Virudhunagar and Tirunelveli.

6.49 The Chennai-Kanykumari section of the East Coast Industrial Corridor is planned with nodes in Madurai and Tuticorin and expected to directly support growth in the region and traffic on the Asset.

6.50 Located in the urbanised and industrialised state of TN, the four-lane Asset highway is part of a well-established road network with stable travel patterns and potential for steady growth.

6.51 While the Asset is the primary connection between northern TN and locations north of the state at one end, and the southern TN region, the parallel Tuticorin-Madurai (NH 38) highway to the east of the Asset caters to Tuticorin port traffic, particularly connecting it with the northern TN hinterland. The Asset is also the primary route for inter-urban travel in the southern TN region – both within the State and with the Thiruvananthapuram district of Kerala. The parallel NH 744 Tirumangalam-Kollam highway connects Madurai and northern Tamil Nadu with Courtallam falls near Tirunelveli and Kollam and neighbouring districts in Kerala.

6.52 Consequent to the expected steady growth on the Asset, TP1 Kappalur and TP4 Nanguneri closer to the cities of Madurai and Tirunelveli are expected to cross capacity for four-lane roads during the concession period.

6.53 With six-lane upgrades for these sections by FY33 and FY48 respectively, the Asset is expected to offer additional capacity and therefore see an improvement in level of service, leading to a considerable additional travel demand.

6.54 Upgrade of the feeder section between Nagercoil/Kanyakumari and Thiruvananthapuram of the NH 66 highway is expected to again lead to improved levels of service for inter-urban travel and induce more car trips. Upgrade and tolling of the alternate NH 744 highway may lead to a small negative diversion impact for heavy vehicles currently using the Asset.

6.55 Our findings and estimates in this report are based on multiple factors; our understanding from the site visit, analysis of primary data available both from surveys and the toll management system (both historical and current), macroeconomic assumptions prescribed by Client, feedback from Client meetings and secondary publicly available data. However, we perceive that there can be risks associated with assumptions and the forecasts which are covered in Upside and Downside Forecast section of the report above.

6.56 Overall, we see a positive outlook for the Asset given the well-established road network, which is driven by inter-urban business, leisure and tourism travel in cars and buses, along with the industrial development of cement and electronic items which will drive the growth of goods vehicle on the Asset.

Appendices

A Top 10 OD Pairs

Further to the OD analysis presented in Chapter 3 this appendix presents the top 10 OD pairs at each toll plaza. Please see this data for both CJVs and MAVs and OSVs combined below.

TP1 Kappalur

Table A.1: CJV, Bus and Mini Bus top 10 OD pair shares at TP1 Kappalur

	OD Pair	Share
1.	Madurai-Tirumangalam	9.6%
2.	Madurai-Tirunelveli	7.0%
3.	Madurai-Tenkasi	6.6%
4.	Madurai-Virudunagar	4.0%
5.	Madurai-Sivakasi	4.0%
6.	Madurai-Kanyakumari	3.1%
7.	Madurai-Rajapalayam	2.6%
8.	Madurai-Kappalur	2.4%
9.	Madurai-Manapad	1.9%
10.	Madurai-Nagercoil	1.8%

Table A.2: MAV and OSV top 10 OD pair shares at TP1 Kappalur

	OD Pair	Share
1.	Madurai-Tirunelveli	4.4%
2.	Madurai-Sivakasi	2.7%
3.	Madurai-Tirumangalam	2.0%
4.	Madurai-Kanyakumari	2.0%
5.	Madurai-Tenkasi	2.0%
6.	Tirunelveli-Tiruchirappalli	1.9%
7.	Tirunelveli-Chennai	1.9%
8.	Madurai-Thiruvananthapuram	1.7%
9.	Madurai-Manapad	1.4%
10.	Madurai-Rajapalayam	1.3%

Source: Steer analysis of OD data

TP2 Etturvattam

Table A.3: CJV, Bus and Mini Bus top 10 OD pair shares at TP2 Etturvattam

	OD Pair	Share
1.	Madurai-Tirunelveli	19%
2.	Madurai-Kovilpatti	7%
3.	Tirunelveli-Chennai	6%
4.	Madurai-Kanyakumari	6%
5.	Tirunelveli-Coimbatore	5%
6.	Madurai-Sattur	4%
7.	Chennai-Kanyakumari	4%
8.	Virudunagar-Sattur	3%
9.	Tirunelveli-Tiruchirappalli	2%
10.	Virudunagar-Kovilpatti	2%

B Detailed forecasts

Further to the summary of forecasts presented in Chapter 6, this appendix presents detailed forecasts.

Traffic forecasts

This section presents the detailed traffic forecasts for the forecast period until FY51, year of expected close of the concession. The following two tables show the AADT and traffic growth, respectively.

Table B.1: Traffic Forecast (with impacts) over horizon years at TP1 Kappalur

Year	CJV	Mini LCV	Buses	LCV	2A	3A	MAV	AADT	PCUs
FY26	19,614	2,570	3,195	1,770	1,376	566	1,035	30,127	43,692
FY27	21,057	2,677	3,283	1,831	1,433	577	1,088	31,949	45,983
FY28	22,555	2,787	3,373	1,894	1,492	589	1,142	33,835	48,348

Disclaimer

This report has been produced for the sole benefit of Cube Highways Pte. Ltd ("the Client"). The report may only be relied upon by Approved Addressees in accordance with the terms of our engagement letter. This Report (the "Report") is confidential and disclosed only for information purposes, and it may not be relied upon by any party other than the Client or a Party to a Reliance Letter, and Steer: a) makes no warranty, expressed or implied, with respect to the use of any information or methods disclosed in this Report; and b) assumes no liability with respect to the use of any information or methods disclosed in this document. Any such party by its acceptance or use of this Report releases Steer from any liability for direct, indirect, consequential, or special loss or damage whether arising in contract, warranty, express or implied, tort or otherwise.

The Report is based on standard professional efforts, and information available to us at the time the review took place and is subject to time and budget constraints of the Report's scope of work. This Report, information and statements contained herein, are all based on third party data provided to us, or sourced by us, and Steer has not sought to establish the reliability of the data, except as specifically stated in the Report. Steer bears no responsibility for the results of any actions taken on the basis of third-party data.

Certain forward-looking statements in the Report are estimates based on interpretations or assessments of information available at the time of writing. The Report is thus to be viewed as an assessment that is time-relevant, specifically referring to conditions at the time of the review. Steer undertakes no obligation to update the Report for any reason.

While the estimates contained in the Report are not precise forecasts, they do represent, in our view a reasonable expectation of the future, based on information we have been provided with or sourced. However, the estimates necessarily rely on numerous assumptions and judgements, and circumstances may occur over the timeframe of the project that go counter to these assumptions and judgements and that affect the project's realized revenues. Actual events may differ from those assumed, and events are subject to change. Therefore, Steer makes or provides no warranty, whether implied or otherwise, as to the accuracy of forward-looking information presented. Further, it is important to note that forecasts presented represent long term growth profiles; the results for individual time periods may vary from forecasted values.

Traffic Consultant developed the relationships in the models used to produce the forecasts for the projects based on data available through September 2025. This report does not consider variations in traffic performance due to changing macro and force majeure events such (but not limited to) as global wars, economic uncertainty (high inflation, global recession), and changes in the regulatory environment. The situation remains dynamic and is subject to significant change in the short and medium term. In this challenging context, Traffic Consultant has produced base forecasts with a view on a possible scenario for the traffic forecasts. However, it is important to note that this is only one view, and there continues to remain uncertainty as to the short-term, intermediate or prolonged effects of and responses to such macro-economic/force majeure events. As a result, no assurance can be provided by Traffic Consultant that the scenarios and assumptions Traffic Consultant has identified will prove to be accurate. Given the uncertainty inherent in this scenario, Traffic Consultant advises that all readers of the Report consider the Report in the context of their own assessment of the impact of such events.

TO THE FULLEST EXTENT PERMITTED BY APPLICABLE LAW, THE LIABILITY OF THE TRAFFIC CONSULTANT FOR ANY LOSS, DAMAGE, COST OR EXPENSE SUFFERED OR INCURRED BY ALL PERSONS OR ENTITIES AND FOR ALL CLAIMS RESPECTING ITS WORK PERFORMED IN CONNECTION WITH THE ISSUE OR THE REPORTS IS HEREBY LIMITED IN THE AGGREGATE TO THE AMOUNT OF FEES ACTUALLY PAID BY THE CLIENT TO THE TRAFFIC CONSULTANT IN RESPECT OF THE REPORTS AND CONNECTED SERVICES.

1 Introduction

The assignment

1.1 The Cube Highways Fund Advisors Private Limited (the "Client") has commissioned Steer Davies Gleave India Private Limited ("Steer") for a traffic due diligence to be carried out on the Nelamangala-Devihalli Toll Road (hereafter called "Asset"). This report forms part of the annual fair market valuation (FMV) undertaken as part of the "Transit 10 project". This report presents an update of the traffic and revenue forecasts based on actual traffic data available up to September 2025 and latest macro-economic assumptions.

1.2 The Asset Nelamangala-Devihalli consists of a single toll road section with two toll plazas. For this report, we hereafter call both the toll road sections and the toll plazas together as Asset and name the toll plazas as TP1 and TP2 respectively as follows:

- TP1 – Doddakarenahalli (Nelamangala)
- TP2 – Karabylu

1.3 Our scope of work for the traffic and revenue forecasting process includes:

Table 1.1: Scope of work and sources of data

Scope of work	Data source
• Review of historical Traffic Management System (TMS) data, Vendor reports and documents	• Provided by client for the period between FY13 and Sep'25
• Historical analysis and forecasts for baseline growth, including; — Background growth, and — Seasonality trends	• Historical data provided by the Client and benchmarking using plazas in the vicinity or of similar nature of the Asset has been done wherever sufficient data was unavailable.
• Validation of revenue reported in FY26YTD	• TMS data provided by Client • Revenue reconciliation using toll plaza traffic and ticket type data to calculate revenue and reconciling it with toll plaza reported revenue
• Origin Destination (OD) analysis to understand growth drivers: — Zonal influence and Top OD pairs — Commodity distribution — Trip length distribution	• Origin Destination (OD) surveys undertaken by Steer in 2023 (TP1) and 2019 (TP2) respectively
• Analysis of upcoming network improvements and other developments, that may have future impacts on traffic	• Secondary research and our in-house experience of working in the vicinity of the Asset. Impact analysis to be conducted by Steer based on

Scope of work	Data source
	Generalised Journey Cost spreadsheet-based analysis
• Historical revenue analysis and forecasts for revenue estimation, including — Toll segmentation and trip factors, — Overloading shares	• Calculated from historical data provided by Client
• Final traffic growth forecasts including baseline growth rates and potential future impacts	• Elasticity based base growth and potential impacts from secondary research, Asset historical traffic performance and Steer's in-house experience of working on toll roads on the corridor • Gross Domestic Product (GDP) forecast assumptions provided by Client
• Toll revenue estimation for the entire concession, including toll evolution	• Toll evolution based on latest toll notification published by National Highway Authority of India (NHAI) and latest actual Wholesale Price Index (WPI) trends as shared by the Client. • Assumptions of WPI forecasts and future tolling length changes provided by Client • Revenues estimated as a product of traffic forecasts and toll evolution

Our approach

1.4 Our approach follows well-established practices for forecasting ongoing traffic growth on an existing/brownfield Asset. The analysis has essentially focused on two sets of issues, namely:

- Understanding the traffic that is currently using the Asset; and
- Identifying how and why that traffic is likely to change in the future.

1.5 To understand the current traffic on the Asset, we have analysed traffic data from multiple independent sources and Client-provided secondary data, including:

- TMS data pertaining from July 2012 to September 2025
- Concession agreement and toll notifications for FY25 and FY26
- Previous studies related to traffic and revenue
- Bid documents and studies by lenders
- Steer-commissioned OD survey on 3rd July 2023 at TP1 Nelamangala to validate any change in growth drivers and travel patterns. The OD survey on TP2 Karabylu had been undertaken in 2019 as part of study in earlier commission.
- Steer-commissioned 3-day TVC survey from 1st July to 3rd July 2023 at TP1 Nelamangala on behalf of the Client to validate TMS data independently. Whereas on TP2 Karabylu TVC survey was conducted in 2021 as part of study in earlier commission.

- We undertook revenue reconciliation for FY26YTD, by building up revenue from the traffic reported by the toll plaza and subsequently matched it to the reported revenue for FY26 using the prevalent toll rates and reported segmentation/toll-frequencies for FY26, this is a key part of our analysis to validate the segmentation/toll-frequency assumptions and the Annual Average Daily Traffic (AADT) reported for each of the toll plaza.

1.6 The estimation of future traffic demand on the Asset was undertaken through:

- Estimating FY26 base year position. The FY26 AADT was calculated using the monthly traffic data for FY25. The annual FY25 AADT was then grown with elasticity linked GDP/GSDP growth to arrive at the FY26 expected traffic. To determine the adopted FY26, the expected FY26 traffic was validated against the ten months of actual traffic (Apr'25-Sep'25) and necessary adjustments were made where required.
- Secondary research to understand plans for new developments and progress of ongoing developments on the Asset.
- Steer independent primary surveys and site visits to validate our network and contextual understanding.
- Developing a bespoke growth model for each Asset/plaza/toll class to forecast year-on-year traffic growth from FY26 to the end of concession period.
- Investigating the elasticity of historical traffic growth compared to state (GSDP) and national (GDP) growth. Where historical data is limited, we have benchmarked the Asset against our Steer knowledge base (e.g., similar Asset types in the same state or on the same corridor), to derive appropriate elasticities.
- Applying our elasticities to independent GDP forecasts as provided by Client.
- Identifying and analysing the potential impacts of any relevant changes to the competitive position of each Asset – these include impacts of changes to road network including expressways and opening of competitive modes of travel.
- Identifying and analysing any other potential impacts to traffic and revenue on each Asset – these include axle load norms, axle shift for heavy goods, FASTag implementation.
- Considering changes in trends of segmentation over time and making suggestions for changes in exemptions in the future
- Preparing traffic and revenue forecast for the Asset for the complete length of concession. The analysis here includes the specific impacts of network, or other exogenous factors specific to the Asset. We have developed a set of forecasting assumptions for three scenarios: a base case and upside and downside scenarios.

Contents of this report

1.7 The report has been divided into the following chapters, including Chapter 1 providing an introduction:

1. Chapter 1 introduces the methodology and approach to undertake the traffic and revenue due diligence;
2. Chapter 2 describes the key characteristics of the Asset and its surrounding road network, primarily based on site visits;
3. Chapter 3 summarises the current and historical traffic on the Asset, including results from the TMS, TVC and OD analyses;

4. Chapter 4 presents the socio-economic context of the corridor and region/state containing the Asset, along with our approach and results on estimating background traffic demand growth; and
5. Chapter 5 presents our baseline year forecast and summarises our results on estimating background traffic demand growth
6. Chapter 6 summarises our assessment of network impacts and presents concession traffic and revenue forecasts for the Asset along with the assumptions for upside and downside cases.

2 The Asset

Introduction

2.1 This chapter provides description of the Asset, based on both primary data (from site visits), and our understanding of the region and network surrounding the Asset. We cover the strategic network context, followed by key economic activities and network developments around the Asset.

Strategic network

2.2 The Asset is situated in the southern state of Karnataka connecting the city of Bengaluru to Mangaluru via NH75. It is one of the three sections making this corridor, the other two being Devihalli-Hassan Tollway Limited (DHTL) and Hassan-Mangaluru highway. Figure 2-1 below shows the regional road network in which the Asset is located.

Figure 2-1: Asset location in the regional road network

Source: Steer cartography using OpenStreetMap data

2.3 The Asset primarily caters to the following types of movements, by virtue of its strategic location:

- **Medium-distance movements** between **Bengaluru and Mangaluru** primarily for leisure and tourism. The CJVs contribute around 80% on an average to the total traffic on the Asset. This is driven by the large number of tourist destinations along the Asset and close to the Asset which drives the car growth such as Bengaluru, Mangaluru, Madikeri, Coorg, etc.
- Work and leisure trips between local cities, towns, and villages like Nelamangala, Hassan, nearby tourist spots, and Bengaluru city.
- Petroleum-related traffic:
  - Between ports and refineries in Mangaluru and Kochi, and liquified petroleum gas (LPG) bottling plants lying on the Asset, viz Hindustan Petroleum Corporation Limited (HPCL) plant at Yediyur and Bharat Petroleum Corporation Limited (BPCL) plant at Solur.
  - Between the bottling plants and the neighbouring consumption centres like Bengaluru.

2.4 The Asset is an 80.26-km toll road which forms a part of NH75 in Karnataka. This is a four-lane road with two toll plazas, namely, Doddakarenahalli/Nelamangala (TP1 closer to Bengaluru) and Karabylu (TP2 closer to Devihalli). Figure 2-2 below provides a closer view of the Asset in the context of its immediate surroundings.

Figure 2-2: Asset context

Concession and tolling details

2.5 The toll plazas on the Asset have been operational since June 2012. There are 7 years left in the concession period with FY33 being the last year of concession. Table 2.1 below provides a summary of the Asset concession details.

Table 2.1: Concession details

Particulars	Details
State	Karnataka
Highway	NH 75 4-lane
Toll Plaza	TP1: Doddakarenahalli TP2: Karabylu
Length (km)	TP1: 40.13 km TP2: 40.13 km
Commencement of operations*	TP1: July 2012 TP2: July 2012
Concession period	20 years
Last year of concession	FY33

2.7 Figure 2-3 below shows a typical cross-section of the Asset and its toll plaza.

Figure 2-3: Typical cross section of the Asset and toll plaza

Source: Steer site visit

2.8 Tolls on the Asset are collected as per the rates presented in Table 2.2 below. The toll plazas have dedicated ETC/FASTag lanes for electronic tolling.

2.9 Apart from single tickets, the typical NHAI ticket categories like return, monthly, local personal and local commercial passes are also available on the Asset.

Table 2.2: Single toll rates on the Asset (INR), applicable September 2025 to August 2026

Type of Vehicle	Single Journey Fee (INR)	
	TP1 Doddakarenahalli	TP2 Karabylu
CJV	60	60
LCV	100	100
Bus/Truck	205	205
3A/MAV/OSV	325	325

Source: NHAI Revision of User fee Rate w.e.f 01.09.2025

2.11 Apart from the (Concession Agreement) CA-prescribed toll categories mentioned above, the toll plaza management charges a small number of school buses at an agreed monthly amount.

Key economic activities

2.12 Bengaluru is both the capital and the largest city of Karnataka. The Asset, passing through several districts, is located just outside and to the west of the Bengaluru urban district.

The industrial town of Nelamangala, at the Asset's eastern end, has several large-scale industries.

2.13 The Asset serves various tourist locations between Bengaluru and Mangaluru such as Madikeri, Coorg and temple tourism spots between the two cities. While Bengaluru earlier known as the 'Garden City' has been popular for its lakes, gardens, and pleasant weather; Mangaluru, on the western Indian coast, is known for its beaches and cuisine. Mangaluru is also the headquarters of the Dakshina Kannada district. Apart from Shravanabelagola, a major Jain pilgrimage centre near Channarayapattana, there are several temple locations in Dakshina Kannada district. Madikeri district, also known as Coorg or Kodagu, is a popular hill destination and coffee-growing region.

2.14 The Asset has two major LPG bottling plants, Solur and Yediyur, in close vicinity. Solur is present near TP1 whereas Yediyur is present near TP2. As urbanisation increases along the corridor, growth of household products and goods including the demand for LPG will also grow and continue to benefit the asset over time. The active implementation of government schemes – like the Pradhan Mantri Ujjwala Yojna, launched in May 2016 - has led to a 6.2% CAGR of total LPG sales in India, between FY15 and FY24[1]

Key Network Developments

2.15 In close proximity to the Asset, the proposed construction of the Satellite Town Ring Road (4-6L) access-controlled expressway is currently underway. Designed to function as a broader bypass, it will facilitate smoother and faster movement of long-distance traffic that does not need to enter the city. This network development has been covered in detail in Chapter 6. [2]

2.16 There are no alternate long-distance or medium-distance routes that pose a threat to the Asset. Also, during our site visit to the Asset, no major micro-diversions through local roads were observed close to the toll plazas. Chapter 6 provides a discussion and estimation of potential impacts on the Asset.

3 Traffic Description

Introduction

3.1 This chapter presents historical and current traffic and revenue trends on the Asset, as well as our analysis of origin-destination (OD) survey data and traffic count data. This covers data which was collected as a part of this study and in previous studies, as well as data provided by the Client.

3.2 Traffic demand data is generally collected and analysed to understand the volume and vehicle composition of demand currently using the Asset, while OD data is used to obtain a better understanding of travel patterns, trip lengths, trip purposes and areas of influence in the vicinity of the Asset, as well as the commodities being moved by goods vehicles. This analysis, combined with our understanding of the Asset (based on our site visits), enables us to identify the key drivers of demand on the Asset.

3.3 Actual toll plaza data is used as the basis from which the current/base year Monthly Average Daily Traffic (MADT) is established. This data is typically provided by the Client and independently analysed and validated by us using Traffic Volume Count (TVC) information.

PCU factor assumptions for reporting

3.4 The PCU values have been taken from 'IRC 64:1990- Guidelines for Capacity of Roads in Rural Areas'. For MAV, based on the discussion with the Client, we have referred to the rigid and trailer splits in the latest TVC counts conducted in 2023 for calculating the effective PCU for MAVs. For rigid trailer trucks we have assumed a PCU factor of 3, whereas for trailer trucks we have assumed a PCU factor of 4.5. These factors have been used to arrive at the PCU values presented in the following sections.

Table 3-1: PCU factors

Vehicle Category	PCU Factor
CJV/Mini LCV	1.0
LCV	1.5
Bus/2A	3.0
3A	3.0
MAV*	3.42
OSV	4.5

Source: Steer analysis and IRC64,1990; MAV PCU factor has been arrived using the split between rigid and trailer trucks

Historical trends

3.5 Table 3.1 through Table 3.4 below present the historical traffic evolution for each of the Asset toll plazas.

Table 3.1: Historical evolution in AADT by vehicle class at TP1- Doddakarenahalli

Vehicle	FY18	FY19	FY20	FY21	FY22	FY23	FY24	FY25	FY26 YTD	CAGR-FY22 - 25 (%)

Source: Steer analysis of Client data; FY26YTD includes data till September'25; Tollable traffic excludes exemption and violation

3.6 On the Asset, Doddakarenahalli toll plaza is trending at around 38,000 PCUs in FY26YTD and Karabylu toll plaza at around 29,000 PCUs.

3.7 In terms of vehicle composition, CJVs are the biggest contributor on the Asset with a share of over 80%. As discussed in Chapter 2, the Asset caters to large volume of tourism-oriented traffic travelling from Bengaluru to tourism centres such as Coorg, Madikeri, and Shravanabelagola which contribute towards the CJV traffic on the Asset. These shares are slightly higher at TP1 which is closer to the urban centre of Bengaluru.

3.8 The CJV traffic on the Asset was impacted during FY20 and FY21 due to Covid-19. Passenger traffic showed signs of recovery post-FY21 and has exhibited stable growth since then. Between FY22 and FY25, overall traffic grew at a PCU CAGR of 9.5% and 9.1% at TP1 and TP2 respectively. This growth across both TPs stems from higher growth observed in the Bus/2A category, followed by CJVs and MAVs.

3.9 The LCVs on the Asset mainly carry items of daily needs and agricultural commodities. As of FY26YTD LCV traffic growth at both TP1 and TP2 has been flat relative to other vehicle categories including CJVs. In contrast, Bus volumes at both plazas through September 2025 have observed robust growth over FY24 levels as the Asset is an important link for tourism related travel and religious tourism.

3.10 Share of MAVs on the Asset has historically remained at about 4-5% of total traffic. Majority of these MAVs carry LPG cylinders from the Hindustan Petroleum Corporation Limited (HPCL) bottling plant at Solur and Bharat Petroleum Corporation Limited (BPCL) bottling plant at Yediyur. Commercial traffic volumes (2A/3A/MAV) at TP2 (Karabylu) observed declines in the early months of FY25 (June-August 2024) as long-distance movements from (or to) Mangaluru along the NH75 were disrupted due to a Landslip near Doddatapale (further west of TP2). TP1 also observed declines but to a lesser extent as traffic volumes observed at TP1 are dominated more by urban activity of Bangaluru city and outside. Periodic landslides every 1-2 years have historically disrupted traffic flows on the NH75, partially due to prolonged roadworks along the Shiradi Ghat section of the highway. These periodic disruptions are expected to continue going forward.

3.11 The Asset saw steady and healthy growth from FY17 to FY26YTD, except for a decline in FY21 due to COVID-19. Both TPs have witnessed strong growth in the number of CJVs on

the route – the only exception being in FY19 due to construction on the Hassan-Mangaluru section at Shiradi Ghat, which was a temporary impact and FY21 due to COVID-19 related restrictions. The increasing number of CJVs observed on this Asset can be directly linked to the growth of the city of Bengaluru both in terms of population and per capita income levels. As mentioned previously, this corridor is primarily used for social, leisure and tourism activities, the growth in local economy and local tourism has led to strong growth in the CJV traffic. The growth in CJVs in FY22 and FY23 is also attributed to Mini LCV now being correctly tolled in CJVs post FASTag implementation, which were earlier accounted in LCVs. These shares have stabilised post this correction, thereby not affecting growth in the recent years leading up to FY26YTD.

3.12 The flat or negative growth trend in LCVs between FY22 and FY25 can be partially attributed to changes in vehicle classification of Mini LCVs under FASTag implementation, where Mini LCVs that were earlier classified as LCVs are now classified as CJVs. Flat growth in LCVs as of FY26YTD is indicative of a stabilisation of these trends and a return to trend growth, and future growth in LCVs are expected to follow underlying trends in the regional economy more closely.

Historical Revenue

3.13 Table 3.5 and Table 3.6 below present the revenue (in INR Lakhs) by each vehicle type at each toll plaza for FY19-FY26 YTD at an annual and daily level.

Table 3.5: Revenue (INR Crore) by vehicle type at TP1 Doddakarenahalli, and AADC (annual average daily collection) in INR Lakhs

	CJV	LCV	Bus	2A	3A/MAV	Total	AADC	Growth %
FY19	13.6	5.9	6.7	3.1	5.8	35.10	9.62	
FY20	15.5	6.2	6.5	3.2	7.8	39.20	10.74	11.7%
FY21	17.0	5.4	4.0	2.6	6.5	35.60	9.75	(9.2%)
FY22	24.7	2.8	4.6	3.2	8.7	44.10	12.08	23.9%
FY23	27.8	3.0	5.6	3.9	9.3	49.60	13.59	12.5%
FY24	31.0	3.0	6.6	5.0	10.7	56.30	15.42	13.5%
FY25	33.5	3.2	7.5	5.2	10.8	60.20	16.50	7.1%
FY26*	17.6	1.6	3.9	2.7	5.2	31.05	17.06	1.6%

Source: Steer analysis of the Client data; AADC represents Average Annual Daily Collection in INR Lakhs; FY26* is FY26YTD data for 6 months from Apr'25 to Sep'26; Revenue excludes the penalty revenue

Table 3.6: Revenue (INR Crore) by vehicle type at TP2 Karabylu, and AADC (annual average daily collection)

	CJV	LCV	Bus	2A	3A/MAV	Total	AADC	Growth %
FY19	11.9	4.3	4.0	2.7	5.3	28.20	7.73	
FY20	13.3	4.8	4.5	2.7	7.3	32.60	8.93	15.6%
FY21	11.4	4.2	2.5	5.6	5.3	29.10	7.97	(10.7%)
FY22	20.4	2.2	4.1	2.7	8.6	38.10	10.44	30.9%
FY23	22.5	2.3	4.6	3.3	9.0	41.70	11.42	9.4%

	CJV	LCV	Bus	2A	3A/MAV	Total	AADC	Growth %
FY24	24.6	2.3	5.9	4.2	11.2	48.20	13.21	15.6%
FY25	26.8	2.5	6.7	4.4	11.7	52.04	14.26	8.3%
FY26*	14.1	1.3	3.4	2.2	5.5	26.60	14.61	0.3%

Source: Steer analysis of the Client data; AADC represents Average Annual Daily Collection in INR Lakhs; FY26* is FY26YTD data for 6 months from Apr'25 to Sep'26; Revenue excludes the penalty revenue

3.14 From the above table it can be observed that TP1 generates higher daily collection for the Asset. This is due to higher volumes of CJV, LCV and MAV traffic on TP1 given its proximity to Bengaluru.

Toll Frequencies

3.15 Toll frequency or segmentation is typically the share of each ticket category recorded for a particular vehicle type. This is based on the toll policy which forms a part of the concession agreement. Each vehicle category has different segmentation. As a part of historical analysis, we calculate the toll frequency for each vehicle category from the monthly data shared by the Client. The most common ticket categories observed on a typical National Highway concession are: Single, Return, Monthly, Local and Exempt. Given the local nature of traffic, some toll plazas offer custom made local passes to attract the local commuters to opt for these category passes instead of evading toll.

3.16 Understanding the toll frequency gives insights into the nature of traffic. CJVs generally have higher shares of return passes or local monthly passes because they travel for short to medium distances, while heavy trucks mostly have single tickets since they travel long distance. CJVs and buses also tend to have a higher share of exemption/violations than other commercial vehicle categories as their tolls are higher and tend to contribute the most to the Asset's total revenue. However, this varies from Asset to Asset or even toll plaza to toll plaza. The Asset catering to short distance local traffic generally observes high share of return or other local monthly passes while the Asset catering to strategic long-distance traffic generally observes high share of single ticket traffic.

3.17 Table 3.7 below presents the different types of tickets being sold at both the Asset plazas.

Table 3.7: Typical ticket types sold at NHAI plazas

Category	Description
Single	Allows the vehicle to cross the toll plaza once
Return	Allows the vehicle to take two trips within a day with second trip at 50% of single fee.
Local Personal	Discounted single entry monthly pass only for private cars of residents within 20km radius of toll plaza
Local Commercial	50% discount on single trips for commercial vehicles registered in the local district. The pass allows single entry only.
Monthly	For all vehicle categories which charges the user 1/3rd the fee of 50 Single trips
Exemptions	Officially exempted vehicles like ambulance, police cars, key political personnel etc.

3.18 Further, the toll plazas also record violations which are non-paying users, who are not officially allowed under exemptions category but are forced exemptions. For the Asset, the segmentation discussed below reports Exemption and violations together

3.19 As a general pattern, the shares of single/return/monthly tickets tend to stabilise within 2-3 years of the commencement of Asset operations. Only in the cases where trip patterns are expected to change significantly due to urban expansion is where we expect these shares to change over the period or due to some external events impacting the trip patterns. During FY20 and FY21, however, two key events impacted the traffic patterns throughout the country: COVID-19 and FASTag implementation.

Introduction of Annual pass for CJVs

3.20 The National Highway Authority of India launched the “The FASTag Annual Pass” on August 15, 2025, a prepaid facility that allows private CJVs to travel across designated National Highway and National Expressway toll plazas. The annual pass is worth INR 3,000. The pass is valid for one year or 200 trips, whichever occurs first and is applicable only to private, non-commercial vehicles (Car/Jeep/Vans).

Since this pass has been introduced by NHAI, it is not valid on

- state governed toll plazas on highways
- state governed toll plazas expressways
- Parking areas or other non-NHAI tolling locations

3.21 The pass can be activated via the RajmargYatra app or the NHAI website, and links directly to an existing FASTag.

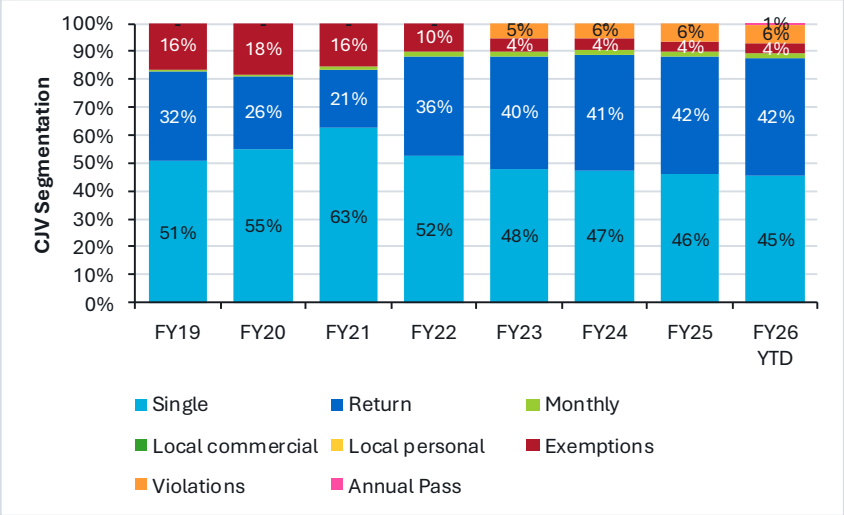
The Annual Pass aims to:

- Promote cashless and seamless travel on national highways.
- Reduce congestion and improve traffic flow at tolls
- Provide cost-effective travel for frequent users of NH/NE toll roads

Share of traffic by payment type

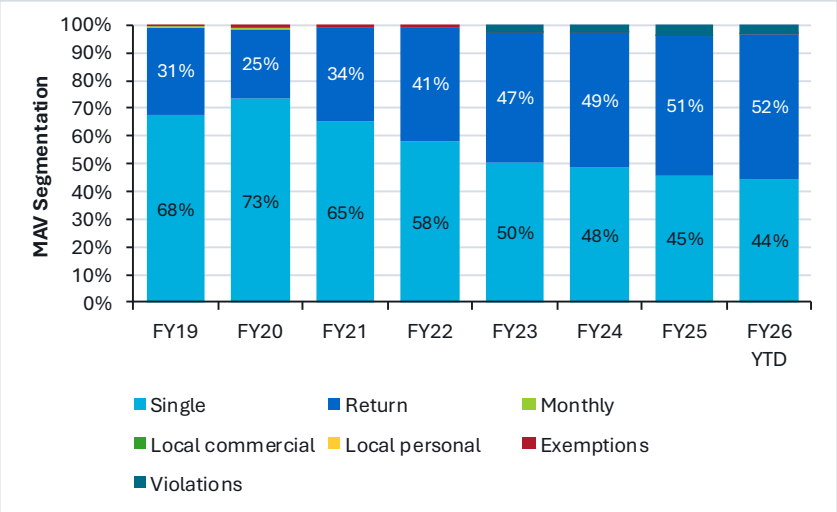
3.22 Figure 3-1 through Figure 3-4 below present toll segmentation for the historical years at TP1 Doddakarenahalli and TP2 Karabylu for CJVs and MAVs. Table 3.8 and Table 3.9 below provide the same for the remaining vehicle types. FY21 was a partial year in terms of operation of the toll plazas. Further, there was a change in ticket patterns due to the mandatory implementation of FASTag as a mode of payment (share of single tickets increased in FY21). FY22 was also impacted by 2nd wave of COVID-19 in Q1 and Q2 of FY22. Hence during this period travel patterns were also disrupted. With FY21 and FY22 being Covid-19 impacted it is assumed that segmentation of FY23 onwards is normal. The figures below show ticket segmentation for CJV and MAV categories.

Figure 3-1: Ticket-segmentation for CJV, TP1 Doddakarenahalli



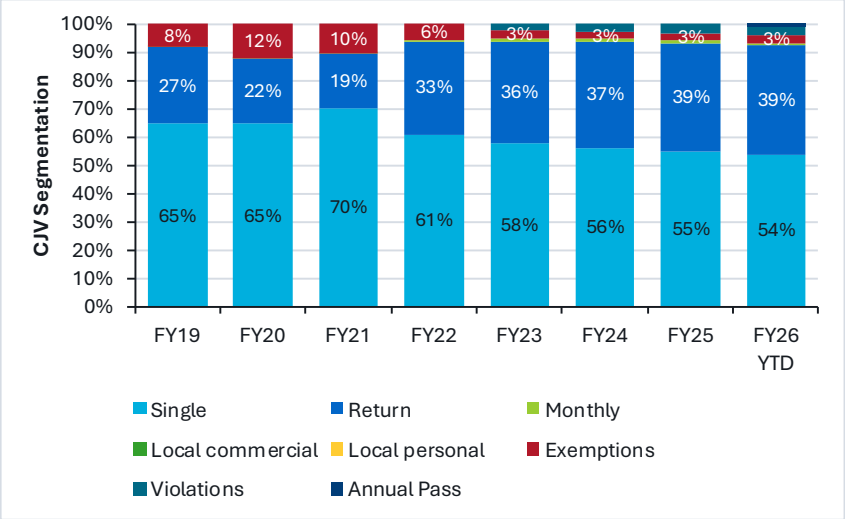
Source: Steer analysis of the Client data. FY26 Segmentation is representative of Client data up till Aug'25.

Figure 3-2: Ticket-segmentation for MAV, TP1 Doddakarenahalli



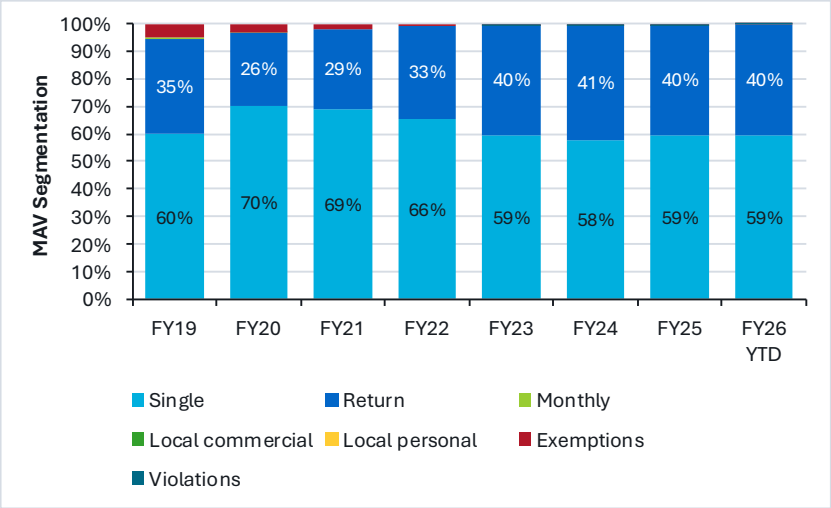
Source: Steer analysis of the Client. FY26 Segmentation is representative of Client data up till Aug'25.

Figure 3-3: Ticket-segmentation for CJV, TP2 Karabylu



Source: Steer analysis of the Client data. FY26 Segmentation is representative of Client data up till Aug'25.

Figure 3-4: Ticket Segmentation for MAV, TP2 Karabylu



Source: Steer analysis of the Client data. FY26 Segmentation is representative of Client data up till Aug'25.

3.23 For CJVs, the dominant ticket type at both plazas is 'Single' tickets (nearly 45% at TP1 and just under 60% at TP2), due to the high share of tourism-related traffic, wherein the commuters generally travel for couple of days, not making users eligible for a return ticket within 24 hours.

3.24 The share of exemptions observed on this Asset is in line with our observations on similar urban Assets across the region. The share of exemptions is higher on TP1 due to its urban nature. With increasing ETC penetration on the Asset, the combined share of exemptions and violations on the Asset has dropped significantly compared to FY22 levels. This is likely because of better management and operation of traffic system post FASTag implementation.

3.25 MAVs also show a high share of 'Single' ticket type (45-50% at TP1 and 60% at TP2), showing the significance of medium-distance traffic. The remaining shares for MAVs are primarily held by 'Return' tickets. Since TP1 of the Asset caters to more local traffic

feeding the local industries as verified from the OD data in chapter 3 therefore the share of return tickets is higher on TP1 of the Asset and has been growing FY22 onwards. In case of MAVs, both the plazas report negligible exemptions.

3.26 Refer below to the table for FY26YTD (Apr'25 – Aug'25) segmentation for LCV, Bus, 2A and 3A /MAV category at TP1 Doddakarenahalli and T2 Karabylu

Table 3.8: Historical ticket segmentation at TP1 Doddakarenahalli

Ticket	LCV	Bus	2A	3A
Single	25.6%	8.0%	28.2%	44.4%
Return	68.3%	86.4%	53.8%	52.0%
Monthly	1.0%	5.3%	0.7%	-
Local commercial	2.3%	-	13.6%	-
Exemptions	0.3%	0.0%	0.2%	0.0%
Violations	2.5%	0.3%	3.4%	3.5%

Table 3.9: Historical ticket segmentation at TP2 Karabylu

Ticket	LCV	Bus	2A	3A
Single	44.8%	9.5%	46.3%	59.3%
Return	51.9%	83.6%	45.7%	40.3%
Monthly	0.7%	6.7%	0.4%	-
Local commercial	0.8%	-	4.3%	-
Exemptions	-	-	-	-
Violations	0.4%	0.1%	1.1%	0.0%

Source: Steer analysis of the Client data till Aug'25.

Overloading

3.27 The Asset being a part of NHAI concession follows the NHAI Overloading policy released in 2016 which bans the overloading of commercial vehicle on any NHAI toll plaza. In case of non-compliance, overloaded vehicles on the Asset are charged twice the toll fee they would otherwise pay for a Single ticket at the toll plaza. The Asset currently doesn't report overloading under any ticket category.

Data Collection exercise

3.28 To validate and inform various inputs used in our forecasting, we undertook primary data collection on the Asset comprising the surveys listed in the table below. OD survey data was collected on behalf of the Client, TVC surveys were commissioned by Steer with a third party. OD data collection typically involves manual data entry by enumerators based on oral surveys with road users crossing toll plazas. TVC data collection involves video graphic capture of traffic passing crossing the toll plazas, followed by manual counting.

Table 3.10: Data collection schedule

Toll Plaza	3-day videography based TVC			1 day OD survey	
	Start date	End date	Time (hrs)	Start date	Time (hrs)
TP1 Doddakarenahalli	1st Jul 2023	3rd Jul 2023	0000-2359	3rd July 2023	08:00
TP2 Karabylu	18 Jan 2021	24 Jan 2021	0000-2359	9 Nov 2019	08:00

Source: Data collection plan as followed for collecting independent survey data

3.29 It should be noted that, in our experience, traffic on national highways shows variation across the week due to the economic activities surrounding each road. To derive a representative TVC count considering daily variation, three-day to seven-day traffic counts are generally recommended, and hence, in order to fully understand the impact of this weekly fluctuation on the Asset, we collected three-day counts at each toll plaza.

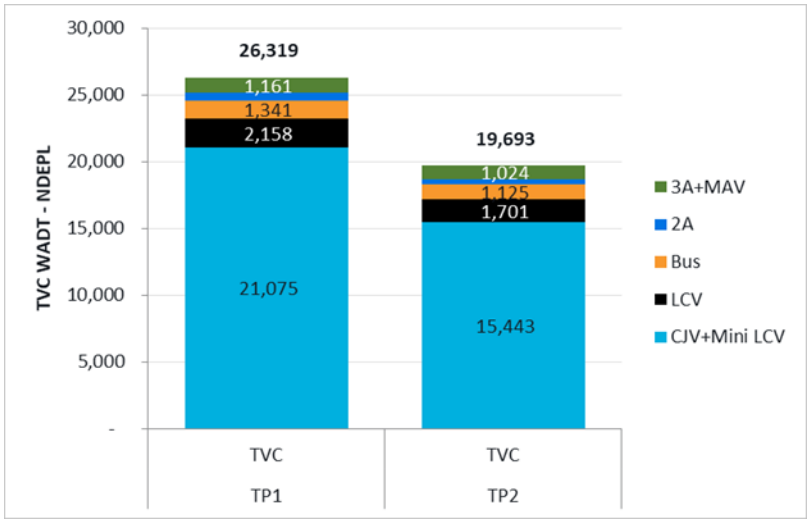
Key findings of the TVC data analysis

WADT estimates

3.30 For Doddakarenahalli, the average of a three-day TVC survey conducted between (1st July – 3rd July 2023, 0000-2359) was used, and for Karabylu an average of the seven-day TVC counts (18th – 24th Jan 2021, 0000-2359) was used, to obtain the following average daily traffic (WADT) for each toll plaza. This WADT excludes non-tollable vehicle such as tractors, two-wheelers, bullock-carts, etc., but includes officially exempt vehicles such as police cars, ambulances, emergency response vehicle, government vehicle and other vehicle types officially allowed as 'exempted' under the concession agreement.

3.31 From Figure 3-5 below, we see that both toll plazas exhibit similar characteristics in terms of vehicle shares. CJVs form major share on both TPs, where they account for ~80% of the total traffic, followed by LCVs which constitute ~8-10% of the remaining shares.

Figure 3-5: TVC WADT



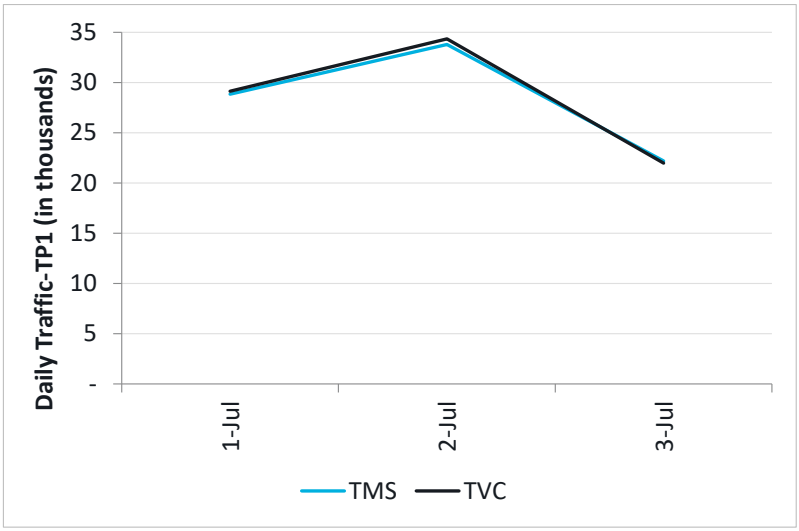
Source: Steer analysis of TVC data

TVC v/s TMS analysis

3.32 We used our TVC data to validate the toll plaza data for the same days, as supplied by the Client via their toll management system (TMS). This TMS data was then used as the base data, for our forecasting model.

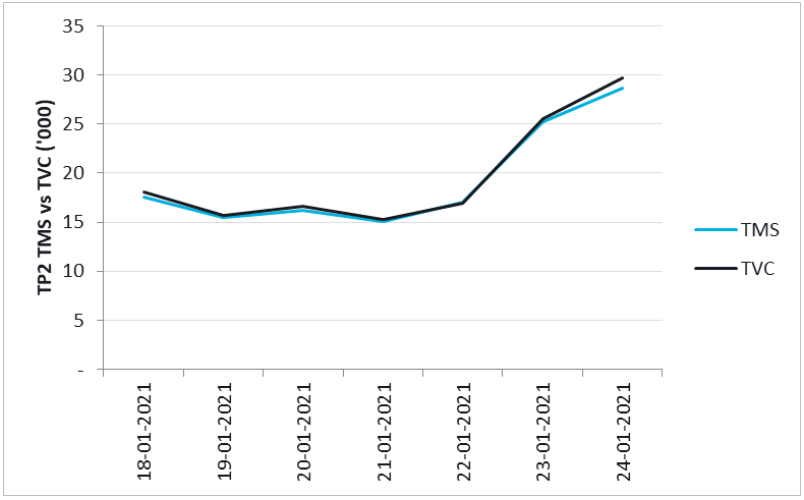
3.33 Figure 3-6 and Figure 3-7 below show the comparison between daily traffic data and shares of vehicle categories in TVC and TMS for the two toll plazas. As can be seen both TP1 Doddakarenahalli and TP2 Karabylu show a good fit between the TVC and TMS. The minor difference on two days of the seven-day period at TP2 is within the acceptable range of variation.

Figure 3-6: Comparison between TVC and TMS daily traffic data on TP1 Doddakarenahalli



Source: Steer analysis of TVC and Client TMS data

Figure 3-7: Comparison between TVC and TMS daily traffic data on TP2 Karabylu

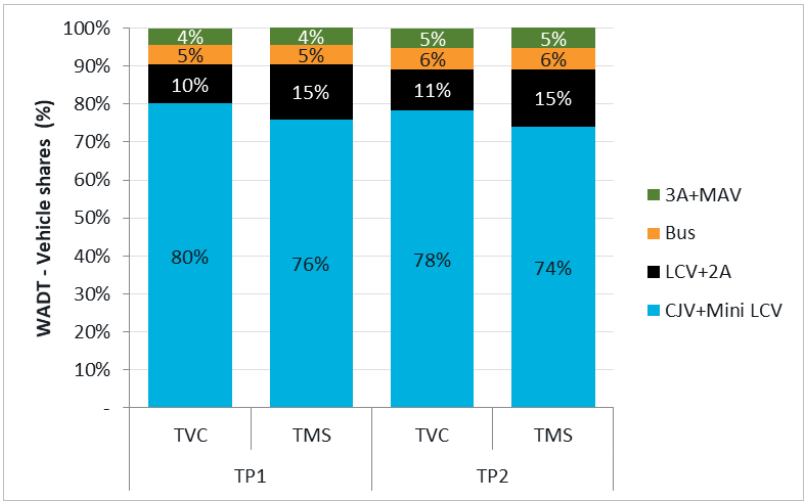


Source: Steer analysis of TVC and Client TMS data

3.34 Figure 3-8 below compares the shares of vehicle types at both plazas, between TVC and TMS data. We see that while most vehicle categories show similar shares, the CJV shares show differences between TMS and TVC. This difference is mostly compensated by the shares of LCVs showing the reverse. This reciprocal mismatch between CJV and LCVs can

be attributed to common misclassification of vehicle categories especially the Mini LCVs. Other vehicle class shares hold consistent across the TVC and TMS.

Figure 3-8 Comparison between vehicle shares from TVC and TMS WADTs



Source: Steer analysis of TVC and Client TMS data

Table 3.11: Difference in vehicle counts when combined

Vehicle type	TP1 Doddakarenahalli			TP2 Karabylu		
	TVC	TMS	TMS vs TVC (%)	TVC	TMS	TMS vs TVC (%)
CJV+Mini LCV	21,705	19,463	8.3%	15,443	14,301	8.0%
Bus	1,341	1,290	4.0%	1,125	1,068	5.4%
LCV+2A	2,731	3,748	(27.1%)	2,095	2,938	(28.7%)
3A+MAV+OSV	1,171	1,146	(2.1%)	1,029	1,025	(0.4%)
Total	26,319	25,646	(2.6%)	19,693	19,332	(1.8%)

Source: Steer analysis of TVC and Client TMS data

Key findings of origin-destination analysis

Overview

3.35 Origin-destination (OD) analysis enables the understanding of the nature of traffic movement on the Asset. The OD analysis presented here is based on data collected on behalf of the Client in July 2023. More recent OD surveys were not undertaken as this Asset has a long operational history, and we did not believe material changes in these patterns would have occurred in this period.

3.36 We have analysed the regional drivers of demand based on the following analyses:

- Zonal influence
- Commodity distribution
- Top OD pairs
- Trip length distribution

3.37 While zonal analysis and the list of top OD pairs help us to understand 'where' people and goods travel, commodity distribution sheds light on 'what' goods get transported. Trip length distribution show 'how far' vehicles and people travel, and goods get transported. This set of analyses is generally used to estimate the key drivers of traffic and aid the making of informed forecasting assumptions around traffic demand elasticities, growth drivers and exogenous impacts.

Sample rates

3.38 Sample rates help understand the reliability of OD data. They are calculated by dividing OD samples captured by the traffic counts (based on the TVC data) during the same time period. Table 3.12 below presents the sample rates for key vehicle type aggregations at both the toll plazas. We believe that the sample rates of the OD data are reasonable. Lower sample share for Cars and LCV on the Asset is due to reduced stopping time of vehicles at the plaza post implementation of FASTag which has affected the sample rate.

Table 3.12: Sample rates for OD data

Vehicle type	TP1 Doddakarenahalli	TP2 Karabylu
Car	31%	35%
Bus	69%	86%
LCV	42%	32%
3A Truck	92%	75%
MAV	91%	97%

Source: Steer analysis of OD data

Zone categories

3.39 To facilitate better interpretation of key regional drivers of traffic as determined by their OD zones, and influenced by various towns, cities, states, and regions in the vicinity of the Asset, we have aggregated zonal data as described in Table 3.13 below. The methodology behind this aggregation of zones may vary as per the characteristics displayed by the different Assets being studied.

Table 3.13: Zone aggregations for zonal influence analysis

Aggregate Zone	Description
Local	Local zones are those that fall on or very close to the Asset.
IAOI	IAOI zones are the locations which generate traffic and lie within approximately 75-150 km distance from the Asset.
Rest of State	Rest of the cities/Districts in the state that Asset lies in.
Tamil Nadu	Tamil Nadu
Telangana	Telangana
Andhra Pradesh	Andhra Pradesh
Kerala	Kerala
Central India	Madhya Pradesh, Chhattisgarh
West India	Maharashtra, Goa, Gujarat
East and Northeast India	West Bengal, Odisha, Jharkhand, Bihar, and Northeast Indian States

North India	Uttar Pradesh, Rajasthan, and other North Indian states
Outside India	Nepal, Bhutan, Bangladesh

Source: Steer analysis

Zonal influence

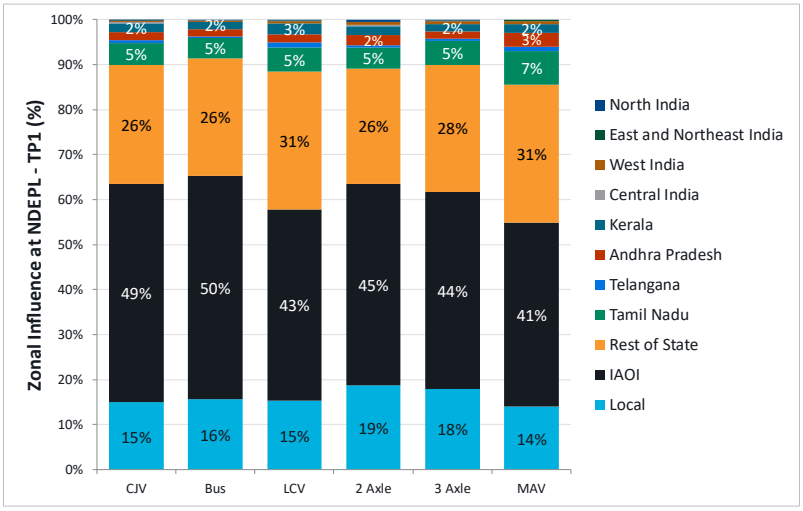
3.40 The zonal influence is the contribution of the zone or the zonal aggregation to trips by a vehicle type. This section presents the zonal influence[3] at each toll plaza of each Asset, aggregated based on zonal aggregation listed in the previous sub-section. Please note that zonal influence is analysed on trip ends and not trips.

3.41 Figure 3-9 and Figure 3-10 below present the zonal influence on various vehicle types on the toll plaza. We can see that 'IAOI', (including locations such as Bengaluru, Hassan, Mandya, etc) trips make up the largest share for all vehicle types. We find high shares of local and IAOI zonal influence. Combined with the internal-external distribution (presented in the next section, showing high I-ROS and ROS-I shares), we see that understandably, trips with one end at various locations in Bengaluru district dominate the traffic profile. These reflect in the IAOI zonal influence.

3.42 At TP1 Doddakarenahalli, the highest share of trips can be attributed to IAOI with a share of 40%-50%. Local trips, i.e., trips with their origins along or very near the Asset (including areas like Kunigal, Solur etc), have 15-20% share across categories and 'Rest of State', which includes locations such as Mysore, Mangaluru, Bellary etc which don't fall in either the local or IAOI categories; has about 25-30% share each across all vehicle categories. Tamil Nadu has a share of 5% across categories which rises to 7% for MAVs.

3.43 These trips which are being made between local and IAOI zones for heavy trucks are majorly concentrated in the regions between Bengaluru, Hassan, and Devihalli. Either the origin point, or the destination for most local/IAOI trips are the aforementioned regions.

Figure 3-9: Zonal influence, TP1 Doddakarenahalli

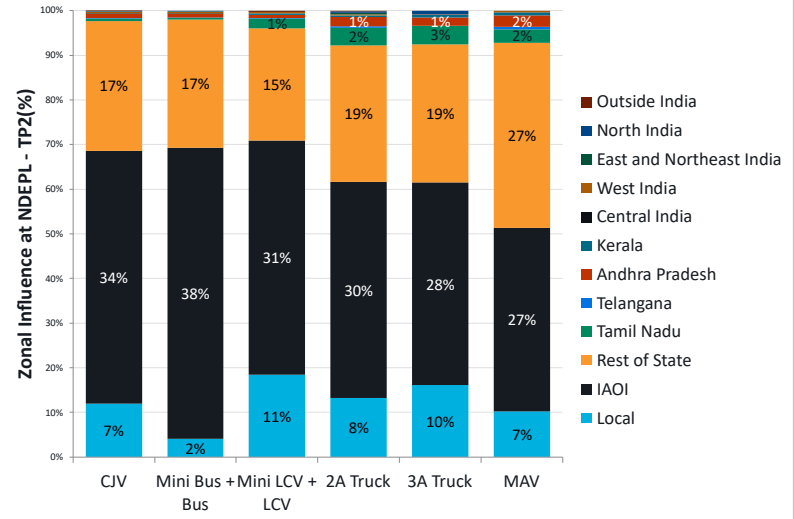


[3] For example, if out of 100 trips at a toll plaza on an Asset, 10 trips are between Hyderabad and Delhi and 90 trips are between Hyderabad and Chennai, then zonal influence of Hyderabad is 50% since one trip end of all trips are at Hyderabad. Likewise, zonal influence of Delhi and Chennai would be 5% and 45%, respectively.

Source: Steer analysis of OD data

3.44 For TP2 Karabylu, IAOI retains the highest proportion on zone influence across all vehicle types, ranging between 27%-38%. This is closely followed by 'Rest of Karnataka' trips, especially for heavy vehicles. Compared to TP1, the share of local trips is comparatively lower at 5%-10% share across the vehicle categories.

Figure 3-10: Zonal influence, TP2 Karabylu



Source: Steer analysis of OD data

Internal External analysis

3.45 Internal-External analysis helps in identifying the trips which have both the origin and destination on or near the Asset i.e local/IAOI zones (Internal-Internal or I-I), any one end on the Asset (Internal-External or I-E), or neither end on the Asset i.e., through trips (External-External or E-E). RoS here represents areas within the state which are neither local nor IAOI. 'Internal' zones are those that were analysed as 'local' and 'IAOI' in the zonal influence analysis, i.e., lying on the Asset, while 'External' zones are areas lying outside the state.

3.46 Figure 3-11 and Figure 3-12 below show the distribution of trips based on these categories. Understandably, these reflect the observations seen in the zonal influence presented earlier, at a higher level of aggregation but at a trip level.

Figure 3-11: Internal-external distribution, TP1 Doddakarenahalli

	Internal	Rest of State	External
External	6%	6%	2%
Rest of State	12%	5%	7%
Internal	30%	26%	6%

Source: Steer analysis of OD data

Figure 3-12 Internal-external distribution, TP2 Karabylu

	Internal	Rest of State	External
External	18%	2%	1%
Rest of State	35%	10%	0%
Internal	19%	9%	6%

Source: Steer analysis of OD data

3.47 As can be seen from the charts above, the I-I distribution makes up the major share for both light and heavy vehicles. This is followed by the trips which have one end of the trip in rest of the state, this includes places like Bengaluru, Mangaluru and Hassan and other end on the Asset.

Commodity distribution

3.48 We have grouped various commodities into aggregate categories for ease of interpretation, as shown in the table below. The charts in the following sub-section present information in terms of aggregate commodity categories.

Table 3.14: Aggregate commodity categories

Commodity Description	Code	Combined codes used for charts
Agriculture Products / Cash crops (Wheat, Rice, Sugar cane, Maize etc.)	AGR	AGR
Cattle Food / Livestock (sheep, goat, cow, cattle food etc)	LIV	
Perishable Items (Fruits, vegetables)	PER	GRO
Animal Products/Dairy/Eggs/Fish/Meat/Animals	DFM	
Groceries / Food items (Soap, Salt, Sugar, Pulses, Spices, Biscuits, bread, cool drinks, beer etc.)	GRO	
Building Material / Construction (Cement, Lime, Brick, fly ash, etc)	CNS	CNS
Sand/Clay	SND	
Stone (kota stone, marble, Granite, Aggregate stone etc.)	STN	
Ceramic	CRM	
Petroleum Products (Oil, LPG, CNG, etc.)	PET	PET
Chemicals / Fertilizers (Acids, Fertilizers etc.)	CHM	
Electrical/Manufacturing items (Electronic items, Medicine, Leather, Wine, Rubber/ Tyre, Plastics, Cloth, Paper etc.)	MAN	MAN
Raw Wood, Cork & Wood Products, Furn	WUD	
Machinery / Spare parts	MAC	
Automobiles (Finished products, auto parts, Car/bike manufacturing, New Chassis)	AUT	AUT
Basic / Fabricated Metals (Iron, Steel / Metal)	MET	MET
Mining Minerals (Coal, Gypsum, Cobalt etc.)	MIN	
Empty	EMT	EMT
Container	CTR	MSC
Miscellaneous (Parcel, Courier, Household items etc.)	MSC	
Passengers	PAS	
Scrap	SCR	

Source: Steer analysis

3.49 Figure 3-13 and Figure 3-14 below present the commodity distribution for goods vehicles at this toll plaza. These help in identifying the mix of goods carried on the Asset and in turn, the potential growth drivers.

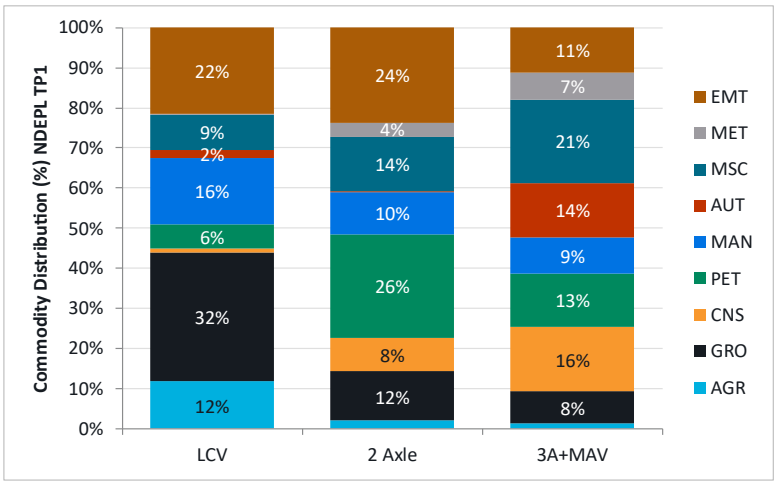
3.50 As observed during our site visits, we see that a significant number of vehicles are bullet tankers carrying petroleum from port and oil refineries in Mangaluru to bottling plants at Yediyur and Solur, and trucks that carry bottled petroleum products. These lie very close to the Asset, leading to the high proportion of petroleum (up to 26% for 2As at TP1) in the commodity distribution.

3.51 A major segment of the 3A+ MAVs (14%) is carrying automobiles and related products. This is due to the presence of the electric vehicle manufacturing cluster around Hosur to the southeast of the Asset.

3.52 Looking by direction, at TP1 the commodity shares in the direction towards Hassan, and the direction towards Bengaluru are somewhat different. Another key difference is that whilst towards Hassan direction has higher shares of empty trucks, this primarily includes empty trucks coming from the city of Bengaluru to be loaded and carrying back commodities for the city consumption. The Bengaluru direction has a higher share of manufactured products especially in LCV category (26%).

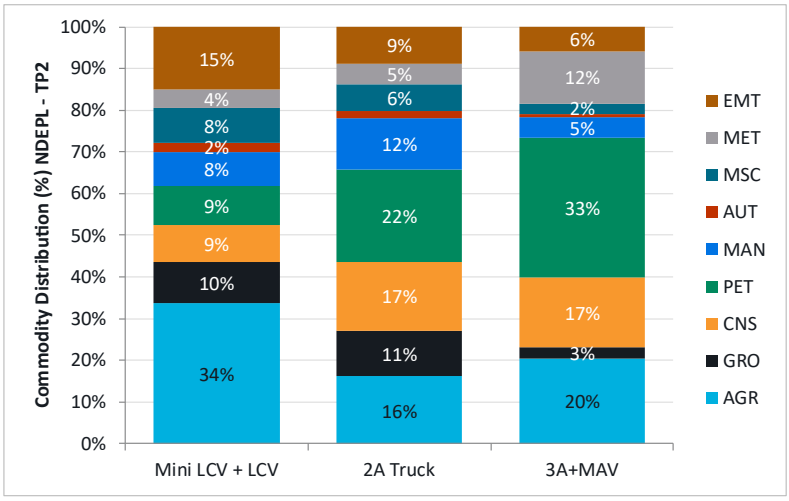
3.53 While at TP2, in the Bengaluru direction petroleum is dominant at a 37% share among 3A+MAVs. Construction materials have a higher share among 3A+MAVs in the direction towards Hassan, at 34% compared to 10% in the opposite direction to Bengaluru.

Figure 3-13: Commodity distribution, TP1 Doddakarenahalli (Total)



Source: Steer analysis of OD data

Figure 3-14: Commodity distribution, TP2 Karabylu



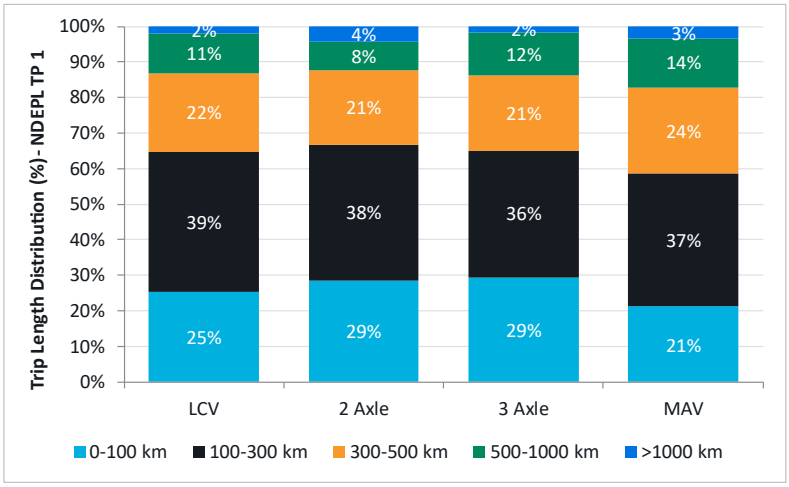
Source: Steer analysis of OD data

Trip length analysis

3.54 Trip-length distribution provides the distance-based profile of various vehicle types. This helps to validate assumptions around the share of macro-economic drivers, inputs from zonal influence and toll segmentation. For ease of interpretation, we have categorised distances into groups –local (0-100km), short-distance (100-300 km), medium-distance (300-500 km), long-distance (500-1000 km) and very-long-distance (+1,000 km). The trip distances were derived as driving distances from Google Distance Matrix Tool based on zonal coordinates for OD pairs.[4]

3.55 Figure 3-15 and Figure 3-16 below present the distribution of trip distances for various vehicle categories at the toll plazas on the Asset.

Figure 3-15: Trip length distribution, TP1 Doddakarenahalli



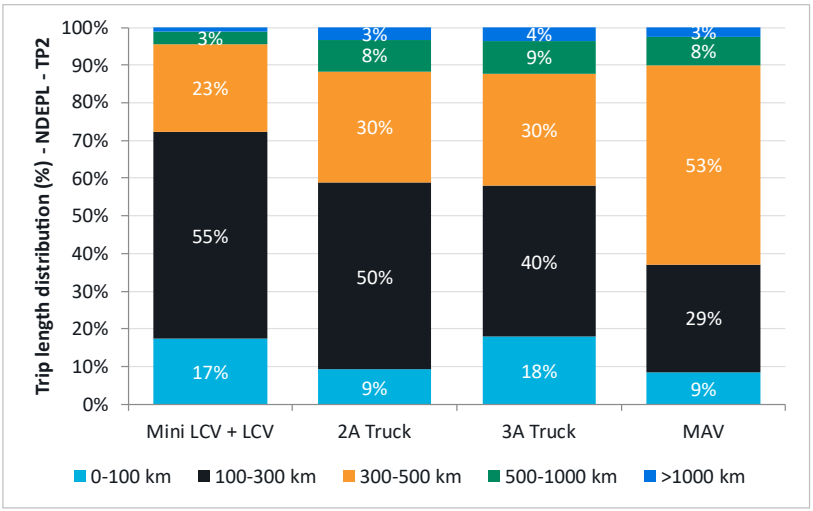
Source: Steer analysis of OD data

3.56 As shown in Figure 3-15 above, TP1 (Doddakarenahalli) has a high share of vehicles covering 100-300 km (~35-40%). The same trend is visible at TP2 for LCV/2A/3As (40%-55%). However, MAV trips covering longer distances (300-500km) are seen to be the dominant category. As previously discussed, the Asset serves mostly short/medium distance traffic between Bengaluru (as one of its major activity centres) and Mangaluru or Hassan being the other main activity centre. The higher proportion of shorter trips (<300 km) at TP1 reflects its proximity to Bengaluru and Nelamangala.

3.57 As we move towards heavy vehicle categories, the trip distances increase. However, the strategic location of the Asset in the east-west direction in the southern Indian peninsular region limits trips to being medium-distance (<500 km). Therefore, MAVs do not show high shares of long-distance traffic (14% on TP1 in the '500-1000 km' category) as observed on other assets located on strategic corridors across the country.

[4] Google Distance API is a tool that is available on a chargeable basis from Google Maps Platform. Link: **https://developers.google.com/maps/documentation/distance-matrix/start**. Travel distance and time information for driving/transit under various congestion scenarios can be extracted through this tool by using macro-enabled Excel, R, etc.

Figure 3-16: Trip length distribution, TP2 Karabylu



Source: Steer analysis of OD data

Conclusions

3.58 In FY25, the Asset's AADT at TP1 Doddakarenahalli reached approximately 26,450, while TP2 Karabylu recorded around 19,493. At both toll plazas, CJVs remain the dominant vehicle class, contributing roughly 77–78% of total traffic. Buses are the second-largest category, accounting for about 6–9%, followed by MAVs, which represent 4.4% at TP1 and 5.8% at TP2. LCVs have a smaller share and even declined slightly at TP2 compared to FY22.

3.59 Since FY22, following the stabilization of pandemic-related impacts, traffic volumes on the Asset have shown robust recovery, supported by economic growth along the corridor. At a PCU level, the Asset has delivered strong growth from FY22 to FY25, with CAGRs of ~10.0% at TP1 Doddakarenahalli and ~9.7% at TP2 Karabylu. This trend underscores sustained improvement in traffic performance and capacity utilization.

3.60 Whilst overall the TVC counts is similar to the TMS, TMS is consistently 1-2% lower than TVC counts. This difference is well within the acceptable ranges and ensures that the systems used by the toll plazas are robust in nature and are able to capture the traffic correctly.

3.61 The OD analysis found that in terms of zonal influence, IAOI retains the highest proportion on zone influence across all vehicle types. This is followed by 'Rest of Karnataka' trips (note the higher share of 'Rest of Karnataka' at TP2). Looking at local trips, the share is 5%-10% lower at TP2 compared to TP1 share across the vehicle categories. Key commodities transported on the Asset include Petroleum products, which is expected given the location of the Asset relative to the Mangaluru and the petroleum bottling plants at Yediyur and Solur. Manufactured products and agriculture products also hold a considerable share of commercial traffic at both plazas (18-21% at TP1 and 15-16% at TP2.)

3.62 When considering the internal – external analysis, I-I, I-ROS and ROS-I distribution makes up the major share for both light and heavy vehicles. The trip length analysis has found that the Asset predominantly serves short/medium distance traffic, with trips under 300km having a share of 60-65% (across all vehicle categories) at TP1, and 58-62% for

LCV/2A/3A traffic at TP2. MAVs at TP2 are observed to traverse comparatively longer distances – with 53% of such trips between 300-500km. The high share of I-I and short/medium distance traffic is considered to be the captive traffic which will remain sticky to the Asset.

3.63 Overall, the historical analysis, the TVC counts and the OD survey data point to the highly tourism and car-dominated nature of the Asset with regional movement of goods traffic, with petroleum being a major regional industry.

4 Socio-economic context and traffic growth

Introduction

4.1 The growth of traffic on existing (brownfield) roads depends on, firstly, how fast the background travel demand grows (background growth); and secondly, how successful the Asset is in attracting that traffic (traffic capture). Background travel demand is driven by the socio-economic conditions of the region where the Asset is located and conditions on a national scale. These include:

1. Changes in factors such as population, economic growth (regional and national) and industrial production; and,
2. Other local factors such as strategic port growth, and growth in local industries near the Assets.

4.2 In turn, the change in the competitive position of the Asset (and thus of the traffic capture it will achieve) derives from how the service offered and the prices charged on the Asset change in comparison to competing roads; and whether any new competing road facilities are available. In this chapter, we assess the socio-economic and macro-economic indicators relevant to traffic growth on the Asset.

Population growth

4.3 We have analysed the key socioeconomic drivers of the background traffic demand in the state of Karnataka, where the Asset is located.

National Level

4.4 The total population in India has grown at a Compound Annual Growth Rate (CAGR) of 1.5% since 2000, decreasing over the years, as shown in Table 4.1 below. The World Bank forecasts this growth to decrease to 0.6% CAGR by the 2030-45 period.

Table 4.1: CAGR of population in India

Years	CAGR		
	Total Population (m)	Rural Population (m)	Urban Population (m)
1970 – 1985	2.3%	1.9%	3.8%
1985 – 2000	2.0%	1.7%	2.9%
2000 – 2015	1.5%	1.0%	2.6%
2015 – 2030*	1.0%	0.3%	2.3%
2030 – 2045*	0.6%	-0.3%	1.9%

Source: World Bank Data on Health Nutrition and Population Statistics, *forecast population growth

State Level

4.5 Table 4.2 below shows the evolution of population in the state of Karnataka (containing the Asset), compared to that of the country. Karnataka's has grown at a rate slower than that witnessed across India – between FY12-24, Karnataka's population grew at a 0.8% CAGR, compared to 1.2% for India.

Table 4.2: Population Growth in Karnataka and India (FY12 – FY24)

State	FY12 Population (m)	FY24 Population (m)	CAGR (FY12 – FY24)
Karnataka	61.5	67.9	**0.8%**
India	1,210	1,395	**1.2%**

Source: MoSPI estimates

4.6 Due to the complexities of urbanisation, and the dynamic nature of local population migration (both of which are very difficult to forecast with accuracy), we do not use population growth as a proxy for understanding future travel demand growth on the Asset. It has been included in this section simply to provide the underlying socio-economic context of the state/trends in the regions in which the Asset is located.

Economic Indicators

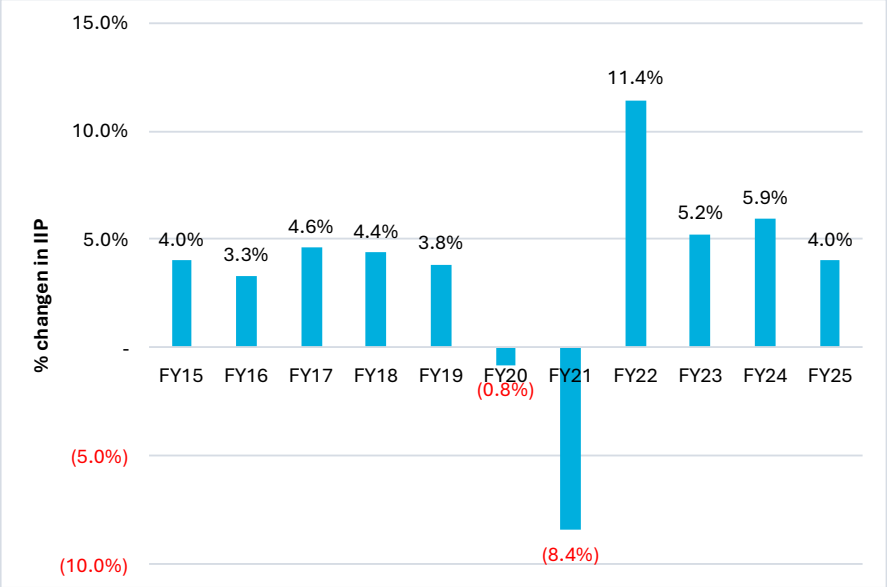
Industrial Production

4.7 The Index of Industrial Production (IIP) is a composite indicator that measures the short-term changes in the volume of production for a basket of industrial products. The IIP data tracks the manufacturing activity in different sectors of an economy, with mining, manufacturing, and electricity being the three broad sectors constituting the IIP.

4.8 Figure 4-1 below shows that at an annual level, national IIP was growing at an average of 4% per year over the period FY15-19, before the country underwent a liquidity crisis and experienced an overall economic slowdown in FY20. In the aftermath, IIP shrank by over 8% in FY21 due to a decline in economic activity in the wake of global lockdowns introduced to curb the Covid-19 pandemic. Post the immediate recovery in FY22, IIP growth has since stabilised, with FY25 recording 4% growth over FY24.

4.9 Since state-level IIP data is not as readily available as national level IIP, we have presented national IIP here to indicate nationwide activity in key industrial sectors like power, manufacturing, and mining, all of which influence long-distance commercial movements across the nation, and not unique to this asset. However, we do not use it to forecast future travel demand growth since long-term forecast for IIP is not available through official sources such as MOSPI, RBI or through multilateral organisations like WB, or the IMF.

Figure 4-1: Annual growth – Index of Industrial Production



Source: Ministry of Statistics and Program Implementation (MoSPI)

Vehicle Ownership

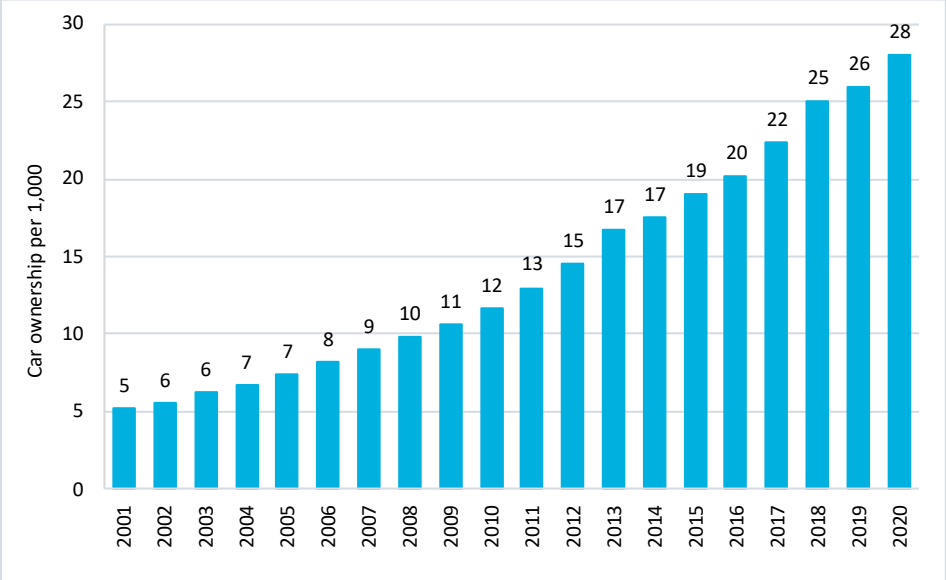
4.10 The gap in car ownership between India and developed nations remains substantial according to recent data. As of 2018, India had approximately 22 cars per 1,000 individuals, a fraction of the 980 cars per 1,000 individuals in the United States[5]. However, this pattern is changing with the increasing per capita income levels. As can be seen in Figure 4-2 below, between 2007-17, number of cars per 1,000 people has more than doubled and increased at a CAGR of about 11%.

4.11 Overall, India still stands at a very nascent stage in the vehicle saturation curve, offering huge potential for growth going forward. As the income per capita of India and the region itself grow further, we expect car ownership levels to increase. As per the India Energy Outlook (2015), car ownership is projected to grow steeply to 175 cars per 1,000 population by 2040 in India.[6]

[5] India has 22 cars per 1,000 individuals: Amitabh Kant, Auto News, ET Auto

[6] https://www.gita.org.in/Attachments/Reports/IndiaEnergyOutlook_WEO2015.pdf

Figure 4-2: Car Ownership in India per 1000 population



Source: International Energy Agency (IEA)

Per Capita Income (PCI)

4.12 As per the latest MOSPI data presented in Figure 4-3, Karnataka's per capita income (PCI) in FY25, at constant 2011–12 prices, stood at around ₹2,00,000, compared to the national average of approximately ₹1,12,000. This implies that Karnataka's PCI was nearly 1.78 times the national level.

4.13 This highlights the relatively stronger economic performance of the state compared to the national average, indicating sustained economic and traffic growth. Going forward, we expect local consumption to be strong which would drive the growth in both passenger and commercial traffic.

Figure 4-3: Per Capita Income

Source: Ministry of Statistics and Program Implementation (MoSPI)

4.14 However, given the difficulty in obtaining granular district level PCI data it is not advisable to use this as a growth driver. Also, since long-term forecasts for PCI are not available, we therefore refrain from using it to forecast traffic.

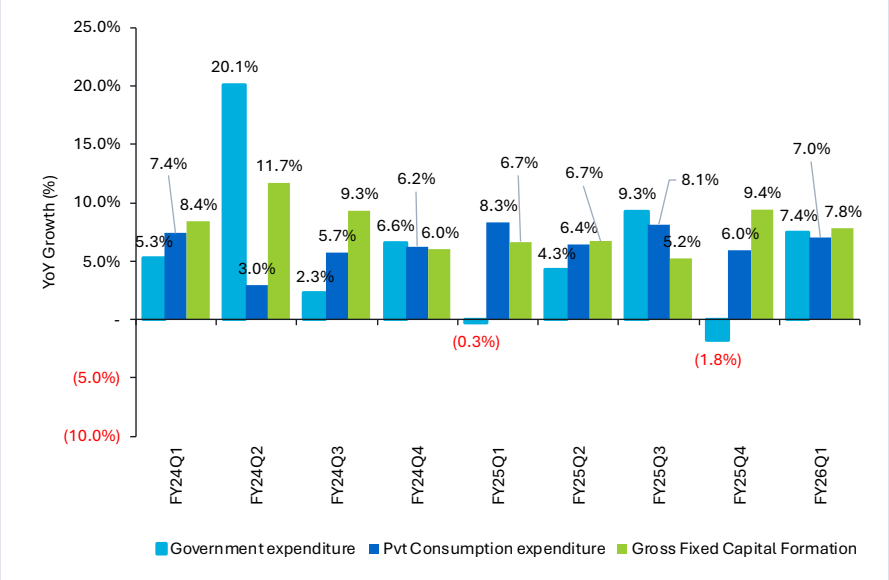
Economic growth

India's Performance

4.15 Despite a slowdown in the economy during H1FY25, the Indian economy has observed strong growth each quarter since FY25Q2, with the latest published estimates for FY26Q1 GDP at 7.8% over FY25Q1. This performance has been driven by strong growth in investment and consumption expenditures and higher consumer optimism for the year ahead[7].

4.16 In Figure 4-4 below, we present quarterly Y-o-Y growth in three major components of GDP – government expenditures, consumption expenditures, and business investment (gross fixed capital expenditure) over the past two years (FY24-FY26Q1).

Figure 4-4: YoY Growth in Government, Consumption and Business Expenditures



Source: Steer Analysis of MOSPI Data

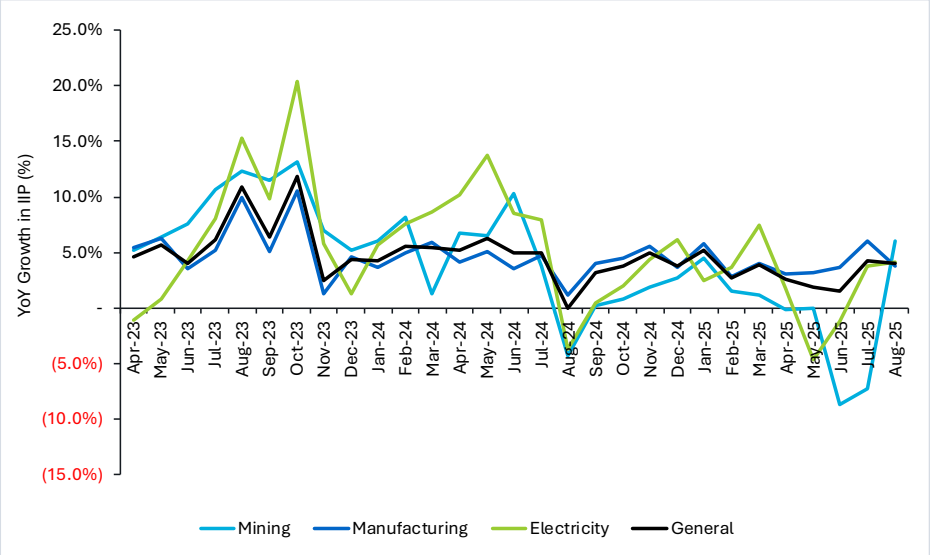
4.17 While consumption and investment expenditures have continued to show consistent growth over the past two quarters, government expenditures observed a marginal decline in FY25Q4. In FY26Q1, government expenditures rebounded, recording 7.4% growth over FY25Q1 levels.

4.18 Performance across different types of industrial activities (such as Mining, Manufacturing, and Power Generation) directly impact freight movement and commercial traffic volume growth across the country, including on the Asset. In Figure 4-5 below, we present growth trends in IIP – a measure that tracks the performance of the economy across these activities. As of FY26YTD (Apr-Aug '25), the Manufacturing sector continues to perform strongly, recording positive y-o-y growth since FY25Q3. While industrial activity across the

[7] Government of India, PIB Release Oct 1 '25

two other sectors (i.e., Power Generation and Mining) dropped between May and Jun/Jul '25, they have since rebounded and show signs of continued growth going forward.

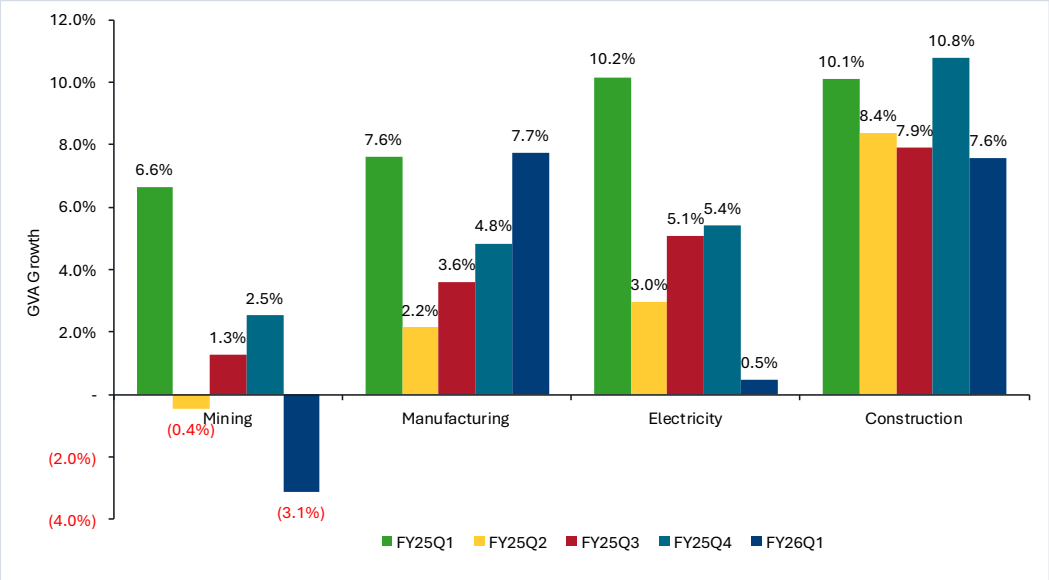
Figure 4-5: Month on Month IIP performance



Source: Steer Analysis of MOSPI Data

4.19 In addition to monthly trends in IIP, Figure 4-6 below presents y-o-y growth of quarterly GVA in four industrial sectors - Mining (& Quarrying), Manufacturing, Electricity (and other Utilities), and Construction. While the Mining and Power sectors observed decline and muted growth in FY26Q1, the Manufacturing and Construction sectors experienced strong growth. Generally, economic growth has remained resilient as of FY26YTD, but performance across industries have varied, impacting economic growth across different regions and on the Asset as well.

Figure 4-6: Industrial components of GVA



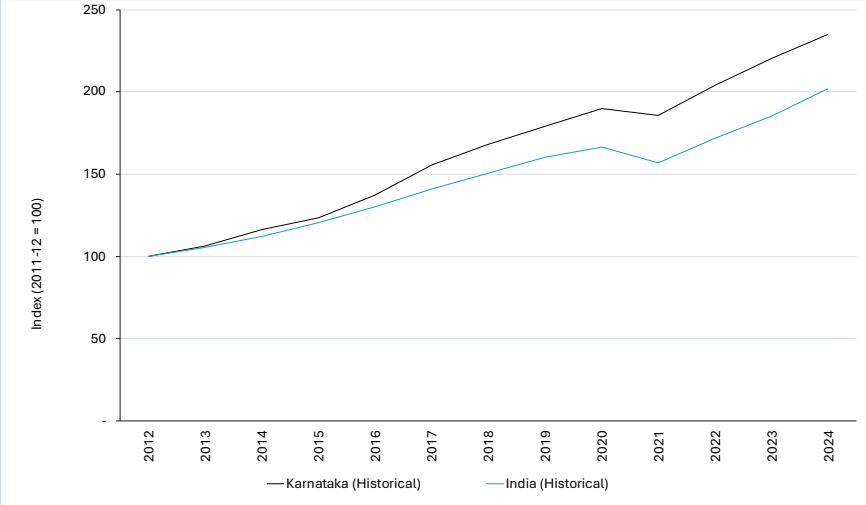
Source: Steer Analysis of MOSPI Data

GDP and GSDP Growth

4.20 Over the period FY12-FY24, National Real GDP (at 2011-12 constant prices) has grown at 5.9% per year, aided by a strong growth in the services/tertiary sector. The economic growth of Karnataka has been stronger than the country overall; between the same FY12-24 period, the state's GSDP grew at a 7.4% CAGR.

4.21 Karnataka contributed approximately 8.2% of India's GDP in FY24 but accounted for 4.9% of its total population – highlighting its relative significance in contributing to nationwide economic growth. Figure 4-7 below compares historical growth of Karnataka's GSDP relative to national GDP growth over the period FY12-FY24.

Figure 4-7: Evolution of Karnataka's state GDP and national GDP



Source: Steer Analysis of MOSPI Data

4.22 Karnataka is the information and technology (IT) hub of India and home to one of the largest technology clusters in the world - Bengaluru. The city contributes to nearly one-third of the state GSDP as of FY24 and houses several major industrial sectors including automobiles, aerospace, textiles, heavy machinery, agriculture and food processing[8].

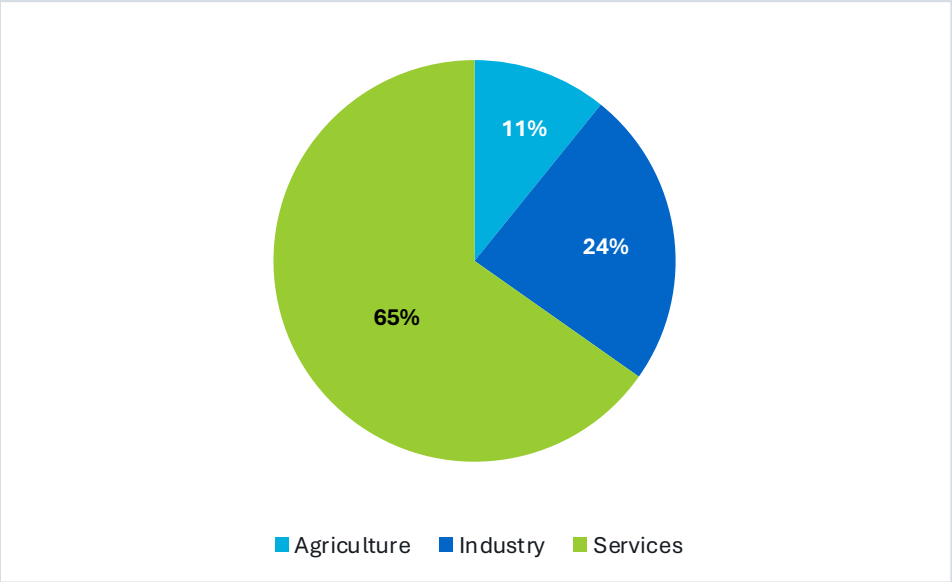
4.23 As shown in Figure 4-7 above, over the past decade, the state of Karnataka followed the same upwards economic growth trend observed at the national level, but at a faster rate. The growth of Karnataka can be attributed to the boom in IT services sector in the region and policies encouraging the establishment of research and development facilities. Apart from the IT sector, automobile, aerospace, textiles, biotechnology, and heavy engineering industries also contribute to the state's growth. Karnataka also houses one of the 13 major ports in India, the Mangaluru port.

4.24 In terms of the secondary sector, the state has key industrial areas in Hubli-Dharwad, Belgaum and Bengaluru (automobile cluster), Mangaluru and Udupi (petrochemical), Bellary, Koppal, Raichur (steel and iron ore) and Belgaum and Bengaluru (aerospace). The state also has a major port in Mangaluru, which is known for import of crude and petroleum products.

[8] **Bengaluru, Karnataka: India Investment Brief**

4.25 As seen in Figure 4-8 below, in terms of sectoral contribution, the services sector is the biggest contributor to the state's GSVA (65%), followed by secondary (24%) and primary sector (11%), as of FY24. Karnataka's GSDP CAGR was 7.4% between FY12-24 and its relative share to the national GDP was around 8.2% in FY24[9]

Figure 4-8: Sectoral contribution to Karnataka's GSDP in FY24



Source: Steer Analysis of MOSPI Data

4.26 The official historical GDP and GSDP data for India are released by the Ministry of Statistics and Program Implementation (MoSPI. The GDP forecasts for India are available from various reliable sources such as Oxford and Consensus, but the GSDP forecasts for the same are not published. However, using the past trends of the relationship between GDP and GSDP, we can develop reasonable GSDP forecasts. Therefore, in our view, GDP is the best source of growth driver for long term traffic forecasts.

4.27 For any indicator to be used as a growth driver to forecast traffic, a reliable source of historical and forecast data availability for that indicator is the key requirement. Of the key socioeconomic indicators discussed above, GDP was assessed to be the only growth driver for which reliable data is available both in terms of historical and forecast data. Therefore, to forecast traffic, we use GDP/GSDP as our key growth drivers.

Forecasts for growth drivers

4.28 Following the discussion in Chapter 4 on the nature of economic activity in the state of Karnataka, in this section, we describe the assumptions in relation to forecasts of the key macro-economic drivers of traffic growth on the Asset.

4.29 We have based our forecasts of GSDP for Karnataka using forecasts of GDP based on the forecasts of the GDP of India as provided by the Client.

[9] GSVA/NSVA by economic activities | Ministry of Statistics and Program Implementation | Government Of India

National GDP

4.30 After the last period of economic slowdown in FY11-12, the country experienced an economic downturn again in late FY19 with FY20 having reported a GDP growth of 4% (relative to an average growth rate of 7% per year between FY13 and FY19). India's GDP growth declined as domestic investment and consumption demand were already under stress because of the liquidity crunch before Covid-19. Other factors that contributed to the economic slowdown included reduced growth rates in automobile sales and production, liquidity crunch in credit markets and rising number of Non-Performing Assets (NPAs) within the banking sector, as well as lower manufacturing production and lower rural consumption.[10]

4.31 The Covid19 outbreak had a significant impact on the Indian economy during the first two quarters of FY21 as government mandated lockdowns across the country effectively stalled economic activity and growth. The growth momentum eventually picked up in Q3 of FY21, with a sharp rebound in the economy in FY22 (GDP recorded 9.7% growth over FY21) and has since observed a consistent growth of 7.6% in FY23, 9.2% in FY24 (as per the SAE) before slowing down to 6.5% in FY25 due to several domestic and external factors.

4.32 Figure 4-9 below shows Client-provided GDP projections for India. The forecast expects the Indian GDP to grow at 6.3% between FY25-FY30[11] and 5.5% between FY31-FY44, gradually tapering down to 5.2% by FY50. The GDP growth forecast is broadly in line with other independent forecasts available from reliable sources such as IMF, World Bank and RBI[12] in the medium term

4.33 State economic policies in combination with its fast-growing urban centres such as Bangalore are expected to keep statewide economic growth buoyant. Thus, over the short and medium term, we have assumed KA GSDP to continue growing above national GDP growth, with gradual convergence with the latter in the long-term.

5 FY26 Base year AADT and Traffic growth Analysis

Introduction

5.1 In this chapter, we present our approach, assumptions, and results for base (or background) traffic growth for each vehicle category on the Asset.

5.2 Traffic growth is commonly related to a variety of macro-economic and industry- or commodity-specific factors (hereafter referred to as 'traffic growth drivers'). These growth drivers are typically identified from the results of the OD data analysis and the site visits that help us appreciate the nature of traffic movement – 'what' travels 'where' and 'why'.

5.3 We carry out regression analyses to determine the historical relationship between traffic growth by vehicle category and growth in the underlying economic drivers. In this specification, traffic volumes form the dependent variable, and the underlying economic driver forms the independent (or "explanatory") variables.

5.4 Typically, passenger and light commercial vehicle traffic like cars, buses, LCVs and 2-axle trucks grow in line with the GSDP of the state in which the toll road is located. Heavy vehicle traffic like 3-axle trucks and MAVs grow in line with the national GDP. This is because most light vehicles tend to travel shorter distances within the state, whereas a significant proportion of heavy vehicles carry commodities for long-distances across the country. These commodities also tend to be part of industry ecosystems whose demand-supply relationships are scattered across the country and are thus related more with GDP growth.

FY26 Base year AADT estimates

5.5 The base year is the year on which long-term background forecast growth rates are applied to derive year-wise average annual daily traffic (AADT) estimates for forecast years. This is therefore an important aspect of our forecasting approach as traffic and ultimately revenue forecasts for future years are built on top of the base year traffic estimate. We have used FY26 as the base year for AADT estimates for the forecast years.

5.6 As described previously in Chapter 3, to establish the base year (FY26) traffic position, we utilised information from various sources – including from the Client and our context knowledge, to assess a reasonable demand on the corridor.

Methodology

5.7 The base traffic for FY26 has been estimated utilizing the actual 12 months of FY25. The weighted average of the actual FY25 traffic (April to March) was taken to arrive at annual

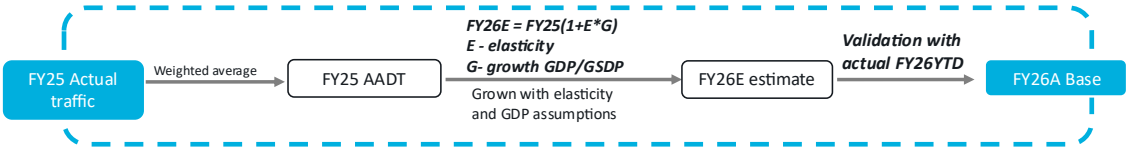
FY25 AADT. Using elasticity-based growth assumptions GSDP or GDP we arrived at FY26E.

5.8 The monthly profile of the FY26E AADT was then compared to the actual traffic observed in the six months (April to September) of FY26 (FY26YTD). The Adopted FY26 AADT (FY26A) was then arrived at by making necessary adjustments to FY26E to reflect the outturn traffic in FY26YTD after adjusting for seasonality.

5.9 As a validation, the FY26 was estimated using SCF (Seasonality Correction Factor) based on six months of FY26 data where the adopted FY26 AADT (FY26A) is within ~0.5% of the AADT arrived using SCF approach[13]. This validates the robustness of the approach used to estimate the FY26 base AADT. The SCFs used in our analysis have been explained in the subsequent section.

5.10 The methodology is represented using the below schematic:

Figure 5-1: FY26 Base Estimation methodology



Source: Steer Analysis

Seasonality Correction factors

5.11 Traffic on any Asset varies on a month-on-month level. Such variations maybe due to monsoons (typically Jul to Sept) or due to festivals in the region. For e.g. It is observed that typically the truck traffic during the first half of the financial year (April-September) is generally lower than the annual average, mainly because of peak summer season followed by monsoons affecting the freight movement patterns in large parts of the country in the July-September period. In addition to these there may be other seasonal variations specific to the Asset.

5.12 In order to normalise for these variations across the year to provide an AADT estimate, Seasonality Correction Factors (SCF) are used. SCFs are estimated to convert the monthly traffic numbers to an AADT level while accounting for seasonal variation due to local/national festivals, weather changes and/or temporary external impacts. These are typically estimated using historical data for each plaza and vehicle category over multiple years. An SCF >1 means that the traffic for the month is lower than the annual average and vice-versa.

5.13 To achieve this, we studied the seasonality between monthly average daily traffic (MADT) – We have analysed the seasonality trends between monthly average daily traffic (MADT) and AADT for data during the historical years of tolling (as described in Chapter 3) excluding the years that were impacted by specific events. This averaged seasonality trend is then applied to the monthly traffic to obtain AADT as mentioned in the previous sections.

[13] *SCF- SCFs are estimated to convert the monthly traffic numbers to an AADT level while accounting for seasonal variation due to local/national festivals, weather changes and/or temporary external impacts.*

5.14 Table 5.1 and Table 5.2 below present the average of FY24 and FY25 SCFs used to arrive at the FY26 base estimates.

Table 5.1: Seasonality correction factors for TP1 – Doddakarenahalli

SCF	Apr	May	Jun	Jul	Aug	Sep	Oct	Nov	Dec	Jan	Feb	Mar

Adopted base estimates

5.15 Based on the above methodology and inputs, the adopted base traffic positions for both the Asset toll plazas are shown in Table 5.3 and Table 5.4 below:

Table 5.3: Adopted AADT for FY26, Doddakarenahalli

	FY25	FY26YTD	FY26A	FY26A vs FY25
CJV	21,415	22,898	23,583	10.1%
LCV	1,204	1,253	1,273	5.8%
Bus	1,698	1,758	1,821	7.3%
2A	1,000	1,058	1,082	8.2%
3A/MAV	1,137	1,089	1,132	(0.4%)
TOTAL	**26,454**	**28,057**	**28,892**	**9.2%**
PCU	**35,014**	**36,947**	**37,887**	**8.2%**

Source: Steer analysis: FY25 is actual full year data. FY26YTD includes 6 months of FY26; FY26A is adopted base for FY26

Table 5.4: Adopted AADT for FY26, Karabylu toll plaza

	FY25	FY26YTD	FY26A	FY26A vs FY25
CJV	15,861	16,996	17,595	10.9%

LCV	835	864	893	6.9%
Bus	1,382	1,436	1,474	6.7%
2A	729	746	772	5.9%
3A/MAV	1,127	1,053	1,110	(1.5%)
TOTAL	**19,934**	**21,095**	**21,845**	**9.6%**
PCU	**27,114**	**28,435**	**29,287**	**8.0%**

Source: Steer analysis: FY25 is actual full year data. FY26YTD includes 6 months of FY26; FY26A is adopted base for FY26

5.16 As we can see from the above tables, FY26A AADT and PCU estimates are 9.2% and 8.2% above full year FY25 for TP1, and 9.6% and 8.0% at TP2 (respectively). TP1 has strong influence of growing Bengaluru economy hence it's growing at a healthy rate. Similar trends are observed at TP2. Both TPs show a muted growth profile for 3A/MAVs, which we believe is largely driven off a negative variance observed in 3As on account of evolving axle-preferences.

Estimation of background elasticities

5.17 Elasticities, in the case of traffic growth, are the relationships between traffic growth and the growth in underlying economic drivers of traffic. Multiplied with forecasts of growth drivers like GDP or GSDP, they provide forecasts of background traffic growth rates.

5.18 The TMS data for the Asset reports Bus and 2A separately whereas 3A and MAV volumes are reported together. Therefore, to understand the growth pattern of the vehicle category separately recent TVC splits of 2023 were used. Following the brief note on historical trends shown in Chapter 3, we now delve deeper into results of the historical growth analysis for each major vehicle type. For this Asset Car, LCV and Bus do more regional movement as validated from OD trip length and zonal analysis hence the growth of this vehicle category is more influenced by Karnataka GSDP. Whereas 2A, 3A and MAV carry heavy commodities like construction material, containers, metals and miscellaneous products within Karnataka, Tamil Nadu, and other parts of the country.

5.19 Table 5.5 below presents the growth drivers identified to model the forecast background traffic growth rates.

Table 5.5: Split between individual vehicle types, 2023

Toll plaza	Vehicle type (for growth)	Share (%)
Doddakarenahalli & Karabylu	3A	39%
	MAV	61%

Source: Steer analysis of independent TVC data

5.20 Table 5.6 below presents the growth drivers identified to model the forecast background traffic growth rates.

Table 5.6: Identified growth drivers to model traffic growth

Vehicle type	GSDP Karnataka	GDP India
Car	100%	
LCV	100%	
Bus	100%	
2A		100%
3A		100%
MAV		100%

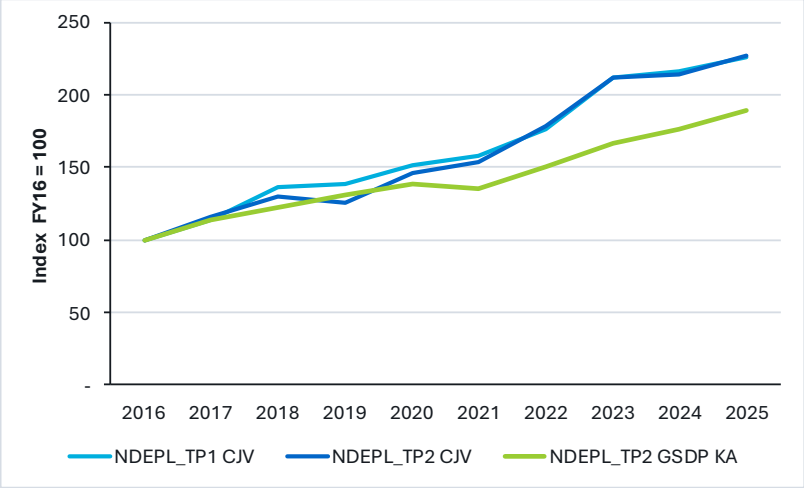
Source: Steer analysis of Client data

5.21 For the purpose of regression analysis, we have considered the period of FY16-25 Though there were combination of activities including construction on the Hassan-Mangaluru section of the corridor and the introduction of the petroleum pipeline between the Mangaluru Port and HPCL bottling plant at Yediyur in FY16-24 period, these episodes didn't impact traffic volumes significantly hence have been considered in regression analysis.

CJV

5.22 We see from the OD data that the CJVs primarily cater to regional movements between Bengaluru, Hassan, Mangaluru, Kunigal and other towns lying on the Asset. We have therefore taken Karnataka GSDP to be the growth driver to model the growth of CJV traffic. Figure 5-2 below shows the relationship between indexed values of CJV traffic and Karnataka GSDP at TP1 Doddakarenahalli and TP2 Karabylu.

Figure 5-2: Relationship between CJV traffic and Karnataka GSDP



Source: Steer analysis of Client TMS data and publicly available GSDP data

5.23 Generally, we would expect that in fast-growing economies with relatively low car ownership levels, car traffic growth rates are often in line with or slightly higher than growth in GSDP/GDP (i.e. suggesting elasticities at or just above 1.0). Further, there is an expected increase in car ownership proportion of overall population as the economy grows. This assumption is very contextual and subject to change as there are changes in economic policies of government and overall economic stability nationally and globally.

5.24 Historically, for the period of FY16-25, Car growth on TP1 (9.6%) and TP2 (9.6%) is similar while the GSDP growth for the same period is 7.3%. This is with the Asset connecting high urban centres Bengaluru and Mangaluru and feeding tourism driven Mysore traffic as well. Considering the positive outlook for passenger traffic on the tourism-driven Asset, proximity to the fast-growing Bengaluru urban agglomeration we have assumed a forecast background elasticity starting of 1.10 at TP1 and TP2 for CJV.

5.25 We have assumed the elasticity of CJV growth to the underlying regional economy to reduce with time at TP2 (i.e., Karabylu), going from 1.10 in FY26 to 1.00 in FY30 and beyond. At TP1 however, we have not tapered our CJV elasticity since this plaza is expected to show more growth potential due to its proximity to Bengaluru city.

LCV, 2A

5.26 Compared to heavy vehicles like 3A and MAV, LCV, 2A and Bus have more regional movements within the state – Karnataka in this case, as seen in the OD data analysis. More than 85% of LCVs, 2A and Bus have both trip ends within Karnataka. We have therefore taken GSDP of Karnataka to be the growth driver to model growth of LCV+2A traffic.

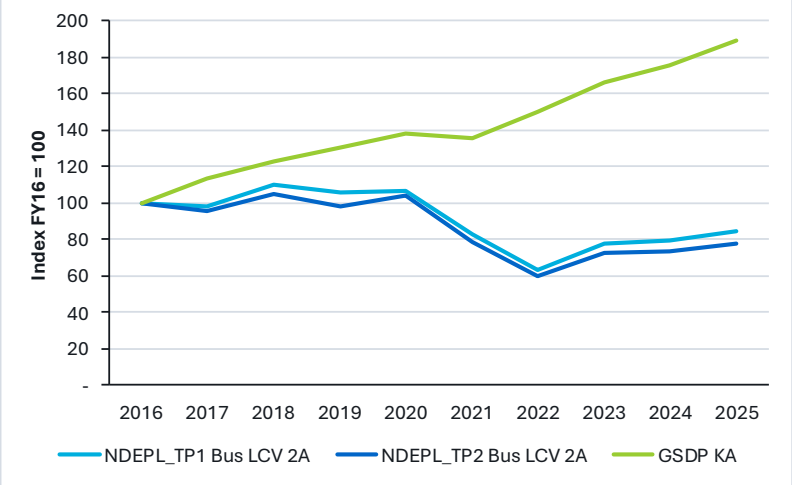
5.27 For the period of FY16-25, combined LCV, Bus and 2A show a degrowth of 1.9% on TP1 and 2.8% on TP2 against growing GSDP. This is because at a vehicle category, LCV are historically dropping more than 7% across both toll plazas. This is with shift from LCV to 2A to carry excess tonnage benefit and a mis-categorisation of 2A, Bus and LCV in reporting system.

5.28 Bus growth tends to be largely supply-driven in many parts of the country, with new buses being bought and deployed by the government at intervals of time. Based on our

experience across the country, buses on inter-urban and tourism corridors show elasticities of 0.4 to 0.6 with respect to the GSDP.

5.29 Figure 5-3 below show the relationship between indexed values of LCV+2A+Bus combined traffic India GDP and Karnataka's GSDP.

Figure 5-3: Relationship between LCV+Bus+2A combined traffic and Karnataka GSDP

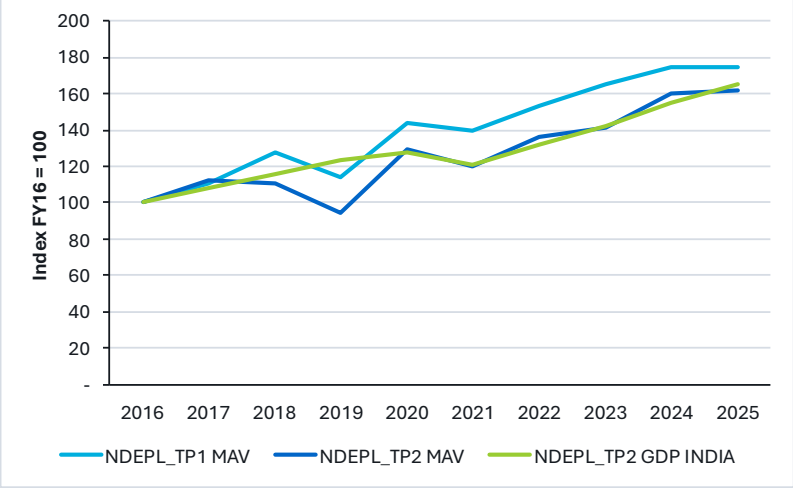


Source: Steer analysis of Client TMS data and publicly available GSDP data

3A/MAV Trucks

5.30 Compared to lighter trucks like LCV and 2A, 3A and MAV have more national or long-distance movements covering several states. Given that manufacturing-related commodities tend to take prominence in their commodity distribution which means that traffic growth in 3A and MAV is dependent on industry demand-supply ecosystems spread across the country, we have taken GDP as the growth driver to model the traffic growth in 3A and MAV. Figure 5-4 below shows the relationship between indexed values of 3A+MAV combined traffic and India's GDP.

Figure 5-4: Relationship between 3A+MAV combined traffic and India's GDP



Source: Steer analysis of Client TMS data and publicly available GDP/GSDP data

5.31 For the period of FY16-25, we observe CAGR 6.4% growth at TP1 and CAGR of 5.4% at TP2 against CAGR of 5.6% GDP growth in the same period. With the shift from 3A to MAV, the growth of 3A has been lower compared to MAV.

Forecasts for background elasticities

5.32 Table 5.7 below presents a summary of the results of the regression analysis carried out on the historical toll plaza data and the macroeconomic (GDP/GDSP) growth, along with the assumed forecast elasticities for background traffic growth.

5.33 Given the nascent stage of India's logistics sector, characterized by a highly fragmented trucking industry (95% of operators owning fewer than five trucks) and low car ownership rates (30-35 per 1000 people), the forecast elasticities for 2A/3A vehicles have been kept constant throughout the concession period, while that of MAVs has been marginally increased in FY27, being brought back to 0.8 from FY30 onwards.

5.34 In terms of passenger traffic, the CJV elasticity at TP2 Karabylu has been tapered down to 1.0 by FY30. This assumption is grounded in historical trends and a long-term perspective on regional and national growth, suggesting market maturity is still several years away.

Table 5.7: Derived elasticities from regression analysis and assumed forecast elasticities for background growth

6 Forecasts: Network overlays and forecasts

Introduction

6.1 Following the discussion on estimated and assumed forecast background growth rates in the previous chapter, this chapter first deals with the forecasting assumptions around base year AADT and potential impacts on traffic growth on the Asset. Later, it also presents the assumed toll segmentation, trip factors and evolution of toll rates for the forecast period which are used to estimate the forecast revenue based on the forecast traffic. In the final section, the chapter summarises the traffic growth rates for the forecast years. The following table lists key intermediate and final outputs that have presented in chapter 3, 5 and 6.

Analysis of potential network/developmental impacts

Summary of alternate routes and planned changes

6.2 The section below details the impacts which we believe would affect traffic on the Asset during the concession period. As discussed earlier in Chapter 2, in order to assess the impacts on the Asset, whether positive or negative, we have studied developments (alternate roads, feeder roads and regulatory) in the surrounding road network.

6.3 Figure 6-1 below shows the road network surrounding the Asset.

Figure 6-1: Alternate routes and Asset shown against the regional network context

Source: Steer analysis and cartography

6.4 Past network developments on the corridor include the construction and improvement of the Shiradi Ghat section on the Hassan-Mangaluru Road. Upcoming developments include potential construction of Satellite Ring Road around Bengaluru. Table 6.1 below presents the upcoming network developments, corresponding feeder routes, year of completion and direction of impact on the Asset.

Table 6.1: List of network/other developments

S. No.	Development	Route affected	Year	Impact (+/-)
1.	Satellite Town Ring Road (STRR) around Bengaluru (Solur to Dobbaspet spur)	Trips between TN/Hyderabad and Coastal Karnataka (TP1 only)	FY26 onwards	-ve
2	Peripheral Ring Road – LOS improvement		FY30 onwards	+ve

Source: Steer analysis

Impact assessment for network/other developments

6.5 The subsections below include a narrative of each of the improvements, as listed in the table above, and impacts associated from each of these. Please note that all traffic volumes for impacts were estimated as impact rates applied on FY26 Base AADT.

Satellite Town Ring Road (STRR) around Bengaluru

6.6 STRR is an under construction 4-6 lane access-controlled expressway around Bengaluru and will provide a larger bypass for long distance traffic. This will serve as bypass around Bengaluru city and increases the speed of freight movement and traffic handling capacity for the long-distance traffic which does not have anything to do with Bengaluru City.

6.7 STRR involves the realignment of NH648 and can be accessed from Dobbaspet. Currently, the Dobbaspet- Doddaballapur- Devanahalli- Hoskote section of the STRR is completed and operational with tolling in place. The remaining two sections of the Obalapur-Mudugadapalli corridor are the last sections of the STRR and includes the Solur to Dobbaspet spur on the western side of Bengaluru city. Our analysis considers the impact of the currently operational sections of the STRR as well as the impact the completion of the Solur-Dobbaspet spur will have on the Asset.

6.8 The impact of STRR will be applicable to only TP1 as this expressway provides a direct bypass option to Industrial clusters at Dobbaspet- Doddaballapur, can access Kempegowde International Airport and NH44 (Hyderabad highway) through Devanahalli Exit and STRR provides a direct connection to the upcoming Bengaluru- Chennai Expressway which originates from Hoskote.

6.9 Based on the GJC approach we estimate the impact of STRR (due to both the current operational sections as well as the future completion of the Solur-Dobbaspet spur) as shown in Table 6.2 below.

Table 6.2 :Impact of STRR (Dobbaspet- Hoskote section) at TP01

Vehicle type	FY27	FY28 Onwards
Staging	*50%*	*100%*
CJV	(1.4%)	(2.8%)
2A	(1.5%)	(3.0%)
3A	(1.7%)	(3.3%)
MAV	(1.8%)	(3.6%)

Source: Steer analysis of Client OD data, Client TMS data and publicly available information.

Peripheral Ring Road – LOS improvement

6.10 he Peripheral Ring Road (PRR) is a proposed 65 km, 100-meter-wide expressway circumventing Bengaluru, intended to connect Tumakuru Road (NH 48) in the northwest to Hosur Road (NH 44) in the southeast. Once completed, the PRR will form an intermediate bypass around the city connecting major radial highways such as NH 75 (Old Madras Road), NH 648, and NH 44. The facility is designed to reduce the volume of through and inter-city traffic currently forced to enter the Outer Ring Road network and Bengaluru's arterial roads.

6.11 The PRR will serve as a high-capacity, access-controlled corridor facilitating smoother traffic distribution across the city's periphery. This is expected to divert part of the intra-metropolitan freight and passenger traffic away from NH 75 towards peripheral routes. By providing alternative connectivity between industrial zones in Hoskote, Tumakuru Road, and Hosur Road, the PRR will indirectly reduce congestion levels on NH 75, particularly

within the sections intersecting the eastern and southeastern parts of Bengaluru's urban limits.

6.12 The expected impact of the Peripheral Ring Road on NH 75 traffic is assessed to be moderately positive, given that it will complement the diversionary benefits currently provided by the Satellite Town Ring Road. While the PRR's influence will be more localized to Bengaluru's outer periphery rather than long-haul freight routes, its operationalization will likely result in marginally higher travel speeds and improved traffic flow on NH 75 due to redistribution of commuter and logistics trips that currently use the highway for orbital movement.

Revenue forecasting assumptions

6.14 To forecast the revenues for a forecast year, the traffic forecast for each vehicle type is converted into tickets sold, which is then multiplied with the corresponding toll rate. While toll segmentation provides the breakup of trips paying each ticket type, trip factors provide the conversion factor to convert from traffic (trips) to tickets sold. This section discusses assumptions related to toll segmentation, trip factors and toll rates for the forecast period.

Toll evolution

6.15 Based on the concession agreement and the gazetted toll notification, we understand that base toll rates increase every year (revision month is September) based on WPI-

linked inflation. These are rounded up to the nearest five decimals to estimate the final toll rate charged to users.

6.16 We have used actual toll rates from the FY25 toll notifications and FY26 WPI to validate the modelling of future toll evolution. Increase in WPI was calculated based on the Client's WPI forecasts, as shown in the table below.

6.17 These forecasts provided by the Client expect the WPI to grow at an average of 4.2% between FY25-FY51. The WPI forecasts available from other independent forecasting agencies may vary from this assumption and could be lower or higher than that provided by the client.

Table 6.5: WPI growth forecast assumptions

Financial year	WPI growth (%)
FY26	2.3%
FY27	2.4%
FY28	5.0%
FY29	5.1%
FY30	4.9%
FY31	4.4%
FY32 onwards	4.1%

Source: FY27 onwards WPI as per client inputs

Table 6.6: Toll estimation overview

Toll fee escalation	Revision date	Nearest rounding
Linked to 100% WPI increase	September	5

Source: Concession agreement and toll notification

Toll segmentation and trip factors

6.18 The Ministry of Road Transport & Highways has finalized a compensation formula for existing toll concessionaires to offset revenue loss from the Annual Pass scheme for non-commercial vehicles[14].

6.19 Across multiple assets, the number of passes sold has observed to be rising on a day-to-day basis, indicating an early adoption among frequent users since its introduction on 15th August 2025 till 30th September 2025, and a corresponding decline in other ticket categories mainly in the single and return categories. The evolution of proportion of users using the annual pass up to September 2025 is presented below:

	15th to 31st Aug	1st to 15th Sept	16th to 30th Sept
Doddakarenahalli	6.2%	9.9%	11.8%

[14] https://morth.nic.in/sites/default/files/Finalization-Concessionaire-Annual-Pass-Facility-on-NHs-01092025.pdf

Karbylu	7.2%	11.0%	13.4%

6.20 CJV Segmentation for FY26 has been developed using the pre annual pass segmentation till 14th August 2025, and daily Annual Pass transaction data from 15th August 2025 till 30th September 2025. Post September 2025, a gradual ramp up is assumed such that they form a large portion of the CJV trips by the end of FY26. This corresponds to a reduction in a proportionate decrease in single and return trips. For FY27 and beyond, we have assumed the share of annual pass trips to be in line with that observed at the end of March 2026, by when we believe the distribution of ticket categories in CJVs should stabilise.

6.21 In FY26, the share of CJVs using the Annual Pass is projected at **11%** and **12%** at TP1 and TP2 respectively (on an annual basis) with March 2026 estimate of around **27%** and **28%** at TP1 and TP2 respectively, which from FY27, is expected to stabilize in March'26 levels.

6.22 For other vehicle categories we have analysed the historical TMS data split by ticket categories, to understand trends, as shown in Chapter 3. For the traffic and revenue forecast, FY26YTD (Apr- Sept) as discussed in the earlier sections, can be considered a normal period.

Table 6.7: Forecast toll segmentation for the forecast years , TP1 Doddakarenahalli

Forecast	CJV (FY26)	CJV (FY27)	Mini-LCV	LCV	Bus	2A	3A/MAV

Revenue reconciliation

6.23 As part of validating the data provided by the Client, as well as our assumptions around toll calculations, we have reconciled the actual reported revenue on a monthly level for the Asset. To reconcile we have used the segmentation and AADT for the period of FY26 (Apr-Aug) and compared it with the reported revenue over the same period.

6.24 The comparison, as shown in Table 6.11 below, shows that our modelled revenue is within a variation of 1.0% from the reported revenue over the selected period of reconciliation (excluding buses). This gives us confidence that the revenues estimated using the traffic

data in our forecasts are accurately representing the revenues being reported from the Asset.

Table 6.11: Revenue reconciliation summary for Apr-Jun FY26 AADC

Toll Plaza	Steer modelled revenue (INR lakhs)	Reported revenue (INR lakhs)	Difference (%)
Doddakarenahalli	15.86	15.76	**0.7%**
Karabylu	13.43	13.45	**0.2%**

Source: Steer comparison between modelled and reported revenue for FY26Q1 excluding buses

Traffic and Revenue forecasts

6.25 Based on the traffic and revenue-related forecast assumptions discussed above, we have modelled the traffic and revenue forecasts for the forecast period for the Asset. Table 6.12, Table 6.13, Table 6.16, and Table 6.17 below present the AADT/PCU forecast growth rates and CAGRs on this Asset. Further, Appendix C presents the detailed AADT and revenues for the forecast period.

6.26 For MAV, based on the discussion with Client, for forecasting purposes, we have referred to the Rigid and Trailer trucks splits in the TVC counts for calculating the effective PCU for MAV trucks. For Rigid trailer trucks we have assumed a PCU factor of 3, whereas for Trailer trucks we have assumed a PCU factor of 4.5.

6.27 As presented in Table 6.13 and Table 6.17 above, at TP1 and TP2, FY26-33 PCU CAGRs (inclusive of impacts) are 5.4% and 5.2% respectively. While the background growth is primarily driven by car growth followed by 3A/MAVs, the opening of the Bengaluru STRR Solur-Dobaspet spur is expected to impact traffic growth over the medium term, after which growth is expected to stabilise and remain stable over the long-term.

Upside and Downside cases

Upside and Downside scenario assumptions

6.28 We have developed our base case scenario considering a balanced view on the risks associated with input assumptions around GDP growth and traffic growth elasticities. There is always a risk that the outturn values of these inputs will vary as compared to the assumptions taken due to exogenous impacts, e.g. GDP growth could be influenced both positively and negatively by the impact of monsoons, export-import balances, political changes etc.

6.29 Similarly, traffic growth elasticities could be influenced by increased efficiencies achieved by technology, large shifts in commodity prices globally, changes in local manufacturing practices. However, at this stage we consider that the base case represents a central case scenario given the risks of variation of input assumptions.

6.30 Further, network developments are highly dependent on governmental directions, policies, legal and financial measure which might result in early or delayed completion of developments. Therefore, we have included an Upside (optimistic) and a Downside (pessimistic) case. However, at this stage, we consider that the base case represents a central case scenario given the risks of variation of input assumptions

6.31 To account for the possible variations in the growth drivers, we are also presenting an Upside (optimistic) and a Downside (pessimistic) scenario. These scenarios are defined by the following variations from the base assumptions:

Table 6.20: Summary of Macro-economic Assumptions for upside and downside cases

Input	Upside	Downside
Macro Assumptions		
GDP/GSDP	+1% every year	-1% every year
WPI	+1% every year	-1% every year
Elasticities	+ 10%	- 10%

Summary outlook

6.35 The Asset is a part of a well-established east-west corridor (NH75) that connects two major cities in Karnataka (Mangaluru and Bengaluru). In general, the Asset's value to the regional economy, and particularly for passenger traffic is defined by the critical link it provides in connecting Bengaluru city to regional activity centres further west of the city and towards Mangaluru. This includes local and regional movements connecting key urban centres of the Bengaluru Metro region with Mangaluru, Udupi and Hassan.

6.36 The Asset also serves as the key gateway and primary route to reach Mangaluru on the western coast of Karnataka - known for its temples, hills and beaches, and popular visitor sites for tourism, business and leisure travellers. It is also the headquarters of the Dakshin Kannada district, which is home to several prominent temple locations including Shravanabelagola. Thus, statewide growth in both services and tourism are expected to positively influence passenger traffic growth on the Asset.

6.37 Commercial traffic plying the Asset carry consumption-based agro-related commodities in light goods vehicles while bullet tankers carry petroleum-related products. Two bottling plants, BPCL (Solur) and HPCL (Yediyur) located on the Asset, as well as the Mangaluru port/petroleum refinery are key (trip) generators in the Asset's region of influence. Given the commodities being carried on the Asset are essential in nature and largely serve the growing urban consumption demand of the Bengaluru Metro region, we believe future growth in commercial traffic on the Asset will follow from expanding urbanisation trends.

6.38 The upgradation of the Bengaluru airport, development of new enterprises nearby, and Bengaluru's overall economic development have all contributed to traffic growth on the Asset and continues to support our growth outlook for the Asset. Ongoing improvements to the Shiradi Ghat section of the NH75 and plans to construct Gundya-Sakleshpur tunnel between Hassan and Mangaluru also bode well for the future level of service of the corridor.

6.39 Our positive outlook for the region is driven by historically robust growth in Karnataka's economy (GSDP CAGR of 7.4% per year) between FY12-24 which we believe to sustain going forward. Continued growth in the regional economy, specifically in service-based sectors such as tourism and IT, and goods-production sectors such as petroleum, agriculture, and consumption-based goods is expected to drive long-term growth in both passenger and commercial traffic on the Asset.

Appendices

A Top 10 OD Pairs

A.1 Further to the OD analysis presented in Chapter 3 this appendix presents the top 10 OD pairs at each toll plaza. Please see this data for both CJVs and MAVs and OSVs combined below.

TP1 Doddakarenahalli

Table A.1: CJV and Bus top 10 OD pair shares at TP1 Doddakarenahalli

9.	Channarayapattana Area-Yadiyuru Area	2.3%
10.	Mangaluru City-Kolar	2.3%

B Data collection exercise

B.1 In order to validate and inform various inputs used in our forecasting, we undertook primary data collection on the Asset. OD survey data was collected on behalf of the Client, TVC surveys were commissioned by Steer with a third party. OD data collection typically involves manual data entry by enumerators based on oral surveys with road users crossing toll plazas. TVC data collection involves video-graphic capture of traffic passing crossing the toll plazas, followed by manual counting.

3/7-day TVC counts

Table B.1: TVC counts at TP1

Date	CJV	Mini LCV	LCV	Bus	2 Axle	3 Axle	MAV	OSV	Total

Disclaimer

This report has been produced for the sole benefit of Cube Highways Pvt. Ltd ("the Client"). The report may only be relied upon by Approved Addressees in accordance with the terms of our engagement letter. This Report (the "Report") is confidential and disclosed only for information purposes, and it may not be relied upon by any party other than the Client or a Party to a Reliance Letter, and Steer: a) makes no warranty, expressed or implied, with respect to the use of any information or methods disclosed in this Report; and b) assumes no liability with respect to the use of any information or methods disclosed in this document. Any such party by its acceptance or use of this Report releases Steer from any liability for direct, indirect, consequential, or special loss or damage whether arising in contract, warranty, express or implied, tort or otherwise.

The Report is based on standard professional efforts, and information available to us at the time the review took place and is subject to time and budget constraints of the Report's scope of work. This Report, information and statements contained herein, are all based on third party data provided to us, or sourced by us, and Steer has not sought to establish the reliability of the data, except as specifically stated in the Report. Steer bears no responsibility for the results of any actions taken on the basis of third-party data.

Certain forward-looking statements in the Report are estimates based on interpretations or assessments of information available at the time of writing. The Report is thus to be viewed as an assessment that is time-relevant, specifically referring to conditions at the time of the review. Steer undertakes no obligation to update the Report for any reason.

While the estimates contained in the Report are not precise forecasts, they do represent, in our view a reasonable expectation of the future, based on information we have been provided with or sourced. However, the estimates necessarily rely on numerous assumptions and judgements, and circumstances may occur over the timeframe of the project that go counter to these assumptions and judgements and that affect the project's realized revenues. Actual events may differ from those assumed, and events are subject to change. Therefore, Steer makes or provides no warranty, whether implied or otherwise, as to the accuracy of forward-looking information presented. Further, it is important to note that forecasts presented represent long term growth profiles; the results for individual time periods may vary from forecasted values.

Traffic Consultant developed the relationships in the models used to produce the forecasts for the projects based on data available through September 2025. This report does not consider variations in traffic performance due to changing macro and force majeure events such (but not limited to) as global wars, economic uncertainty (high inflation, global recession), and changes in the regulatory environment. The situation remains dynamic and is subject to significant change in the short and medium term. In this challenging context, Traffic Consultant has produced base forecasts with a view on a possible scenario for the traffic forecasts. However, it is important to note that this is only one view, and there continues to remain uncertainty as to the short-term, intermediate or prolonged effects of and responses to such macro-economic/force majeure events. As a result, no assurance can be provided by Traffic Consultant that the scenarios and assumptions Traffic Consultant has identified will prove to be accurate. Given the uncertainty inherent in this scenario, Traffic Consultant advises that all readers of the Report consider the Report in the context of their own assessment of the impact of such events.

TO THE FULLEST EXTENT PERMITTED BY APPLICABLE LAW, THE LIABILITY OF THE TRAFFIC CONSULTANT FOR ANY LOSS, DAMAGE, COST OR EXPENSE SUFFERED OR INCURRED BY ALL PERSONS OR ENTITIES AND FOR ALL CLAIMS RESPECTING ITS WORK PERFORMED IN CONNECTION WITH THE ISSUE OR THE REPORTS IS HEREBY LIMITED IN THE AGGREGATE TO THE AMOUNT OF FEES ACTUALLY PAID BY THE CLIENT TO THE TRAFFIC CONSULTANT IN RESPECT OF THE REPORTS AND CONNECTED SERVICES.

YTD	Year to Date

1 Introduction

The assignment

1.1 The Cube Highways Fund Advisors Private Limited (the "Client") has commissioned Steer Davies Gleave India Private Limited ("Steer") for a traffic due diligence to be carried out on the Western UP Tollways Limited Road (hereafter called "Asset"). This report forms part of the annual fair market valuation (FMV) undertaken as part of the "Transit 10 project". This report presents an update of the traffic and revenue forecasts based on primary surveys undertaken in 2023, actual traffic data available up to September 2025 and latest macro-economic assumptions.

1.2 The Asset consists of a single stretch of toll road. For this report, we hereafter call the toll plaza on the Asset as TP1.

- Western UP Tollways Limited: WUPTL: TP1 - Siwaya

1.3 Our scope of work for the traffic and revenue forecasting process includes:

Table 1.1: Scope of work and sources of data

Scope of work	Data source
• Review of historical Traffic Management System (TMS) data, Vendor reports and documents	• Provided by client for the period between Apr'12 and Sept'25
• Historical analysis and forecasts for baseline growth, including; — Background growth, and — Seasonality trends	• Historical data provided by the Client and benchmarking using plazas in the vicinity or of similar nature of the Asset has been done wherever sufficient data was unavailable
• Validation of revenue reported in FY26YTD	• TMS data provided by Client • Revenue reconciliation using toll plaza traffic and ticket type data to calculate revenue and reconciling it with toll plaza reported revenue
• Origin Destination (OD) analysis to understand growth drivers: — Zonal influence and Top OD pairs — Commodity distribution • Trip length distribution	• Origin Destination (OD) surveys dated Apr'23.
• Analysis of upcoming network improvements and other developments, which may have future impacts on traffic	• Secondary research and our in-house experience of working in the vicinity of the Asset. Impact analysis to be conducted by Steer based on Generalised Journey Cost spreadsheet-based analysis
• Historical revenue analysis and forecasts for revenue estimation, including	• Calculated from historical data provided by Client

Scope of work	Data source
— Toll segmentation and trip factors, — Overloading shares	
• Final traffic growth forecasts including baseline growth rates and potential future impacts	• Elasticity based base growth and potential impacts from secondary research and Steer's in-house experience of working in the vicinity of the Asset
• Toll revenue estimation for the entire concession, including toll evolution.	• Toll evolution based on toll notification published by National Highway Authority of India (NHAI); and Gross Domestic Product (GDP) & Wholesale Price Index (WPI) trends as shared by the client

Our approach

1.4 The approach employed by Steer in the preparation of these forecasts was developed to take advantage of existing knowledge of the Asset and available data from various sources made available by the Client as well as publicly sourced. It follows well-established practices for forecasting ongoing traffic growth on an existing/brownfield Asset.

1.5 The analysis focused on two sets of issues, namely:

— understanding the traffic that is currently using the Asset; and
— identifying how and why that traffic is likely to change in the future.

1.6 To understand the current traffic on the Asset, we have analysed traffic data from multiple independent sources:

- Client-provided secondary data, including:
  — TMS data pertaining from April FY12 up to September 2025.
  — Concession agreement and toll notifications for FY25 and FY26
  — Previous studies related to traffic and revenue
  — Client commissioned OD survey in April 2023 (FY24) on the toll plaza to validate any change in growth drivers and travel patterns.
  — Steer-commissioned TVC counts from 20th to 26th March 2021 as part of study in earlier commission
- Secondary research to understand plans for new developments and progress of ongoing developments on the Asset.
- Review of Concession agreement and toll notifications for FY25 and FY26 provided by client.
- To arrive at the base position for FY26, FY25 monthly traffic data was used to arrive at annual FY25 position which then with FY25 GDP/GSDP and Elasticity was grown to FY26. Further, longer historical data was used for validation/computation of Asset SCF considering which monthly FY26 was computed which was validated to 6 months actual FY26.
- Revenue Reconciliation: We undertook revenue reconciliation for FY26YTD, by building up revenue from the traffic reported by each of the toll plaza and subsequently match it to the reported revenue for FY26YTD using the prevalent toll rates and reported segmentation/toll-frequencies for FY26YTD, this is a key part of our analysis to validate the segmentation/toll-frequency assumptions and the Annual Average Daily Traffic (AADT) reported for each of the toll plaza.

1.7 The estimation of future traffic demand on the Asset was undertaken through:

- Detailed assessment of the Asset performance from traffic and revenue perspective based on the previous study and client team.
- As a part of current study, the OD survey data was further utilised in developing the views on the forecasts of traffic on this corridor. Outputs from OD data such as zonal influence, trip lengths, and commodity distribution are presented in this report.
- Developing a bespoke growth model for each Asset/plaza/toll class to forecast year-on-year traffic growth from FY26 to the end of concession period.
- Investigating the elasticity of historical traffic growth compared to state (GSDP) and national (GDP) growth. Where historical data is limited, we have benchmarked the Asset against our Steer knowledge base (e.g., similar Asset types in the same state or on the same corridor), to derive appropriate elasticities.
- Applying our elasticities to independent GDP forecasts as provided by client.
- Identifying and analysing the potential impacts of any relevant changes to the competitive position of each Asset – these include impacts of changes to road network including expressways and opening of competitive modes of travel.
- Identifying and analysing any other potential impacts to traffic and revenue on each Asset – these include axle load norms, axle shift for heavy goods, FASTag implementation.
- Considering changes in trends of segmentation over time and making suggestions for changes in exemptions in the future
- Preparing traffic and revenue forecast for the Asset for the complete length of concession. The analysis here includes the specific impacts of network, or other exogenous factors specific to the Asset. We have developed a set of forecasting assumptions for three scenarios: a base case and upside and downside scenarios.

Contents of this report

1.8 The report has been divided into the following chapters, including Chapter 1 providing an introduction:

- Chapter 1 introduces the methodology and approach to undertake the traffic and revenue due diligence;
- Chapter 2 describes the key characteristics of the Asset and its surrounding road network, primarily based on site visits;
- Chapter 3 summarises the current and historical traffic on the Asset, including results from the TMS, TVC and OD analysis;
- Chapter 4 presents the socio-economic context of the corridor and region/state containing the Asset, along with our approach and results on estimating background traffic demand growth; and
- Chapter 5 presents our baseline year forecast and summarises our results on estimating background traffic demand growth
- Chapter 6 summarises our assessment of network impacts and presents concession traffic and revenue forecasts for the Asset along with the assumptions for upside and downside cases

2 The Asset

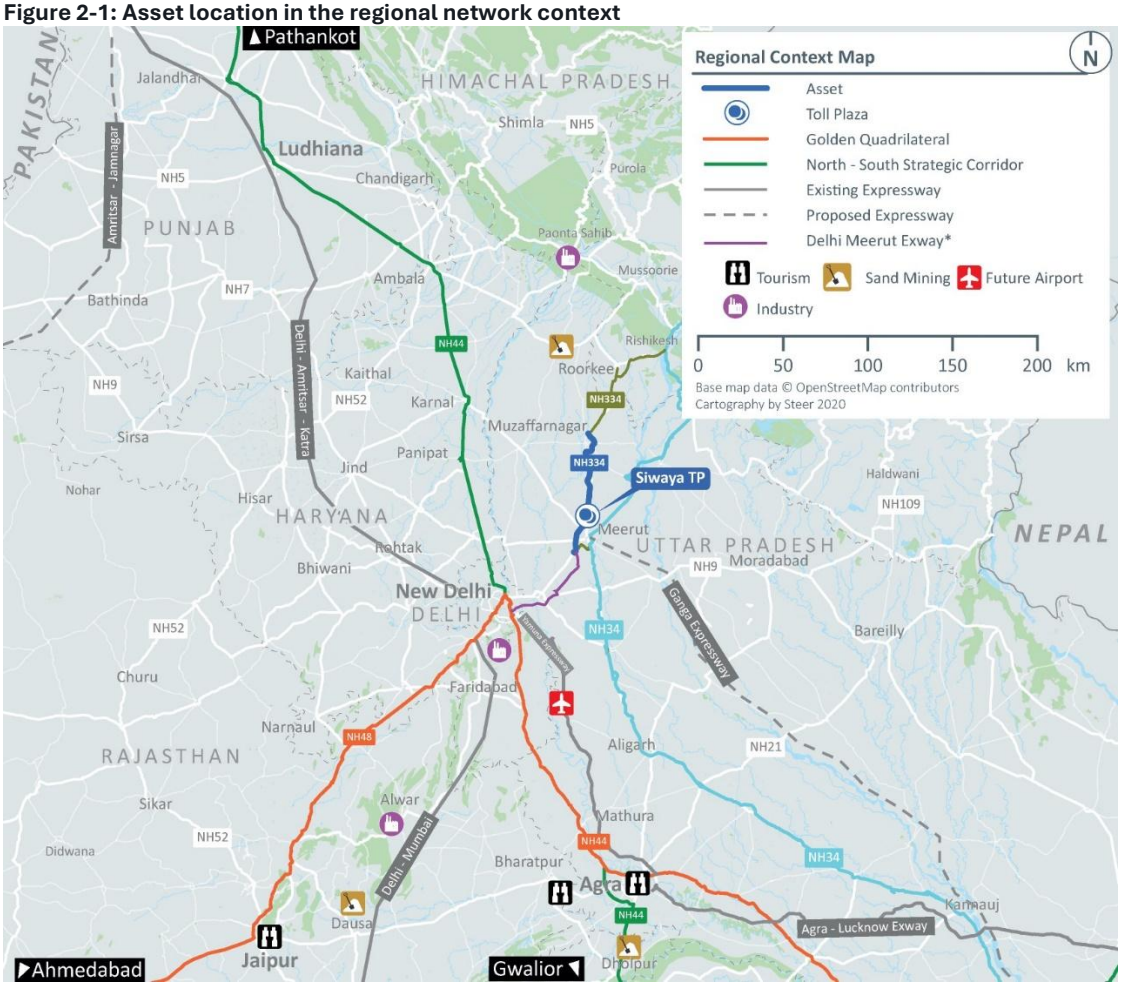
Introduction

2.1 This chapter provides a description of the Asset, based on primary data (from site visits), and our understanding of the region and network surrounding the Asset. We cover the strategic network context, followed by key economic activities and network developments around the Asset.

Strategic network

2.2 The Asset is situated in western Uttar Pradesh (UP), connecting the cities of Meerut and Muzaffarnagar. Figure 2-1 below shows the regional road network in which the Asset is located.

Figure 2-1: Asset location in the regional network context



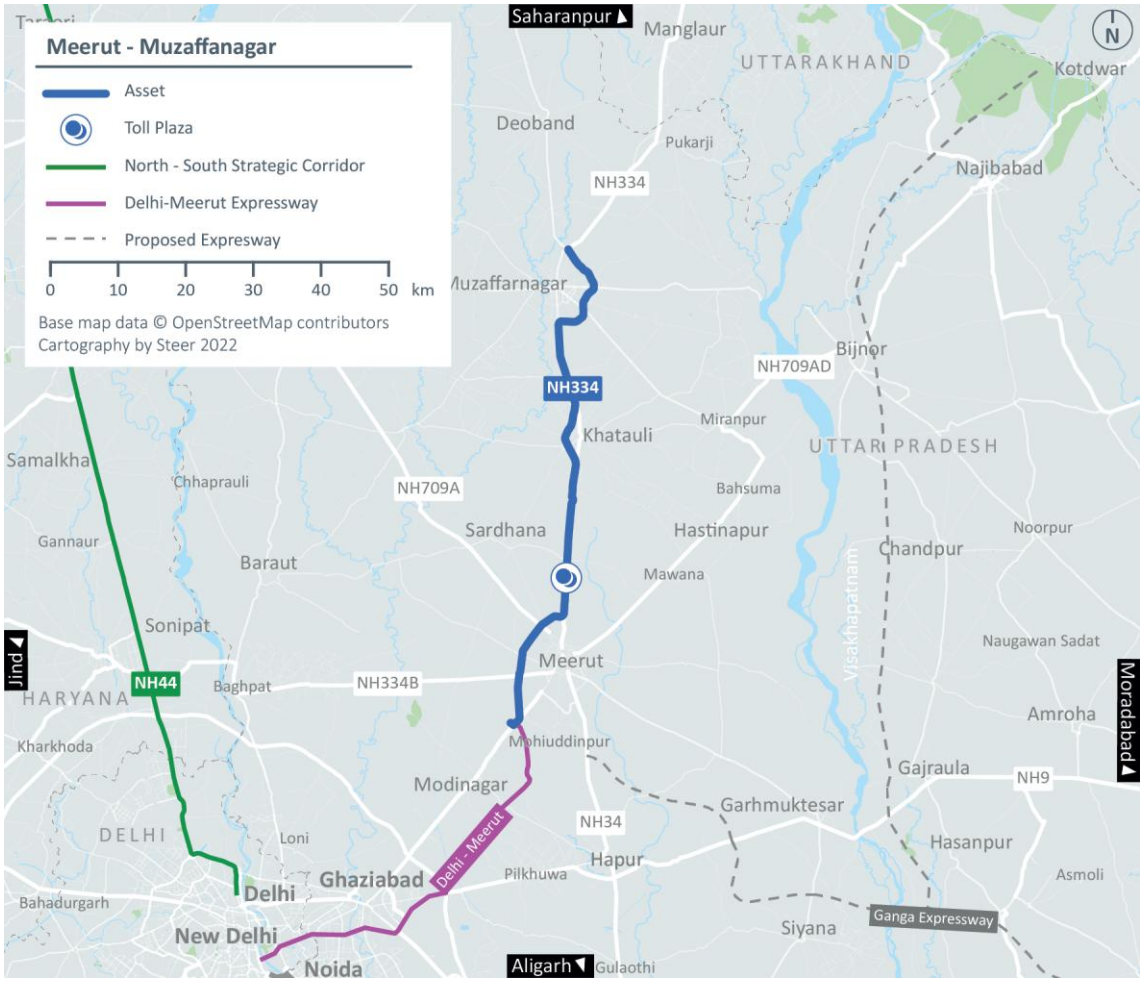
Source: Steer cartography using OpenStreetMap data

2.3 This Asset primarily caters to two different types of strategic movements:

- **Short-distance trips** by locals travelling within the National Capital Region (NCR) for work, leisure or short trips. This region is made up of contiguous urban settlements which are largely co-dependent on each other for goods and services.
- **Medium-distance trips** on the Asset which mostly have one end of their trip in Uttarakhand. This is because the Asset is the primary route connecting Delhi NCR to the popular tourist destinations of Uttarakhand such as Dehradun and Mussorie. Increased traffic volumes can be observed on the Asset closer to weekends, as people from Delhi and nearby areas travel to Uttarakhand for leisure, and tourism purposes.

2.4 The Asset is a 77.8-Km four-lane toll road which forms a part of the NH 334 in Uttar Pradesh. This Asset has one toll plaza, namely, Siwaya (TP1) at Km 76.0, which lies close to Meerut (approximately 10 km from the city). Figure 2-2 provides a closer view of the Asset in the context of its immediate surroundings and location of toll plaza.

Figure 2-2: Asset context



Source: Steer cartography using OpenStreetMap data

Concession and tolling details

2.5 The toll plaza on the Asset has been operational since April 2011, and the Client took over operations in FY16. There are four years left in the concession period. Though March 2026 was the end of the concession period as per the original concession, FY27 is now expected

to be the end of the concession period considering claims for demonetisation and COVID-19-related impacts. The following table presents a summary of the Asset.

Table 2.1: Summary of concession

	Particulars
State	Uttar Pradesh
Highway and lane configuration	NH 334 four lane
Toll plazas	TP1: Siwaya
Length (Km) as per concession agreement	77.80 Km
Commencement of operations	TP1: April 2011
Operated by Client since	FY16
Concession period	15 years
Last year of concession	FY27

Source: Client data

2.6 Figure 2-3 shows a typical cross-section of the Asset and its toll plaza.

Figure 2-3: Typical cross-section and toll plazas on the Asset.

Source: Steer site visit

2.7 The tolls on the Asset are collected for the standard vehicle categories as per toll notification, with toll rates as shown in the Table 2.2. The toll plazas have dedicated FASTag lanes for electronic tolling.

Table 2.2: Single toll rates on the Asset (INR), applicable FY26

Type of Vehicle	Single Journey Fee
CJV	115

Type of Vehicle	Single Journey Fee
LCV	200
Bus/Truck	400
3A/MAV	645
HCM/EME/OSV	645

Source: NHAI Revision of User fee Rate w.e.f 01.06.2025

2.8 The Asset currently issues tickets including single, local commercial and local personal under NHAI concession. There are no return and monthly tickets issued on the Asset. The local commercial and local personal ticket categories are discounted single entry tickets for trips within 20kms and 10kms respectively. Further detailed information on this have been provided in Chapter 3 of the report.

Key Economic activities

2.9 Uttar Pradesh is the most populous state in the country, accounting for 17% of India's total population which also makes its high consumer base. Its real GSDP has grown at 5.8% CAGR between FY12 and FY14, contributing 8% to the national GDP. According to the 2011 census, it also the state where approximately 50% of all workers are dependent on agriculture for livelihood.

2.10 Agriculture is the most important and the biggest sector in the state economy followed by the services sector comprising of travel, tourism, real estate, insurance and the finance industry.

Tourism

2.11 Given that the Asset provides a key link to major religious and tourists destinations in Uttarakhand such as Haridwar, Mussoorie and Rishikesh, the major economic activity along the Asset is mostly tourism-focussed. Several wayside amenities, restaurants and hotel chains are located along the Asset, with tourism being the biggest driver of passenger traffic growth.

2.12 Post opening of Delhi Meerut Expressway in April 2021, the Asset gained tourism related traffic particular Car and Bus volumes which are shown in the historical section below.

Agriculture

2.13 Muzaffarnagar being on one end of the Asset, is rich in agriculture production of rice, maize, sugar and Jaggery. Modinagar is an important industrial town on the periphery of the Asset and is traditionally known for sugar mills that generate employment and revenue for the region. It is popularly known as "Sugar Bowl of India". Hence, significant influence of this commodity is also witnessed in the traffic pattern as validated in Origin Destination (OD) Analysis where these produced products are carried to consumption centres of Meerut, Uttarakhand, Rest of UP and Delhi NCR.

Manufacturing

2.14 Manufacturing of wood, paper and steel is another key economic activity in Muzaffarnagar and neighbouring regions. Muzaffarnagar is popular for its wood carving where the wood crafts are exported nationally and internationally. Similarly, the city also has large scale paper manufacturing and steel processing plants which drives major good traffic on the

Asset. Also, the Asset is a heavy courier/parcel carrying route moving from Delhi NCR to Uttarakhand, Meerut, Muzaffarnagar, Saharanpur.

Sandmining and industry

2.15 Uttarakhand and Haridwar are developing regions wherein the government is actively investing in several industrial parks through its arm, State Industrial Development Corporation of Uttarakhand Limited (SIDCUL) which further attracts traffic movements plying on the Asset.

2.16 Sandmining is another activity which is based just north of the Asset along the banks of river Yamuna in Saharanpur and had contributed to traffic movements on the Asset until FY15 after which regulatory developments on illegal sand mining led to a drop in traffic share carrying construction-related commodities.

Alternate routes

2.17 The major competitor to the Asset was the Upper Ganga Canal (UGC) road which connects Muradnagar to Khatauli (and further north up to Uttarakhand) and especially helps light vehicles (CJV, LCVs) to bypass the toll plaza and the congested Muradnagar-Modinagar-Meerut feeder stretch to the Asset. However, UGC is no more a competitor to the Asset since the opening of feeder Delhi-Meerut expressway. The alternate is a decent-quality two-lane road without paved shoulders, initially developed by the state government to facilitate religious pilgrimage to Rishikesh/Haridwar and further north.

2.18 Another possible alternate route between Delhi NCR region and Uttarakhand is the Delhi-Baghpat-Shamli-Saharanpur section of NH 709B. The four laning of the road has been completed. However, the concession ends by FY27 therefore no impact has been considered on the Asset. For destinations to Haridwar in Uttarakhand, the Asset continues to remain the preferred route even after the existing upgrade on the Delhi-Shamli section due to faster exits out of Delhi through the Delhi-Meerut Expressway. Therefore, no major impact is expected due to the completion of construction of the remaining two stretches.

2.19 Further, an upcoming feeder to the Asset route would be six laned access-controlled Ganga Expressway. The expressway is expected to reduce travel time between NCR, Meerut and Prayagraj substantially and would help in decongesting the existing road network once operational in FY27. As on date, construction works are progressing. Bijauli village in Meerut - where the Asset starts - is the point where Phase-1 of the Expressway would start hence a positive impact in terms of induced traffic is assumed in Chapter 6[1].

2.20 Delhi-Saharanpur- Dehradun Expressway is another potential alternate to the Asset under NHAI concession. This 210km proposed expressway is 6/12 laned access-controlled corridor under Bharatmala Pariyojana. The expressway is under construction stage and is expected to get completed by end of 2025. Being a parallel competing route to the Asset, once operational the impact of the expressway is assumed and mentioned in Chapter 6 of the report.

2.21 Additionally, an option of micro-diversion exists for road users around the toll plaza, east of the Asset wherein a local road was partially upgraded under the Pradhan Mantri Gram Sadak Yojana and at present, several users (especially cars) bypass the toll plaza and use

[1] **Latest Updates on Ganga Expressway: Route, Map, and More -TimesProperty**

this local road instead. Further, the traffic on the local road was observed to have increased after the compulsory implementation of FASTag as car users who have not installed FASTag on their vehicles bypass the toll plaza to avoid paying penalty charge. However, this road has now crossed saturation capacity and is no longer expected to result in further diversions.

3 Traffic Description

Introduction

3.1 This chapter outlines the historical and current traffic and revenues on the Asset, as well as our analysis of origin-destination (OD) data and traffic volume count (TVC) data. This includes data collected as a part of this study and previous studies of this Asset, as well as data provided by the Client.

3.2 Traffic demand data is generally collected and analysed to understand the volume and vehicle composition of traffic currently using the Asset, while OD data is used to obtain a better understanding of travel patterns, trip lengths, trip purposes and areas of influence in the vicinity of the Asset, as well as the commodities being moved by the goods vehicles. This analysis, combined with our understanding of the Asset (based on our site visits), enables us to identify the key drivers of demand on the Asset.

3.3 Actual toll plaza data is used as the basis from which the current/base year annual average daily traffic (AADT) is established. This data is provided by the Client and independently analysed and validated by us using traffic volume count (TVC) information.

PCU factor assumptions for reporting

3.4 The PCU values have been taken from 'IRC 64:1990- Guidelines for Capacity of Roads in Rural Areas'. For MAV, based on the discussion with the Client, we have referred to the rigid and trailer splits in the latest TVC counts conducted in 2023 for calculating the effective PCU for MAVs. For rigid trailer trucks we have assumed a PCU factor of 3, whereas for trailer trucks we have assumed a PCU factor of 4.5. These factors have been used to arrive at the PCU values presented in the following sections.

Table 3.1: PCU factors

Vehicle Category	PCU Factor
CJV	1.0
Mini LCV	1.0
LCV	1.5
Bus/2A/3A	3.0
MAV	3.71
OSV	4.5

Source: Steer analysis and IRC64,1990

Historical trends

3.5 The historical traffic performance of the Asset is summarised in the table below:

Table 3.2: Historical evolution in AADT by vehicle class at TP1 – Siwaya

Vehicle Category	FY18	FY19	FY20	FY21	FY22	FY23	FY24	FY25	FY26 YTD	CAGR (20-25)	CAGR (18-25)
CJV	18,067	17,228	15,802	11,724	20,562	28,069	30,431	30,592	30,834	14.0%	7.8%
LCV	2,333	1,668	1,251	1,048	1,007	997	1,022	1,033	990	(4.0%)	(11.0%)
Bus/2A	2,238	2,436	2,396	1,510	1,774	2,327	2,585	2,646	2,659	2.0%	2.4%
3A/MAV	891	1,098	1,165	1,249	1,265	1,441	1,581	1,446	1,306	4.4%	7.2%
Total	**23,529**	**22,454**	**20,767**	**15,498**	**24,608**	**32,834**	**35,618**	**35,717**	**35,789**	**11.5%**	**6.1%**
PCU	**31,380**	**30,905**	**29,124**	**22,135**	**31,797**	**41,561**	**45,217**	**45,112**	**44,842**	**9.1%**	**5.4%**

Source: Steer analysis of the Client data; Note: On this toll plaza, we have 3A/MAV combined volumes. However, for PCU calculations, to maintain consistency, we have used the shares derived from the latest TVC on the Asset

3.6 The high CJV volumes observed on the Asset (~30,000 as of FY25) is primarily due to the Asset lying on a tourism-driven corridor which fetches high daily passenger trips between Delhi NCR and Uttarakhand.

3.7 Traffic growth remained flat in FY25, compared to FY24. This decline is primarily due to a significant drop in MAV volume, as most of the traffic originating from Farukhnagar/Bahadurgarh and north-west and traveling towards Haridwar/Dehradun and above earlier used to pass through our Asset, i.e. the Delhi–Meerut–Muzaffarnagar–Dehradun. However, since the completion of the 4-lane construction on the alternate NH-709B i.e. Baghpat–Shamli-Muzaffarnagar section in FY24, traffic has gained better access and has shifted to the alternate route.

3.8 Additionally, the Kanwar Yatra is an annual pilgrimage undertaken by millions of devotees (Kanwariyas) of Lord Shiva, particularly during the Hindu month of Shravan (July-August). During July-August 2024, authorities implemented traffic restrictions and diversions on major highways, including the Delhi-Meerut Expressway, to accommodate pilgrims. Such measures may have influenced traffic patterns on the Asset too.

3.9 Additionally, passenger volumes have seen flat growth in FY25, driven by shift in demand towards the 2025 Maha Kumbh Mela in Prayagraj. In addition, the section between Muzaffarnagar and Dehradun is currently under construction as the Delhi-Dehradun expressway is being built, resulting in increased travel times. As a result, passenger traffic on the Asset witnessed a decrease in passenger volumes during latter half of the year.

3.10 The Delhi Meerut Expressway was commissioned in April 2021, resulting in significant LOS improvement and providing direct uninterrupted connectivity to Meerut. Thus, the CJV volumes picked up significantly on the Asset in FY23 and have been observed to be on a continuous rise - with increased tourism activity and opening of the Expressway.

3.11 The impact of the opening of the Delhi-Meerut Expressway and the increasing tourism-related traffic can be seen in the growth CAGRs between FY20 – 25, wherein CJVs grew at more than 14% - driving an overall AADT growth of 11.3% and a PCU growth of 9%.

Table 3.3: Historical Tollable Traffic Levels at TP1 – Siwaya

Vehicle Category	FY18	FY19	FY20	FY21	FY22	FY23	FY24	FY25	FY26 YTD	CAGR (20 – 25)
CJV	14,612	13,368	12,238	8,640	16,689	23,039	24,273	23,845	24,589	14.3%
LCV	2,270	1,597	1,198	1,021	970	962	984	997	963	(3.6%)
Bus/2A	2,200	2,389	2,348	1,462	1,730	2,283	2,527	2,593	2,632	2.0%
3A/MAV	874	1,050	1,119	1,199	1,242	1,427	1,568	1,432	1,299	5.1%
Tollable AADT	**19,957**	**18,404**	**16,903**	**12,322**	**20,632**	**27,709**	**29,352**	**28,867**	**29,484**	**11.3%**
Tollable PCU	**27,661**	**26,583**	**24,973**	**18,730**	**27,656**	**36,625**	**39,146**	**38,433**	**38,751**	**9.0%**

Source: Steer analysis of Client data, (FY21* includes 6 months of data from Oct'20 to Mar'21); FY26YTD includes data till Sept'25; Tollable traffic excludes exemption and violation

3.12 The share of LCVs has registered a negative CAGR between FY19-25 period. This decline is primarily due to a shift occurring between LCVs and 2A vehicles. Additionally, some mini-LCVs previously classified as LCVs are now categorized under the CJV category following the implementation of FASTag. The LCV-2A category has historically faced classification challenges because of the similarity in size and appearance of the vehicles. In recent years, there has been a growing preference for 2A trucks, which has further contributed to the decrease in the dominance of LCVs. As a result, traffic data now shows a higher presence of 2A vehicles compared to LCVs.

3.13 However, it's important to note that buses are also included within the 2A category, which means that the shift from LCV to 2A may not be readily visible in the data analysis below.

Historical Revenue

3.14 The table below presents the reported historical revenue on the Asset.

Table 3.4: Historical revenue evolution (in INR crores) and AADC (in Lakhs)

Revenue	FY16	FY17	FY18	FY19	FY20	FY21	FY22	FY23	FY24	FY25	FY26YTD
Total	91.2	74.0	82.4	86.0	85.4	67.2	106.1	153.9	171.7	169.4	83.9
AADC	25.0	21.9	22.7	23.8	23.8	16.7	29.1	42.2	46.9	46.4	45.6
AADC Growth		**(12.4%)**	**3.7%**	**4.8%**	**(0.7%)**	**(29.8%)**	**74.3%**	**45.0%**	**11.1%**	**(1.5%)**	**(1.8%)**

Source: Steer analysis of the Client data

3.15 As we can see from the above Table 3.4, revenue receipts decreased significantly in FY24 and FY25. 1.5% decrease in FY25 AADC can be attributed primarily lower traffic in FY25 compared to FY24. this trend has continued in FY26YTD period as well, however CJV have registered an uptick in the period, whereas commercial volumes have remained in line with FY25 YTD volumes.

Toll Frequencies

3.16 Toll frequency or segmentation is typically the share of each ticket category recorded for a particular vehicle type. Each vehicle category has different segmentation. As a part of historical analysis, we calculate the toll frequency for each vehicle category from the monthly data shared by the client. The most common ticket categories observed on a typical National Highway concession are: Single, Return, Monthly, Local and Exempt. Given the local nature of traffic, some Assets offer custom made local passes to attract the local commuters to opt for these category passes instead of evading toll. Brief description of different ticket-types is given in the subsequent table.

3.17 Understanding the toll frequency gives insights into the nature of traffic. CJVs generally have higher shares of return passes or monthly passes, while heavy trucks mostly have single tickets since they travel long distance. However, this varies from Asset to Asset or even toll plaza to toll plaza. The Asset catering to short distance local traffic generally observes high share of return or other local monthly passes while the Asset catering to strategic long-distance traffic generally observes high share of single ticket traffic. The same can be verified through OD data where the vehicle category with high single ticket shares would have longer trip length with one of their trips ends outside the Asset state. Other reasons for high single shares include the absence of return, local passes, through in and through-out tickets issued on the Asset. This is especially post- FASTag implementation where the user is allowed to pay at each toll plaza.

Table 3.5: Typical ticket types sold at NHAI plazas

Category	Description
Single	Allows the vehicle to cross the toll plaza once
Return	Allows the vehicle to cross the plaza twice in a day at discounted rates.
Monthly Pass	Discounted single entry ticket for users undertaking more frequent trips via the toll plaza.
Local Personal	Discounted single entry pass only for private cars of residents within 20km radius of toll plaza
Local Commercial	50% discount on single trips for commercial vehicles registered in the local district. This pass allows single entry only
Exemptions	Officially exempted vehicles like ambulance, police cars, key political personnel etc.

3.18 In addition to the above ticket categories, a special category pass of “Local Monthly” is also being sold on the Asset. This pass has been issued by the toll plazas individually and the toll plaza is deciding on the toll for such special passes.

Introduction of Annual pass for CJVs

3.19 The National Highway Authority of India launched the “The FASTag Annual Pass” on August 15, 2025, a prepaid facility that allows private CJVs to travel across designated National Highway and National Expressway toll plazas. The annual pass is worth INR 3,000. The pass is valid for one year or 200 trips, whichever occurs first and is applicable only to private, non-commercial vehicles (Car/Jeep/Vans).

Since this pass has been introduced by NHAI, it is not valid on

- state governed toll plazas on highways
- state governed toll plazas expressways
- Parking areas or other non-NHAI tolling locations

3.20 The pass can be activated via the RajmargYatra app or the NHAI website, and links directly to an existing FASTag.

The Annual Pass aims to:

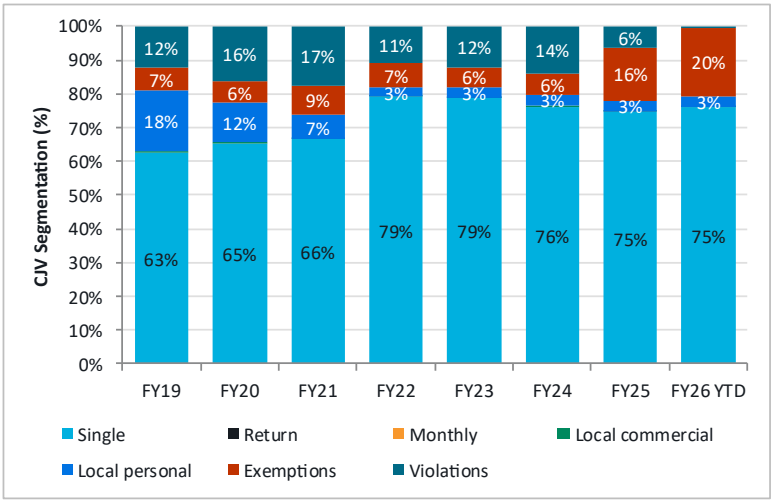
1. Promote cashless and seamless travel on national highways.
2. Reduce congestion and improve traffic flow at tolls

3.21 Provide cost-effective travel for frequent users of NH/NE toll roads

Share of traffic by payment type

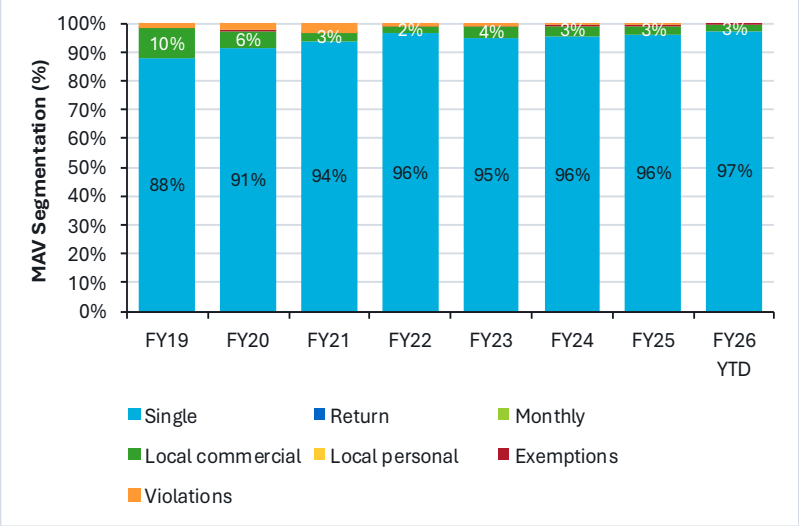
3.22 The following figures provide the toll segmentation for the historical years at TP1 Siwaya for CJV and MAV while the table provides the same for the remaining vehicle types.

Figure 3-1: Ticket-segmentation for CJV at TP1 Siwaya



Source: Steer analysis of the Client data; FY26 YTD includes data till August'25.

Figure 3-2: Ticket-segmentation for MAV at TP1 Siwaya



Source: Steer analysis of the Client data; FY26 YTD includes data till August'25.

3.23 As can be seen in the given figures, in FY26 YTD the share of single tickets has been 75% for CJVs, with the remainder made up of 20% exemptions and 3% local personal tickets. From FY26 onwards, the shares of violations appear to have reduced significantly, which suggests better management the plaza.

3.24 Additionally, the reported high share of exemptions aligns with the asset's urban nature, which typically sees a higher proportion of non-paying CJV traffic.

3.25 The share of MAVs buying single tickets is stable at 97% between FY22-26YTD. This high share of single ticket type is due to other tickets such as return and monthly being not available as per the toll notification. As expected, there is a negligible share of violations for MAVs. The ticket segmentation of other vehicle types is presented in the table below

Table 3.6: Historical ticket segmentation at TP1 Siwaya

LCV	FY20	FY21	FY22	FY23	FY24	FY25	FY26YTD
LCV							
Single	93%	96%	95%	96%	94%	95%	95%
Local commercial	2%	1%	1%	2%	2%	2%	2%
Local personal	0%	0%	0%	0%	0%	0%	0%
Violation	4%	1%	2%	2%	2%	2%	0%
Exemption	1%	1%	1%	1%	1%	2%	3%
Bus/2A							
Single	97%	96%	97%	98%	97%	97%	98%
Local commercial	1%	1%	1%	0%	0%	1%	1%
Violation	2%	2%	2%	1%	2%	2%	-
Exemption	0%	1%	1%	0%	1%	1%	1%

Source: Steer analysis of the Client data

Data collection and validation

Overview

3.26 As mentioned previously, to validate and inform various inputs used in our forecasting, we undertook primary data collection on the Asset, comprising the surveys listed in the table below. OD survey data was collected by the Client in April'23, TVC surveys were commissioned by Steer with a third party as a part of the study in earlier commission. OD data collection typically involves manual data entry by enumerators based on oral surveys with road users crossing toll plazas, which Steer also commissioned with a third party. TVC data collection involves video-graphic capture of traffic passing crossing the toll plazas, followed by manual counting.

Table 3.7: Data collection schedule

TP1	7-day videography based TVC			1 day OD survey	
	Start date	End date	Time (hrs)	Start date	End date
TP1	20-Mar-2021	26-Mar-2021	0000-2359	3rd -Apr-2023	4th -Apr-2023

Source: Steer analysis

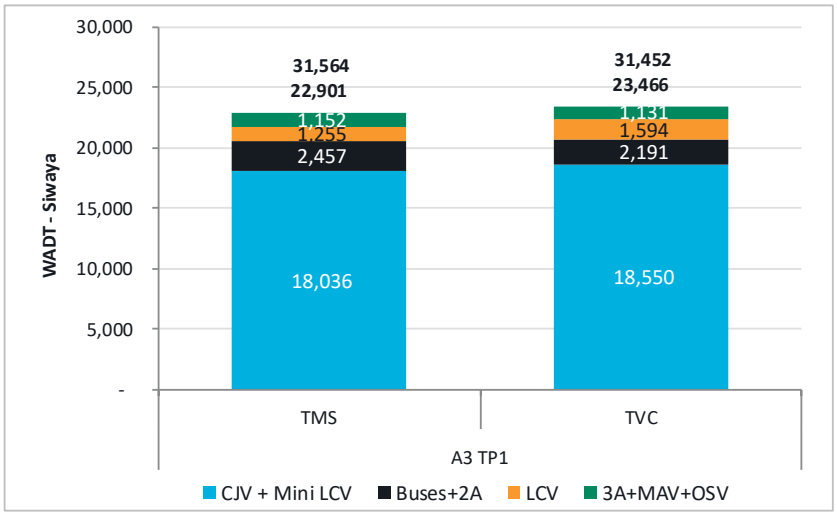
3.27 It should be noted that, in our experience, traffic on national highways shows variation across the week due to the economic activities surrounding each road. To derive a representative TVC count considering daily variation, three-day to seven-day traffic counts are generally recommended, and hence, to fully understand the impact of this weekly fluctuation on the Asset, we collected seven-day counts at each toll plaza.

Key findings of the TVC data analysis

WADT estimates

3.28 Taking an average of the seven-day TVC counts (18-24th January 2021, 0000-2359 hours), we obtained the following weekly average daily traffic (WADT) for each toll plaza. This WADT excludes non-tollable vehicles such as tractors, two-wheelers, bullock-carts, etc., but includes officially exempt vehicles such as police cars, ambulances, emergency response vehicles, government vehicles and other vehicle types officially allowed as 'exempted' under the concession agreement.

Figure 3-3: WADT TVC- TMS at TP1



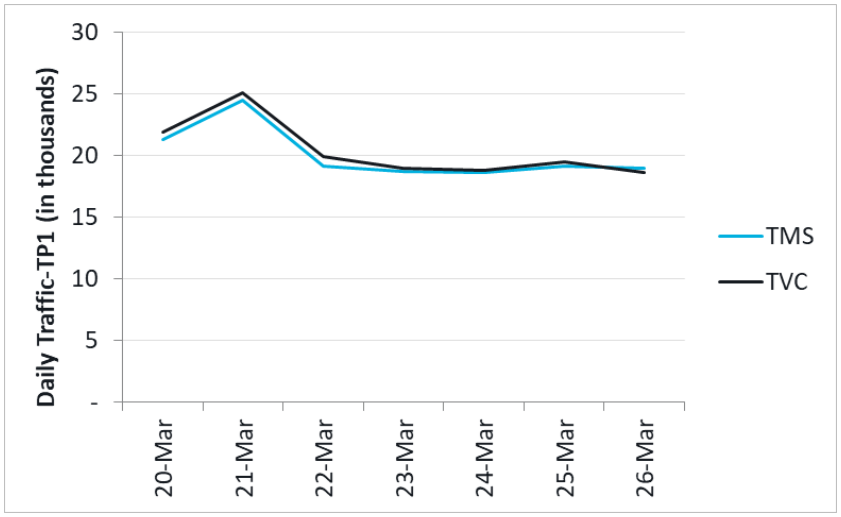
Source: Steer analysis of TVC data

TVC v/s TMS analysis

3.29 As we use the TMS data to estimate the base year AADT, we have used our TVC data to validate the TMS data on those particular days, as supplied by the Client.

3.30 The following figures show the comparison between the daily traffic observed by TVC and TMS at TP1 Siwaya. As shown in the figures below, TVC and TMS show a close fit overall and the differences are within the acceptable range of variation.

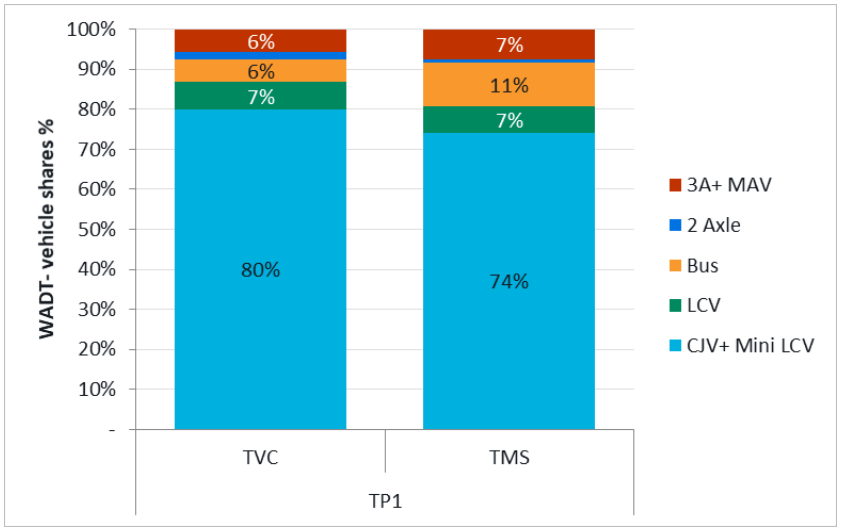
Figure 3-4: Comparison between TVC and TMS daily traffic data on TP1



Source: Steer analysis of TVC and Client TMS data

3.31 The figure below compares the shares of vehicle types on the Asset, between TVC and TMS data. As this shows, there is a slight difference at the vehicle category level, which can be attributed to common misclassification of vehicles and their categories specially between CJV, Mini-LCV, LCV and 2A.

Figure 3-5 Comparison between vehicle shares from TVC and TMS WADTs



Source: Steer analysis of TVC and Client TMS data

3.32 Given the overall good fit of the data at an WADT level and minimal variation between the TVC and TMS data for the largest revenue generator, CJVs and MAVs are within reasonable limits, giving us the confidence that the base year traffic calculated using the Client data forms a robust base year traffic estimate.

Key findings of origin-destination analysis

Overview

Origin-destination (OD) analysis enables the understanding of the nature of traffic movement on the Asset. The OD analysis presented here is based on data collected by client in April 2023.

3.33 We have analysed the regional drivers of demand based on the following analyses:

- Zonal influence
- Commodity distribution
- Top OD pairs
- Trip length distribution

3.34 While zonal analysis and listing of top OD pairs help us to understand 'where' people and goods travel, commodity distribution sheds light on 'what' goods get transported. Trip length distribution shows 'how far' vehicles and people travel, and goods get transported. This set of analyses is used to estimate the key drivers of traffic and aids in forecasting assumptions around traffic demand elasticities, growth drivers and exogenous impacts.

Sample rates

3.35 Sample rates help understand the reliability of OD data. They are calculated by dividing the OD samples captured by the traffic counts (based on the TVC data) during the same time period. The table below presents the sample rates for key vehicle type aggregations at both toll plazas. We believe that the sample rates of the OD data are reasonable for the analysis required.

Table 3.8: Sample rates for OD data

Vehicle category	TP1
Car	32%
Bus	48%
LCV	65%
MAV	65%

Source: Steer analysis of Client OD data

Zone categories

3.36 To facilitate better interpretation of key regional drivers of traffic as determined by their OD zones, and influenced by various towns, cities, states and regions in the vicinity of the Asset, we have aggregated zonal data as described in the table below. The methodology behind this aggregation of zones may vary as per the characteristics displayed by the different Assets being studied.

Table 3.9: Zone aggregations for zonal influence analysis

Aggregate Zone	Description
Local	On or very close to the Asset.
Immediate area of influence (IAOI)	Fall within two districts from the Asset, roughly up to about 75-150 km from the Asset.

Aggregate Zone	Description
Rest of State	Rest of the cities/Districts in the state that Asset lies in (other than Local/IAOI)
Uttarakhand	Uttarakhand.
Delhi	Delhi
Rajasthan	Rajasthan.
Gujarat	Gujarat
Maharashtra	Maharashtra
Punjab	Punjab
Himachal Pradesh	Himachal Pradesh
North India	Jammu and Kashmir
Haryana	Haryana
Goa	Goa
South India	Andhra Pradesh, Tamil Nadu, Karnataka, Kerala
Madhya Pradesh	Madhya Pradesh.
North East	West Bengal, Northeast Indian states
Orissa	Orissa
Bihar	Bihar
Jharkhand	Jharkhand
Outside India	Nepal, Bhutan, Bangladesh.

Source: Steer analysis

Zonal influence

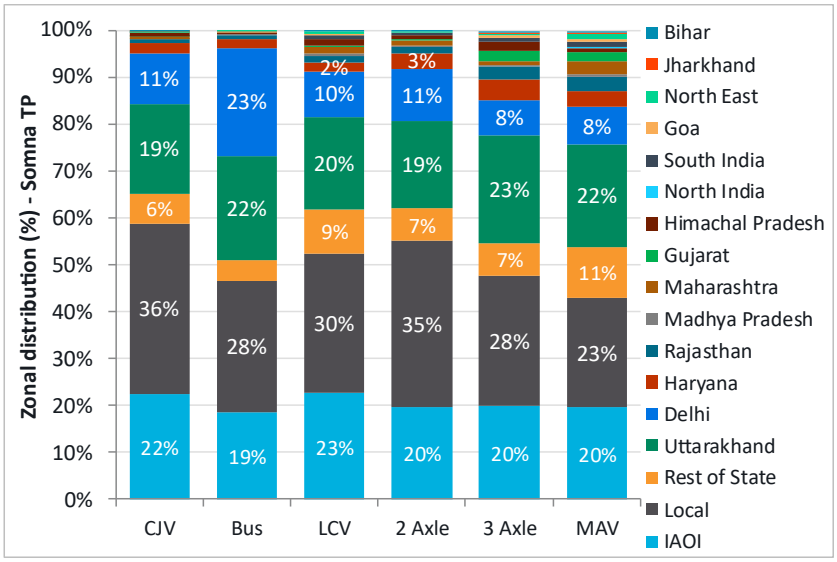
3.37 The zonal influence is the contribution of the zone or the zonal aggregation to trips by a vehicle type. This section presents the zonal influence[2] at TP1 of this Asset aggregated based on zonal aggregation listed in the previous sub-section. Please note that zonal influence is analysed on trip ends and not trips.

3.38 The figure below presents the zonal influence on various vehicle types the toll plaza. We can see that 'local' trips make up the largest share for all vehicle types. Generally smaller vehicles see a higher share of local trips than Trucks and MAVs. Across all vehicle categories UP, Uttarakhand and Delhi have highest influence making ~80% on the Asset. In case of CJV and Bus it is with the significant tourism driven traffic, given the Asset connects tourism and major pilgrimage destinations Haridwar, Rishikesh, Mussoorie, Dehradun and so on. While in case LCV and 2A the cater to local agri based demand and carry miscellaneous goods from Meerut, Delhi to Muzaffarnagar and north. Heavy goods 3A and MAV have high influence because heavy sand mining belt located near the Asset in Saharanpur in Behat region which attracts MAV traffic. Beyond the local area, all vehicle

[2] For example, if out of 100 trips at a toll plaza on an Asset, 10 trips are between Hyderabad and Delhi and 90 trips are between Hyderabad and Chennai, then zonal influence of Hyderabad is 50% since one trip end of all trips are at Hyderabad. Likewise, zonal influence of Delhi and Chennai would be 5% and 45%, respectively.

types see relatively high proportions of trips from Uttarakhand occupying approximately 20% for all vehicle types.

Figure 3-6: Zonal influence at TP1



Source: Steer analysis of OD data

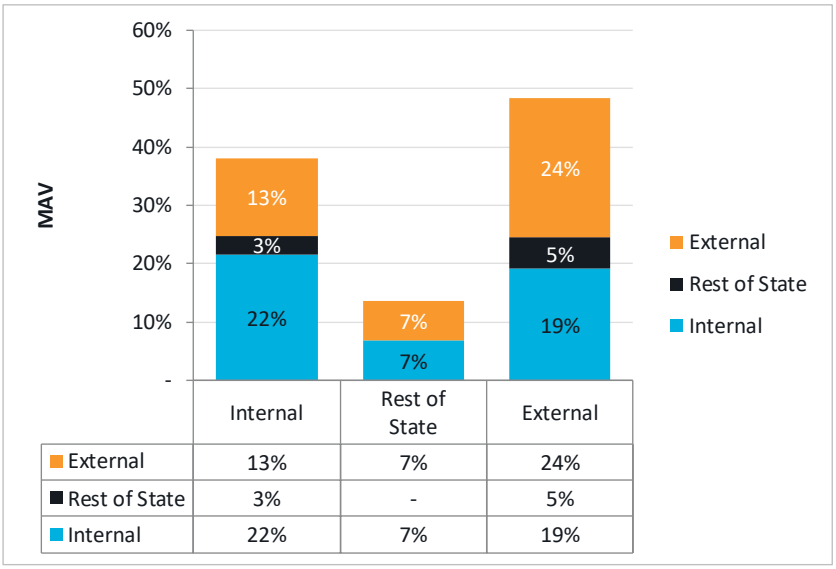
Internal External analysis

3.39 Internal-External analysis helps in identifying the trips which have both the origin and destination on or near the Asset i.e local/IAOI zones (Internal-Internal or I-I), any one end on the Asset (Internal-External or I-E), or neither end on the Asset i.e. through trips (External-External or E-E). RoS here represents areas within the state which are neither local nor IAOI. 'Internal' zones are those that were analysed as 'local' and 'IAOI' in the zonal influence analysis, i.e. lying on the Asset, while 'External' zones are areas lying outside the state.

3.40 Figure 3-7 figure below shows the distribution of trips based on these categories. Understandably, these reflect the observations seen in the zonal influence presented earlier, at a higher level of aggregation.

3.41 We see that for MAVs 24% of the trips both the origin and destination lie externally. Overall, the external influence is 40% of the MAV trips. A significant part of these fully external trips are between Delhi or other states such as Haryana and Uttarakhand and are expected to continue being made on the corridor, given the strategic accessible location of the tourist state in relation to Delhi and UP.

Figure 3-7 Internal-external distribution at TP1



Source: Steer analysis of OD data

Commodity distribution

3.42 We have grouped various commodities into aggregate categories for ease of interpretation, as shown in the table below. The charts in the following sub-section present information in terms of these aggregate commodity categories.

Table 3.10: Aggregate commodity categories

Commodity Description	Code	Combined codes used for charts
Agriculture Products / Cash crops (Wheat, Rice, Sugar cane, Maize etc.)	AGR	**AGR**
Cattle Food / Live Stock (sheep, goat, cow, cattle food etc)	LIV	
Perishable Items (Fruits, vegetables)	PER	**GRO**
Animal Products/Dairy/Eggs/Fish/Meat/Animals	DFM	
Groceries / Food items (Soap, Salt, Sugar, Pulses, Spices, Biscuits, bread, cold drinks, beer etc.)	GRO	
Building Material / Construction (Cement, Lime, Brick, fly ash, etc)	CNS	**CNS**
Sand/Clay	SND	
Stone (kota stone, marble, Granite, Aggregate stone etc.)	STN	
Ceramic	CRM	
Petroleum Products (Oil, LPG, CNG, etc.)	PET	**PET**
Chemicals / Fertilizers (Acids, Fertilizers etc.)	CHM	
Electrical/Manufacturing items (Electronic items, Medicine, Leather, Wine, Rubber/ Tyre, Plastics, Cloth, Paper etc.)	MAN	**MAN**

Commodity Description	Code	Combined codes used for charts
Raw Wood, Cork & Wood Products, Furn	WUD	
Machinery / Spare parts	MAC	
Automobiles (Finished products, auto parts, Car/bike manufacturing, New Chassis)	AUT	**AUT**
Basic / Fabricated Metals (Iron, Steel / Metal)	MET	**MET**
Mining Minerals (Coal, Gypsum, Cobalt etc.)	MIN	
Empty	EMT	**EMT**
Container	CTR	**MSC**
Miscellaneous (Parcel, Courier, House hold items etc.)	MSC	
Passengers	PAS	
Scrap	SCR	

Source: Steer analysis

3.43 The figure below presents the commodity distribution for goods vehicles at this toll plaza. As also observed during our site visits, we see that a significant number of vehicles are "Empty". There is a significant share of Automobiles being transported along this corridor, along with Chemicals. Overall, Manufactured products make up the top aggregate category at this toll plaza.

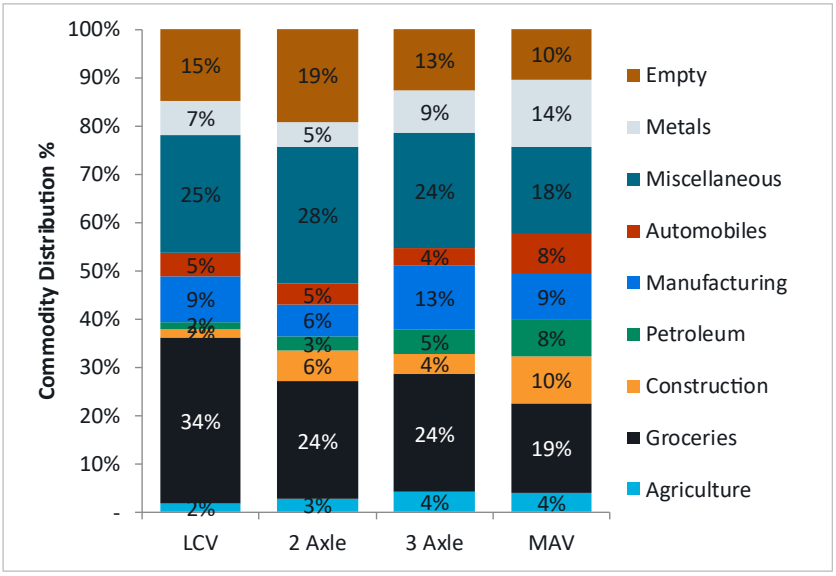
3.44 The high share of manufacturing in commodities can be attributed to presence of several small manufacturing units and small industries along the Asset Road in Muzaffarnagar, Saharanpur and Meerut and other industries that have been setup in Uttarakhand.

3.45 Another significant commodity observed is Agriculture and groceries with over ~19% share in all vehicle categories carrying rice, maize, sugar from production centres of Muzaffarnagar, Meerut and Saharanpur to consumption centres Meerut, Delhi NCR and other parts of UP.

3.46 Construction material makes up 10% of traffic volume for MAVs on this Asset. Metals and related goods also have significant contribution making for 14% of MAV volumes. As was observed from the site visit and background research, though sand volumes have not reached the levels they were at before the ban on sandmining, these trucks carry construction-related material (including sand) from Saharanpur, Dadri and other mining regions and supply to Delhi NCR region for various construction needs.

3.47 Looking by direction you can see from the charts below that a smaller proportion of vehicles travelling towards Meerut are empty as compared to those travelling towards Muzaffarnagar. Aside from the different proportions of Empty vehicle, the most significant difference is that those travelling towards Meerut have a greater share of Metals materials (17% compared to 11%).

Figure 3-8: Commodity distribution at TP1 (Total)



Source: Steer analysis of OD data

Trip length analysis

3.48 Trip-length distribution provides the distance-based profile of various vehicle types. This aids in validating assumptions around the share of macro-economic drivers, inputs from zonal influence and toll segmentation. For ease of interpretation, we have categorised distances into 5 groups – local (0-100km), short-distance (100-300 km), medium-distance (300-500 km), long-distance (500-1000 km) and very-long-distance (+1,000 km). The trip distances were derived as driving distances from Google Distance Matrix Tool based on zonal coordinates for OD pairs.[3]

3.49 As can be seen in the figure below, there are minimal long-distance (considered as >500km) movements, even for heavier vehicle categories. ~50% trips for all vehicle categories are between 100-300-km long, which is the average distance between Delhi and Uttarakhand. Generally, smaller vehicles have shorter distances (0-100km) compared to goods-carrying heavy vehicles. For example, 31% of LCVs make trips less than 100-km long, while 20% of MAVs make trips of that length.

3.50 Around ~65-70% share of trips covering between 0-300-Km even among the goods vehicles supports our observations and understanding that this Asset generally caters to the regional urban demand between the contiguous population centres that lie along it. The 15% of MAVs travel longer than 1000km, these trips are primarily from states of Rajasthan, Maharashtra and Gujarat and are destined to Uttarakhand.

[3] Google Distance API is a tool that is available on a chargeable basis from Google Maps Platform. Link: **https://developers.google.com/maps/documentation/distance-matrix/start**. Travel distance and time information for driving/transit under various congestion scenarios can be extracted through this tool by using macro-enabled Excel, R, etc.

	LCV	2 Axle	3 Axle	MAV
Average trip length Km	311	255	348	466

Source: Steer Analysis of OD data

Conclusions

3.51 In summary, in FY25 the Asset had an AADT of ~35,000 at the Siwaya toll plaza. Looking at the vehicle shares of this Asset, the dominant vehicle class is CJVs, holding 86% of the vehicle class share. Traffic on the Asset has grown consistently starting FY22 when the Delhi-Meerut expressway was commissioned resulting in improved connectivity to Delhi. MAV's have also grown in the recent years driven by increase in sand mining traffic as one of the key reasons.

3.52 Concurrently, commercial vehicle traffic experienced a 0.6% decline in PCUs compared to FY24, mainly due to a significant drop in MAV volumes as traffic shifted to the newly completed 4-lane Baghpat–Shamli-Muzaffarnagar section of NH-709B.

3.53 In terms of revenue collection, the Asset observed a CAGR of 19% between FY22-24, reflecting the impact of the opening of the Delhi-Meerut Expressway and the consistent growth in Bus/2A and 3A/MAV volumes.

3.54 The OD analysis found that in terms of zonal influence, local (with trip end on Asset), Uttarakhand and the rest of Central NCR are dominant zones. This is expected given the Asset's location, and the industrial, employment and tourism generators and attractors in these zones. The key commodities transported on the Asset are Manufactured products and Construction materials, with a significant share of Empty vehicles showing the influence of short-distance trips serving the regional economy.

3.55 Looking at the internal and external distribution, I-I and E-E trips are dominant, holding the greatest share for all vehicle classes. I-I, I-E and E-I trips are captive to the Asset with one

trip end lying on it. E-E trips are expected to continue being made on the corridor, given the strategic accessible location of the tourist state in relation to Delhi and UP. The trip length analysis validates this conclusion, finding most of the trips (60%+) travelling within 300kms.

3.56 Overall, the analysis of historical traffic, TVC counts, and OD survey data conducted on the Asset in FY24 confirm the understanding from the site visits that the Asset has a tourism and urban nature for CJVs and light goods vehicle, with primary goods movement involving sugar industries, agriculture, and sandmining. Tourism movement majorly includes destinations in Uttarakhand while industries include sugar mills and sandmining in the western UP region.

4 Socio-economic context

Introduction

4.1 The growth of traffic on existing (brownfield) roads depends on, firstly, how fast the background travel demand grows (background growth); and secondly, how successful the Asset is in attracting that traffic (traffic capture). Background travel demand is driven by the socio-economic conditions of the region where the Asset is located and conditions on a national scale. These include:

- Changes in factors such as population, economic growth (regional and national) and industrial production; and,
- Other local factors such as strategic port growth, and growth in local industries near the Assets.

4.2 In turn, the change in the competitive position of the Asset (and thus of the traffic capture it will achieve) derives from how the service offered and the prices charged on the Asset change in comparison to competing roads; and whether any new competing road facilities are available.

4.3 In this chapter, we assess the socio-economic indicators relevant to traffic growth on the Asset.

Population growth

4.4 We have analysed the key socioeconomic drivers of the background traffic demand in Uttar Pradesh state, where the Asset is located.

National Level

4.5 The total population in India has grown at a Compound Annual Growth Rate (CAGR) of 1.5% since 2000, decreasing over the years, as shown in the table below. The World Bank forecasts this growth to decrease to 0.6% CAGR by the 2030-45 period.

Table 4.1: CAGR of population in India

Years	CAGR		
	Total Population (m)	Rural Population (m)	Urban Population (m)
1970 - 1985	2.3%	1.9%	3.8%
1985 - 2000	2.0%	1.7%	2.9%
2000 - 2015	1.5%	1.0%	2.6%
2015 – 2030*	1.0%	0.3%	2.3%
2030 – 2045*	0.6%	-0.3%	1.9%

Source: World Bank Data on Health Nutrition and Population Statistics, *forecast population growth

State Level

4.6 Uttar Pradesh represents approximately 17% of the country's population, with the total state population of 237 million, as of FY24. Table 4.2shows the evolution of population in the state of Uttar Pradesh (containing the Asset), compared to that of the country.

Table 4.2: Population Growth in Uttar Pradesh and India (2012-2024)

State	2012 Population (m)	2024 Population (m)	CAGR (2012 – 2024)
Uttar Pradesh	201	237	**1.4%**
India	1,210	1,395	**1.2%**

Source: MoSPI Estimates

4.7 The growth of the population of Uttar Pradesh is of direct relevance to the Asset. Uttar Pradesh observed healthy growth in population between 2012-24 indicating that the Asset is expected to continue serving the local consumption demand. However, due to the complexities of the patterns in which urbanisation takes place, and the very dynamic nature of local population migration (which are very difficult to forecast with accuracy), we do not use population growth as a proxy for understanding future travel demand growth on the Asset. It has been included in this section simply to provide a general context of the region in which the Asset are located.

Economic Indicators

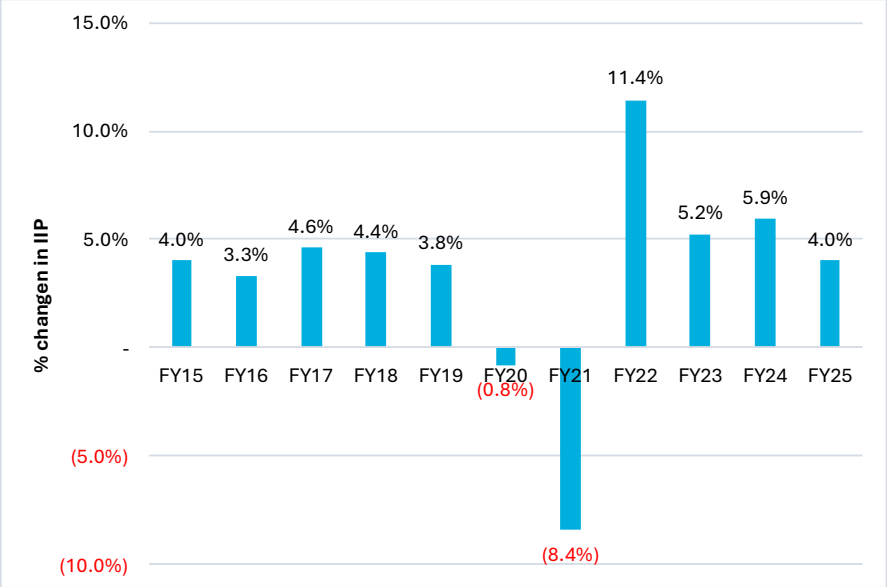
Industrial Production

4.8 The Index of Industrial Production (IIP) is a composite indicator that measures the short-term changes in the volume of production for a basket of industrial products. The IIP data tracks the manufacturing activity in different sectors of an economy, with mining, manufacturing, and electricity being the three broad sectors constituting the IIP.

4.9 Figure 4-1 below shows that at an annual level, national IIP was growing at an average of 4% per year over the period FY15-19, before the country underwent a liquidity crisis and experienced an overall economic slowdown in FY20. In the aftermath, IIP shrank by over 8% in FY21 due to a decline in economic activity in the wake of global lockdowns introduced to curb the Covid-19 pandemic. Post the immediate recovery in FY22, IIP growth has since stabilised, with FY25 recording 4% growth over FY24.

4.10 Since state-level IIP data is not as readily available as national level IIP, we have presented national IIP here to indicate nationwide activity in key industrial sectors like power, manufacturing, and mining, all of which influence long-distance commercial movements across the nation, and not unique to this asset. However, we do not use it to forecast future travel demand growth since long-term forecast for IIP is not available through official sources such as MOSPI, RBI or through multilateral organisations like WB, or the IMF.

Figure 4-1: Annual growth – Index of Industrial Production



Source: Ministry of Statistics and Program Implementation (MoSPI)

Vehicle ownership

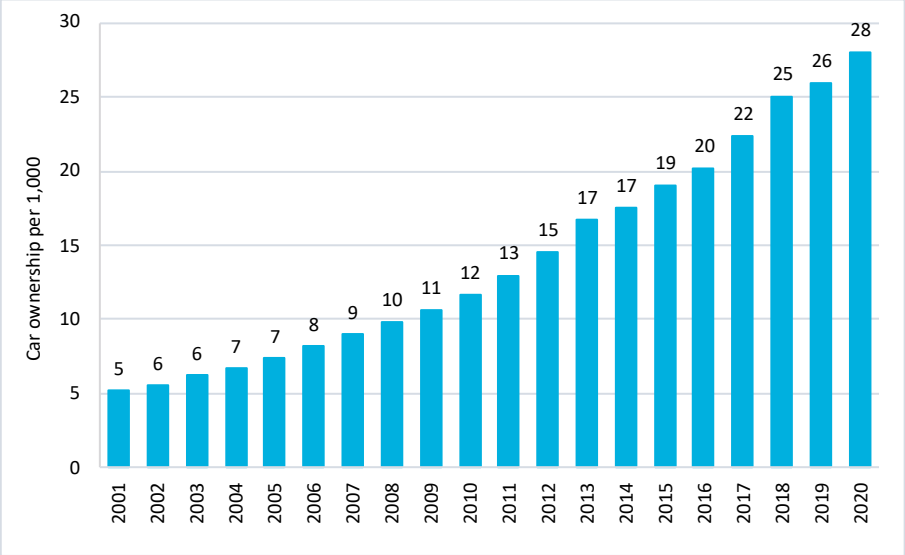
4.11 The gap in car ownership between India and developed nations remains substantial according to recent data. As of 2018, India had approximately 22 cars per 1,000 individuals, a fraction of the 980 cars per 1,000 individuals in the United States[4]. However, this pattern is changing with the increasing per capita income levels. As can be seen in **Error! Reference source not found.** below, between 2007-17, number of cars per 1,000 p eople has more than doubled and increased at a CAGR of about 11%.

4.12 Overall, India still stands at a very nascent stage in the vehicle saturation curve, offering huge potential for growth going forward. As the income per capita of India and the region itself grow further, we expect car ownership levels to increase. As per the India Energy Outlook (2015), car ownership is projected to grow steeply to 175 cars per 1,000 population by 2040 in India.[5]

[4] India has 22 cars per 1,000 individuals: Amitabh Kant, Auto News, ET Auto

[5] https://www.gita.org.in/Attachments/Reports/IndiaEnergyOutlook_WEO2015.pdf

Figure 4-2: Car Ownership in India per 1,000 population

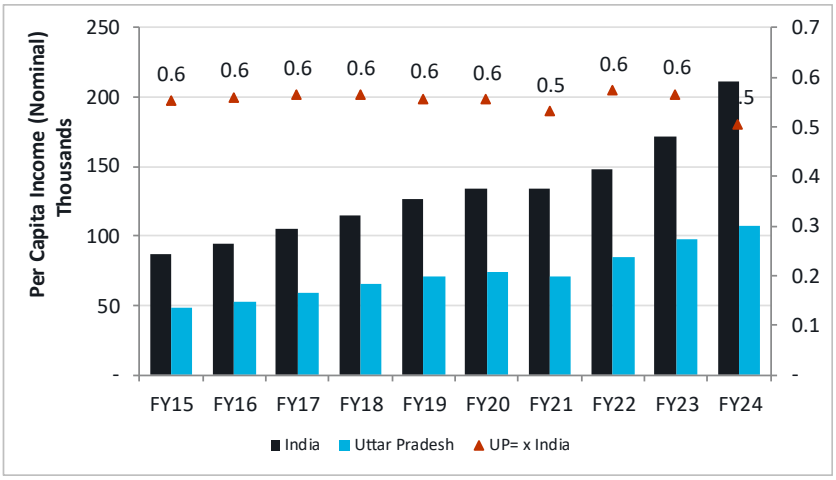


Source: International Energy Agency (IEA)

Per Capita Income (PCI)

4.13 The per capita income of the state where the Asset lies i.e., Uttar Pradesh is lower as compared to the national average. It has been at a level of 50-60% of the national average. In dollar terms, PCI of just $1,000 per head indicates that the state is at a very early stage of consumption curve. Going forward, we therefore expect local consumption to be strong which would drive the growth in both passenger and commercial traffic.

Figure 4-3: Per Capita Income (PCI)



Source: Steer analysis of MoSPI data

4.14 However, given the difficulty in obtaining granular district level PCI data it is not advisable to use this as a growth driver. Also, the long-term forecast for PCI is not available we therefore refrain from using it to forecast traffic.

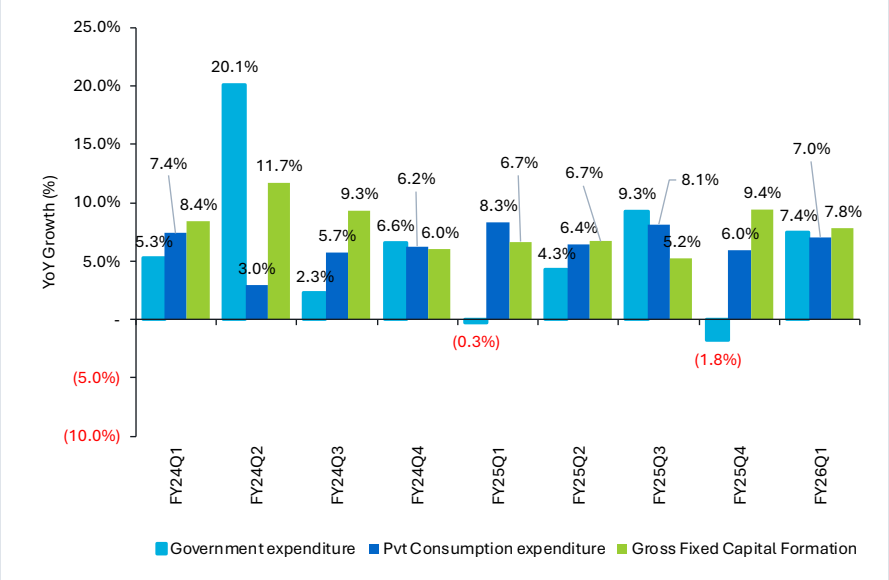
Economic growth

India's Performance

4.15 Despite a slowdown in the economy during H1FY25, the Indian economy has observed strong growth each quarter since FY25Q2, with the latest published estimates for FY26Q1 GDP at 7.8% over FY25Q1. This performance has been driven by strong growth in investment and consumption expenditures and higher consumer optimism for the year ahead[6].

4.16 In Figure 4-4 below, we present quarterly Y-o-Y growth in three major components of GDP – government expenditures, consumption expenditures, and business investment (gross fixed capital expenditure) over the past two years (FY24-FY26Q1).

Figure 4-4: YoY Growth in Government, Consumption and Business Expenditures



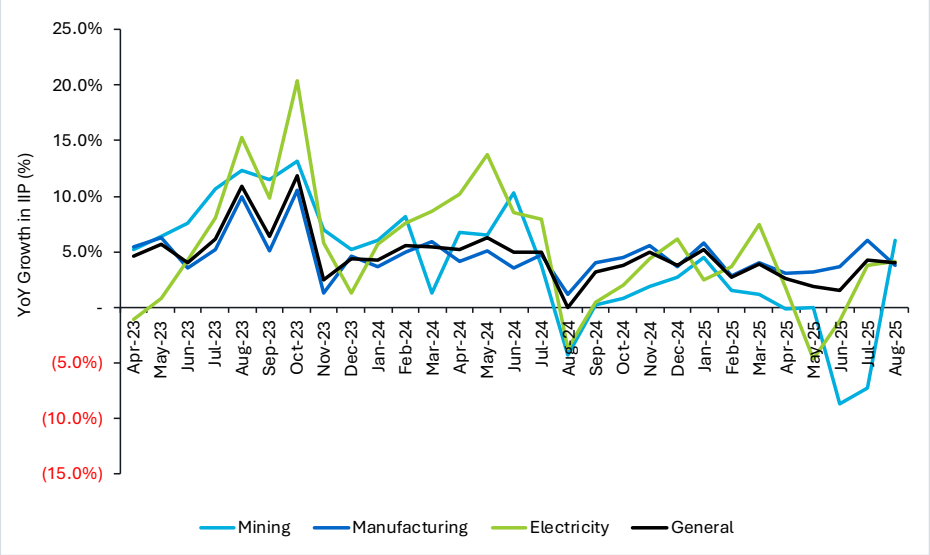
Source: Steer Analysis of MOSPI Data

4.17 While consumption and investment expenditures have continued to show consistent growth over the past two quarters, government expenditures observed a marginal decline in FY25Q4. In FY26Q1, government expenditures rebounded, recording 7.4% growth over FY25Q1 levels.

4.18 Performance across different types of industrial activities (such as Mining, Manufacturing, and Power Generation) directly impact freight movement and commercial traffic volume growth across the country, including on the Asset. In Figure 4-5 below, we present growth trends in IIP – a measure that tracks the performance of the economy across these activities. As of FY26YTD (Apr-Aug '25), the Manufacturing sector continues to perform strongly, recording positive y-o-y growth since FY25Q3. While industrial activity across the two other sectors (i.e., Power Generation and Mining) dropped between May and Jun/Jul '25, they have since rebounded and show signs of continued growth going forward.

[6] Government of India, PIB Release Oct 1 '25

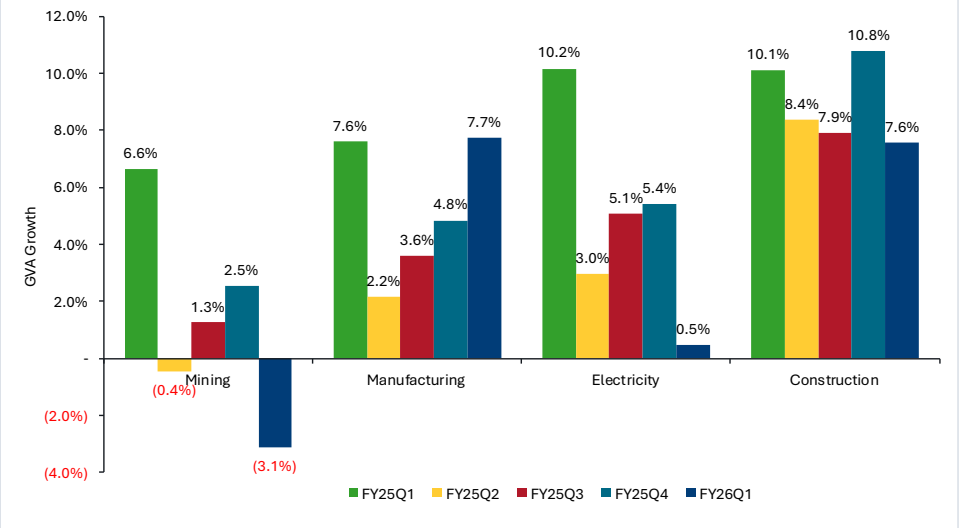
Figure 4-5: Month on Month IIP performance



Source: Steer Analysis of MOSPI Data

4.19 In addition to monthly trends in IIP, Figure 4-6 below presents y-o-y growth of quarterly GVA in four industrial sectors - Mining (& Quarrying), Manufacturing, Electricity (and other Utilities), and Construction. While the Mining and Power sectors observed decline and muted growth in FY26Q1, the Manufacturing and Construction sectors experienced strong growth. Generally, economic growth has remained resilient as of FY26YTD, but performance across industries have varied, impacting economic growth across different regions and on the Asset as well.

Figure 4-6: Industrial components of GVA



Source: Steer Analysis of MOSPI Data

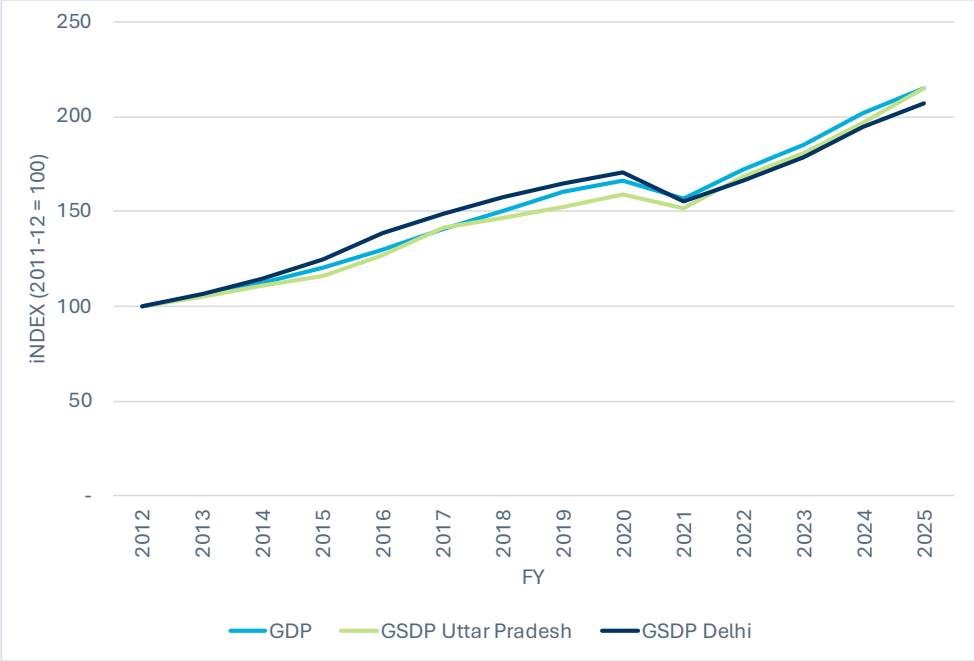
GDP and GSDP Growth

4.20 The Indian economy has grown at a CAGR of 6.1% during FY12-25, aided by a strong growth in the services/tertiary sector. UP GSDP grew at 6.1% per year between FY12 and FY25 – in step with the national economy. Uttar Pradesh approximately contributes 8% to

the India's GDP. In terms of per capita income, Uttar Pradesh's has lower per capita income than the country.

4.21 As shown in Table 4.2 above, UP accounted for 17% of national population in FY24. In terms of national economic contribution, Uttar Pradesh contributed approximately 8% respectively to India's GDP in FY24.

Figure 4-7: Evolution of Delhi's and Uttar Pradesh's GSDP and national GDP



4.22 Source: Ministry of Statistics and Program Implementation (MoSPI

Economic activity in the state

Uttar Pradesh

4.23 Uttar Pradesh is the most populous state in India with a population of ~237 million people (as of FY24). The state has a large pool of skilled, semi-skilled and unskilled labour. A shown in Figure 4-8**Error! Reference source not found.** below, the tertiary sector has the highest sectoral contribution (49%) to the state GSVA followed by the secondary (28%) and primary (23%) sectors, as of FY25.

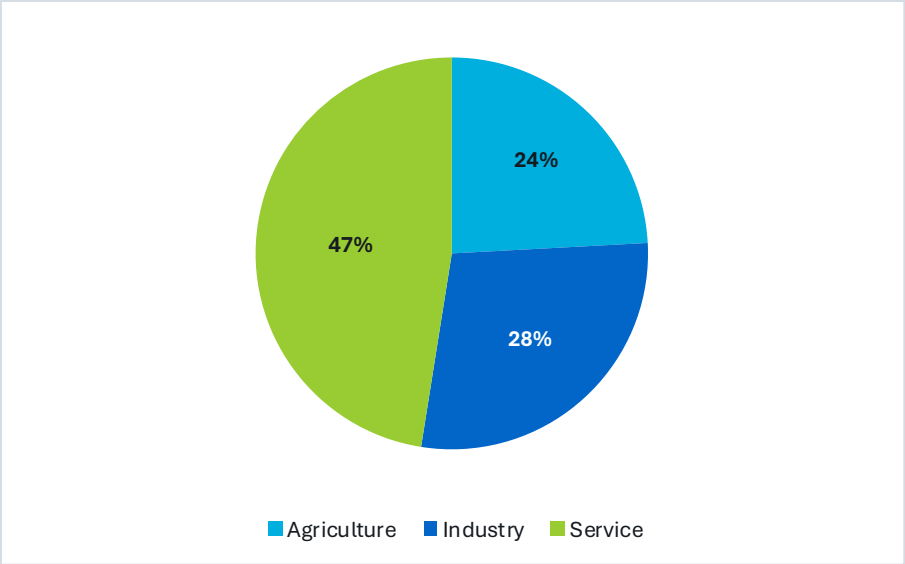
4.24 Uttar Pradesh is considered one of the primary tourist destinations in India, with key tourist attractions being Agra, Varanasi, Mathura and Prayagraj. The state recorded a tourist footfall of 64.90 crore in 2024, a significant increase of over 17 crore in 2023, as per Union Ministry of Tourism[7]. Overall, Uttar Pradesh had an 8.2% contribution to national GDP as per FY24 data by the Ministry of Statistics and Program Implementation.

4.25 In terms of secondary sector, the state has key industrial areas in Khurja (Ceramic); Moradabad (Metals); Meerut, Bareilly, Mirzapur and Lucknow (Handloom & Handicrafts); and Kanpur and Noida (Leather and tannery). The state also has an oil refinery in Mathura, operated by Indian Oil Corporation.

[7] up-sees-65-crore-tourists-in-2024-over-17-crore-more-from-2023

4.26 Uttar Pradesh has very fertile Gangetic land with a large share of population dependent upon agriculture sector for the livelihood. The key primary industries in the state include crop production and horticulture. The state is mainly known for production of wheat, sugarcane, potato and mango.

Figure 4-8: Sectoral Distribution of GSDP of Uttar Pradesh for 2025



Source: Steer Analysis of MoSPI data

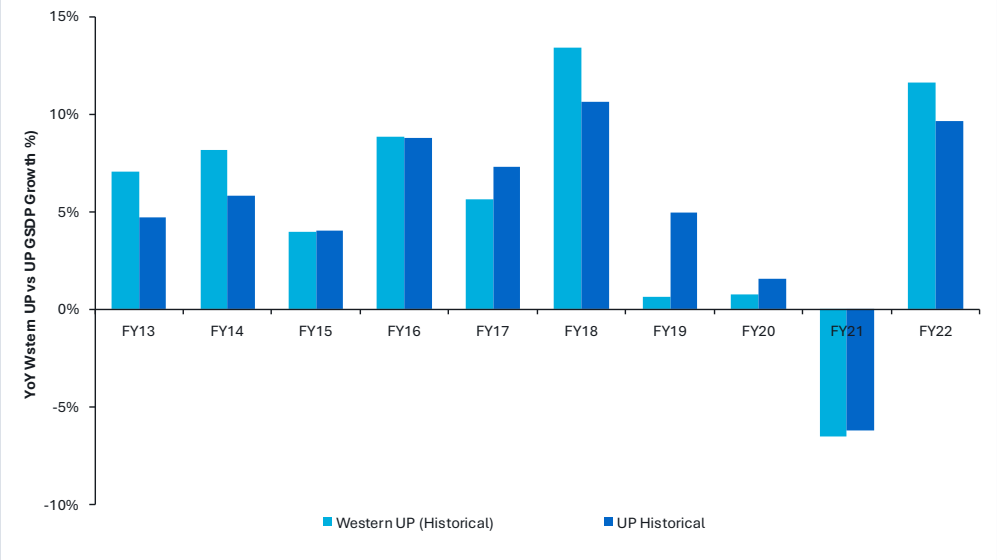
Western UP vs UP GSDP Growth

4.27 Since FY13, growth of Western UP GSDP[8] has remained relatively stable, and in line with UP statewide GSDP growth. In Figure 4-9 below, we see that between FY13 and FY22, GSDP growth in Western UP exceeded that of UP overall in 5 of the 10 years (FY13, FY14, FY18, FY21 and FY22), was consistent with UP in 2 of the 10 years (FY15 and FY16), and was below UP GSDP growth in 3 of the 10 years (FY17, FY19 and FY20). While UP statewide growth is largely influenced by Western UP, in recent years (FY21-22), Western UP GSDP has exhibited growth more sensitive than statewide trends.[9]

[8] The Western UP region consists of 30 districts, prominent among which are Ghaziabad, Gautam Budh Nagar, Agra, Meerut, Mathura and Bareilly. Historically, this collective region has been the more economically developed part of Uttar Pradesh, and as of FY22 accounted for half of the statewide total GSDP.

[9] Steer analysis of data sourced from the Directorate of Economics and Statistics, Uttar Pradesh (**UPDES website**)

Figure 4-9: Western UP vs UP GSDP Growth



Source: Directorate of Economics and Statistics, Uttar Pradesh

4.28 This can be explained due to a combination of policy- and market-driven factors which have contributed to higher growth in the Western region of the state. Some of these major developments pertaining to large-scale infrastructure investments in the region include:

Delhi – Meerut Expressway[10]
Ganga Expressway [11]
Noida International Airport (Jewar Airport) [12]
Logistics hub in Agra, by the Agra Development Authority [13]
'New Noida' initiative by the Uttar Pradesh government [14]

4.29 Between FY12–FY25, the GSDP of Uttar Pradesh grew at a CAGR of 6.1% per year. Over the same period, national GDP grew at 6.1%[15] per year, implying that the long-term elasticity factor of UP GSDP growth to national GDP growth is roughly 1. In this context, as Western UP has exhibited more elastic growth relative to UP state overall in recent years, as well as expectations of strong near-term growth in the Western region driven by large-scale infrastructure and commercial investments, we have assumed the near-term growth forecast for Western UP to be similarly elastic to India's GDP growth forecast.

4.30 Figure below presents the Client-provided forecasts of national (India) GDP growth from FY26 to FY45, and our assumed GSDP forecast for Western Uttar Pradesh over the same period. In the short term, we have assumed GSDP of Western UP to grow at 1.2 times that of national GDP growth forecast, eventually tapering down to a factor of 1.0 over time as it

converges to the national growth rate forecast by FY45.

Forecasts for growth drivers

4.31 Following the discussion in Chapter 4 on the nature of economic activity in the state of Uttar Pradesh, in this section, we describe the assumptions in relation to forecasts of the key macro-economic drivers of traffic growth.

4.32 Particularly, we have based our forecast on GDP and GSDP using forecasts of GDP as provided by the Client.

National GDP

4.33 After the last period of economic slowdown in FY11-12, the country experienced an economic downturn again in late FY19 with FY20 having reported a GDP growth of 4% (relative to an average growth rate of 7% per year between FY13 and FY19). India's GDP growth declined as domestic investment and consumption demand were already under stress because of the liquidity crunch before Covid-19. Other factors that contributed to the economic slowdown included reduced growth rates in automobile sales and production, liquidity crunch in credit markets and rising number of Non-Performing Assets (NPAs) within the banking sector, as well as lower manufacturing production and lower rural consumption.[16]

4.34 The Covid19 outbreak had a significant impact on the Indian economy during the first two quarters of FY21 as government mandated lockdowns across the country effectively stalled economic activity and growth. The growth momentum eventually picked up in Q3 of FY21, with a sharp rebound in the economy in FY22 (GDP recorded 9.7% growth over FY21) and has since observed a consistent growth of 7.6% in FY23, 9.2% in FY24 and 6.5% in FY25 (as per the SAE) before slowing down over the past year due to several domestic and external factors.

4.35 Figure 4-10 below shows client-provided GDP and GSDP projections for India and Uttar Pradesh. The forecast provided by the Client expects the Indian GDP to grow at 6.5% between FY25-FY27. The India GDP growth forecast is in line with other independent forecasts available from reliable sources such as IMF, World Bank and RBI[17] in the medium term.

5 FY26 Base year AADT and Traffic growth analysis

Introduction

5.1 In this section, we present our approach, assumptions, and estimates for base year AADT and background traffic growth for each vehicle category on the Asset

5.2 Traffic growth is commonly related to a variety of macro-economic and industry- or commodity-specific factors (hereafter referred to as 'traffic growth drivers'). These growth drivers are typically identified from the results of the OD data analysis and the site visits that help us appreciate the nature of traffic movement – 'what' travels 'where' and 'why'. To understand the historical traffic trends in relation to these growth drivers, we carry out regression analyses to determine the historical relationship between each traffic belonging to each major vehicle category and its macroeconomic growth driver at each toll plaza. The dynamics of traffic demand is the dependent variable while the dynamics of one or more identified growth drivers are the independent or explanatory variables.

5.3 Typically, passenger and light commercial vehicle traffic like cars, buses, LCVs and 2-axle trucks grow in line with the GSDP of the state in which the toll road is located. Heavy vehicle traffic like 3-axle trucks and MAVs grow in line with the national GDP. This is because many light vehicles tend to travel shorter distances within the state, whereas a significant proportion of heavy vehicles carry commodities for long-distances across the country. These commodities also tend to be part of industry ecosystems whose demand-supply relationships are scattered across the country and therefore relate more with GDP growth.

FY26 Base year AADT estimates

5.4 The base year is the year on which long-term background forecast growth rates are applied to derive year-wise average annual daily traffic (AADT) estimates for forecast years. This is therefore an important aspect of Steer's forecasting approach as traffic and ultimately revenue forecasts for future years are built on the top of the base year traffic estimate. We have used FY26 as the base year for AADT estimates for the forecast years.

5.5 As described previously in Chapter 3, to establish the base year (FY26) traffic position, we utilised information from various sources – including from the Client and our contextual knowledge, to assess a reasonable demand on the corridor.

Methodology

5.6 The base traffic for FY26 has been estimated utilizing the actual 12 months of FY25. The weighted average of the actual FY25 traffic (April to March) was taken to arrive at annual

FY25 AADT. Using elasticity-based growth assumptions GSDP or GDP we arrived at FY26E.

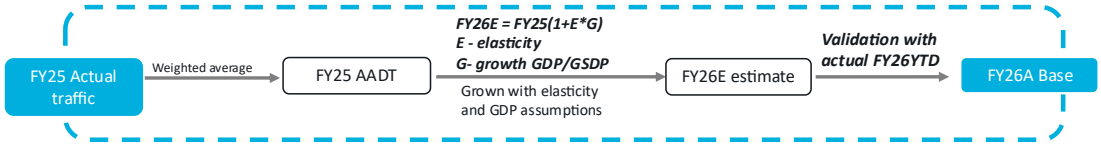
5.7 The monthly profile of the FY26E AADT was then compared to the actual traffic observed in the six months (April to September) of FY26 (FY26YTD). The Adopted FY26 AADT (FY26A) was then arrived at by making necessary adjustments to FY26E to reflect the outturn traffic in FY26YTD after adjusting for seasonality.

5.8 Historical traffic data was available for all toll vehicle categories starting October 2020 up-to September 2025. Therefore, in absence of longer-term historical data for the Asset where FY21 and FY22 are COVID-19 impacted years, we assume FY23 and FY24 to be normal years, with the latest full year considered for the FY25 base year estimation

5.9 As a validation, the FY26 was estimated using SCF (Seasonality Correction Factor) based on ten months of FY26 data where the adopted FY26 AADT (FY26A) is within ~0.5% of the AADT arrived using SCF approach.[18] This validates the robustness of the approach used to estimate the FY26 base AADT. The SCFs used in our analysis have been explained in the subsequent section.

5.10 The methodology is represented using the below schematic:

Figure 5-1: FY26 Base Estimation methodology



Source: Steer Analysis

5.11 The two key inputs to estimate the base year FY26 traffic are FY25 traffic and seasonality correction factor (SCF).

Seasonal Correction Factors

5.12 Traffic on any Asset varies on a month-on-month level. Such variations maybe due to monsoons (typically Jul to Sept) or due to festivals in a particular region. For e.g. It is observed that typically the truck traffic during the first half of the financial year (April-September) is generally lower than the annual average, mainly because of peak summer season followed by monsoons affecting the freight movement patterns in large parts of the country in the July-September period. In addition to these, there may be other seasonal variations specific to the Asset.

5.13 To normalise for these variations across the year to provide an AADT estimate, Seasonality Correction Factors (SCF) are used. SCFs are estimated to convert the monthly traffic numbers to an AADT level while accounting for seasonal variation due to local/national festivals, weather changes and/or temporary external impacts. These are typically estimated using historical data for each plaza and vehicle category over multiple years. An SCF >1 means that the traffic for the month is lower than the annual average and vice-versa.

[18] *SCF- SCFs are estimated to convert the monthly traffic numbers to an AADT level while accounting for seasonal variation due to local/national festivals, weather changes and/or temporary external impacts.*

5.14 To achieve this, we studied the seasonality between monthly average daily traffic (MADT) – We have analysed the seasonality trends between monthly average daily traffic (MADT) and AADT for data during the historical years of tolling excluding the years that were impacted by specific events. This averaged seasonality trend is then applied to the monthly traffic to obtain AADT as mentioned in the previous sections.

5.15 The seasonality factors assumed for individual vehicle types are shown in the table below.

Table 5.1: SCF values for WUPTL

Vehicle Category	Apr	May	Jun	Jul	Aug	Sep	Oct	Nov	Dec	Jan	Feb	Mar
CJV	0.94	0.87	0.79	1.25	1.14	1.13	0.99	0.93	1.03	1.15	1.00	0.98
LCV	0.94	0.86	0.91	1.15	1.11	1.02	0.98	1.00	1.04	1.10	0.96	1.02
Bus	1.01	0.92	0.90	1.22	1.04	1.00	0.97	0.97	1.03	1.09	0.97	0.96
2A	1.01	0.92	0.90	1.22	1.04	1.00	0.97	0.97	1.03	1.09	0.97	0.96
3A/MAV	0.95	0.98	0.98	1.27	1.01	1.06	1.04	1.04	0.97	0.98	0.90	0.91

Source: Steer analysis based on benchmarks

Adopted base estimates

5.16 Based on the above methodology and inputs, the adopted base for the toll plaza has been shown below:

Table 5.2: Adopted base estimates: WUPTL TP1

Vehicle	FY25	FY26YTD	FY26A	FY26A vs FY25
CJV	30,592	30,834	30,602	0.0%
LCV	1,033	990	976	(5.6%)
Bus/2A	2,646	2,659	2,670	0.9%
3A/MAV	1,446	1,306	1,349	(6.7%)
Total	**35,717**	**35,789**	**35,597**	**(0.3%)**
PCUs	**45,112**	**44,842**	**44,770**	**(0.8%)**

Source: Steer analysis: FY25 actual full year, FY26YTD includes 6 months of data till Sept'25, FY26A is adopted base for FY26

5.17 As can be seen from Table 5.2 above, the comparison between FY26A and FY25 highlights flatlining and degrowth across all vehicle categories. The PCU growth from FY26A compared to the complete year FY25 is -0.8%, while at an AADT level the growth is -0.3%.

5.18 MAVs observed a decline of 6.7% from FY26 over F25. This primarily is due to the shift of traffic originating from Farukhnagar/Bahadurgarh and north-west bound traffic since the since the completion of the 4-lane construction of the Baghpat–Shamli-Muzaffarnagar section in FY24 which previously used to travel via our Asset.

5.19 This increase in Buses and 2As, reflects the nature of the Asset as a facilitator for both tourism-related traffic, as well as movement of key commodities contributing to the

state's economy – such as agricultural products, sand, and manufacturing items. Heightened tourism and pilgrimage activities towards destinations like Haridwar, Rishikesh, and Dehradun, driving growth in CJVs and Buses is expected to continue contributing to traffic on the Asset in the upcoming years.

Estimation of background elasticities

5.20 Elasticities, in the case of traffic growth, are the relationships between traffic growth and the growth in growth drivers of traffic. Multiplied with forecasts of growth drivers like GDP or GSDP, they provide the forecasts of background traffic growth rates.

5.21 As the TMS data did not provide a breakup between the individual vehicle categories for the toll categories 2A/Bus and 3A/MAV, we have used TVC data of FY21, as discussed in Chapter 3, to estimate the splits in FY25. Table 5.3 presents the splits which have also helped in the elasticity estimation. However, in our regression analysis, we have used the combined traffic as data for historical years which were available only in combined form.

Table 5.3: Split between individual vehicle types

Vehicle type (for toll)	Vehicle type (for growth)	Share (%)
Bus/2A	Bus	77%
	2A	23%
3A/MAV	3A	33%
	MAV	67%

Source: Steer analysis of independent TVC data

5.22 The below table presents the growth drivers identified to model the forecast background traffic growth rates.

Table 5.4: Identified growth drivers to model traffic growth.

Vehicle type	GDP India	GSDP Uttar Pradesh
Car		100%
LCV		100%
Bus		100%
2A		100%
3A	100%	
MAV	100%	

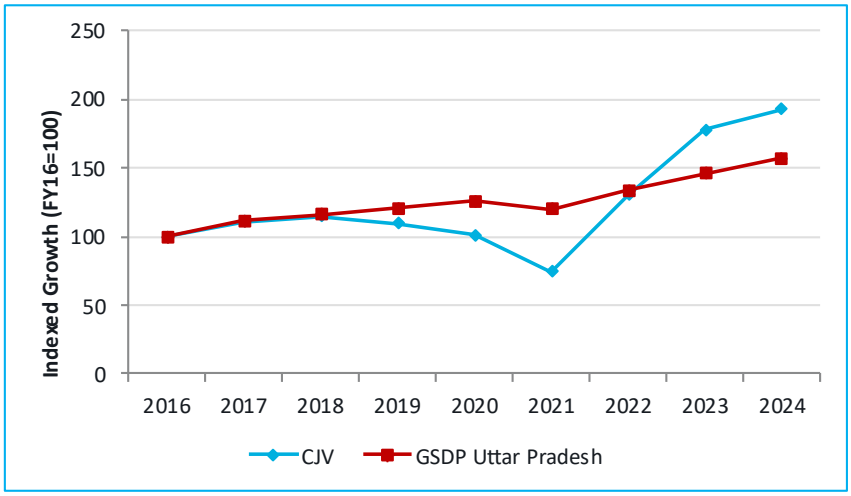
Source: Steer analysis of Client data

5.23 Please note that given that the historical period before FY17/ FY16 is chequered with several impacts due to network developments and a ban on sandmining, especially for commercial vehicles, only a few unaffected years were available for the regression analysis. This, along with the understanding gained of changes in the ecosystem of the traffic growth drivers, is the reason for differences between the derived and assumed elasticities.

CJV

5.24 We can see from the OD data recently conducted in FY24 that the CJVs primarily cater to regional movements related to tourism within the Delhi NCR region, western Uttar Pradesh, and Uttarakhand. More than 60% trips have one end in Uttar Pradesh. We have therefore taken GSDP of Uttar Pradesh to be the growth driver to model the growth of CJV traffic. Figure 5-2 shows the relationship between indexed values of CJV traffic and Uttar Pradesh's GSDP.

Figure 5-2: Relationship between CJV traffic and Uttar Pradesh's GSDP



Source: Steer analysis of Client TMS data and publicly available GDP/GSDP data

5.25 Generally, we would expect that in fast-growing economies with relatively low car ownership levels, car traffic growth rates are often in line with or slightly higher than growth in GSDP/GDP (i.e. suggesting elasticities at or just above 1.0). Further, there is an expected increase in car ownership proportion of overall population as the economy grows. This assumption is very contextual and subject to change as there are changes in economic policies of government and overall economic stability nationally and globally.

5.26 Historically, the CJV traffic on the Asset has shown positive slower growth until FY18, and after the pandemic-impacted years of FY20 and FY21, a consistent upturn in traffic has been observe. Historical growth of Cars has been slower to 3% between FY16-19 and jumped to 8.6% between FY16-24.

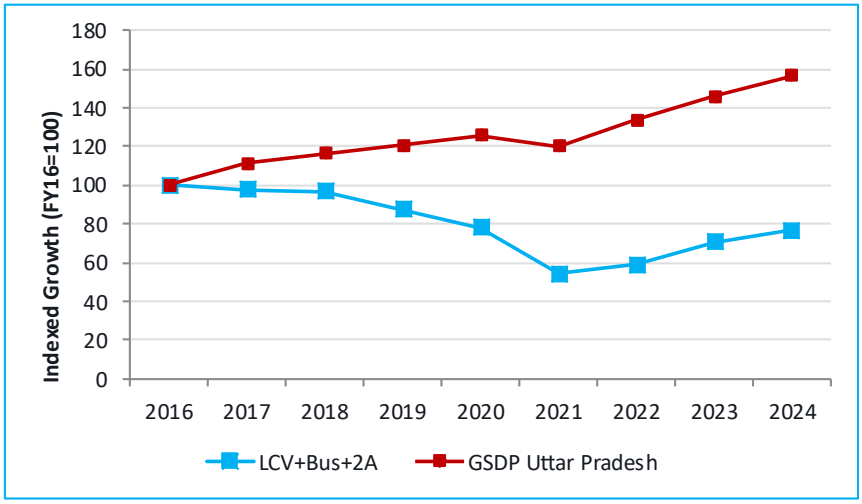
5.27 The regression analysis suggests that between FY16 and FY24 traffic has grown with a background traffic growth elasticity of 0.9 with respect to GSDP on the Asset. Taking note of the positive outlook for passenger traffic on the Asset, driven by improved connectivity for business and leisure trips, and a benchmark toll road in the region, we have assumed a forecast background elasticity of 1.0 for CJV going forward.

LCV, 2A and Bus

5.28 Compared to heavy vehicles like 3A and MAV, LCV, 2A and Bus have more regional movements within the state - Uttar Pradesh in this case as seen in the OD data analysis more than~50% share. More than 60% of LCVs and 2A trucks have one of their trip ends in Uttar Pradesh. We have therefore taken GSDP of Uttar Pradesh to be the growth driver to model growth of LCV, 2A and Bus traffic.

5.29 The Bus and 2A were combined due to same toll rates. Figure 5-3 figure shows the relationship between indexed values of LCV+2A+Bus combined traffic and Uttar Pradesh's GSDP. LCVs have witnessed a dropping trend 11% degrowth in FY16-24, with shift between LCV and 2A. The traffic up to FY20 was also impacted by the Upper Ganga Canal and local leak, which were easily accessible by the small vehicles like LCV.

Figure 5-3: Relationship between LCV, Bus and 2A combined traffic and Uttar Pradesh's GSDP



Source: Steer analysis of Client TMS data and publicly available GDP/GSDP data

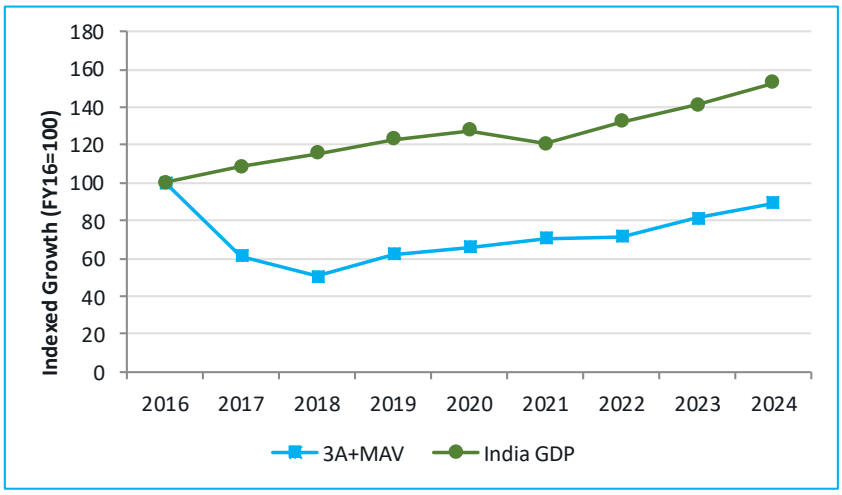
5.30 Around 60% of the bus trips have one end on the Asset or around it. Based on our experience across the country, buses in corridors with tourism-driven passenger growth show moderate elasticities of 0.4 to 0.6. However, with the regression Bus and 2A combined show an elasticity of 0.3. With increasing tourism activity in the region higher growth for bus can be assumed.

5.31 Based on benchmark elasticities from other toll roads, we have therefore assumed a forecast elasticity of 0.2, 0.5 and 0.6 for LCV, Bus and 2A respectively, with respect to GSDP of Uttar Pradesh.

3A/MAV Trucks

5.32 Compared to lighter trucks like LCV and 2A, 3A and MAV have more national or long-distance movements covering several states. Given that manufacturing-related commodities tend to take prominence in their commodity distribution which means that traffic growth in 3A and MAV is dependent on industry demand-supply ecosystems spread across the country, therefore we have taken GDP as the growth driver to model the traffic growth in 3A and MAV. Figure 5-4 shows the relationship between indexed values of 3A+MAV combined traffic and India's GDP.

Figure 5-4: Relationship between 3A+MAV combined traffic and India's GDP



Source: Steer analysis of Client TMS data and publicly available GDP/GSDP data

5.33 Due to new mining policy regulated and licences being given out for sandmining in the Saharanpur region, the negative impact of previous mining bans and the pandemic on 3A + MAV movement was offset. The growth CAGR for 3A + MAV between 2022-24 has been 11.8%, compared to a degrowth of 14.7% between 2016-19

5.34 As discussed earlier in the chapter, the TMS system reports 3A and MAV traffic as a combined category. We have therefore taken a proportional split based on our TVC counts to provide an understanding of how 3A and MAV will grow relative to each other. We believe 3A to grow slower as compared to MAV, as there is an increasing preference seen for MAVs instead of 3As for long-distance movements. This is because MAVs have higher load capacity which generate economies of scale and therefore lower costs. However, it is unlikely that 3A trucks will disappear from the market completely as there are likely certain commodities or movements which are best served by 3As.

5.35 Based on all the above observations, we have assumed elasticities of 0.20 and 0.65 for 3A and MAV trucks, respectively.

Forecasts for background elasticities

5.36 Table 5.5 presents a summary of the results of the regression analysis carried out on the historical toll plaza data and the macroeconomic (GDP/GDSP) growth, along with the assumed forecast elasticities for background traffic growth.

5.37 Given the nascent stage of India's logistics sector, characterized by a highly fragmented trucking industry (95% of operators owning fewer than five trucks) and low car ownership rates (30-35 per 1000 people), the forecast elasticities are projected to remain constant throughout the concession period. This assumption is grounded in historical trends and a long-term perspective on regional and national growth, suggesting market maturity is still several years away.

Table 5.5: Derived elasticities from regression analysis and assumed forecast elasticities for economic growth

Vehicle type	Growth driver	TP1 Siwaya			
		History		Forecast	
		Derived elasticity	Years considered	Assumed forecast elasticity	Evolution of elasticity
Car	GSDP Uttar Pradesh	0.68	FY14-24	1.10	No change
LCV	GSDP Uttar Pradesh	N.A*	FY14-24	0.20	No change
Bus	GSDP Uttar Pradesh	0.41	FY14-24	0.50	No change
2A	GDP			0.80	No change
3A	GDP	1.10	FY14-25	0.20	No change
MAV	GDP			0.65	No change

Source: Steer analysis of Client data; *elasticity not representative and shows insignificant results; #regression was run on 2A-Bus and 3A-MAV combined; ##FY26 is the base year AADT, with 6 months of actual traffic data (April – Sept)

5.38 In recent historical traffic performance across all national highway corridors, a notable trend has emerged: there is a discernible shift in axle preference towards 2As and MAVs, resulting in a dampening effect on the growth of 3As. This trend is mirrored in the Assets FY23 and FY24 performance as well, which has been discussed in detail in the subsequent sections. Because of these evolving axle preferences, it has been assumed that the relationship between 3As and GDP will be relatively muted at 0.2, whereas 2As and MAVs are expected to grow more closely in line with the country's GDP at 0.6 and 0.65, respectively.

6 Forecasts: Network overlays and forecasts

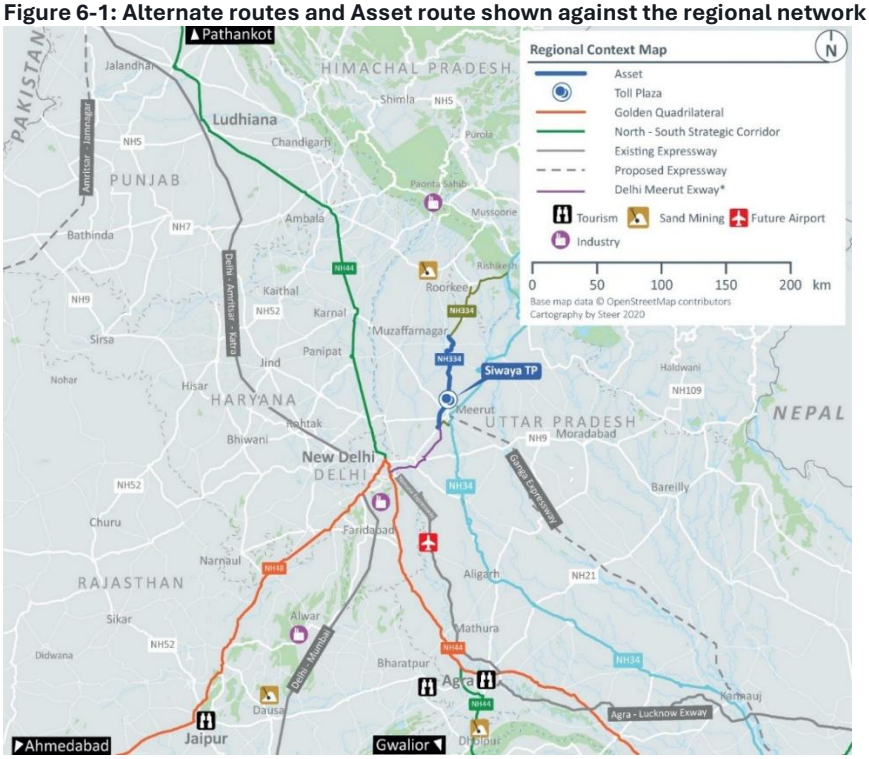
Introduction

6.1 Following the discussion on our forecast of economic growth rates in the previous chapter, this chapter first covers the forecasting assumptions around base year AADT and potential network impacts on traffic growth on the Asset. Thereafter, we present our assumptions around toll segmentation, trip factors and growth of toll rates for the forecast period which have been used to forecast revenues as derived from forecast traffic. This chapter summarises traffic growth rates for the forecast years.

Analysis of potential network/developmental impacts

6.2 The section below details the impacts which we believe would affect traffic on the Asset during the concession period. As discussed earlier in Chapter 2, to assess the impacts on the Asset, whether positive or negative, we have studied developments (alternate roads, feeder roads and regulatory) in the surrounding road network.

Figure 6-1: Alternate routes and Asset route shown against the regional network context



Source: Steer analysis and cartography

6.3 Table 6.1 presents the network/other developments, corresponding alternate/feeder routes, year of completion and indicative direction of impact on the Asset.

Table 6.1: List of network/other developments

S. No.	Development	Route affected	Year of completion	Impact (+/-)
1.	Ganga Expressway	Asset route: Haridwar-Asset-Ganga Expressway-Prayagraj Alternate route: Haridwar-Moradabad-Bareilly-Sitapur-Prayagraj	FY27	+ve
2	Delhi-Dehradun Expressway	Asset Route: Delhi- Baghpat (EPE)- Sahranpur-Dehradun Alternate Route: Delhi- Meerut- Muzaffarnagar-Sahranpur- Delhi	FY27	-ve

Source: Steer analysis *as per Client inputs

Ganga Expressway

6.4 Ganga expressway is a greenfield six-laned expressway (expandable upto 8 lanes) of length 594 kms connecting Meerut to Prayagraj in the State of Uttar Pradesh. The expressway is expected to reduce travel time between NCR, Meerut and Prayagraj substantially and would help in decongesting the existing road network. This would be an access-controlled expressway and is proposed to have 17 entry/exit points.

6.5 As on date, construction works are progressing at brisk pace on all packages of the Expressway, and it is 81% complete overall as per information available on UPEIDA website[19]. The expressway is divided in 4 different packages considered as 4 concessions as presented below:

Table 6.2: Details of Ganga Expressway (Phase I)

Package	Description of sections	Length (kms)	Expected timeline for completion	Awarded
Package 1	Meerut-Hapur (49 km) Hapur to Amroha (30 km) Amroha to Budaun (51 km)	130	FY27	IRB Infrastructure Developers Ltd.
Package 2	Budaun villages Naglabarah to	152		Adani Enterprises Ltd.

[19] https://upeida.up.gov.in/en/page/ganga-expressway

Package	Description of sections	Length (kms)	Expected timeline for completion	Awarded
	Binawar (52 km) Budaun-Shahjahanpur (47 km) Shahjahanpur-Hardoi (53 km)			
Package 3	Hardoi- Unnao (156 km)	156		
Package 4	Hardoi-Prayagraj (157 km)	157		

6.6 Ganga expressway is proposed to extend to Tigri on the UP-Uttarakhand border in north and to Ballia near Varanasi in the east. This alignment would run parallelly to NH19 and would offer direct connectivity from the North to Varanasi and East via Moradabad-Bareilly- Sitapur serving as an alternate.

6.7 As per its latest alignment, Delhi Meerut expressway is expected to intersect with Ganga Expressway which can provide an alternate faster route to traffic currently plying between Haridwar and north in Uttarakhand and Lucknow in eastern UP. Passenger traffic can therefore alternately travel from Haridwar through Muzaffarnagar and Meerut (Asset section) and further south eastwards through the Delhi-Meerut and Ganga Expressways to reach Prayagraj (Allahabad) with much higher levels of service and speeds.

6.8 Our estimates of the positive impact after completion of Ganga Expressway is presented below:

Table 6.3: Diversion impact due to Ganga Expressway

Vehicle type	FY27
Staging	*80%*
CJV	1.3%

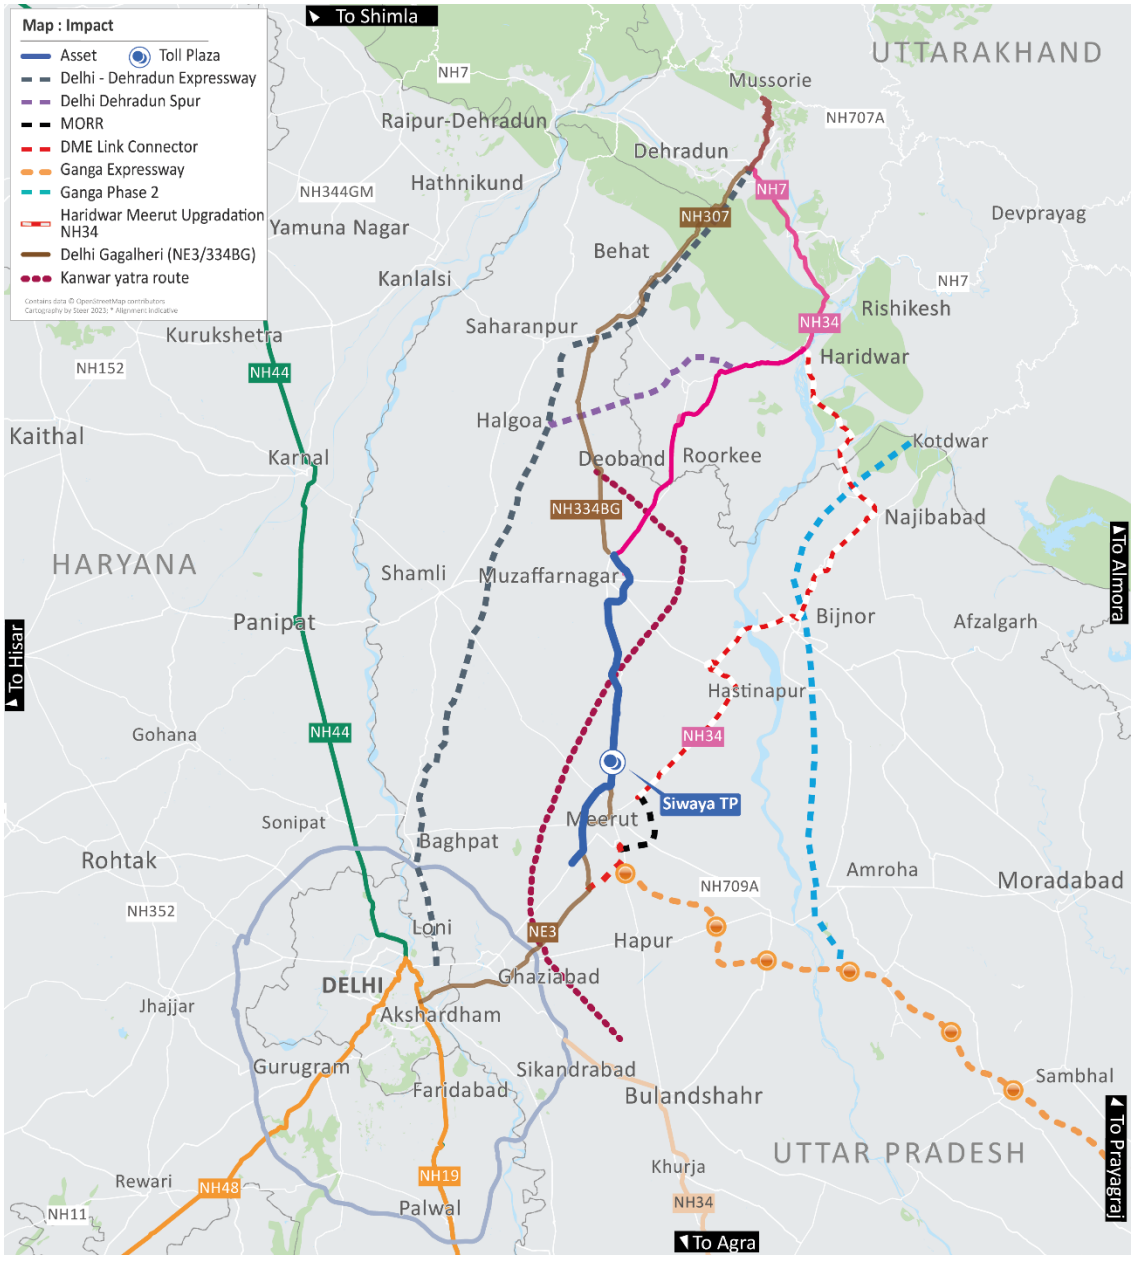
Source: Steer Analysis

Delhi- Dehradun Expressway

6.9 NHAI is executing a 210km access controlled expressway connecting Delhi & Dehradun. This expressway is a mix of both greenfield & brownfield alignment. As on date all the contracts have been awarded and the work is progressing at a rapid pace and is expected to be operational by end of 2025[20] as per latest reports, then impact is assumed from FY26 onwards. The expressway is divided in 4 different phases as presented below:

[20] **English Releases**, Press Information Bureau, Government of India, May 2025

Figure 6-2: Alternate routes and Asset routes shown against the regional network context



Source: Steer analysis and cartography

Table 6.4 Details of Delhi- Dehradun Expressway

Phase	Description of sections	Length (kms)	Expected timeline for completion	Nature of Development
Phase 1	Aksharadham (Delhi) to Baghpat Interchange (EPE)	32	FY27	Brownfield
Phase 2	Baghpat to Saharanpur (This section will feature 7 interchanges)	118		Greenfield
Phase 3	Sahranput to Ganeshpur	40		Brownfield
Phase 4	Ganeshpur to Dehradun (This section will consist of 2.322 km twin tunnels and 0.3 km	19.5		Brownfield

Phase	Description of sections	Length (kms)	Expected timeline for completion	Nature of Development
	approach, 4.82 km 4 lane elevated flyover with 6m vertical clearance for elephants and other wildlife, a 2.12 km hill section and 340m single tube tunnel.)			

6.10 The expressway once operational will have an impact on Delhi/NCR bound traffic travelling to Dehradun, Mussorie and Uttarkashi. Our estimates of the impact due to the expressway are presented below:

Revenue forecasting assumptions

6.11 To forecast the revenues for a particular year, the traffic forecast for each vehicle type is converted into tickets sold, which is then multiplied with the corresponding toll rate. While toll segmentation provides the breakup of trips paying each ticket type, trip factors provide the conversion factor to convert from traffic (trips) to tickets sold. This section discusses assumptions related to toll segmentation, trip factors and toll rates for the forecast period.

Toll segmentation

6.12 The Ministry of Road Transport & Highways has finalized a compensation formula for existing toll concessionaires to offset revenue loss from the Annual Pass scheme for non-commercial vehicles. To access the document, refer to the following **link**.

6.13 Across multiple assets, the number of passes sold has observed to be rising on a day-to-day basis, indicating an early adoption among frequent users since its introduction on 15th August 2025 till 30th September 2025, and a corresponding decline in other ticket categories mainly in the single and return categories. The evolution of proportion of users using the annual pass up to September 2025 is presented below:

Table 6.6: Evolution of annual pass trips (15th August to 30th September 2025)

	15th to 31st Aug	1st to 15th Sept	16th to 30th Sept
Siwaya	13.6%	22.2%	27.2%

Source: Steer analysis of Client TMS data

6.14 CJV Segmentation for FY26 has been developed using the pre annual pass segmentation till 14th August 2025, and daily Annual Pass transaction data from 15th August 2025 till 30th September 2025. Post September 2025, a gradual ramp up is assumed such that

they form a large portion of the CJV trips by the end of FY26. This corresponds to a reduction in a proportionate decrease in single and return trips. For FY27 and beyond, we have assumed the share of annual pass trips to be in line with that observed at the end of March 2026, by when we believe the distribution of ticket categories in CJVs should stabilise.

6.15 In FY26, the share of CJVs using annual passes at Siwaya is projected at **19%** (on an annual basis) with a March 2026 estimate of around 38%, which from FY27, expected to stabilize at March'26 levels.

6.16 For other vehicle categories we have analysed the historical TMS data split by ticket categories, to understand trends, as shown in Chapter 3. For the traffic and revenue forecast, FY26YTD (Apr- Aug) as discussed in the earlier sections, can be considered a normal period.

6.17 The table below provides the toll segmentation assumed for the period of forecast. We believe with FASTag penetration stabilising and reaching upto 100% in MAVs and minimal impact of COVID-19 during these months, FY26YTD segmentation provides us with stable toll segmentation which can be used for the forecast years.

Table 6.7: Toll segmentation for FY26 onwards at TP Siwaya

Forecast	CJV FY26	CJV FY27	Mini-LCV	LCV	Bus/2A	3A/MAV
Single	58%	39%	77%	95%	98%	97%
Local commercial	0%	0%	0%	2%	1%	3%
Local personal	3%	3%	3%	-	-	-
Exemptions	20%	20%	20%	3%	1%	1%
Violations	0%	0%	0%	0%	0%	0%
Annual Pass	18.7%	37.8%				

Source: Steer analysis of Client TMS data

6.18 The Annual pass compensation is separately calculated using the formula prescribed by NHAI in the same circular. Following Table 6.8 presents the Annual pass compensation computed for the toll plaza.

Table 6.8: Annual pass compensation for CJVs (in Crore)

Toll Plaza	FY26	FY27
Siwaya	22.8	44.2

6.19 Source: Steer Analysis

Trip factors

6.20 Trip factors are used to calculate the revenue for the trips made on passes such as return, local personal, monthly passes. The trip factors assumed are based on the latest FY25 data available and listed in the table below:

Table 6.9: Trip factors on at TP Siwaya

Forecast	CJV/Mini-LCV	LCV	Bus	2A	3A	MAV
Single	1	1	1	1	1	1
Return	2	2	2	2	2	2

Forecast	CJV/Mini-LCV	LCV	Bus	2A	3A	MAV
Monthly	45	45	45	45	45	45
Local commercial	1	1	1	1	1	1
Local Personal	1	1	1	1	1	1

Source: Steer analysis of Client TMS data

Toll evolution

6.21 Based on the concession agreement and the gazetted toll notification, we understand that base toll rates increase every year (revision month is July) based on WPI-linked inflation. These are rounded up to the nearest five to estimate the final toll rate charged to users.

6.22 We have used actual toll rates from the FY25 toll notifications and latest print WPI for the month of March'25[21] for FY26 to validate the modelling of future toll evolution. Increase in WPI was calculated based on the Client's WPI forecasts, as shown in Table 6.10 below. The upward trend in inflation is expected to continue in the medium term, before gradually tapering to 5.0% by FY28.

Table 6.10: WPI growth forecast assumptions

Financial year	WPI growth (%)
FY26	2.05%
FY27	2.4%

Source: Client inputs used for WPI FY27 onwards.

Revenue reconciliation

6.23 As part of the validation process to test our model, we have carried out a revenue reconciliation exercise where we compare actual reported revenue against the modelled revenue. For the Asset we have reconciled reported revenue for the FY26YTD with the modelled revenue based on FY26YTD MADT and forecast assumptions on toll segmentation, trip factors and toll rates.

6.24 The comparison, as shown in Table 6.11 below, shows that modelled revenue overall is within a variation from the reported revenue. This gives us confidence that the revenues estimated using the traffic data in our forecasts are accurately representing the revenues being reported from the Asset.

Table 6.11: Revenue reconciliation summary for FY25

Steer modelled daily revenue (INR lakhs)	Reported daily revenue (INR lakhs)	Difference (%)
47.56	47.57	-

Traffic and Revenue forecasts

6.25 Based on the traffic and revenue-related forecast assumptions discussed above, we have modelled the traffic and revenue forecasts for the concession period for the Asset. The table below presents the AADT/PCU forecast and CAGRs on this Asset. Further, Annexure B presents year-wise AADT, traffic growth rates and revenues for the forecast period till FY45.

Table 6.12: Traffic forecasts (with impacts) AADT forecast for TP Siwaya

Vehicle Type	FY26	FY27	FY27 vs FY26
CJV	29,082	27,845	(4.3%)
Mini LCV	1,520	1,568	3.2%
LCV	976	933	(4.3%)
Bus	2,285	2,358	3.2%
2A	384	374	(2.6%)
3A	439	398	(9.4%)
MAV	910	860	(5.5%)
AADT	**35,597**	**34,337**	**(3.5%)**
PCU's	**44,770**	**43,395**	**(3.1%)**

Source: Steer analysis

Table 6.13: Revenue forecast (INR crores) for TP Siwaya including annual pass compensation for CJVs

Vehicle Type	FY26	FY27	FY27 vs FY26
CJV	92.3	89.4	(3.1%)
Mini LCV	4.8	5.0	4.3%
LCV	6.7	6.6	(2.0%)
Bus	32.2	34.1	5.8%
2A	5.4	5.4	(0.1%)
3A	10.0	9.2	(7.3%)
MAV	20.6	19.9	(3.3%)
Total	**172.1**	**169.8**	**(1.4%)**

Source: Steer analysis

6.26 As presented in the table above, the growth between FY26-FY27 in terms of AADT and PCUs for the traffic forecasts (with impacts) is (3.5%) and (3.1%) respectively.

Upside and Downside cases

Upside and Downside scenario assumptions

6.27 We have developed our base case scenario considering a balanced view on the risks associated with input assumptions around GDP growth and traffic growth elasticities. There is always a risk that the outturn values of these inputs will vary as compared to the assumptions taken due to exogenous impacts, e.g. GDP growth could be influenced both positively and negatively by the impact of monsoons, export-import balances, political changes etc.

6.28 Similarly, traffic growth elasticities could be influenced by increased efficiencies achieved by technology, large shifts in commodity prices globally, changes in local manufacturing practices. However, at this stage we consider that the base case represents a central case scenario given the risks of variation of input assumptions.

6.29 To account for the possible variations in the growth drivers, we are also presenting an Upside (optimistic) and a Downside (pessimistic) scenario. These scenarios are defined by the following variations from the base assumptions:

Table 6.14: Summary of Macro-economic Assumptions for upside and downside cases

Input	Upside	Downside
Macro Assumptions		
GDP/GSDP	+1% every year	-1% every year
WPI	+1% every year	-1% every year
Elasticities	+ 10%	- 10%

Source: Steer analysis

Impacts-Upside Case

6.30 The upside case impacts included in forecasts are summarised in below.

Table 6.15: Summary of impacts on the Assets

Development	Year of impact	Change in impact w.r.t base case	Magnitude of impact
Ganga Expressway	FY27* (80% of the full impact considered)	+25% of base case	CJV: 1.6%
Delhi- Dehradun Expressway	FY27* (80% of the full impact considered)		CJV: (11.0%) LCV: (8.7%) 2A: (9.2%) 3A: (13.2%) MAV: (11.7%)

Summary Outlook

6.33 Overall, the Asset serves a diverse traffic base, encompassing both regional passenger movement between urban centres in Uttar Pradesh and Central National Capital Region (Delhi), and significant tourism traffic heading to Uttarakhand. Goods traffic on the Asset is predominantly driven by regional industries such as sugar mills, paper, and construction-related movements, which have demonstrated a recovery.

6.34 While historically, network developments like the Upper Ganga Canal (UGC) Road caused diversions away from the Asset and its toll plaza, the UGC Road is no longer considered a competitor since the commissioning of the feeder Delhi-Meerut Expressway. Similarly, a local micro-diversion road around the Siwaya toll plaza, which allowed some users to bypass the toll activates as an when the road gets built, no further impact of the alternate road has been assumed.

6.35 The commissioning of the Delhi Meerut Expressway in April 2021 has already led to a significant increase in traffic volumes on the Asset since FY23, particularly boosting CJV and Bus traffic due to improved connectivity and increased tourism activity. Looking ahead, the upcoming Ganga Expressway, expected to be complete in FY27, is anticipated to bring additional traffic to the Asset. This is projected to create a positive diversion from the competing Moradabad-Bareilly-Sitapur route for traffic traveling from Haridwar to Prayagraj, owing to the improved speeds and service levels of the combined expressways. However, the construction of the Delhi-Dehradun Expressway, expected to be completed by FY27, is a parallel competing route that may negatively impact traffic on the Asset.

6.36 Despite some diversionary impacts, the overall outlook for the region and the Asset remains positive. This is largely due to the Asset's strategic position as the primary route on the tourism corridor connecting Delhi NCR with Uttarakhand, a key hill station state in Northern India with numerous destinations. Further investments in Uttar Pradesh's infrastructure landscape are also expected to drive additional traffic onto the Asset. Our findings and estimates in this report are based on our understanding from the site visit, analysis of primary data available both from surveys and the toll management system (both historical and current), macroeconomic assumptions prescribed by Client, feedback from Client meetings and secondary publicly available data. There can be both positive and negative risks associated with assumptions and the forecasts using them as summarised below.

B Data Collection exercise

B.1 In order to validate and inform various inputs used in our forecasting, we undertook primary data collection on the Asset. OD survey data was collected on behalf of the Client, TVC surveys were commissioned by Steer with a third party. OD data collection typically involves manual data entry by enumerators based on oral surveys with road users crossing toll plazas. TVC data collection involves video-graphic capture of traffic passing crossing the toll plazas, followed by manual counting.

7-day TVC counts

Table B.1: 7-day TVC counts at TP Siwaya

1 Executive Summary

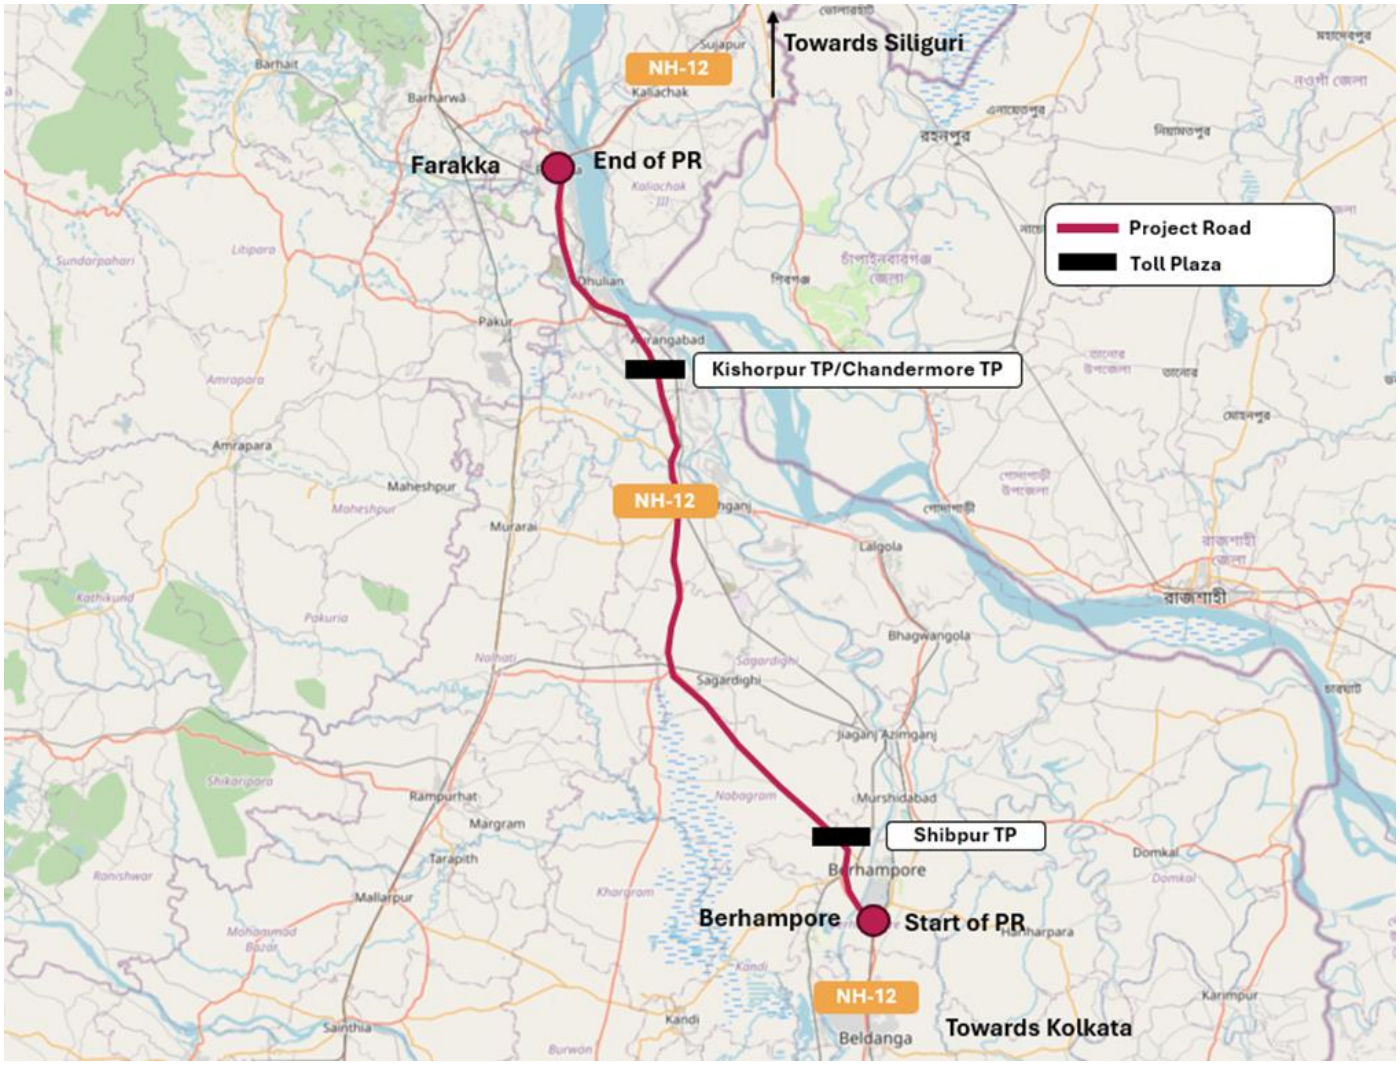
1.1 Project Details

M/s Cube Highways Trust (hereinafter “the Client”) as sponsor has appointed M/s CRISIL Limited (hereinafter referred as “Technical Consultant”) to carry out Traffic and Revenue Due Diligence of operational asset of Behrampore to Farakka section of NH-12 in the state of West Bengal (herein after refer as “the Project”) which is being operated by “M/s **Behrampore-Farakka Highways Limited**" (hereinafter refer as “the Concessionaire or Company or BFHL”).

1.2 Asset Overview

Project road Berhampore to Farakka is a four lane, 90kms long stretch, on NH-12. The project stretch has two toll plazas located at Km 206 near Berhampore and Km 260 near Kishorpur. Key cities and villages along the route include Berhampore, Morgram, Umarpur and Farakka.Project Road connects Kolkata, the state capital, with Siliguri and Darjeeling, which are major tourist attractions.

Figure 1-1: Project Road

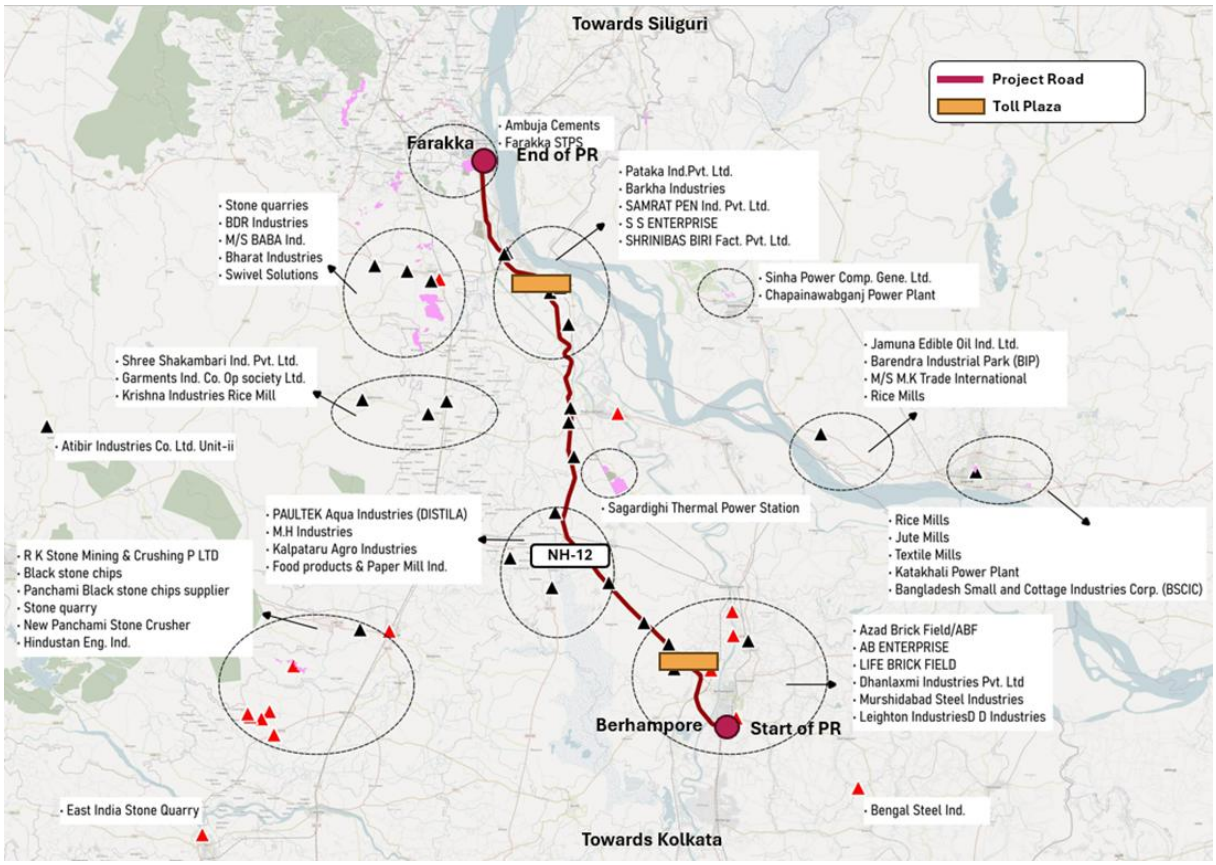


Source: Open Street Map, Crisil Intelligence

Salient growth features and traffic generators

Project section part of NH-12 stretches from Dalkhola in the northern part of West Bengal to Bakkhali in the south, linking all significant hubs within the state. The project section is located near numerous rice mills and is situated in a region of India where rice is the predominant crop. The areas of Bardhhaman, Hooghly, Birbhum, Parganas, and Murshidabad are known as rice-producing regions. Fruits, Vegetables, and Fish: Ina addition project influence area around the project section are agricultural zones for fruits such as mangoes and bananas, cash crops like jute, as well as vegetables and fish, which are distributed to nearby areas and consumption centres in Northeast India and Kolkata. The main commodity being transported along the project section include stone aggregates and sand, sourced from Nalhati, Rampurhat, Pakur, and Sainthia, mainly directed towards Kolkata, Siliguri, and Bangladesh. The aggregates are extracted from the mining areas of Nalhati and Pakur, as well as villages in the Rampurhat subdivision of Birbhum District. Asansol and Sainthia are the principal sources of sand, which is obtained from the sand beds along the Hooghly riverbed. Also, around the project influence area there are significant industrial establishments, the National Thermal Power Corporation (NTPC) operates a thermal power plant in Farakka, while Ambuja Cement, a leading cement manufacturer in India, has a facility also located in Farakka. Jangipur features a large food processing park adjacent to the BFHL section. The Industrial Park in Behrampore serves as a vital manufacturing centre, with Additionally, the Kalyani Industrial Park (SEZ) has been established with units that produce electronics, tools, and spare part. The location of industries and economic centers around the project corridor is presented below

Figure 1-2: Industrial and economic influence around the project section

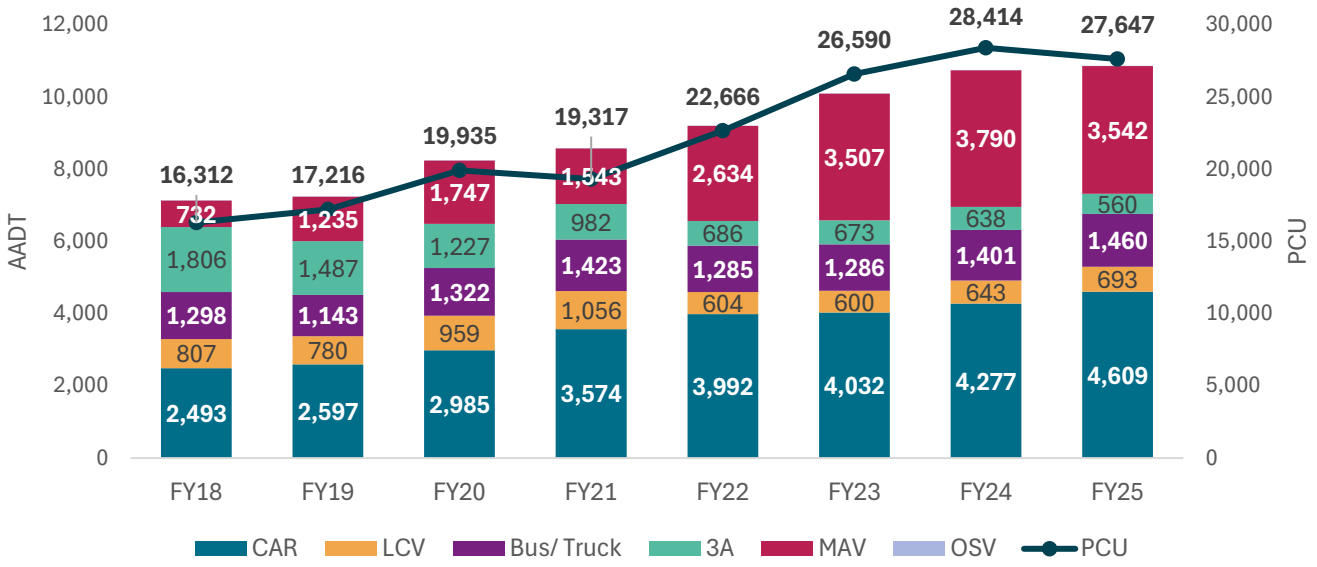


Source: Open Street Map, Crisil Intelligence

1.3 Historical traffic data

Mode wise traffic from April-2017 till Oct-2025 was made available by client. Historical AADT for the toll plazas is presented below

Figure 1-3: Historic Annual Average Daily Traffic (AADT) -TP01

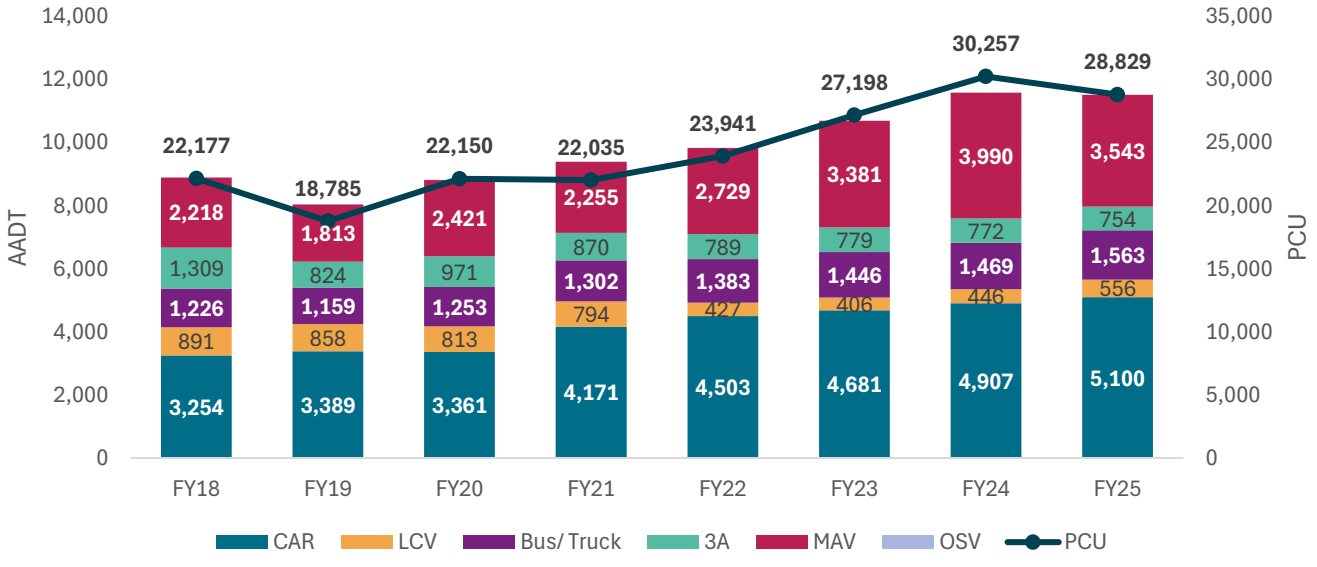


Source: Client Data, Crisil Intelligence

- TP01 is largely influenced by CJV traffic, which is plying mostly between Malda, Farakka, Behrampore and Kolkata, it accounts to about 43 percent followed by MAV which accounts to about 32 percent of the total tollable traffic in FY25.

- The plaza in terms of PCUs has observed to be grown at 8.2 percents for the period FY25 vs FY19.

Figure 1-4: Historic Annual Average Daily Traffic (AADT)-TP02



Source: Client Data, Crisil Intelligence

- TP02 is largely influenced by CJV traffic, which is plying mostly between Malda, Farakka, Behrampore and Kolkata, it accounts to about 44 percent followed by MAV which accounts to about 31 percent of the total tollable traffic in FY25.

- The plaza in terms of PCUs has observed to be grown at 7.4 percents for the period FY25 vs FY19.

1.4 Base traffic estimation

For base traffic estimation for the present study, the 7-months (Apr-25-Oct-25) of traffic data for all the two toll plazas were annualized using SCF factor of 7-12 months were derived from the year FY23, FY24 &FY25 for estimating FY26 AADT.

The AADT estimation for the base case for FY26 is presented below

Table 1-1: Base traffic-FY26

TP	Car	LCV	Bus/2A	3A	MAV	PCU
ADT (April-Oct) FY26						
TP01	4,938	778	1,510	512	3,097	26,103
TP02	5,207	622	1,649	698	3,230	27,718
SCF (April-Oct)- Avg of FY23, FY24 & FY25						
TP01	1.01	1.02	1.03	0.99	1.10	
TP02	1.00	1.02	1.01	1.01	1.04	
AADT- FY26						
TP01	4,985	796	1,553	505	3,411	27,704
TP02	5,198	637	1,670	706	3,365	28,429

Source: Client Data, Crisil Intelligence

1.5 Tolling lengths

The tolling lengths for the project section as per concession agreement is presented below

Table 1-2: Tolling Lengths for the project section

Toll Plaza	Chainage	Tolling Length
TP01	Km 206	39.63
TP02	Km 260	50.17

Source: Concession Agreement, Crisil Intelligence

1.6 Traffic Projections

The total traffic projected in terms of PCUs based on most likely growth rates is presented below:

Table 1-3: Traffic projection in terms of PCU for the project section

FY Year	TP01	TP02
2026	27,703	28,426
2027	30,651	30,744
2028	32,646	33,193
2029	33,032	31,808
2030	34,036	33,430
2031	35,098	38,532
2032	36,815	40,412
2033	38,689	42,463
2034	38,951	40,579
2035	40,925	42,620
2036	44,862	49,196
2037	47,109	51,640
2038	49,443	54,173
2039	49,698	51,653
2040	52,141	54,158
2041	57,134	62,495

Source: Crisil Intelligence

TP01 and TP02 traffic in terms of PCUs is projected grow at 4.9 percent and 5.4 percent respectively.

1.7 Revenue Projections

The revenue in ₹ million for the project road is projected to grow at a CAGR of about 9.8 percent for the forecast period from FY26 to FY41 and is presented in the below table.

Table 1-4: Projected Revenue in ₹ million

FY Year	TP01	TP02	Total
2026	1,222.0	849.9	2,071.8
2027	1,400.0	950.8	2,350.9
2028	1,562.8	1,081.0	2,643.8
2029	1,656.3	1,071.8	2,728.1
2030	1,786.5	1,181.6	2,968.1
2031	1,921.9	1,437.5	3,359.3
2032	2,106.1	1,571.6	3,677.7
2033	2,309.1	1,719.1	4,028.2
2034	2,421.2	1,705.2	4,126.4
2035	2,657.6	1,863.3	4,520.9
2036	3,043.1	2,273.8	5,316.8
2037	3,330.2	2,471.2	5,801.4
2038	3,651.1	2,706.7	6,357.8
2039	3,831.4	2,679.6	6,511.0
2040	4,202.6	2,940.8	7,143.3
2041	4,805.9	3,559.9	8,365.8
CAGR (FY26-FY41)	**9.6%**	**10.0%**	**9.8%**

2 Introduction

2.1 Asset Overview

Project road Berhampore to Farakka is a four lane, 90kms long stretch, on NH-12. The project stretch has two toll plazas located at Km 206 near Berhampore and Km 260 near Kishorpur. Key cities and villages along the route include Berhampore, Morgram, Umarpur and Farakka.Project Road connects Kolkata, the state capital, with Siliguri and Darjeeling, which are major tourist attractions. Project section part of NH-12 stretches from Dalkhola in the northern part of West Bengal to Bakkhali in the south, linking all significant hubs within the state. The section serves as the primary access route to the North-eastern states and is a vital artery for West Bengal. Additionally, this corridor is a crucial link to Northeast India. Its closeness to Bangladesh further establishes it as an essential route for international trade.

2.2 Scope

The scope of the traffic assessment for the project road is divided into following four sections.

1. Detailed Assessment of the project road
   Include review of the Historic TMS Data, past traffic growth, detailed network assessment.
2. Primary Data collection & Analysis
   Conducting preliminary traffic surveys like Registration plate and Origin-Destination (O-D) to understand the traffic patterns, commodity profiles.
3. Network Impact Assessment
   To Analyse the upcoming network developments which may impact the project road traffic
4. Traffic and Revenue Projections
   Traffic & Revenue projections considering relevant growth drivers and network developments

Approach & Methodology is detailed out in Traffic Growth Estimation & Traffic forecast chapter.

2.3 Overview of Key Influence Area

The project road entirely falls in the state of West Bengal. A brief description of state profile and key influencing district around the project section is presented below.

Overview of West Bengal State profile

West Bengal is located in the eastern region of India, bordered by Bihar and Jharkhand to the west, Odisha to the southwest, Sikkim and Bhutan to the north, and Assam to the northeast, with the Bay of Bengal along its southern coastline. The state occupies a strategic geographic position, serving as a gateway to Northeast India. Key national highways such as NH-16, NH-19, NH-27, and NH-34 facilitate connectivity between West Bengal and the neighbouring states, supporting both intra-state mobility and long-distance freight movement. Kolkata serves as the primary urban and economic hub, supported by Netaji Subhas Chandra Bose International Airport, which offers a wide range of domestic and international flight services. West Bengal's Gross State Domestic Product (GSDP) for 2024-25 is estimated at approximately ₹ 94,185,372, reflecting steady economic performance with a long-term growth trend supported by robust services and industrial activity. The tertiary sector is the major contributor to the state economy—accounting for over 55 percent—driven by trade, finance, transport, and public services. The secondary sector contributes around 25 percent, supported by manufacturing, metallurgy, petrochemicals, cement, and engineering industries, while the primary sector accounts for the remaining share with agriculture, fisheries, and horticulture being key contributors. The state is rich in natural and industrial resources and hosts significant infrastructure such as the Haldia Port and Syama Prasad Mookerjee Port in Kolkata, which serve as major maritime gateways for eastern and northeastern India. West Bengal also has substantial coal reserves in the Raniganj coalfields and remains one of India's leading producers of tea, contributing significantly to national and global supply chains.

Murshidabad District profile

Murshidabad is located in the central-northern part of West Bengal and shares borders with Bihar to the west and Bangladesh to the east, making it an important administrative and commercial district in the region. The district is strategically positioned along National Highway NH-12, which connects Kolkata with North Bengal and further to Assam. Additional corridors such as NH-14 and state highways enhance linkages with neighbouring districts including Birbhum, Nadia, and Malda. The presence of the Farakka Barrage and its rail-road bridge further strengthen cross-river mobility and freight movement towards North and Northeast India. Murshidabad's economy is driven primarily by agriculture, services, and small-scale industry. The district is a major producer of rice, jute, mango, and silk, with its traditional silk weaving (Murshidabad Silk) being nationally renowned. The tertiary sector has been growing steadily, supported by trade, transport, education, and administrative services. Industrial activity is influenced by the presence of the Farakka Super Thermal Power Project, and agro-processing units.

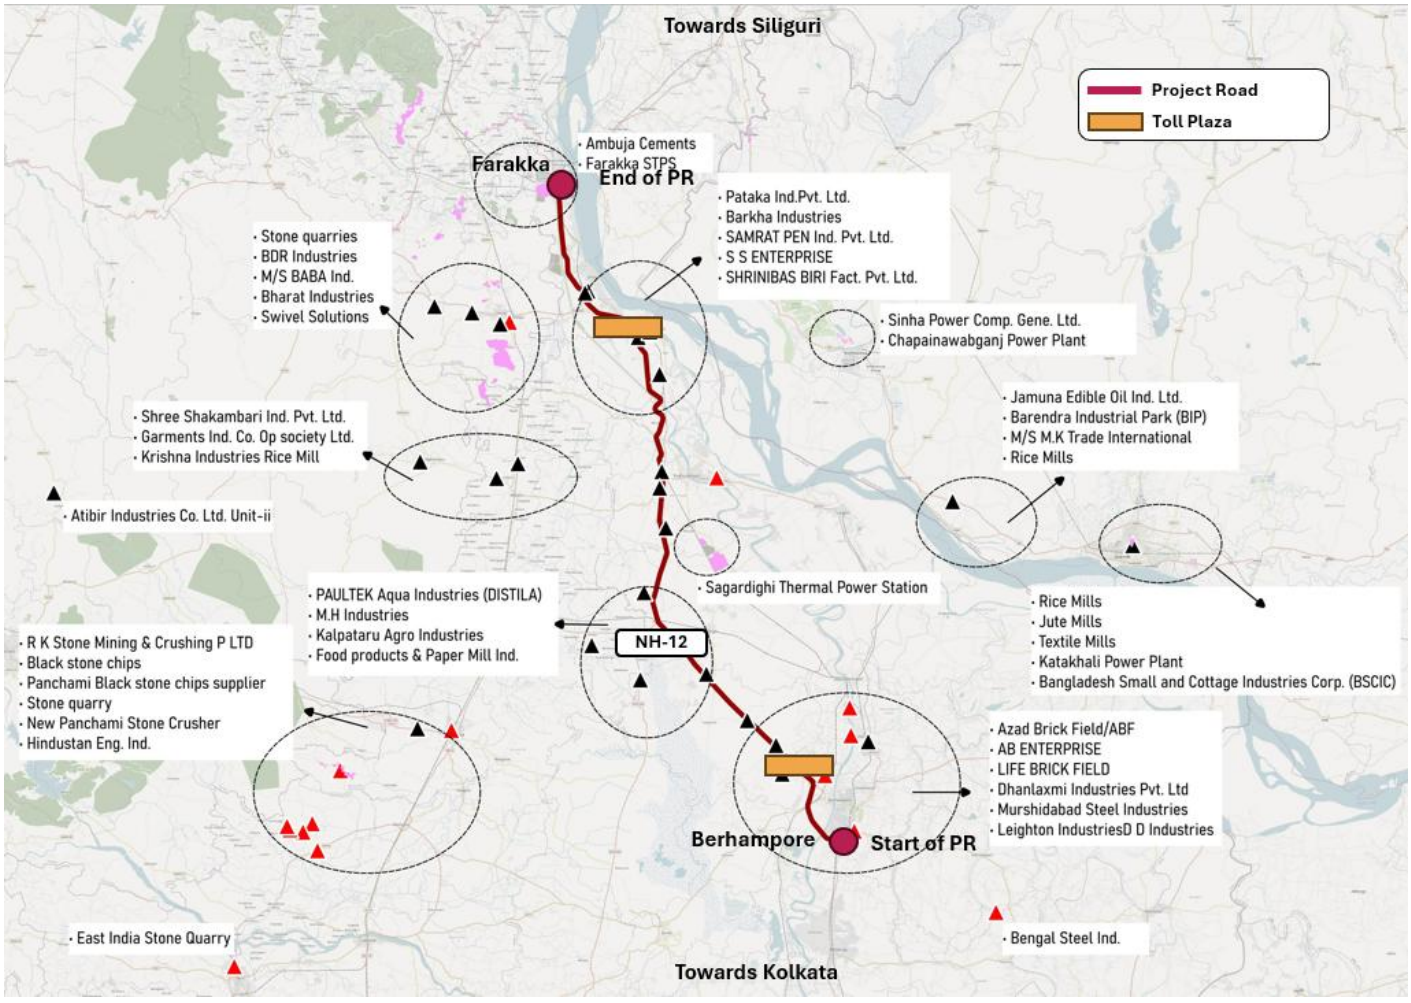
An important economic factor in the region is the substantial supply of construction materials sourced from nearby stone quarry belts. Nalhati, located in the adjacent Birbhum district, acts as the dominant hub for stone chips, aggregates, and crushed materials used across central and northern West Bengal. The steady inflow of Nalhati stone to Murshidabad supports major infrastructure development, road construction, and building activities in the district.

This supply chain also contributes significantly to freight traffic movement, influencing regional logistics patterns and supporting local employment in transportation and handling sectors.

2.4 Industrial and economic profile around the project section

Project section part of NH-12 stretches from Dalkhola in the northern part of West Bengal to Bakkhali in the south, linking all significant hubs within the state. The project section is located near numerous rice mills and is situated in a region of India where rice is the predominant crop. The areas of Bardhhaman, Hooghly, Birbhum, Parganas, and Murshidabad are known as rice-producing regions. Fruits, Vegetables, and Fish: Ina addition project influence area around the project section are agricultural zones for fruits such as mangoes and bananas, cash crops like jute, as well as vegetables and fish, which are distributed to nearby areas and consumption centres in Northeast India and Kolkata.

Figure 2-2: Industries and economic profile



Source: Open Street Map, Crisil Intelligence

The main commodity being transported along the project section include stone aggregates and sand, sourced from Nalhati, Rampurhat, Pakur, and Sainthia, mainly directed towards Kolkata, Siliguri, and Bangladesh. The aggregates are extracted from the mining areas of Nalhati and Pakur, as well as villages in the Rampurhat subdivision of Birbhum

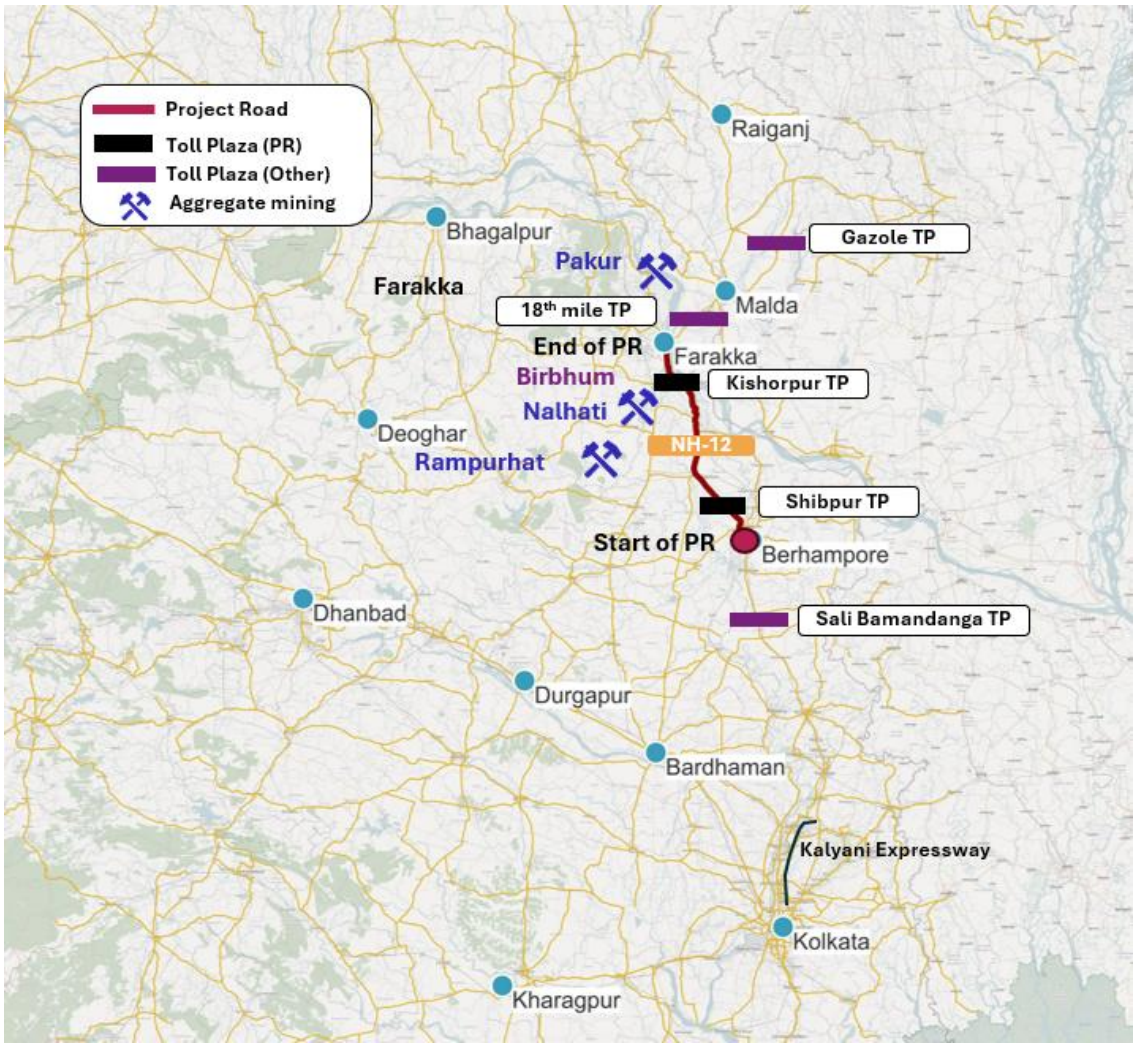
District. Asansol and Sainthia are the principal sources of sand, which is obtained from the sand beds along the Hooghly riverbed.

Also, around the project influence area there are significant industrial establishments, the National Thermal Power Corporation (NTPC) operates a thermal power plant in Farakka, while Ambuja Cement, a leading cement manufacturer in India, has a facility also located in Farakka. Jangipur features a large food processing park adjacent to the BFHL section. The Industrial Park in Behrampore serves as a vital manufacturing centre, with Additionally, the Kalyani Industrial Park (SEZ) has been established with units that produce electronics, tools, and spare part.

Neighbourhood project roads/assets have shown diverse traffic growth in the recent years

Indian Highways Management Company Limited (IHMCL) publishes toll plazas traffic data for the plazas on national highways and data is analysed for neighboring plazas to understand traffic growth patterns in the region, nearby plazas have shown good traffic growth in recent years.

Figure 2-3: Network and mining activities



Source: Open Street Map, Crisil Intelligence

As stated in the previous section, the project is located on NH-12, linking Berhampore to Farakka. To understand the

traffic specially CJV & MAV pattern at the nearby plazas, were examined since the movement across the selected sections has around majority of the share in traffic from MAV vehicles. It is important to note, however, that the traffic flow from the project section has a distinct nature due to the movement from industries and stone mining, which will differ from that of other plazas. The section/toll plaza studied is presented below.

Table 2-2: Network Analysis

Toll Plaza	Location	FY25	FY24	FY23
CJV				
Gazole TP	North	5,319	5,149	4,861
18TH Mile TP		3,803	3,640	3,444
Kishorpur TP	**Project section**	4,564	4,390	4,188
Shibpur TP		4,154	3,819	3,575
Sali Bamandanga TP	South	3,721	3,183	2,913
CJV Growth				
Gazole TP	North	3.3%	5.9%	
18TH Mile TP		4.5%	5.7%	
Kishorpur TP	**Project section**	4.0%	4.8%

Kishorpur TP		-11.4%	18.1%	
Shibpur TP		-6.4%	7.1%	
Sali Bamandanga TP		-7.6%	7.7%	

Source: IHMCL, Crisil Intelligence

It may be noted that the project section serves as an important connection to Kolkata, along with the influence area various network and economic development which led to diverse growth trends across the corridor. Key developments which impacted the traffic are listed below:

- **Barrackpore-Kalyani Expressway:**

  Kalyani Expressway connects the Belghoria Expressway (NH-19) at Nimta, close to Kolkata Airport, and extends to Kampa in North 24 Parganas. This corridor integrates with the Magra-Barajaguli Road Corridor, which leads to NH-12 at Barajaguli in Nadia. It circumvents congested routes such as Jessore Road, providing a quicker option to access northern suburbs including Sodepur, Barrackpore, Naihati, Kanchrapara,

Barasat, Madhyamgram, and Kalyani.Commercial vehicles heading towards North Bengal, the North-Eastern States of India, and Bangladesh frequently encounter traffic jams in these areas where NH-34 runs through densely populated urban regions like Birati, Madhyamgram, and Barasat. To alleviate this traffic congestion, a parallel expressway was constructed. Majority of the project is completed and operational. This expressway provides direct feeder connectivity to NH-12 and provides seamless connectivity to the project section. Majority of the traffic through the expressway and to the project section is largely established and form already part of the current traffic profile.

- **Stone quarry and sand mining:**

  The asset is situated in a rich belt of Basalt and Coal minerals in the Birbhum district, along with Sand sourced from the dry riverbed of the Mayurakshi River, a tributary of the Hooghly. The Birbhum zone, located 250 km north of Kolkata, boasts a rich mineral profile, featuring the largest coal belt at Deucha Panchami and the Panchami crushing zone, which has historically been a significant rock crushing area.

  In 2021, the West Bengal government implemented a Quarrying permit and Sand mining Policy aimed at reducing illegal mining activities in the region and making efforts to legalize such operations. By 2022, stone quarries and mines in Birbhum that were operating without valid licenses were classified as illegal, resulting in the closure of approximately 300 mines. Following this initiative, many quarry owners transitioned their operations to the nearby Nalhati and Rampurhat areas from the Panchami block, establishing them as major activity clusters.

  Nalhati and Rampurhat have now emerged as significant exporters of aggregates to the eastern region of India. The Sainthia and Madna sand block is a dry riverbed sand mining zone located in the Birbhum district, close to project section. It supports local construction activities as well as those in Bangladesh. The robust road connectivity via NH12 makes it a vital economic cluster.

  Key Timeline to sandmining policy in West Bengal

  July-2021: West Bengal sand mining Policy on illegal mining activities and directive to legalize the same

  November-2021: Temporary suspension of quarrying operations starting from November 2021 in the Panchami crushing zone – with quarries relocating to Nalhati and Rampurhat

  Feburary-2024: NGT direction to prevent illegal stone quarry mining in Birbhum

  Since project has majority of the traffic catering to stone and sand commodities, following above mentioned directive on the mentioned timeline has impacted the growth trends across the project section.

3 Primary Data Collection & Analysis

3.1 General

Primary traffic surveys, i.e. Origin Destination surveys and registration plate surveys were collected on the project road to understand the traffic and travel pattern of vehicles plying on the project road.

For the present study, one day (24-Hours) origin destination survey and one day (24-Hours) Registration Plate survey was conducted at the toll plaza location on the project road. The schedule of the traffic surveys carried out as part of the study on the project road are presented in the table and figure below.

Table 3-1: Type of Survey & Schedule

Location	Location	Survey Duration	Survey Date
OD Survey and Registration Plate Survey	TP01 (Shibpur TP)	1 Days	24-09-2025
	TP02 (Chandermore TP)		25-09-2025

Source: Crisil Intelligence

Figure 3-1: Survey Location

Source: Open Street Map, Crisil Intelligence

3.2 Origin-Destination Analysis

Origin-Destination survey was carried out for 1 Days (24-hours), by roadside interview method as described in IRC: 102-1988. A random sampling approach was employed to interview both passenger and freight vehicles traversing the project road at the toll plaza locations. The survey aimed to gather information on various aspects, including origin, destination, frequency of trips, purpose of travel and for freight vehicles, the type of commodity being transported. The project influencing states will provide an overview of the factors likely to influence the pattern of economic development and hence the flows and volumes of traffic on the project road.

3.2.1 Regional Influence

The key influencing regions from the origin destination survey are West Bengal and Northeast. Regional distribution mode wise is given in the below table.

Table 3-2: Regional Distribution in %

Date	CJV	Bus	2A	3A	MAV
TP01					
West Bengal	97.2%	96.2%	88.2%	84.2%	91.2%
Northeast	1.9%	3.1%	7.9%	13.1%	7.8%
Rest of India	0.9%	0.7%	3.9%	2.7%	1.0%
Total	**100.0%**	**100.0%**	**100.0%**	**100.0%**	**100.0%**
TP02					
West Bengal	95.1%	97.2%	87.2%	83.2%	88.9%
Northeast	3.8%	1.9%	8.5%	12.9%	9.2%
Rest of India	1.1%	0.9%	4.3%	3.9%	1.9%
Total	**100.0%**	**100.0%**	**100.0%**	**100.0%**	**100.0%**

Source: Primary survey, Crisil Intelligence

Passenger Traffic

- In case of CJV, West Bengal is a major contributor accounting to about 97 percent in TP01 and about 95 percent in TP02.
- Similar trend is observed for Buses in both the toll plazas.

Freight Traffic

- In case of 2A trucks, West Bengal contributes to about 88 percent at TP01 and about 87 percent at TP02, followed by Northeast account to about 7-8 each at both the toll plaza.
- Similarly in case of MAV, West Bengal contributes to about 91 percent at TP01 and about 89 percent at TP02, followed by Northeast accounting to about 8 percent at TP01 and 9 percent at TP02.

Key Origin-Destination (OD) Pairs for Car Traffic:

- TP01: Malda to Behrampore accounts for 6.5 percent of total trips followed by Nabagram to Behrampore accounts to 6.2 percent of total trips.

- TP02: Malda to Behrampore accounts for 6.7 percent of total trips followed by Malda to Kolkata accounts to 4.9 percent of total trips.
- **Key Origin-Destination (OD) Pairs for MAV (4-6 Axle) Traffic:**
- TP01: Nalhati to Kolkata accounts for 27.5 percent of total trips followed by Nalhati to Behrampore accounts to 7.7 percent of total trips.
- TP02: Malda to Kolkata accounts for 7.7 percent of total trips followed by Siliguri to Kolkata accounts to 7.0 percent of total trips.

Mode wise TOP OD pairs for both the toll plazas is presented in Annexure.

3.2.2 Commodity Distribution

Analysis was carried out to understand the various freight vehicles being used to transport different commodities. Table below presents the commodity distribution for all the toll plazas in project road.

Table 3-3: Commodity distribution of the project section

Date	LCV	2A	3A	MAV	Total
TP01					
Agri Produce	31.1%	29.1%	28.1%	13.8%	21.9%

Source: Primary Survey, Crisil Intelligence

- The analysis of freight movement across the toll plazas reveals that the major commodities being transported include Agri produce, Stone/Gitti, Courier and parcels, and consumer foods.
- At TP01, a significant portion of vehicles, specifically 30 percent of two axle trucks, about 29 percent of three axle trucks and around 14 percent of MAV (4-6) trucks are engaged in the transportation of Agri produce and their parts across the toll plazas. Similarly, at TP02, about 24 percent of two axle trucks, about 18 percent of three axle trucks and around 16 percent of MAV (4-6) were found to carrying Agri produce.
- Agricultural regions of northern West Bengal, Assam, and Malda, which includes the tea plantations in Darjeeling, and the large urban consumption hubs such as Kolkata and cities located in the southern states.

Potatoes and onions are the key commodities being transported, with potatoes sourced from Malda and onions from Beldanga, a region renowned for its onion exports, heading towards Behrampore and the southern areas

- In addition, about 14 percent of two axle trucks, around 9 percent of three axle trucks and around 2 percent of MAV (4-6) trucks at TP01 are found to carrying courier and parcels which can be attributed to increasing e commerce demand. However, at TP02, about 14 percent of two axle trucks, around 12 percent of three axle trucks and around 8 percent of MAV (4-6) trucks are found to carrying courier and parcels. Long distance traffic carrying courier and parcels started using NH-116A and hence larger share is observed in TP02 as compared to TP01 on account of Kolkata entry points.
- Moreover, a smaller yet significant share of MAV (4-6) trucks around 8 percent at TP02 are engaged in transporting iron and steel products. This is linked to the presence of an iron and steel manufacturing plant located in the project influencing region. The distribution of these commodities underscores the industrial and commercial linkages between the regions served by project section.
- MAV (4-6) trucks also play critical role in the movement of Stone/Gitti with 43 percent at TP01 and around 10 percent at TP02 transporting stone aggregates located near Nalhati/Murarai crossing TP01 and near Pakur crossing TP02. Traffic diversion at Nalhati prior to Kishorpur Plaza. Most Aggregates operate between Nalhati and Kolkata (Shibpur Plaza).
- Stone aggregate and sand, which are primarily moved from Nalhati, Rampurhat, Pakur, and Sainthia to Kolkata, Siliguri, and Bangladesh. Aggregates are sourced from the Nalhati and Pakura mining areas, as well as villages in the Rampurhat subdivision of Birbhum District. Asansol and Sainthia serve as the main sources of sand, which is extracted from the sand beds on the Hooghly riverbed.

Key directional movement:

- At TP01, Stone/Gitti is a significant commodity in MAVs that predominantly travels in a north to south direction, starting from Nalhati, Rampurhat, Pakur, and Sainthia towards Kolkata and Siliguri. It primarily transports stone and Gitti (aggregates) since Nalhati/Rampurhat serves as a key hub for stone quarries and crushers, supplying stone to the Northeastern states and Bangladesh.
- Agricultural goods and groceries represent another significant commodity that predominantly travels from the north to the south. They are primarily transported in 2A and 3A trucks. These journeys typically occur between the agricultural regions of northern West Bengal, Assam, and Malda, which includes the tea plantations in Darjeeling, and the large urban consumption hubs such as Kolkata and cities in the southern states. Potatoes and onions are the key commodities being transported, with potatoes sourced from Malda and onions from Beldanga,
- Consumer products also contribute to significant share across all vehicle categories at TP02, primarily transported in a north to south direction from Assam and Malda to Kolkata and Arunachal Pradesh, which serve as key consumption centres. The main commodities noted include tea from Farakka and potatoes from Siliguri.

- Approximately 8% of MAV trucks were found to be transporting petroleum and their products at TP02, traveling from south to north towards Assam. The primary supply source is Haldia, which hosts numerous petrochemical industries

Direction wise commodity distribution is presented in the below tables.

Table 3-4: Direction wise commodity distribution- TP01

Date	LCV	2A	3A	MAV	Total	LCV	2A	3A	MAV	Total
	Farakka to Berhampur					Berhampur to Farakka

4 Review of Historical Traffic Overview

4.1 General

This section summarizes the historical performance of the project section in order to understand baseline traffic patterns comprising of historical traffic and revenue growth, traffic and revenue composition, trip distribution, trip factors, seasonality and trend of traffic over the available data set.

The historical tollable traffic and revenue data mode wise was made available by client from April-2017 to Oct 2025 and is presented in below table.

Table 4-1: Historical Traffic and Revenue Data Availability

Toll Plaza	Toll Plaza chainage	Period
TP01	Km 206	April-2017 – Oct-2025
TP02	Km 260	April-2017 – Oct-2025

Source: Client, Crisil Intelligence

The summary of historic traffic data in terms of PCUs is presented below

Table 4-2: Past traffic in PCU

FY	TP01	TP02
2018	16,312	22,177
2019	17,216	18,785
2020	19,935	22,150
2021	19,317	22,035
2022	22,666	23,941
2023	26,590	27,198
2024	28,414	30,257
2025	27,647	28,829

Source: Client, Crisil Intelligence

Traffic in terms of PCUs at TP01 and TP02 has grown at 6.9 percent and 11.2 percent respectively during the period FY24 vs FY23.The asset specially in CJV and LCV has demonstrated robust growth particularly following the pandemic. This growth is fuelled by enhanced reporting efficiencies, which are bolstered by the expansion of local urban economies. However, FY25 has shown a downward trend on account of other network improvements and sand and stone movement restriction which are detailed out in following sections.

4.2 Historical traffic and composition

Overall traffic growth in terms of PCU for the period FY25 vs FY18 is about 7.8 percent. However external factors mentioned below had impacted mode wise and overall traffic while comparing year on year.

- Covid-19 pandemic for three different waves has significantly impacted traffic across India and on to the project section. First wave (March-April-2020), Second wave (September-Nover-2020) and Third wave during (January-Feburary-2021)
- Post three strong waves of covid-19 i.e. from FY21 onwards traffic specially in cars has seen significant growth across all India across all toll plaza owing to increased use of private mode of transport
- Post ETC/Fastag implementation; LCV and 2A corrections have also been observed across the project corridor which is in line with benchmark across the country
- Growth rate of LCV traffic is subdued at toll plaza owing to conversion of LCV to higher load carrying capacity vehicles from 4-wheel LCV to 6 -wheel LCV made which categorized based on its GVW to 2-axle category
- Also, shift of vehicles from Three axle trucks to higher category vehicles such as 5-axle and 6-axle trucks observed across the country and at the project section for its economic advantage. It is worth noting that within MAV category 5 Axle trucks are gaining importance as compared to 4 axle trucks.
- In case of 3A and MAV following events have impacted the growth trends across the assets (both the toll plazas) and are listed below
    - June-2018: Network improvement and completion of Malda Bypass
    - Feb-2019: Sandeshkhali agitation
    - November-2019: Cyclone “Bulbul”
    - November-2021 onwards: Temporary suspension of quarrying operations in the Panchami crushing zone, with quarries relocated to Nalhati and Rampurhat after the granting of new quarry leases.
    - August-2021: Strict overloading norms from West Bengal government
    - June-2023: Cyclone “Biparjoy”
    - Feburary-2023: NGT direction to authorities for illegal stone quarrying in Birbhum
    - November-2024 onwards: TP01 started observing decline in traffic on account of diversion to NH-116A on account of restriction in Kolkata entry during the daytime.

The above-mentioned events and network improvements has led to diverse growth trends for the period between FY18 to FY25

The mode wise historical traffic for TP01 is presented below

Table 4-3: Historical mode wise traffic-TP01

FY Year	Car	LCV	Bus/2A	3A	MAV	PCU
2018	2,493	807	1,298	1,806	732	16,312

5 Base Traffic Estimation

5.1 Seasonality Factors

Traffic volumes on roads varies throughout the year, influenced by socio-economic activities in the surrounding regions. To accurately estimate the Annual Average Daily Traffic (AADT) for the road, it is crucial to account for these seasonal variations.

To achieve this, a seasonal correction factor is applied, which is derived from secondary data sources such as historical traffic data, fuel sales and similar indicators. In this assessment as long historic traffic data is available, consultants have the traffic data for seasonality

Seasonal correction Factors (SCF)

Seasonal correction factors for the latest years of FY23, FY 24 & FY 25 are tabulated below.

Table 5-1: Seasonal correction factors for FY 23, FY 24 and FY 25- TP01

5.2 Base Traffic Estimation

For base traffic estimation for the present study, the 7-months (Apr-25-Oct-25) of traffic data for all the two toll plazas were annualized using SCF factor of 7-12 months were derived from the year FY23, FY24 &FY25 for estimating FY26 AADT.

The AADT estimation for the base case for FY26 is presented below

Table 5-3: Base traffic-FY26

TP	Car	LCV	Bus/2A	3A	MAV	PCU
ADT (April-Oct) FY26						
TP01	4,938	778	1,510	512	3,097	26,103
TP02	5,207	622	1,649	698	3,230	27,718
SCF (April-Oct)- Avg of FY23, FY24 & FY25						
TP01	1.01	1.02	1.03	0.99	1.10	
TP02	1.00	1.02	1.01	1.01	1.04	
AADT- FY26						
TP01	4,985	796	1,553	505	3,411	27,704
TP02	5,198	637	1,670	706	3,365	28,429

6 Network developments in the Region

In the case of the project road, there is no short distance alternate routes available that will impact the traffic on the project road. However ongoing and upcoming development that could impact the project road

The details of the development in term of milestone, expected completion date and possible impact to project road traffic is presented in below table.

Table 6-1: Details of Network Development and Possible impact

S. No	Details of Development	Milestone/Completion	Possible Impact
1	**Kharagpur-Morgram Greenfield expressway** This project is part of the Kharagpur-Siliguri Economic Corridor (EC-14) and runs in a north-south direction through West Bengal. The expressway is anticipated to serve as an alternative route.	Based on the information available in the public domain likely completion of the expressway to be FY30. Impact has been considered in a phased manner, 50% in FY30 and 100% from FY31 onwards	**Negative:TP01** Impact considered for two different pairs: **Short Distance:** Trips from Kolkata to Morgram **Long Distance:** Trips from Kharagpur to Morgram
2	**Kharagpur-Morgram -NH116A expansion** Trips from Kolkata to Morgram diversion to project road during the construction period of NH116A	Based on the site reconnaissance and the information available in the public domain the four laning/upgradation for NH-116A will likely to be between FY27-30	**Positive:TP01** Impact years: FY27 to FY30
3	**Sand/Stone mining recovery** As of February 2024, a temporary prohibition on illegal mining in the Birbhum district, implemented by the National Green Tribunal (NGT), has affected construction traffic in the TP2 catchment area, which has a greater impact.	Once the ban is removed, there will be an increase in construction traffic on the asset, resulting in a rise in demand over the upcoming years. Consequently, a recovery in construction traffic is expected from FY27 onwards on a cyclic trend	**Positive:TP01 & TP02** Impact years: FY27 onwards on a cyclic trend keeping in mind external factors such lease renewals.

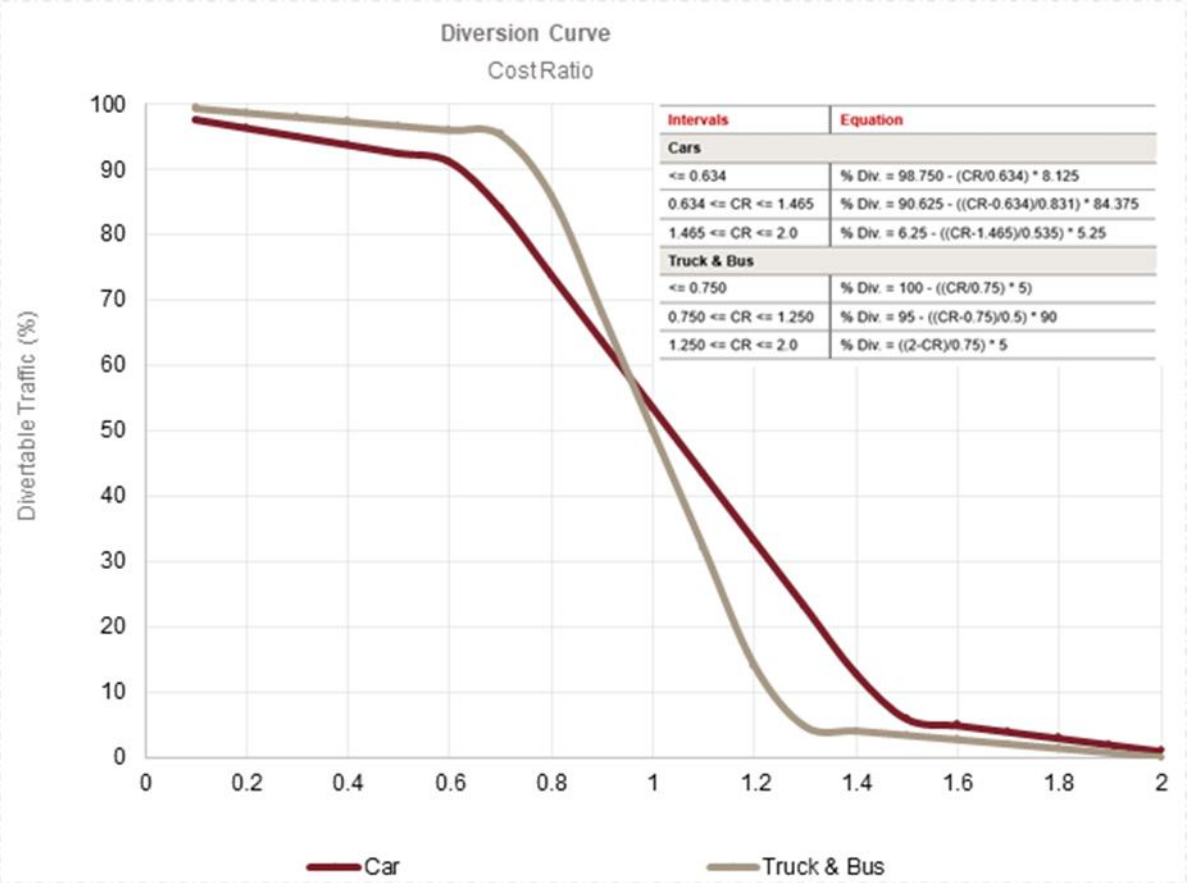
Source: Crisil Intelligence

6.1 Approach and Methodology for Diversion Analysis

The assessment of traffic diversion if any away from the project road has been done using cost ratio analysis. The road user cost is estimated based on the vehicle operating cost (VOC) and Value of time (VOT) as mentioned in IRC: SP30-2019. The generalized cost ({VOC} + t{VOT} + {toll rates}) for the project road and the alternate or proposed route is then compared to obtain a cost ratio. Cost ratio is applied on the diversion curve equations (Binary logit model) to estimate the expected percentage of traffic diverting, based on users perceived costs on the existing and alternate or proposed facility. The diversion percentages are then applied on the in-scope traffic derived from the OD

analysis to estimate the traffic that would shift to/from the project road. Diversion curve (equation) mentioned in IRC:108-2015 and is presented below

Figure 6-1: Diversion curve as per IRC:108-2015



Source: IRC 108-2015, Crisil Intelligence

6.2 Kharagpur-Morgram Greenfield expressway & 4L expansion of NH-116A

The Kharagpur–Morgram Expressway, officially designated as NH 116A, is a proposed greenfield expressway that will constitute the southern section of the extensive 516 km Kharagpur–Siliguri Economic Corridor in West Bengal.

Stretching roughly 231 km, this four-lane, access-controlled greenfield expressway is designed to significantly cut down travel time and logistics expenses between Kharagpur and Morgram, thereby enhancing connectivity for both freight and passenger traffic in the area.

Key feature of the alternate route:

- The expressway starts near Kharagpur on NH-16 and stretches to Morgram, where it intersects with NH-34 and NH-60, traversing through Chandrakona, Jayrambati, Burdwan, Guskara, and Morgram.
- Once operational, the distance from Kharagpur to Morgram will be reduced by 135 km, leading to a decrease in travel time and making this route more appealing for traffic traveling between Kharagpur/South and Morgram/North.

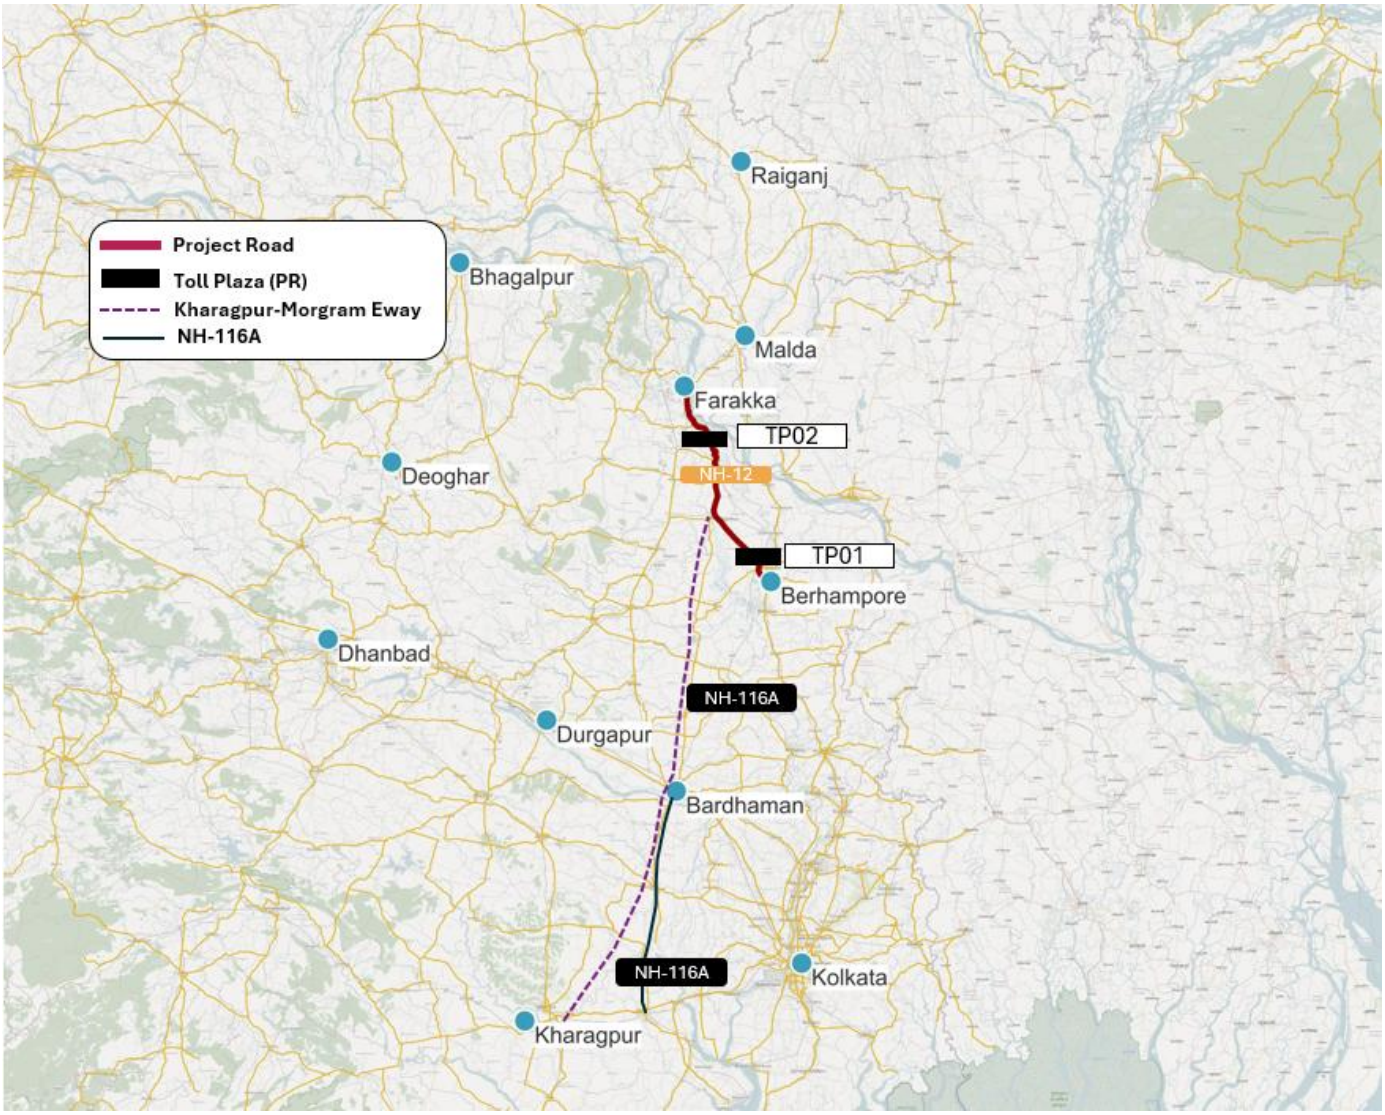
The impact has been estimated for two pair of traffic:

- Kolkata-Morgram (Short Distance): Travel via NH-12 from Kolkata to Bardhhaman, then access the expressway leading from Bardhhaman to Morgram. Distance via project road is about 232 Km as against 240 Km via alternate route.

- Kharagpur-Morgram (Long Distance): Traffic originating from Kharagpur and the southern regions (Odisha, South India, etc.) heading towards northeastern India and eastern Bihar. Distance via project road is about 363 Km as against 230 Km via alternate route.

The alignment of the expressway and the project section is presented below

Figure 6-2: Kharagpur-Morgram Expressway & NH-116A upgradation



Source: Crisil Intelligence

The estimation for the traffic to diver to the alternat route has been considered basis cost-based analysis. The assessment of diversion from the project road is presented below

Particulars	CJV	LCV	2A	3A	MAV
Trips to/from Kolkata from/to Morgram (Short Distance)					
In scope Traffic	3.6%	10.9%	11.6%	14.9%	3.9%
GJC-PR	4,928	8,365	11,841	12,066	17,697
GJC-AR	5,101	9,399	12,327	11,925	15,116
Cost-Ratio	1.04	1.12	1.04	0.99	0.85
Diverted Traffic	**1.8%**	**3.1%**	**4.9%**	**7.8%**	**3.0%**
Trips to/from Kharagpur from/to Morgram (Long distance)					
In scope Traffic	-	-	3.8%	5.9%	1.2%
GJC-PR	-	-	17,448	17,448	26,007
GJC-AR	-	-	18,175	17,987	26,674
Diverted Traffic	-	-	**1.6%**	**3.1%**	**0.9%**

Source: Crisil Intelligence

Conclusion

The operation of Kharagpur-Morgram expressway may result in a loss at TP01.The diverted traffic to the Kharagpur-Morgram expressway has been grown appropriately till FY30 and considered from FY30 in a base case at TP01 in a phased manner-50 percent in FY30, and 100 percent in FY31 onwards.

In addition, the historical analysis reveals that there has been reduction in traffic in MAV over the past months. Also, as per the information made available from client and while comparison, it was observed that the Kharagpur-Morgram Short Distance pair has experienced a decline across all categories however notable change has been observed in MAV traffic.

In MAVs, the percentage has dropped from 16.3% to 4.7% during the survey period of July-2024 to March 2025 and further declined to 3.9 percent during the recent study This decline includes trips mainly originating to/from Kolkata from/to Siliguri, confirming the adverse diversion at TP01, where long-distance trips are rerouting to NH116A due to stricter daytime restrictions on heavy vehicle movement in Kolkata. It is anticipated that during the four-laning of this section traffic will likely to shift to the project section and will have positive impact to the asset during the period from FY27 to FY30 during the network development of NH-116A.The estimation for the traffic to divert to the project during the upgradation period of NH-116A has been considered basis cost-based analysis keeping into account potential traffic during earlier data and the present data analysis. The estimated traffic from the above-mentioned factor for is MAV is about 6.8 percent and has been considered from FY27-30 period.

6.3 Impact of Sand/Stone mining recovery

As mentioned in the earlier section the main commodity being transported along the project section include stone aggregates and sand, sourced from Nalhati, Rampurhat, Pakur, and Sainthia, mainly directed towards Kolkata, Siliguri, and Bangladesh. The aggregates are extracted from the mining areas of Nalhati and Pakur, as well as villages in the Rampurhat subdivision of Birbhum District. Asansol and Sainthia are the principal sources of sand, which is obtained from the sand beds along the Hooghly riverbed.

Nalhati and Rampurhat have now emerged as significant exporters of aggregates to the eastern region of India. The Sainthia and Madna sand block is a dry riverbed sand mining zone located in the Birbhum district, close to project section. It supports local construction activities as well as those in Bangladesh. The robust road connectivity via NH12 makes it a vital economic cluster.

In 2021, the West Bengal government implemented a Quarrying permit and Sand mining Policy aimed at reducing illegal mining activities in the region and making efforts to legalize such operations. By 2022, stone quarries and mines in Birbhum that were operating without valid licenses were classified as illegal, resulting in the closure of approximately 300 mines. Following this initiative, many quarry owners transitioned their operations to the nearby Nalhati and Rampurhat areas from the Panchami block, establishing them as major activity clusters.

Since February 2024, a temporary prohibition on illegal mining in the Birbhum district, enforced by the National Green Tribunal (NGT), has affected construction traffic in both the toll plazas. This prohibition has resulted in a downward trend in heavy vehicle categories (MAV) associated with stone/sand traffic. However, it is anticipated that this ban is temporary and will likely be lifted. The similar trend was noticed in other commodity-driven assets where temporary bans, due to environmental regulations, are enacted, facilitating the replacement of mines. Consequently, once the ban is lifted, construction traffic on the asset will rise, resulting in a recovery in demand. To assess the impact of the recovery the share of stone/sand/Gitti has been compared with the earlier data provided with the client and recent conducted by crisil. The quantum of traffic estimated while assessing earlier commodity share and the present it was estimated that about 3.7 percent of MAV and about 8.8 percent at TP02 will have a recovery on the sand/stone mining/construction activity around the project section.

Also, it is to be noted that, the commodity sector is inherently high-risk and subject to uncertainties, which may result in similar fluctuations in the future hence the impact is considered in cyclic trend over the projected period and has been considered from FY27 onwards.

7 Traffic Growth Estimation & Traffic Forecast

7.1 Approach for traffic growth rates estimation

Crisil, based on its coverage of 80+ sectors and the MSME industry, has developed a knowledge base to understand the growth of industries and demand across various regions and clusters. The growth expectations for various industries are applied to each vehicle category based on the commodity composition of the vehicle category. For example, the share of light commercial vehicles (LCVs) carrying agricultural commodities is expected to grow as per agricultural output growth; the share of LCVs carrying consumer products is expected to grow as per the volume growth of durables; and the share of Multi axle vehicles (MAVs) carrying steel commodities is expected to grow as per demand/supply volume of steel products based on regional dynamics. This approach helps Crisil provide a more accurate growth rate of commercial traffic in the region.

For passenger traffic, Crisil assesses the sale of passenger cars in the region, growth of vehicular population, purpose and frequency of passenger travel, population growth, expansion of the city, and infrastructure development in the catchment area.

Further, Crisil also examines the various factors that will impact traffic over the concession period, such as upcoming alternative road routes, truck aggregation by logistics players, dedicated freight corridors and other transportation options. Thus, the analysis considers the impact of central and state policies, growth in production and consumption centres along the stretch, and infrastructure in the adjoining regions. The report covers both growth drivers and restraints for the traffic along the stretch. Crisil has enumerated and detailed the parameters that will positively/negatively impact the traffic on the stretch in the future.

Crisil has used its proprietary traffic projection methodology to project traffic using regional industry growth assumptions, macroeconomic developments, infra development and consumption centre growth factors of the catchment area and adjacent regions.

Figure 7-1: Commodity based approach: Illustrative example for Commercial vehicles

Commodity	MAV (Vehicles) Year 1	YoY growth	MAV (Vehicles) Year 2
Construction materials	300	9%	327
Consumer products	100	4%	104
Agri Produce	200	3%	206
Iron & Steel products	50	9%	55
Chemical products	200	5%	210
Total vehicles	XX		YY

Commodity	LCV (Vehicles) Year 1	YoY growth	LCV (Vehicles) Year 2
Construction materials	100	9%	109
Consumer products	200	4%	208
Agri Produce	50	3%	52
Iron & Steel products	300	9%	327
Chemical products	200	5%	210
Total vehicles	XX		YY

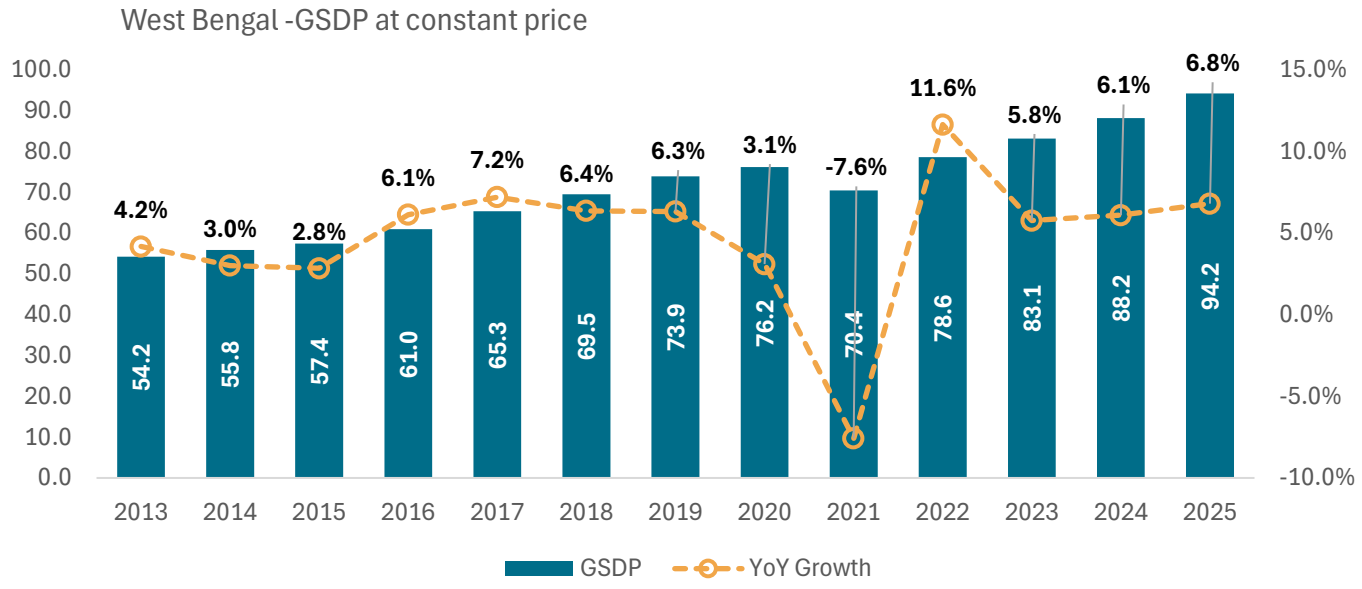
Growth rates for commodities are based on commodity specific demand/supply drivers and regional dynamics

Source: Crisil Intelligence

7.2 West Bengal State profile

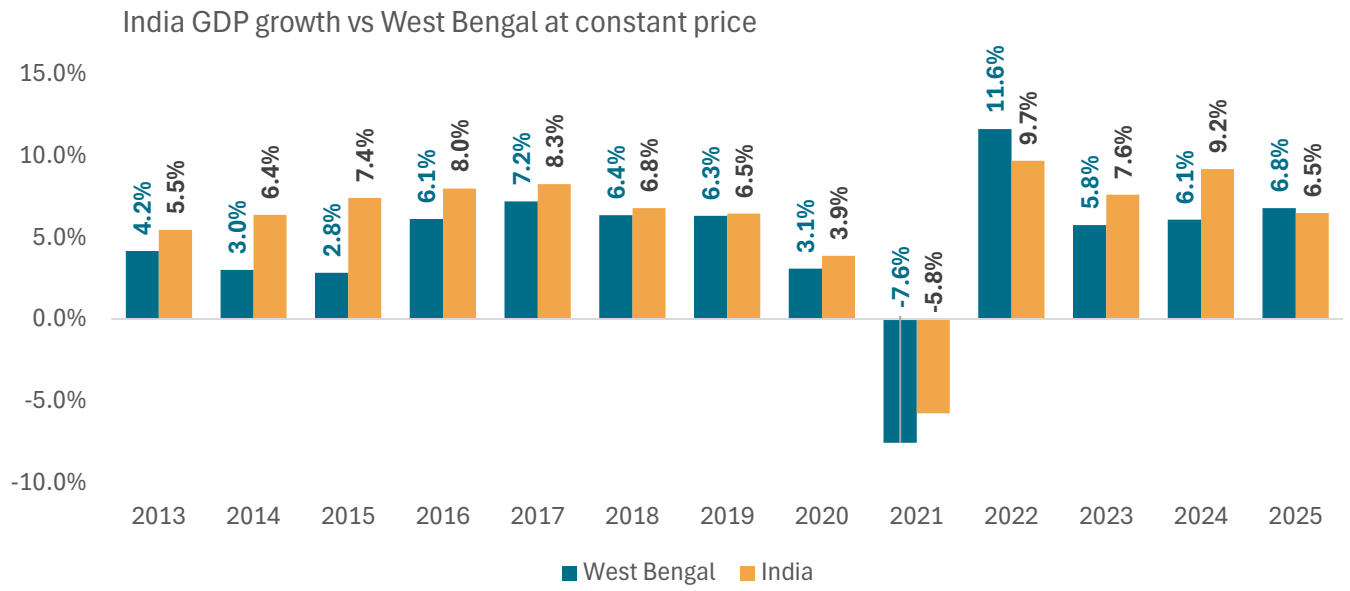
West Bengal is located in the eastern region of India, bordered by Bihar and Jharkhand to the west, Odisha to the southwest, Sikkim and Bhutan to the north, and Assam to the northeast, with the Bay of Bengal along its southern coastline. The state occupies a strategic geographic position, serving as a gateway to Northeast India. Key national highways such as NH-16, NH-19, NH-27, and NH-34 facilitate connectivity between West Bengal and the neighbouring states, supporting both intra-state mobility and long-distance freight movement. Kolkata serves as the primary urban and economic hub, supported by Netaji Subhas Chandra Bose International Airport, which offers a wide range of domestic and international flight services. West Bengal's Gross State Domestic Product (GSDP) for 2024-25 is estimated at approximately ₹ 94,185,372, reflecting steady economic performance with a long-term growth trend supported by robust services and industrial activity. The tertiary sector is the major contributor to the state economy—accounting for over 55 percent—driven by trade, finance, transport, and public services. The secondary sector contributes around 25 percent, supported by manufacturing, metallurgy, petrochemicals, cement, and engineering industries, while the primary sector accounts for the remaining share with agriculture, fisheries, and horticulture being key contributors. The state is rich in natural and industrial resources and hosts significant infrastructure such as the Haldia Port and Syama Prasad Mookerjee Port in Kolkata, which serve as major maritime gateways for eastern and northeastern India. West Bengal also has substantial coal reserves in the Raniganj coalfields and remains one of India's leading producers of tea, contributing significantly to national and global supply chains.

Figure 7-2: West Bengal GSDP



Source: MOSPI, Crisil Intelligence

Figure 7-3: West Bengal GSDP vs India GDP



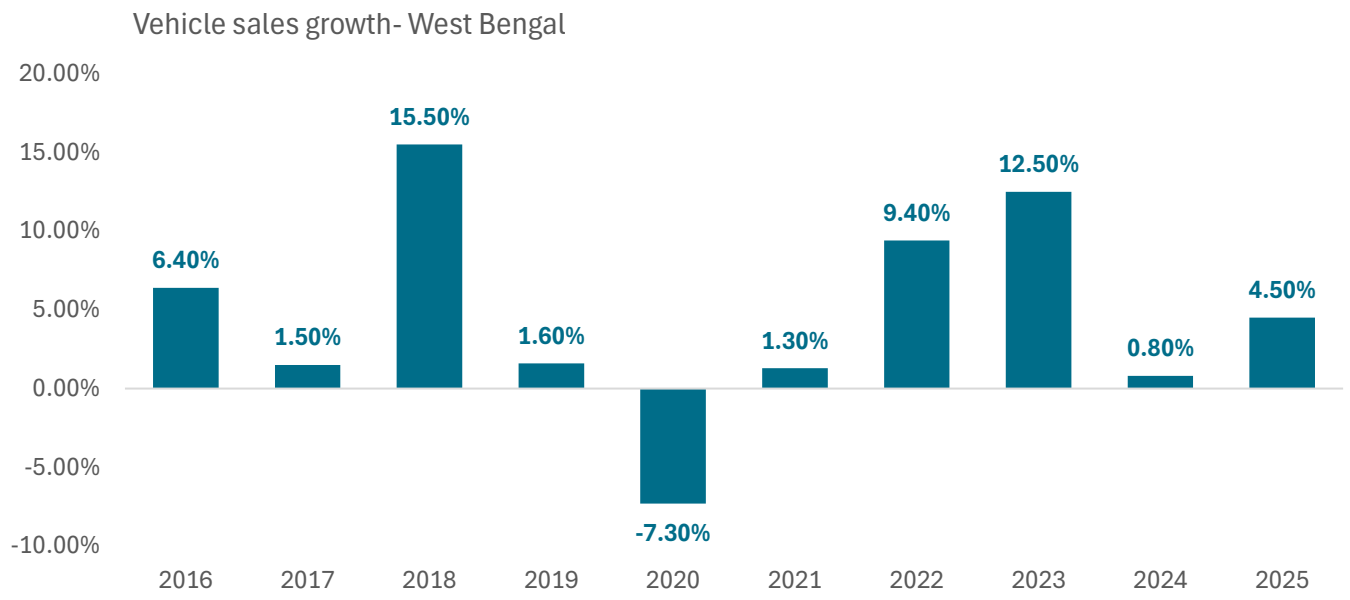
Source: MOSPI, Crisil Intelligence

7.3 Outlook for car growth

The rate of car ownership in India has increased from 6.6 per 1,000 people in 2001 to 25 per 1,000 people in 2019. Despite India's car fleet growing at an annual rate of 10% for nearly 25 years, the rate of car ownership remains low compared to countries with similar economic status and significantly lower than developed countries, which have a rate of around 450 per 1,000 people. This low rate of car ownership indicates potential for continued growth in the coming years. With the ongoing increase in car ownership and improvements in the road network, the use of cars for inter-urban travel is showing a growing trend.

Vehicles sales in West Bengal have grown to about 5 percent for the period FY16 vs FY25 also about 4 percent during the period FY19 vs FY25. The project road CJV traffic have grown to about 10 percent for the period FY25 vs FY19 at TP01 and about 6.5 percent at TP02 for the same period. Higher growth observed at TP01 on account of improvement in network connectivity and closer interaction to Kolkata. The YoY passenger vehicles sales growth is presented below.

Figure 7-4: Vehicle sales growth-West Bengal



Source: SIAM, Crisil Intelligence

7.4 Commodity Overview

As mentioned in section primary data collection & analysis, the analysis of freight movement across the toll plaza reveals that the major commodities being transported include courier and parcels, Agri produce, consumer foods, construction material especially stone/aggregate.

Courier and parcels

Courier/Parcel traffic on the project stretch form a significant proportion of the commercial traffic and is majorly for the purpose of consumption in domestic market in the urban and semi urban regions of Malda, Behrampore, Kolkata, Siliguri and nearby regions of the catchment. Traffic on the project stretch originates majorly from West Bengal. Courier/Parcel traffic is destined for consumption in regions of consumption hubs like Kolkata, Malda, and Northeastern states.

India has been becoming a significant domestic shipment market, with significant companies entering and expanding networks in the market. The industry was flush with early-stage and venture capital funding that led to growing e-commerce penetration in different retail product segments. Apart from primary growth drivers such as increasing internet penetration, higher disposable incomes, and rising urbanisation, factors such as user-friendly interface of portals offered by players, ease of shopping, increasing awareness, relatively higher pricing discounts (in comparison with brick-and-mortar stores), and easy delivery and innovation, have propelled growth. Pandemic has brought about a shift in buying behaviour with more and more people taking the online route.

High domestic consumption of e-commerce goods is expected leading to exports growth. Going forward it is expected that the demand will remain high along with the pick-up in domestic consumption.

Crisil expects a growth of 7.2 from fiscal FY 27-31 considering historical and the above-mentioned factors for courier and parcels related traffic on the project road.

Agri Produce

Agricultural regions of northern West Bengal, Assam, and Malda, which includes the tea plantations in Darjeeling, and the large urban consumption hubs such as Kolkata and cities located in the southern states. Potatoes and onions are the key commodities being transported, with potatoes sourced from Malda and onions from Beldanga, a region renowned for its onion exports, heading towards Behrampore and the southern areas. Agri produce is one of the major goods carried in the project corridor since the districts though which the project corridor passes are largely agrarian in nature.

West Bengal state is known for its varied agro-climatic conditions which, in a way, supports the cultivation of wide range of crops across the year. The state has net cropped area as 52.05 lakh ha. which comprises 68% of geographical area and 92% of arable land. In terms of vegetables production, the top five states as of fiscal 2024 are West Bengal (28.3 MMT), Uttar Pradesh (27.5 MMT), Madhya Pradesh (18.8 MMT), Bihar (16.9 MMT), and Gujarat (12.6 MMT). West Bengal has time and again topped the vegetable production, nationwide, thus proving to be one of the important states as far as Agriculture sector is concerned.

Also, on the other hand, as Bay of Bengal is close by, the state has faced many calamities like cyclones, hailstorms, thus leading to considerable damage to the Agri output. The Indian agriculture sector is highly volatile as it is still dependent on the outcome of the monsoon season.

CRISIL's methodology considers the growth of the Agri produce commodity at the regional level to derive the traffic growth of each vehicle category. Growth in Agri produce is highly volatile as it depends on the positive outcome of the monsoon season. Hence on a long-term period, it grows at a low rate compared to the aggregate GDP. Given the high proportion of Agri produce on the stretch, it's imperative to assess it at a regional and commodity level, compared to a macroeconomic level. This is evident, considering only the macro level growth.

Crisil expects a growth of 2.5 from fiscal FY 27-31 considering historical and the above-mentioned factors for courier and parcels related traffic on the project road.

Consumer foods

Consumer foods also account to about 7-8 percent in the commercial vehicles in the project stretch. This accounts to close proximity of consumption centres such as Malda, Kolkata, Behrampore and Siliguri. The fast-moving consumer goods (FMCG) industry or consumer packaged goods (CPG) industry is mainly responsible for producing, distributing, and marketing fast-moving consumer goods. Fast-moving consumer goods (FMCG) sector is India's fourth-largest sector and has been expanding at a healthy rate over the years because of rising disposable income, a rising youth population, and rising brand awareness among consumers.

Changing food habits and consumption patterns post the pandemic, rising demand for healthy products, increasing appetite for discretionary spends on processed foods and increasing focus on health and sanitation, shift in demand from loose to branded packaging to support growth. Demand is also expected to be supported by new product launches, rising distribution network with players catering to multiple segments.

Crisil expects a growth of a4.1 from fiscal FY 27-31 considering historical and the above-mentioned factors for courier and parcels related traffic on the project road.

Construction materials

Construction Materials especially stone/Gitti is the largest commodity crossing TP01 accounting to about 43 percent and about 10 percent at TP02. These commodities are majorly destined to Kolkata and nearby project influence areas and within the state.

These stone/Gitti are sourced from Nalhati, Rampurhat, Pakur, and Sainthia, mainly directed towards Kolkata, Siliguri, and Bangladesh. The aggregates are extracted from the mining areas of Nalhati and Pakur, as well as villages in the Rampurhat subdivision of Birbhum District. Asansol and Sainthia are the principal sources of sand, which is obtained from the sand beds along the Hooghly riverbed

There are greenfield expressways coming in the vicinity of project stretch, which may add to the construction materials demand going up the coming time. Some of the key expressways that may do so are, Raxaul-Haldia Expressway, Varanasi-Kolkata Expressway and Kharagpur-Morgram Expressway.

In the last five years, the eastern (Odisha, Bihar, and West Bengal) regions exhibited strong demand led by a surge in infrastructure. construction and rural housing. Madhya Pradesh, Uttar Pradesh, West Bengal, Bihar, and Odisha form almost 65% of under construction houses in PMAY Rural.

As seen in the past decade, the Eastern and Central regions are expected to continue to drive construction material demand in India in the medium term on the back of continued government thrust on infra and housing in the region. Healthy rural housing demand in West Bengal as well as a plethora of infrastructure projects and pickup in urban housing will aid the construction material traffic. Key infrastructure projects in the region such as East Coast Corridor Project and other road and highway projects, and the Economic Corridor (Kharagpur-Bardhhaman-Morgram) Project will keep the demand elevated.

In addition, Cement demand is an ideal proxy for construction demand as most infrastructure projects and pucca / concrete housing projects required cement and as cement is used along with sand, aggregates, TMT bars etc. it provides a good indicator for construction material demand. During fiscals 2023-27, the upcoming cement capacity additions in the eastern region amount to ~47-49 million tonnes, 1/3rd of all India capacity addition. Rising income levels and growing preference of rural consumer for ceramic tiles will drive the long-term growth of the construction material traffic on the stretch. Government initiatives such as 100 smart cities, Housing for all by 2022, increase in deduction limit for housing loan, relaxed norms for issuing long term bonds by banks for financing affordable housing will aid growth.

Crisil expects a growth of 7.4 from fiscal FY 27-31 considering historical and the above-mentioned factors for courier and parcels related traffic on the project road.

7.5 Commodity Outlook

Crisil Intelligence has forecasted the freight traffic growth based on the growth in relevant sectors influencing traffic in the region. Industry growth has been analysed and forecasted based on our proprietary database of industries for the surrounding regions that impact traffic on project road as well as our internal assessment on a relevant set of sectors at the pan India level. Package wise forecast incorporates the regional dynamics including, but not limited to, investments, commodity trends, district output (GDDP) profile (primary/secondary, construction/manufacturing) etc. The traffic for the coming years is projected by factoring in the impact of these parameters on commodity wise growth rates and is presented in below table.

Table 7-1: Commodity Outlook for the Project Section

Commodity Type	FY 27-31	FY 31-35	FY 35-39	FY27-41
Agri Produce	2.5%	2.3%	2.2%	2.3%
Automobiles	5.4%	5.1%	5.0%	5.1%
Chemical products	4.0%	3.7%	3.6%	3.7%
Coal	0.9%	0.9%	0.8%	0.9%
Construction materials	7.4%	7.1%	6.9%	7.1%

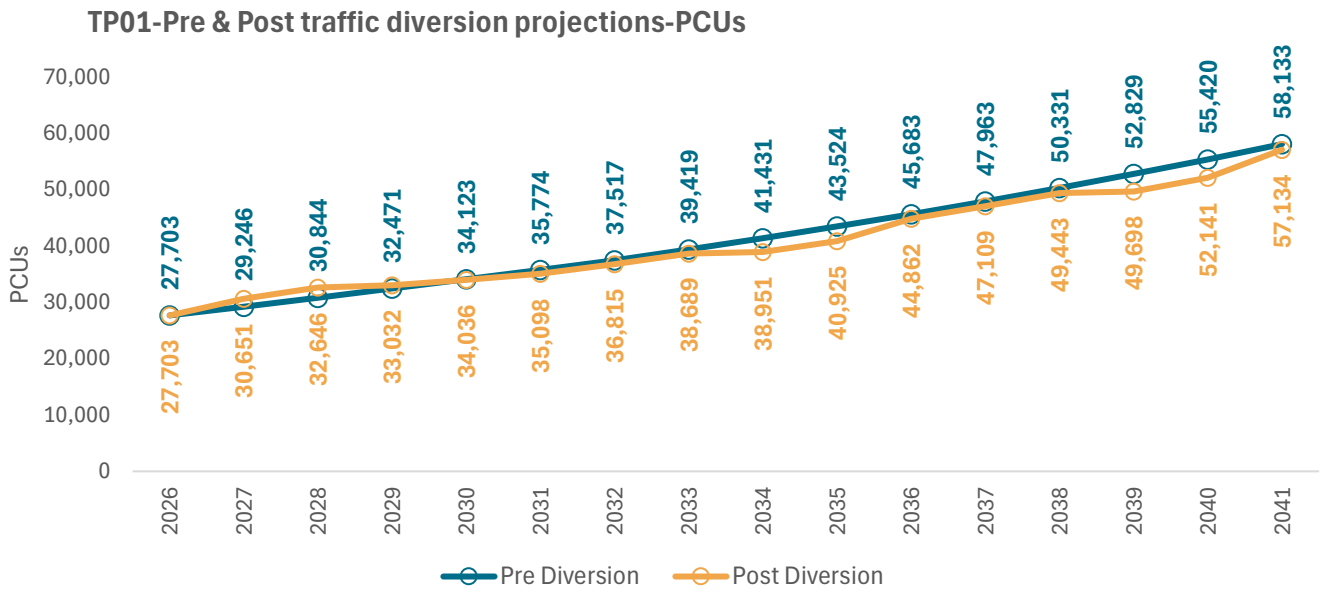
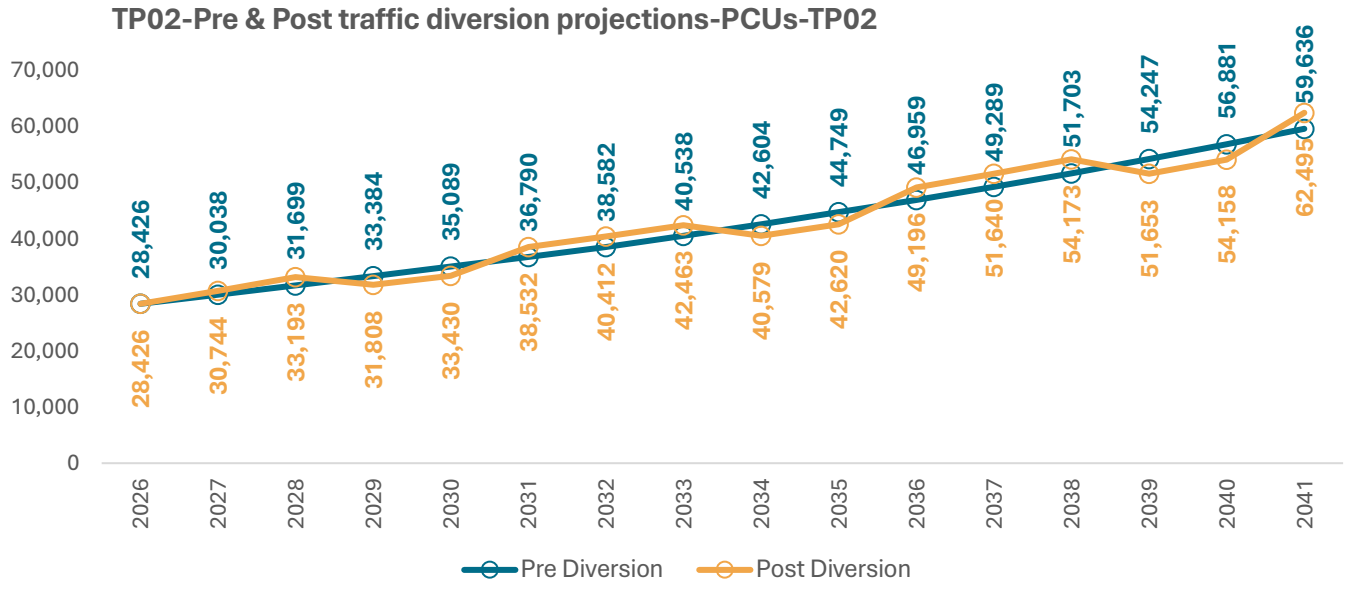
Pre and post traffic projections in terms of PCU is presented below

Figure 7-5: Pre and post traffic diversion projections-PCUs-TP01



Source: Crisil Intelligence

Figure 7-6: Pre and post traffic diversion projections-PCUs-TP02



Source: Crisil Intelligence

The traffic at TP01 and TP02 in terms of PCUs is expected to grow at 4.9 percent and 5.4 percent respectively for the period FY26-41.

8 Revenue forecast

8.1 General

At present the project section is under “open tolling system” which enables the concessionaire to collect tolls from long distance as well as short distance traffic joining the project from adjoining highways.

8.1.1.1 User Fee Schedule

As per Gazette notification dated 05.12.2008, under National Highways Fee (Determination of Rates and Collection) Rules 2008 [GSR 838 (E) and concession agreement the per km toll rates applicable from 2007/08 for normal tolling length and permanent structure, the revision basis and concessions are provided.

Local traffic Car / Jeep / Vans (CJV) - This category includes local users who own a vehicle registered for non-commercial use, living within 20 km of the toll plaza and crossing it for commuting. The reduced fee for these users is a monthly pass priced at Rs. 150.00.

Daily Pass If a vehicle needs to cross the tolled area more than once in a single day, the user can choose to pay one and a half times (1.5 times) the fee for a single entry; this pass is valid for 2 entries within 24 hours of purchase.

Monthly Pass Users who frequently utilize the project road throughout the month may opt to buy a monthly pass by paying a fee equivalent to two-thirds of the cost for 50 single journeys; this pass allows for a maximum of 50 one-way trips during its month of validity

The concessions of traffic have been provided under the categories/ toll tickets as presented in below table.

Table 8-1: Tolling Tickets

Ticket	Maximum number of one-way journeys allowed	Period of validity
Single/Normal	Single	-
Daily Pass	Two	24 hours
Monthly Pass	Fifty	One month from the date of payment
Local Personal	Multiple	One month from the date of payment

8.1.1.2 Toll Segmentation

As mentioned in section historical toll data of FY 25 is used in adopting the segmentation for the project road. The traffic tolling segmentation in (%) adopted for the present study for FY26 onwards is presented in below table.

Table 8-2: Toll segmentation in % - FY26

Mode	Single journey	Return journey	Monthly Pass	Local Pass	Annual Pass (*)	Exempt
TP01						
Car	23.4%	53.8%	0.1%	5.0%	8.7%	9.0%
LCV	30.5%	49.7%	19.0%	0.0%		0.8%
Bus	16.7%	73.0%	9.4%	0.0%		1.0%
2A	69.1%	29.6%	0.0%	0.0%		1.3%
3A	83.1%	16.8%	0.0%	0.0%		0.1%
MAV	35.7%	64.2%	0.0%	0.0%		0.1%
OSV	100.0%	0.0%	0.0%	0.0%		0.0%
TP02						
Car	20.6%	53.1%	0.0%	8.3%	7.7%	10.2%

OSV	100.0%	0.0%	0.0%	0.0%		0.0%

Source: Historical toll data, Crisil Intelligence,
Note: Annual pass: Data for September & October 2025

The normal toll paying traffic for Cars is about 23 percent at TP01, and about 20.6 percent at TP02 respectively. In case of MAV vehicle normal toll paying is about 36 percent at TP01 and about 66 percent at TP02 respectively.

As per recent announcements, the annual Pass activated on the Fastag will allow free passage of private car/jeep/van at designated National Highway (NH) and National Expressway (NE) fee plazas for one year or 200 trips (whichever is earlier), without per-trip user fee charges. The Annual Pass is applicable only for private non-commercial Car/Jeep/Van after checking through VAHAN database.

To assess the impact of the annual pass, frequency of travel, and number of trips, were made available from client from September 2025 to October 2025. For estimating the annual pass revenue, the plaza constant factor has also been provided by client for both the toll plaza. Details for estimating the annual pass revenue is presented below

Table 8-3: Annual pass- Trips & Plaza constant factor

TP	% Trips	% Trips <2 trips	Plaza constant factor
TP01	8.7%	98.2%	0.83
TP02	7.7%	97.9%	0.81

Source: Historical toll data, Client input, Crisil Intelligence

8.1.1.3 Trip Rates

The trip rates for CJV are adopted based on the FY 26 historic traffic data and trip rates for the present study for FY26 onwards is presented in below table. It may be noted that for other vehicles trip rates of 1.0 is adopted as per schedule of user fee.

Table 8-4: Trip rates for CJV

Mode	Single journey	Return journey	Monthly Pass	Local Pass	Annual Pass
TP01	1.00	2	50	21.86	200
TP02	1.00	2	50	21.91	200

Source: Historical toll data, Crisil Intelligence

8.1.1.4 Tolling lengths

The tolling lengths for the project section as per concession agreement is presented below

Table 8-5: Tolling Lengths for the project section

Toll Plaza	Chainage	Tolling Length
TP01	Km 206	39.63
TP02	Km 260	50.17

Source: Concession Agreement, Crisil Intelligence

8.1.1.5 Toll Rates Estimation

The toll rates that are likely to be applicable on the project section during the project study are in accordance with the National Highways Fee (Determination of Rates and Collection) Rules 2008 [GSR 838 (E),2008 and article 27 of the concession agreement.

The toll rates (Rs/km) for the base year 2007-08 for different vehicle categories are as per fee rule/concession agreement mentioned above and are presented below

Table 8-6: Base Rate in Rs/km

Mode	Car	LCV	2A/Bus	3A	MAV	OSV
Rs/km	0.65	1.05	2.20	3.45	3.45	4.20

Source: Concession agreement, Schedule of user fee

As per the concession agreement structure cost of 150.160 will be applicable at TP01. Thus, the user fee for use of permanent bridge, bypass or tunnel will be applicable considering base year 2007-08 and is presented below

Table 8-7: Base Rate for structure cost more than 50 crores

Cost of permanent bridge, bypass or tunnel (In cr)	Car	LCV	2A/Bus	3A/MAV	OSV
10-15	5.0	7.50	15.0	22.0	30.0
Every 5 cr; 15-100 cr	1.0	1.5	3.0	4.5	6.0
Every 5 cr; 100-200 cr	0.75	1.15	2.25	3.4	4.5
Every 5 cr; >200 cr	0.5	0.75	1.50	2.25	3.0

Source: Concession agreement, Schedule of user fee

In addition, overloaded vehicles are plying on the project road, and overloading revenue has been collected at both the plaza in accordance with gazette notification dated 25th September 2018, G.S.R. 920(E).

The driver or owner or person in charge of a mechanical vehicle shall be liable to pay fee, for entering the overloaded vehicle on the national highway, to the user fee collecting agency, equal to fees as follows

Table 8-8: User fee for overloaded vehicles

Percentage of excess load over Maximum Permissible Gross Vehicular Weight	Multiplying factor to base rate of fees	Fees
0% to 20%	2	[(Fees applicable for such category of mechanical vehicle under sub-rule of rule 4) X (Multiplying factor)]
>20% to 40%	4	
>40% to 60%	6	
>60% to 80%	8	
>80% and above	10	

Source: G.S.R. 920(E).

The overloaded vehicles plying on the project section is provided by client as part of the assignment and the overloading share has been estimated from FY26 (April-Oct) data and is presented below

Table 8-9: Overloading Share %

Particulars	CJV	LCV	2A/Bus	3A	MAV
TP01					
% Overload	0.5%	1.4%	3.6%	0.2%	0.4%

8.1.1.6 Review and Outlook of Whole-Sale price index (WPI)

The projected toll rates are dependent on Wholesale Price Index (WPI) assumptions for 2024 to 2045. For WPI projection, Crisil Intelligence has relied on inputs from Client. Past and outlook WPI growth is presented in below table.

Table 8-10: WPI Outlook

Year	WPI	Expected Year-on-year growth
2025	478.6	
2026P	490.0	2.40%
2027P	514.5	5.00%
2028P	540.8	5.10%
2029P	567.3	4.90%
2030P	592.2	4.40%
2031P	616.5	4.10%
2032P	641.8	4.10%
2033P	668.1	4.10%

8.2 Revenue Estimates

According to the concession agreement, the duration of the concession for the project section is set at 25 years. The concession period is scheduled to conclude at the end of FY36; however, based on the information provided by the client regarding target traffic, the concession period is expected to be extended by 5 years. The revenue estimates have been presented till FY41 and is presented below

Table 8-11: Revenue in ₹ Million for the Project Section

FY Year	TP01	TP02	Total
2026	1,222.0	849.9	2,071.8
2027	1,400.0	950.8	2,350.9
2028	1,562.8	1,081.0	2,643.8
2029	1,656.3	1,071.8	2,728.1
2030	1,786.5	1,181.6	2,968.1
2031	1,921.9	1,437.5	3,359.3
2032	2,106.1	1,571.6	3,677.7
2033	2,309.1	1,719.1	4,028.2
2034	2,421.2	1,705.2	4,126.4

CAGR (FY26-FY41)	**9.6%**	**10.0%**	**9.8%**

Source: Crisil Intelligence, Overloading revenue (Including all vehicles)

The share of revenue from TP01 and TP02 is about 57.4 percent and 42.6 percent of the total revenue from the project section.

At both toll plazas, MAV is major contributor in total revenue accounting to about 55 percent, followed by 2A accounting to about 13 percent. CJV accounts to about 14 percent at TP01 and about 12 percent at TP02 of the total revenue

Table 8-12: TP01 Revenue by Mode in ₹ Million

About Crisil Intelligence (formerly Market Intelligence & Analytics)

Crisil Intelligence is a leading provider of research, consulting, risk solutions and advanced data analytics, serving clients across government, private and public enterprises. We leverage our expertise in data-driven insights and strong benchmarking capabilities to help clients navigate complex external ecosystems, identify opportunities and mitigate risks. By combining cutting-edge analytics, machine learning and AI capabilities with deep industry knowledge, we empower our clients to make informed decisions, drive business growth and build resilient capacities.

For more information, visit Intelligence.Crisil.com

About Crisil

Crisil is a global, insights-driven analytics company. Our extraordinary domain expertise and analytical rigour help clients make mission-critical decisions with confidence.

Large and highly respected firms partner with us for the most reliable opinions on risk in India, and for uncovering powerful insights and turning risks into opportunities globally. We are integral to multiplying their opportunities and success.

Headquartered in India, Crisil is majority owned by S&P Global.

Founded in 1987 as India's first credit rating agency, our expertise today extends across businesses: Crisil Ratings, Crisil Intelligence, Crisil Coalition Greenwich and Crisil Integral IQ.

Our globally diverse workforce operates in the Americas, Asia-Pacific, Europe, Australia and the Middle East, setting the standards by which industries are measured.

1 Executive Summary

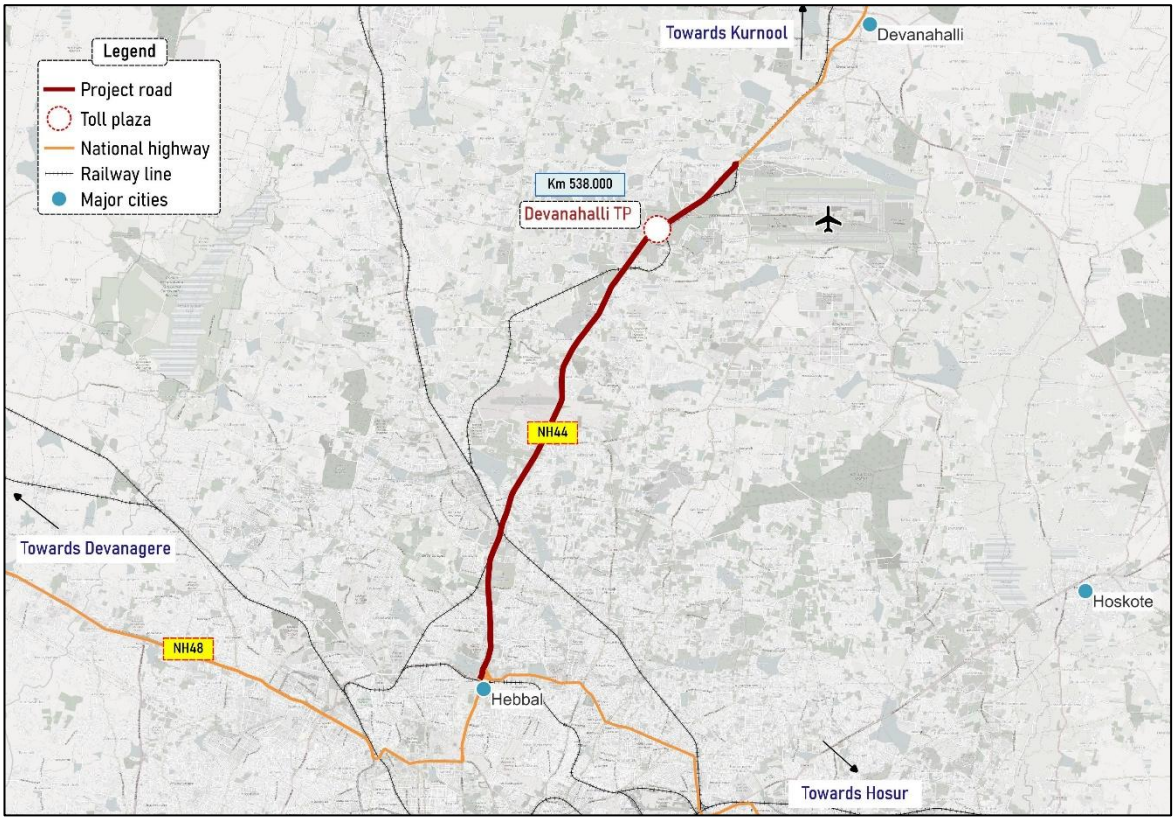
1.1 Project Details

M/s Cube Highways Trust (hereinafter “the Client”) as sponsor has appointed M/s CRISIL Limited (hereinafter referred as “Technical Consultant”) to carry out Traffic and Revenue Due Diligence of operational asset of six Laning of Devanahalli-Hebbal Road on DBFOT Toll Basis in the State of Karnataka (herein after refer as “the Project”) which is being operated by “M/s Devanahalli Tollway Private Limited" (hereinafter refer as “the Concessionaire or Company or DTPL”).

1.2 Asset overview

Project road Devanahalli-Hebbal is a 6-lane, 22.12 km long stretch, on NH-44 in the state of Karnataka and connects the city Bengaluru to Kempegowda International Airport and the traffic moving towards Hyderabad and further North. The project highway has been constructed on Design, Build, Finance, Operate and Transfer (DBFOT) basis with a six – lane divided configuration. The project road has a total of 1 mainline toll plaza Devanahalli TP and 1 check plaza as Sadahalli TP.

Figure 1-1: Project Road



Source: Open Street Map, Crisil Intelligence

The said project stretch is part of NH-44, which is a major north-south national highway from Srinagar in Jammu & Kashmir to Kanyakumari in Tamil Nadu. NH-44 connects several cities and town from north to south such as Srinagar, Delhi, Nagpur, Hyderabad, , Bengaluru, and Kanyakumari. NH 44 covers the north-south corridor of national highway development programme (NHDP) and it is officially listed as running over 3,745 km from Srinagar to Kanyakumari.

Salient growth features and traffic generators

- **IT and ITES Hub**: Bangalore is known as the "Silicon Valley of India" and is home to many top IT companies, including Infosys, Wipro, and Tata Consultancy Services (TCS).
- **Biotechnology and Pharmaceutical Hub**: Bangalore is a major center for biotechnology and pharmaceutical companies, with many research institutions and companies like Biocon and AstraZeneca.
- **Aerospace and Defense Hub**: Bangalore is a significant hub for the aerospace and defense industries, with companies like Hindustan Aeronautics Limited (HAL) and the Indian Space Research Organization (ISRO).
- **Start-up Ecosystem**: Bangalore has a thriving start-up ecosystem, with many incubators, accelerators, and venture capital firms supporting new businesses.
- **Education and Research**: Bangalore is home to many top educational institutions, including the Indian Institute of Science (IISc), Indian Institute of Information Technology (IIIT), and Bangalore University.

The city's traffic generators include IT parks and tech hubs like Electronic City, Whitefield, Koramangala, Manyata Tech Park, and Bagmane Tech Park, which attract a large number of employees and visitors. Commercial centers like MG Road, Brigade Road, Commercial Street, Indiranagar, and Jayanagar are also major traffic generators, with many shops, restaurants, and entertainment options. Industrial areas like Peenya, Yeshwantpur, Hosur Road, Bommasandra, and Jigani are also significant traffic generators, with many manufacturing units and warehouses. Educational institutions like universities, colleges, schools, and research institutions also generate traffic, particularly during peak hours. Hospitals and healthcare facilities like Apollo Hospital, Fortis Hospital, Narayana Hrudayalaya and Manipal Hospital also attract a large number of patients and visitors.

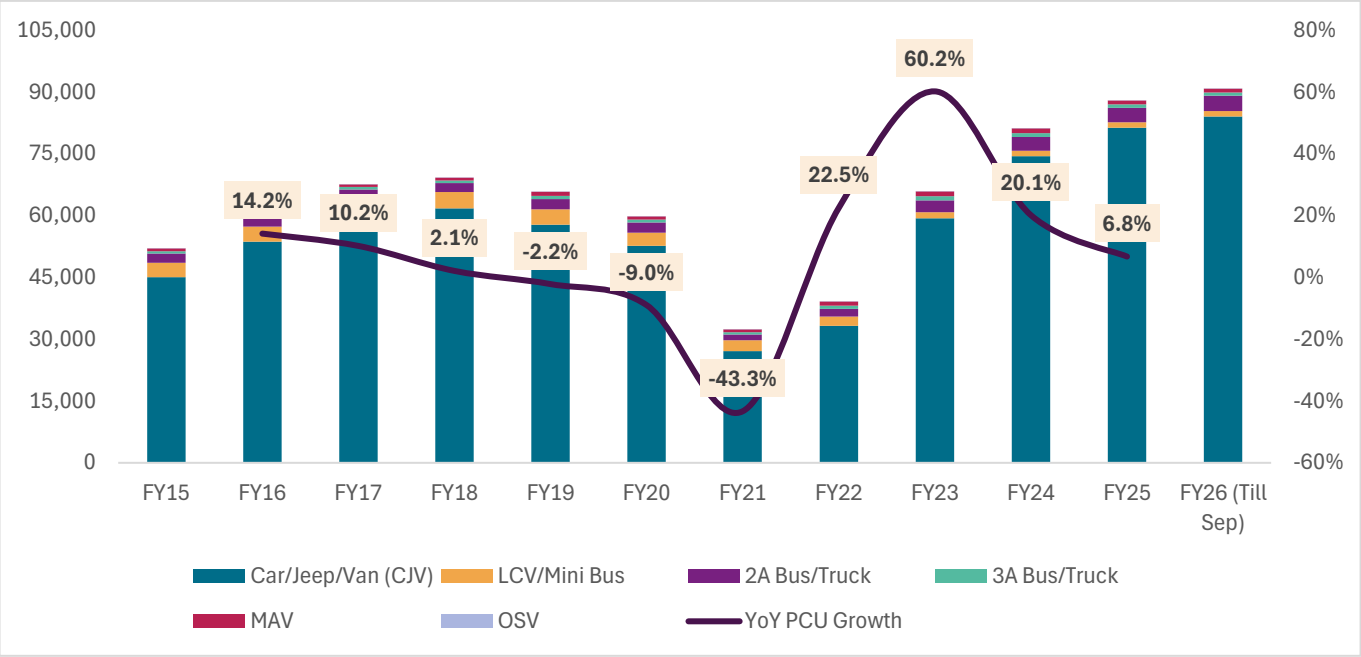
In terms of upcoming developments, Bangalore is expected to see significant growth in the coming years. The city is planning to have a 1,000-acre aerospace park near Devanahalli, which will house many aerospace and defense companies. A 10,000-acre ITIR is also being developed near Devanahalli, which will house many IT companies and create over 1 million jobs. The Bengaluru-Mysuru Industrial Corridor, a 111-km long corridor along the Bengaluru-Mysuru highway, is also being developed, which will house many industries and create over 1 million jobs. The Bengaluru-Chennai Industrial Corridor, a 260-km long corridor along the Bengaluru-Chennai highway, is also being developed, which will house many industries and create over 1.5 million jobs. The city is also expected to see significant development in terms of smart infrastructure, transportation, and public services, with the implementation of the Smart City Project. The metro rail network is also being expanded to 250 km, and a high-speed rail link is being planned between Bengaluru and Mysuru.

1.3 Historical traffic data

The chart below shows the average daily traffic on Devanahalli-Hebbal stretch from the start of commercial operations to Sep 2025. The commercial operations for the toll plazas on the project road are:

- Devanahalli TP

Figure 1-2: Historic Annual Average Daily Traffic (AADT) – Devanahalli TP



Source: Client Data, Crisil Intelligence

1.4 Base Traffic Estimation

For base traffic (annual average daily traffic) estimation of the present study, current fiscal 6-months (Apr-25 to Sep-25) of traffic data were annualized using SCF factor of FY 24 & FY 25 to arrive at the annual average daily traffic (AADT) for FY 26.

The AADT estimation for the base case for FY26 is presented table below.

Table 1-1: Base Traffic Estimation - FY26 AADT

Particulars	FY Year	Car/Jeep/Van (CJV)	LCV/Mini Bus	2A Bus/Truck	3A Bus/Truck	MAV	OSV	Vehicles	PCU
ADT (Apr-Sep)	**FY 26**	84,064	1,344	3,723	773	905	2	90,811	103,650
SCF	**FY 24 & FY 25**	1.03	1.00	1.03	0.97	0.97	0.92		
AADT	**FY 26**	**86,930**	**1,341**	**3,818**	**750**	**879**	**2**	**93,720**	**106,608**

Source: Client TMS Data, Crisil Intelligence

1.4.1 Toll Segmentation

For the present study FY26 (Apr-Sep) toll segmentation has been adopted for FY26. However, in case of Car category Oct-25 data has been used for the segmentation. Return tickets are major in CJV category primarily due to the closer proximity of Bengaluru city and Kempegowda International Airport.

Table 1-2: Historic Toll Segmentation at the toll plaza on the project road

FY	Vehicle Type	Single	Return	Monthly	Local Pass	Exempt	Annual Pass
Oct-25	**Car/Jeep/Van (CJV)**	21.6%	56.8%	2.8%	2.3%	6.1%	10.4%
	LCV/Mini Bus	39.0%	57.7%	0.4%	0.0%	2.9%	

FY	Vehicle Type	Single	Return	Monthly	Local Pass	Exempt	Annual Pass
2026 (Apr-Sep)	2A Bus	3.8%	89.7%	2.3%	0.0%	4.2%	
	2A Truck	57.6%	39.4%	0.3%	0.0%	2.6%	
	3A Bus/Truck	37.4%	57.9%	2.0%	0.0%	2.7%	
	MAV	57.4%	40.6%	1.5%	0.0%	0.5%	
	OSV	54.9%	19.1%	0.0%	0.0%	26.0%	

Source: Client TMS Data, Crisil Intelligence

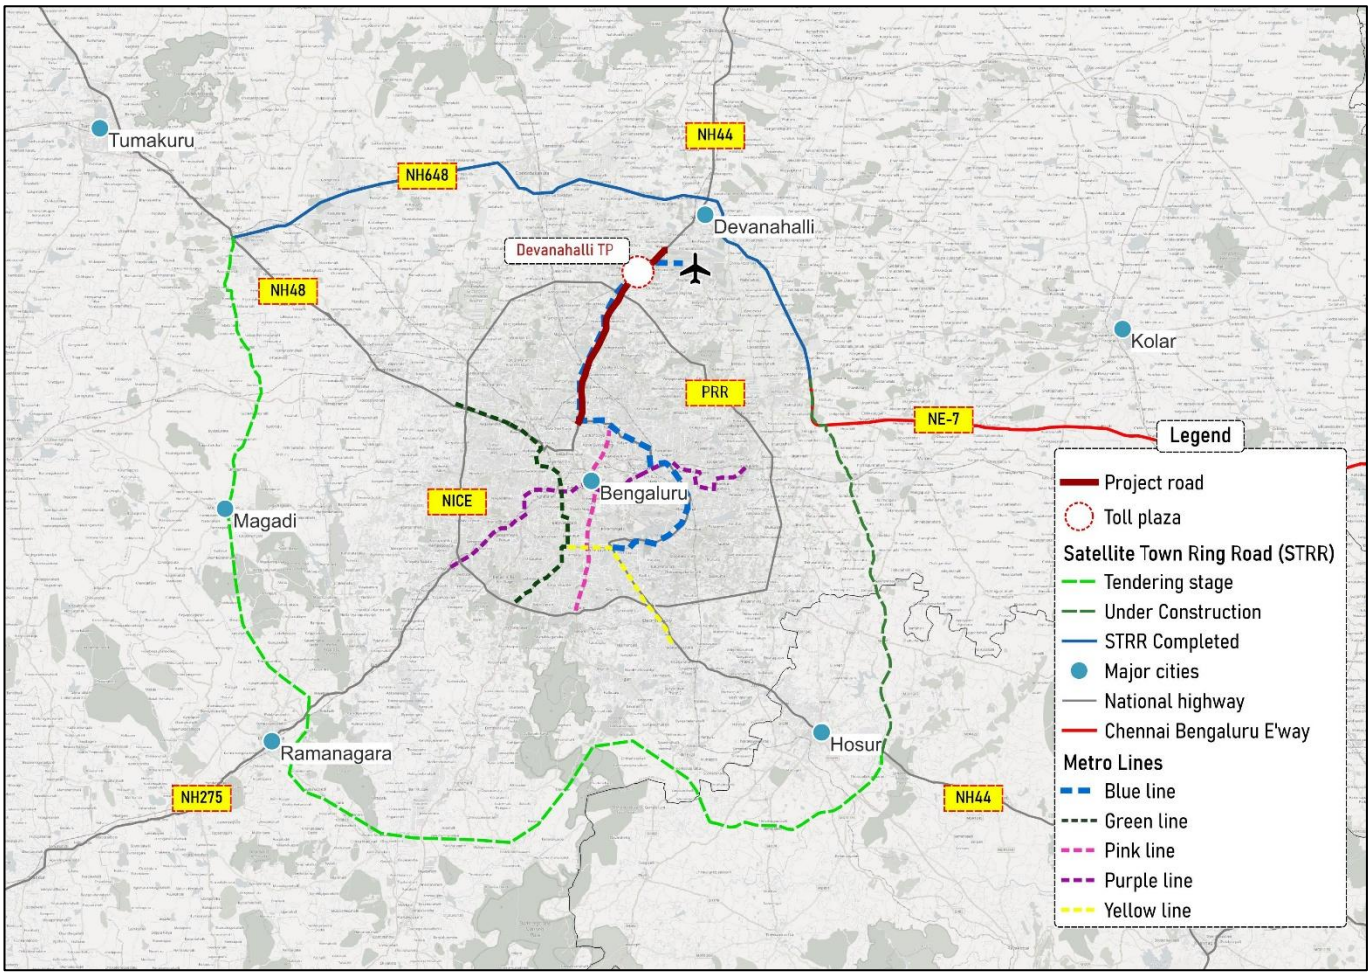
1.5 Network Developments in the Region

In the case of the project road, there are no short distance alternate routes available that will impact the traffic on the project road. However ongoing and upcoming network developments that could impact the project road are:

- Bengaluru Satellite Town Ring Road (STRR)
- Bengaluru Metro- Airport Blue Line

The alignment of the developments along with the project road are presented in figure below.

Figure 1-3: Network Development around project road



Source: Open Street Map, Crisil Intelligence

1.6 Traffic Projections

The table below provides the traffic growth rates considering various diversion/impacts, as provided by the Traffic Consultant:

Table 1-3: Projected Traffic Growth Rates- Post Diversion

Vehicle category	FY27	FY28	FY29	FY30	FY31	FY32	CAGR (FY26-FY32)
Car/Jeep/Van (CJV)	7.6%	3.7%	5.7%	9.0%	6.4%	6.4%	6.4%
LCV/Mini Bus	2.6%	2.4%	3.1%	2.9%	0.0%	0.0%	1.8%
2A Bus	4.1%	-6.1%	-7.3%	3.9%	3.8%	3.7%	0.2%
2A Truck	3.4%	3.2%	4.0%	3.8%	0.9%	0.9%	2.7%

Source: Crisil Intelligence

Actual User Fee on 1st April 2025 Calculated in accordance with the toll Notification applicable at all the toll plaza on the project road for current fiscal (FY26) is provided below:

Table 1-5: Toll Rates

Type of vehicle	Single	Return	Monthly	Local Commercial	Local Personal
Car/Jeep/Van (CJV)	120	180	3,970	60	350
LCV/Mini Bus	185	275	6,100	90	
2A Bus/Truck	370	550	12,265	185	
3A Bus/Truck/MAV	560	840	18,615	280	
OSV	725	1,090	24,245	365	

Source: Crisil Intelligence

1.7 Revenue Projections

The revenue in ₹ million for the project road is projected to grow at a CAGR of about 10.3 percent for the forecast period from FY26 to FY32 and is presented in the table below.

Table 1-6: Projected Revenue in ₹ Millions

FY Year	Devanahalli TP
FY26	3591.8
FY27	3962.1
FY28	4282.4
FY29	4670.9
FY30	5334.9
FY31	5872.7
FY32	6471.9
CAGR (FY26-32)	**10.3%**

2 Introduction

2.1 Asset Overview

Project road Devanahalli-Hebbal is a 6-lane, 22.12 km long stretch, on National Highways 44 in the state of Karnataka. The project stretch serves as the primary road to the Bengaluru airport from Bengaluru city. The traffic composition of the stretch largely comprises of passenger traffic originating and destined for the airport. The project road has been constructed on Design, Build, Finance, Operate and Transfer (DBFOT) basis with a six – lane divided configuration. The project road has 1 mainline plaza and 1 check plaza: Devanahalli TP (mainline).

The project highway provides seamless connectivity to the long-distance traffic travelling between northern parts of India to Southern parts of India as it connects Srinagar in North and Kanyakumari in South.

Table 2-1: Details of the road stretch

Project stretch	State	Toll plaza	Length (km)
Devanahalli-Hebbal section of NH-44 from Km 534.720 to Km 556.840 in the state of Karnataka	Karnataka	Devanahalli TP	22.12

2.2 Scope

The scope of the traffic assessment for the project road is divided into following four sections.

1) Detailed Assessment of the project road: - Include review of the Historic TMS Data, past traffic growth, detailed network assessment.

2) Primary Data collection & Analysis: - Conducting preliminary traffic surveys like Registration Plate and Origin-Destination (O-D) to understand the traffic patterns, commodity profiles.

3) Network Impact Assessment: - To Analyse the upcoming network developments which may impact the project road traffic

4) Traffic and Revenue Projections: - Traffic & Revenue projections considering relevant growth drivers and network developments

Approach & Methodology is detailed out in Traffic Growth Estimation & Traffic forecast chapter.

2.3 Neighbourhood Plazas Traffic Growth

Indian Highways Management Company Limited (IHMCL) publishes toll plazas traffic data for the plazas on national highways and data is analyzed for neighboring plazas to understand traffic growth patterns in the region, nearby plazas have shown good traffic growth in recent years. FY25 traffic PCU and FY24 traffic PCU growth is presented in the figure below.

Figure 2-2: Neighbourhood plazas traffic & growth

2.4 Industrial Profile on the project road

Bengaluru district is a major industrial hub in India, with a diverse range of industries, including IT, biotechnology, aerospace, automotive, and manufacturing. The district is home to many large and small-scale industries and is a significant contributor to the state's economy.

Industrial Sectors:

IT and ITES:

- Bengaluru is known as the "Silicon Valley of India" and is home to many top IT companies, including Infosys, Wipro, TCS, and IBM.
- The IT sector is the largest contributor to the district's economy, with over 50% of the state's IT exports coming from Bengaluru.

Biotechnology:

- Bengaluru is a major hub for biotechnology, with many companies, including Biocon, AstraZeneca, and Novartis, having a presence in the city.

- The biotechnology sector is a significant contributor to the district's economy, with many companies involved in research and development, manufacturing, and exports.

Aerospace:

- Bengaluru is home to many aerospace companies, including Hindustan Aeronautics Limited (HAL), Indian Space Research Organization (ISRO), and Bharat Electronics Limited (BEL).
- The aerospace sector is a significant contributor to the district's economy, with many companies involved in the manufacture of aircraft, spacecraft, and defense equipment.

Automotive:

- Bengaluru is a major hub for the automotive industry, with many companies, including Toyota, Honda, and Volvo, having a presence in the city.
- The automotive sector is a significant contributor to the district's economy, with many companies involved in the manufacture of vehicles, components, and accessories.

Manufacturing:

- Bengaluru is home to many manufacturing companies, including those involved in the production of textiles, leather goods, and food products.
- The manufacturing sector is a significant contributor to the district's economy, with many companies involved in the production of goods for both domestic and international markets.

Industrial Estates and Parks:

- **Peenya Industrial Estate:** One of the largest industrial estates in Bengaluru, with over 1,000 industries, including textiles, engineering, and food processing.
- **Yeshwantpur Industrial Estate:** A major industrial estate in Bengaluru, with over 500 industries, including textiles, leather goods, and engineering.
- **Electronic City:** A major IT hub in Bengaluru, with over 100 companies, including Infosys, Wipro, and TCS.
- **Whitefield Industrial Estate:** A major industrial estate in Bengaluru, with over 500 industries, including textiles, engineering, and food processing.
- **Bommasandra Industrial Estate:** A major industrial estate in Bengaluru, with over 1,000 industries, including textiles, engineering, and food processing.

Major Industries around the Project corridor are presented in **Figure 2-3**.

2.5 Overview of Key Influence Area & Industrial profile

The project road entirely falls in the state of Karnataka passing through the district of Bengaluru. A brief description of key influencing district around the project section is presented below.

Bengaluru District Profile

Bengaluru, the capital city of Karnataka, is a district that embodies a unique blend of traditional and modern culture. Located in the southeastern part of the state, Bengaluru district is spread over an area of approximately 2,190 square kilometres. The district is bounded by the districts of Kolar to the east, Chikballapur to the north, Tumkur to the northwest, and Ramanagara to the southwest.

Bengaluru district is home to a diverse population of over 9.6 million people, making it one of the most populous districts in the country. The district is divided into four taluks: Bengaluru North, Bengaluru South, Bengaluru East, and Anekal.

The district is also a major economic hub, with a thriving IT industry, and is home to many multinational companies, startups, and research institutions, making it a hub for innovation and entrepreneurship. The district has a rich cultural heritage, with a blend of traditional Kannada culture and modern influences, reflected in its cuisine, festivals, and architecture. Overall, Bengaluru district is a vibrant and dynamic region that offers a unique blend of tradition, culture, and modernity.

3 Primary Data Collection & Analysis

3.1 General

Primary traffic surveys, i.e. Origin Destination and Registration Plate surveys were collected on the project road to understand the travel pattern of vehicles plying on the project road.

For the present study, one day (24-Hours) origin destination survey and one day (24-Hours) Registration Plate survey was conducted at the toll plaza location on the project road. The schedule of the traffic surveys carried out as part of the study on the project road are presented in the table and figure below.

Table 3-1: Type of Survey & Schedule

Type of Survey	Survey Duration	Location	Survey Date
Origin-Destination (O-D) Survey	1 Day	Devanahalli TP	22nd September 2025
Registration Plate (RP) Survey	1 Day	Devanahalli TP	22nd September 2025

3.2 Origin-Destination (OD) Analysis

Origin-Destination survey was carried out at toll plaza for 1 Day (24-hours), by roadside interview method as described in IRC: 102-1988. A random sampling approach was employed to interview both passenger and freight vehicles traversing the project road at the toll plaza locations. The survey aimed to gather information on various aspects, including origin, destination, frequency of trips, purpose of travel and for freight vehicles, the type of commodity being transported.

The project influencing states will provide an overview of the factors likely to influence the pattern of economic

development and hence the flows and volumes of traffic on the project road.

3.2.1 Regional Influence

The key influencing regions from the origin destination survey are Bengaluru district, and Chikballapur district for passenger traffic and for goods traffic Bengaluru district, Chikballapur district and Hyderabad. Regional distribution for passenger traffic and goods traffic is given in the table below.

Table 3-2: Regional Distribution in %

State/Region	Car/Jeep/Van (CJV)	2A Bus	LCV	2A Truck	3A Bus/Truck/MAV
Karnataka	96.1%	92.4%	87.7%	86.8%	80.3%
Andhra Pradesh	2.1%	6.1%	7.0%	9.3%	9.4%
Telangana	1.2%	1.3%	4.5%	2.3%	8.5%
Tamil Nadu	0.6%	0.1%	0.8%	1.6%	1.9%
Total	**100.0%**	**100.0%**	**100.0%**	**100.0%**	**100.0%**

Source: Crisil Intelligence

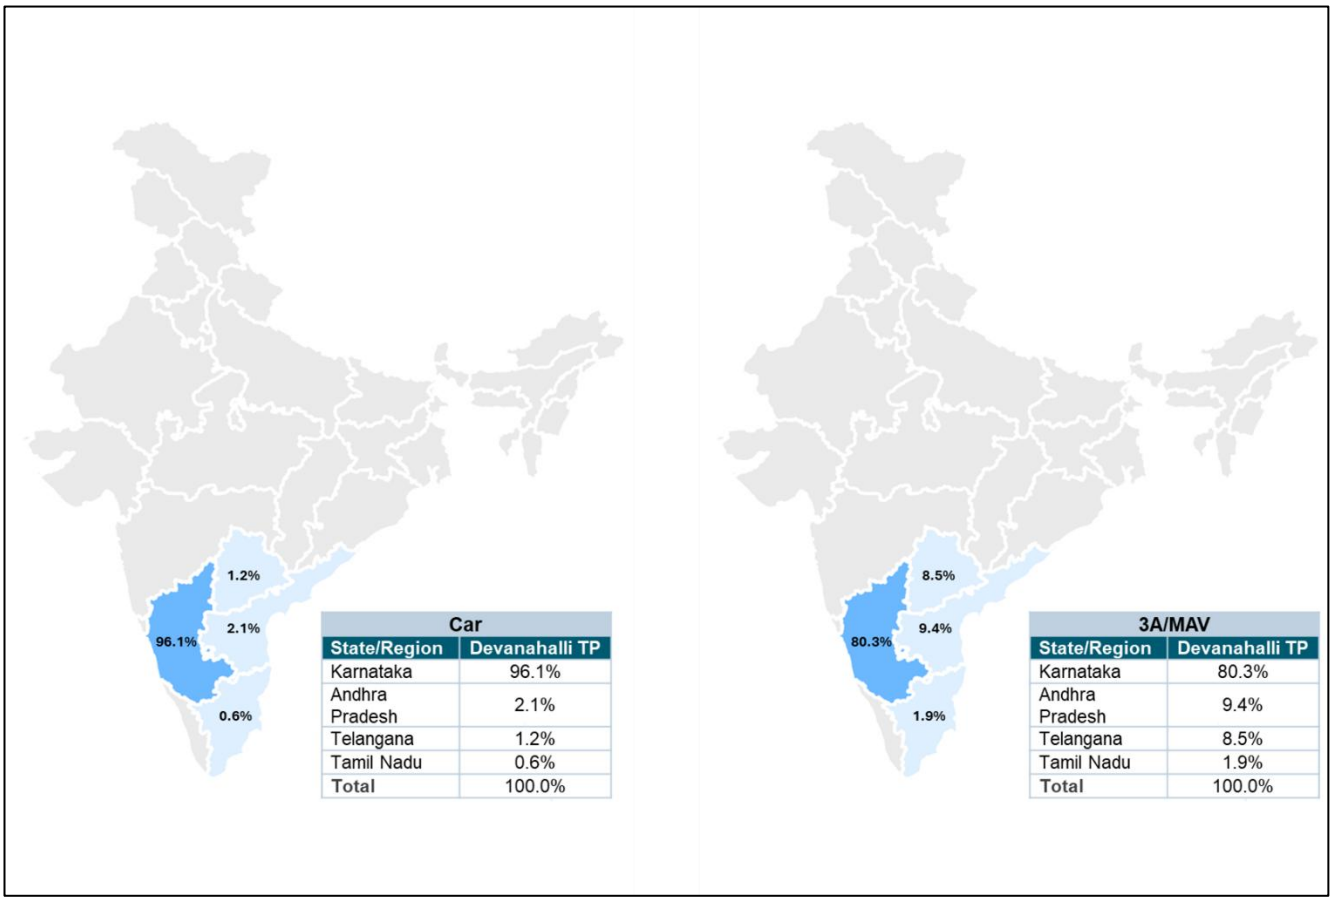
Passenger Traffic

- **Karnataka** contribute to 96.1% car traffic and followed by **Andhra Pradesh and Telangana** with 2.1% and 1.2% respectively.
- About 92.4% bus traffic is contributed by Karnataka state followed by Andhra Pradesh with 6.1%
- **Majestic Bus Stand, City Railway Station to Bangalore International Airport- Terminal 1** and vice versa are the major OD pairs in car traffic**.**

Freight Traffic

- **Karnataka** contribute to 80.3% of 3AT&MAV traffic followed by **Andhra Pradesh and Telangana** with 9.4% and 8.5% respectively.
- In case of 2AT, about 86.8% traffic is contributed by Karnataka followed by Andhra Pradesh state with 9.3%
- Rest of Bangalore City to Devanahalli, Udayagiri, Boovanahalli, Hosathota, Chikkasanne and vice versa are the top OD pair in 3AT&MAV traffic

Figure 3-2: State influence for Car and 3A/MAV at Devanahalli



Car

State/Region	Devanahalli TP
Karnataka	96.1%
Andhra Pradesh	2.1%
Telangana	1.2%
Tamil Nadu	0.6%
Total	100.0%

3A/MAV

State/Region	Devanahalli TP
Karnataka	80.3%
Andhra Pradesh	9.4%
Telangana	8.5%
Tamil Nadu	1.9%
Total	100.0%

Source: Crisil Intelligence

3.2.2 Zonal Influence

The key influencing zones/regions at Devanahalli TP from the origin destination survey are Bengaluru district, and Chikballapur district for passenger traffic and for goods traffic Bengaluru district, Chikballapur district and Hyderabad.

Table 3-3: Zonal influence in % for passenger and goods traffic at Devanahalli TP

Zone	Car/Jeep/Van (CJV)	2A Bus	LCV	2A Truck	3A Bus/Truck/MAV
Bangalore Urban District	46.5%	47.9%	46.6%	46.0%	45.7%
Bangalore Airport	31.9%	18.2%	12.8%	14.5%	10.6%
Bangalore Rural District	10.7%	15.7%	15.1%	12.5%	14.0%
Chikballapur District	5.8%	10.2%	12.5%	13.5%	9.1%
Ananthapur District	1.4%	4.3%	3.9%	6.7%	4.8%
Hyderabad city	1.1%	1.3%	4.2%	1.9%	8.1%
Ramanagaram District	1.0%	0.8%	1.3%	2.1%	1.9%
Mysore and Chamarajanagar Districts	1.0%	0.8%	1.8%	2.2%	2.4%
Rest of Andhra Pradesh	0.3%	0.7%	1.6%	0.0%	2.8%
Krishnagiri District	0.3%	0.0%	0.2%	0.5%	0.5%
Total	**100.0%**	**100.0%**	**100.0%**	**100.0%**	**100.0%**

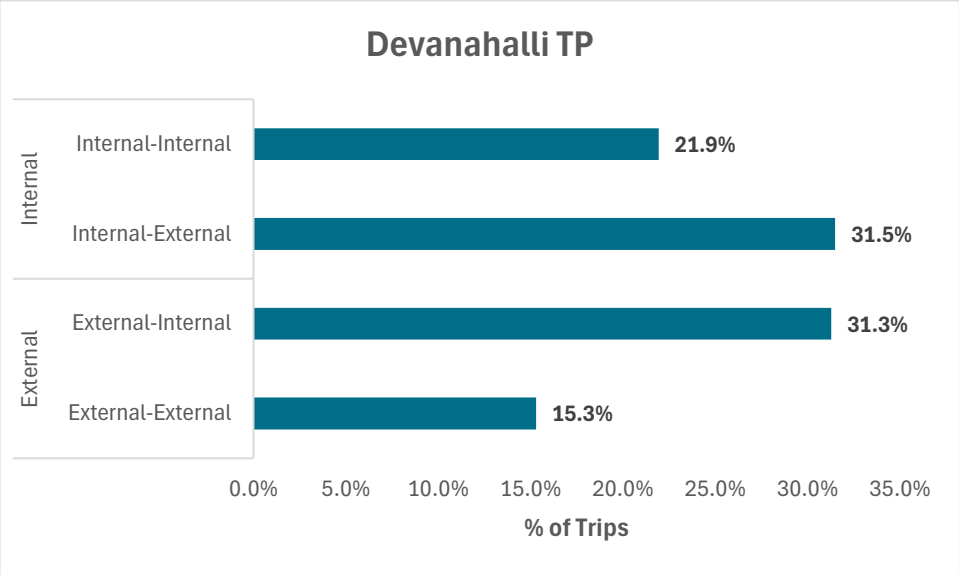
3.2.3 Internal External Analysis

To understand the influence of the zones, present along the project corridor and the dependency and impact of traffic from outside of the project road, internal-external analysis has been done. The zones which fall along the project road and very near project road are considered as internal zones and other zones are considered as external zones. If both end of the trips are internal, those trips are internal-internal trips. If one end of the trips is internal and other is external those trips are internal to external and external to internal trips. If both ends of the trips are external, those are external-external trips. Internal-External analysis is presented in the figure below.

Figure 3-3: Internal-External Influence at the toll plaza



Source: Crisil Intelligence

It can be observed that higher Internal-External and External-Internal trips at the toll plaza, this is due to the closer proximity of Bengaluru city and Airport trips.

3.2.4 Commodity Distribution

Analysis was carried out to understand the various freight vehicles being used to transport different commodities. Table below presents the commodity distribution for the toll plaza in project road.

Table 3-4: Commodity Distribution (in %) on the project road

Commodity	LCV	2A Truck	3A Truck	MAV	Total
Agri Produce	13.6%	8.6%	11.1%	7.6%	11.2%
Automobiles	1.1%	1.0%	2.9%	4.0%	2.0%
Chemical products	0.3%	0.5%	0.5%	0.4%	0.4%
Coal	0.1%	0.0%	0.0%	0.2%	0.1%
Construction materials	5.5%	11.3%	15.2%	11.1%	9.4%
Consumer Foods	9.0%	9.0%	3.5%	7.1%	7.5%
Consumer Products	2.6%	4.4%	2.2%	2.6%	2.8%
Container	0.0%	0.0%	0.2%	0.0%	0.0%
Courier & parcel	15.0%	12.9%	9.5%	12.5%	13.2%
Iron & Steel Products	5.6%	12.9%	10.6%	11.9%	8.9%
Machinery	0.1%	0.0%	0.2%	0.2%	0.1%
Milk & Animal Food	1.6%	0.5%	1.2%	0.6%	1.2%

Commodity	LCV	2A Truck	3A Truck	MAV	Total
Others	0.4%	0.5%	0.5%	0.4%	0.4%
Paper products	0.5%	1.5%	0.5%	1.5%	0.9%
Petroleum Products	0.5%	0.9%	1.3%	1.5%	0.9%
